<i>How has the banks' approach as for the lending changed compared to 2008?</i>	entrepreneurs-artists in %	entrepreneurs-laborers in %	p-value
1. Their approach has significantly deteriorated	18.18	12.54	0.16758
2. Their approach has slightly deteriorated	29.55	19.09	0.03156
3. Their approach has slightly improved	11.36	11.40	0.99202
4. Their approach has significantly improved	2.27	1.14	0.41222
5. Their approach has not changed	10.23	13.11	0.46540
6. I do not know	28.41	42.74	0.01428

The Hypothesis 3 was partially confirmed, as it was found out that there were statistically significant differences between the defined types of businessmen while evaluating changes to the current approach of commercial banks to lending to SMEs in comparison to the pre-crisis period in response No.2. This was the largest group of the respondents, if there are excluded those respondents who did not know how to answer this question.

According to our results, a positive evaluation of the current approach of commercial banks for funding SMEs was reported by 37.50% of the entrepreneurs-artists and by 33.05% of the entrepreneurs-laborers. Entrepreneurs in the Czech Republic assess the approach of commercial banks to financing of their needs more positive than the entrepreneurs in Slovakia. (Belás, Bilan, Demjan, Sipko, 2015)

In Table 4 there are stated the opinions of defined groups of entrepreneurs on whether they can properly manage risks.

Tab. 4 – Evaluation of ability to manage financial risks in their own company by the entrepreneurs-artists and entrepreneurs-laborers. Source: own research

<i>Do you think that you can properly manage financial risks in the company?</i>	entrepreneurs-artists in %	entrepreneurs-laborers in %	p-value
1. Yes	33.72	30.86	0.61006
2. To some extend	59.30	61.14	0.75656
3. No	3.49	0.86	0.06010
4. Cannot tell	3.49	7.14	0.21498

The Hypothesis 4 was rejected. There haven't been found any statistically significant differences in the opinions of defined types of businessmen to manage financial risks in their companies.

Within the regional comparison, there was found out that the entrepreneurs in Zlin region evaluate their ability to manage financial risks in the company more optimistically than entrepreneurs in the Zilina region (p-value (No. 1)<0.01/p-value (No.2)=0.0210). (Belás et al., 2014)

In this context Krištofík (2010) states that the financial crisis has significantly changed the view on risk management in the SME segment in the European countries, including Slovakia. Based on many studies dealing with corporate management in Slovakia and published during the crisis, the most common failures, which can substantially affect the potential ability of a company to survive during the crisis, were for example mismanagement of cash flows or insufficient management of financial risks, i.e., the lack of an early warning from the financial manager. The results of our research, however, showed a high degree of confidence of individual groups of entrepreneurs.

## 5 CONCLUSION

The aim of this article was to examine the relationship between personality characteristics and approach to the perception and management of credit risks.

The most important finding in the context of our research is that the knowledge of lending criteria, which represents an important element in the management of SME credit risk, is likely to depend on personal characteristics of entrepreneurs.

According to our research there are significant differences between defined types of businesses in assessing of changes to the current approach of commercial banks regarding the lending to SMEs in comparison to the pre-crisis period.

The results of our study have showed a high degree of confidence of individual groups of entrepreneurs when evaluating their ability to manage financial risks in the company.

Our study has some limitations because it was performed on a limited sample of respondents and has a regional character. At the same time, this research suggests that there is likely a correlation exists between personality characteristics of businessmen of small and medium enterprises in approaching credit risk management, which will be the subject of our further research.

## **DEVELOPMENT OF AN EFFECTIVE TAX RATE AND OTHER SELECTED INDICATORS OF PERSONAL INCOME TAX IN YEARS 1993 – 2014**

*Michal Krajňák*

### **Abstract**

The paper deals with an analysis of the development of an effective income tax rate in the Czech Republic in years 1993 – 2014. The paper shows that the decisive factor for the evaluation of the tax burden is not only an income tax rate specified by law but also the existence of items reducing the tax base or the tax. In cases where the taxpayers apply only the basic tax advantage for themselves, there occurs the growing trend of effective tax rate in the mentioned years. The trend of development is reverse in the second analyzed situation where, in addition to the basic benefit for the taxpayer, there is applied also fiscal advantage for two dependent children in cohabitation.

*Keywords: income tax, the effective tax rate, tax credit, tax allowances*

JEL Classification: C30, H24.

### **1 INTRODUCTION**

The personal income tax is a part of the tax system in the Czech Republic since its introduction. Since that date, the incomes of individuals are taxed by personal income tax using a gliding progressive tax rate. The tax reform which took place in 2008 replaced the gliding progressive tax rate by an unified rate. Due to the tax allowances and credits this tax remains, in most cases, progressive. For many taxpayers, the change led to a lower tax burden by direct taxes compared to indirect taxes. The choice between direct and indirect taxation is one of the oldest issues of taxation policy (Atkinson, 1997). Income tax is one of the major revenue of the state budget of the Czech Republic (Široký, Kovářová, Randová, 2012).

The aim of this article is to analyze the development of effective income tax rate (*ERT*) in years 1993 – 2014. Comparison of effective tax rates over time enable taxpayers to better evaluate current rates compared to earlier ones (Woolsey, Foster, 2009). Beside the *ERT* analysis, the paper deals with the effective tax rate after taking into account the mandatory contributions paid by employees ( $ERT_{T+1}$ ) and the implicit tax rate on labor ( $ITR_L$ ). Another part of the paper evaluates the trend of development of *ERT* with the aid of a regression analysis. The source of data for calculation of an income tax is the average wage in the Czech Republic, its 0,5 and 1,5 fold. The paper also uses the methods of description, analysis, comparison.

### **2 PERSONAL INCOME TAX**

Income taxes in the Czech Republic are regulated by Act no. 586/1992 Coll. on the Income Taxes, as amended. Selected provisions of the act undergo changes on every year basis. Among the most significant changes, there are those in tax rates or tax reliefs. The tax relief brings benefit to taxpayers in the form of lower or paid-later tax compared with a status if such provision in the tax act was not mentioned (Kubátová, Jareš, 2005).

## 2.1 Development in tax rates

Široký et al. (2008) states that there is a reduction of the tax burden by direct taxes at the expense of indirect taxes. The tax rate itself might not reflect the actual amount of the tax burden, for the tax base is usually reduced by tax reliefs. In many cases, the tax credit can be deducted from the calculated tax. The development of income tax rates during the years 1993 – 2014 is shown in Tab. 1. The analysis of a share of the tax in the tax mix of selected European countries was performed by Vitek (2011), tax reforms were dealt with by e.g. Appel (2006).

Tab. 1 - Development of personal income tax rates in the Czech Republic. Source: own processing according to the Income Tax Act

Years	1993	1994	1995	1996 - 2002	2001- 2005	2006- 2007	2008- 2014
Tax rate in %	15 – 47	15 – 44	15 – 43	15 – 40	15 – 32	12 – 32	15

Gliding progressive tax rate was preserved until 2007. During this period, the range, number and size of range of individual bands varied. Comparison to the baseline in year 1993 and the state before the tax reform in 2008 is stated in Tab. 2 and Tab. 3.

Tab. 2 - The personal income tax rates in 1993. Source: own processing according to § 16 of the Income Tax Act

From the tax base		Tax	From the tax base exceeding (CZK)
From CZK	Up to CZK		
0	60 000	15 %	
60 000	120 000	9 000 CZK + 20 %	60 000
120 000	180 000	21 000 CZK + 25 %	120 000
180 000	540 000	36 000 CZK + 32 %	180 000
540 000	1 080 000	151 200 CZK + 40 %	540 000
1 080 000	and more	367 200 CZK + 47 %	1 080 000

Tab. 3 - The personal income tax rates in 2007. Source: own processing according to § 16 of the Income Tax Act

From the tax base		Tax	From the tax base exceeding (CZK)
From CZK	Up to CZK		
0	121 200	12 %	
121 200	218 400	14 544 CZK + 19 %	121 200
218 400	331 200	33 012 CZK + 25 %	218 400
331 200	and more	61 212 CZK + 32 %	331 200

Since 2008, for the first time in history of the Czech Republic, the income is taxed not by gliding progressive tax rate, but as stated by Šíroký (2008), by a unified tax rate. A reason for the change is stated to be greater tax fairness. The rate is set at 15 %. The assessment base is not a gross wage after deduction of compulsory social security contributions and health insurance paid by the employee, but the super-gross wage, where, on the contrary, the gross wage is increased by social security contributions and health insurance paid by the employer. There was a decrease in a tax rate in most cases, but an increase in tax base. There was an introduction of 7%-solidarity tax in 2013 that is paid by taxpayers with income of more than 48 multiple of average wage in the national economy (Schellkens, 2014). The advantages and disadvantages of tax progressiveness is examined by e.g. Szyber (2003). Bahl, Wallence (2004) recommend a gliding progressive tax rate as the basis of taxation.

Many EU countries still use gliding progressive tax rates. To learn more about progressiveness indicators, see e.g. Nyamongo, Schoeman (2007). Even outside Europe, this fact is not sporadic, e.g. China or Canada (Shi, Xiaozhong, 2012). Whereas the tax rate is set in ad valorem, i.e. as a percentage, there will be an increase in the tax liability together with the growth of the tax base. This shall imply that one of the tasks of the income tax is to reduce income differences among tax payers (Chen, 2012). Whether it is optimal to have one band or more tax bands is very difficult to establish (Zee, 2005).

## 2.2 Development of values of deductions

Up to 2006, it was possible to deduct allowances for a taxpayer from the tax base. The amount, as stated in Tab. 4, had gradually increased. A similar trend could be seen in case of allowances for dependants living with the taxpayer in cohabitation.

Tab. 4 - The development of tax allowances [in CZK], Source: own processing according to § 15 of the Income Tax Act

Year	1993	1994	1995	1996	1997	1998	1999-2000	2001-2003	2004	2005
Taxpayer	20 400	21 600	24 000	26 400	28 800	32 040	34 920	38 040	38 040	38 040
Child	9 000	10 800	12 000	13 200	14 400	18 000	21 600	23 520	25 560	-

Tax allowances for a child was replaced in 2005 by a tax credit that may even have the character of a tax bonus, if the value of this amount is higher than calculated tax liability. Another replacement of tax allowances by tax credits occurred in 2006. The amounts of selected credits are shown in Tab 5.

Tab. 5 - The development of tax allowances [in CZK], Source: own processing according to § 35 of the Income Tax Act

Year	2005	2006 – 2007	2008 – 2009	2010	2011	2012 – 2014
Taxpayer	-	7 200	24 840	24 840	23 640	24 840
Child	6 000	6 000	10 680	11 604	11 604	13 404

The significant change of amounts occurred at the beginning of 2008. The reason for the increase was the change in technical calculation of tax liability. Compulsory social security contribution and health insurance is included in the tax base that is, in addition, increased by compulsory social security contributions and health insurance paid by the employer. The amount for dependents living in cohabitation in the period of years 2008 - 2012 increased, the credit for a taxpayer since 2008 still remains at the same level, except for a temporary reduction in 2011. Since 2015 there is an increase in the amount per child for people nourishing more children in cohabitation. The amount for the second and third dependent domestic child is increased by 200 CZK, respectively 300 CZK per month. Tax credits, as well as tax allowances have an impact on the amount of *ERT*.

### 3 METHODOLOGY

To assess the development of the tax burden, the time series will be analyzed. Time series consist of *ERT*, *ERT<sub>T+I</sub>* and *IRT<sub>L</sub>* calculated for the period of years 1993 – 2014 for the average wages (or 0.5 and 1.5fold of the average wage) in the Czech Republic. *ERT*, *ERT<sub>T+I</sub>* and *IRT<sub>L</sub>* are calculated using relation (1), (2) and (3). The *ERT* is characterized by the average tax rate that is defined as the percentage ratio of tax obligation to gross pay (Friedrich, Maková, Široký, 2012). *IRT<sub>L</sub>* measures the ratio of total taxation on labor in the total volume of employees' income (Pavel Vítek, 2005).

$$ERT = \frac{T}{W_g}, \quad (1)$$

where *T* is a tax liability and *W<sub>g</sub>* is gross wage.

$$ERT_{T+I} = \frac{T+I}{W_g}, \quad (2)$$

where *I* is social security contribution and health insurance payed by an employee.

$$IRT_L = \frac{T+I_E+I_R}{W_{sb}}, \quad (3)$$

where *I<sub>E</sub>* is social security contribution and health insurance paid by the employee, *I<sub>R</sub>* is social security contribution and health insurance paid by the employer and *W<sub>sb</sub>* is a super-gross wage.

A time series is a set of measurements, ordered over time, on a particular quantity of interest. (Newbold, 2013) For analysis of time series, there is a calculation of absolute increment in *AC* (4), relative increment *RC* (5) and the growth factor *CG* (6).

$$AC = y_1 - y_{t-1}, \quad (4)$$

$$RC = \frac{y_t - y_{t-1}}{y_{t-1}}, \quad (5)$$

$$CG = \frac{y_t}{y_{t-1}}. \quad (6)$$

where *y<sub>t</sub>* is the amount of the tax burden in year *t* and *y<sub>t-1</sub>* is the tax burden in the year *t-1*.

The tools of regression and correlation analysis are used to describe the dependencies between two statistical variables. Correlation and regression techniques may be applied to time-series

or cross-section data (Barrow, 1988). A simple regression lies in finding the dependency of one variable (a dependent variable  $y$ ) on a single variable (an independent variable)  $x$ . The task of regression (settlement) of argument  $y$  is to find such a regression function that would express the dependence of  $y$  on  $x$  in the best way. The best position for the regression line is found by maximizing the explained part and minimizing the error part.

$$y = \beta_0 + \beta_1 x, \tag{7}$$

where  $\beta_0$  and  $\beta_1$  are the parameters of a regression line.

For the estimates of parameters  $\beta_0$  and  $\beta_1$  obtained by the least-squares method, there is valid (8) and (9). To learn more about the method of least squares, see e.g. Morris (2012).

$$\beta_0 = \frac{\sum y_i}{n} - \beta_1 \frac{\sum x_i}{n}, \tag{8}$$

$$\beta_1 = \frac{n \sum x_i y_i - \sum x_i \sum y_i}{n \sum x_i^2 - (\sum x_i)^2}. \tag{9}$$

Coefficient of determination  $R^2$  evaluates an adherence of the measured values to a relevant regression function,

$$R^2 = \frac{s_{\hat{y}}^2}{s_y^2}, \tag{10}$$

where  $s_{\hat{y}}^2$  is an empirical variance of balanced values and  $s_y^2$  an empirical variance of the measured values (Neumann, 2000).

## 4 ANALYSIS

Analysis of the development of the tax burden is evaluated using *ERT* indicator. In addition to that, the values  $ERT_{T+I}$  and  $IRT_L$  are calculated for the average wage in the Czech Republic, its 0,5 and 1,5 folds for the period 1993-2014. The development of annual average wage in the Czech Republic in this period is shown in Tab. 6. A objective way to measure the tax circumstances of the taxpayers is using an average wages (Šíroký, Maková, 2009).

Tab. 6 - The average annual gross wage [in CZK] in the Czech Republic 1993-2014, Source: [www.czso.cz](http://www.czso.cz)

Year	1993	1994	1995	1996	1997	1998	1999	2000

#### 4.1 ERT and other indicators in case of application of the basic tax relief for a taxpayer

In this case, selected indicators are calculated under the condition when the taxpayer applies a tax relief only for himself. Results are shown in Tab. 7.

Tab. 7 ERT [in %] and Tax [in CZK] for taxpayer applying tax relief for himself. Source: own calculations

T = tax, HM = gross wage

*ERT* value is the highest in situation where the taxpayer's income is equal to the average wage in 2011. This was caused by a reduction in basic tax credit for a taxpayer by 1 200 CZK. In case of examining the development trend there holds the growth trend up till year 2005, in 2006 *ERT* decreased by 1.5 percentage points, afterwards it gradually increased up to 2011 when it reached the highest value. During the course of last three years, there can be seen almost constant value. The similar development concerns *ERT* for taxpayers with incomes of

0.5 or 1.5-fold of the average wage. Indicators  $ERT_{T+1}$  and  $IRT_L$  were calculated using relation (2) and (3). Their values are stated in annex in Tab A. Development is similar to  $ERT$ . Both the values of these indicators are higher, because they involve rates of compulsory social security contribution and health insurance.

Absolute increments ( $AC$ ), relative increment ( $RC$ ) and growth factors ( $CG$ ) for  $ERT$  were determined using (4), (5) and (6) (for more details for individual years see the annex Tab. B). In case of a taxpayer with an income amounting 0.5-fold of the average wage, the tax liability for the reference period increased each year by 0.09 %, in case of the average wage by 0.16 % and in case of a 1.5-fold of average wage there was an increase by 0.18 %.  $CG$  values less than one for a taxpayer with an income equal to the average wage were found in years 1998, 1999, 2006, and 2012. In those years,  $ERT$  value was, compared to last year, reduced. In years 1998 and 1999, there was an increase in the tax allowance for the taxpayer, in 2006 there was a decrease in income tax rate in the first band from 15 % to 12 %.

In other years, on the contrary,  $ERT$  was increasing, and therefore the average growth rate comes out in the positive value. Low-income taxpayers experienced a reduction of  $ERT$  still in 2001. The taxpayers with higher incomes additionally in 2008. The reason in this case was the replacement of gliding progressive tax rate by a 15% income tax. The gradual increase in ranges of bands might at first sight lead to the fact that the tax burden is reduced. Since the average wage increases, in all situations (0.5; 1.0 and 1.5-folds of the average wage) there was an increase of  $ERT$  (compared to the original year 1993 and year 2014).

The best way of presenting time series data is a time series plot (Buglear, 2012). The development of  $ERT$  for a taxpayer applying a basic tax relief is presented in Fig. 1. Estimation of parameters of the line is obtained by the least-squares method. In all three cases, the coefficient  $\beta_0$  is greater than zero, which means that on average the tax increased each year. The form of equation (7) was gained by using the relation (8) and (9). The coefficient of determination  $R^2$  for a taxpayer with 1.5-fold the average wage has a value of 0.93, which means that 93 % of the variability is explained by the regression model shown in Fig. 1. Relatively high level of reliability is performed by a function for the taxpayers with average income. Low level of reliability is displayed by a function for a taxpayer whose income reaches 0.5-fold of the average wage ( $R^2 = 0.19$ ).

#### 4.2 ERT and other indicators in case of application of the basic tax relief for a taxpayer and tax benefit for 2 dependent children

A similar analysis is carried out in the case where the taxpayer applies, in addition to the tax relief for taxpayer, also for a tax benefit for 2 dependent children in cohabitation.

T = tax, HM = gross wage

Taxpayers with average and lower-than-average income record reduction of *ERT* compared to years 1993 and 2014. Most of notable reduction of *ERT* occurred at the turn of 2004/ 2005 and 2007/2008. In case of taxpayers with above-average incomes, *ERT* reaches the higher value by 0.6 percentage point in comparison to years 1993 and 2014.

*ERT* was increasing up to year 1997 for all the analyzed income groups of taxpayers. Increased range and a reduction of the number of tax bands led to a reduction of *ERT* in years 1998 and 1999. During 2000 - 2004, *ERT* was increasing, with one exception. Range of bands and level of rates remained unchanged between years 2001 to 2005. The situation in 2005 is noteworthy, at that time the reduction of *ERT* was noted by taxpayers with average and lower-than-average income, while *ERT* for taxpayers with higher incomes increased.

In 2006 and 2007 we can observe a gradual increase of *ERT* shown in Fig. 2. The reason of this is a growing level of average wages and a replacement of tax allowances for the taxpayer by a tax credit. The highest benefit from replacement of tax allowances by tax credits had taxpayers with low incomes. *ERT* reduction occurred in 2008 – the tax rate and the technique of its calculation changed. Until the end of the analyzed period there were no major changes in the amount of *ERT*, except for year 2011 when there was a reduction of tax credit for the taxpayer by 1 200 CZK.

By applying the tax allowance or tax credit for dependents, *ERT* has, in comparison with past results, lower values. The negative values of *ERT* in the years 2008 – 2014 for low-income taxpayers are noteworthy. The value of tax credits is higher than the tax liability before credits and there occurs an entitlement to a tax bonus.

Due to the income tax progressiveness, there arises the highest value of *ERT* in case of taxpayers with above-average income. Even if the minimum amount of income tax rate was at the level of 15 % during the most of the reference period, the *ERT* does not acquire that level of amount in any of the observed years. These above mentioned conclusions of *ERT* analysis is valid for the Czech Republic, because personal income taxes are strongly differentiated in European Union member states (Wołowiec, Sobon, 2011). The development of  $ERT_{T+I}$  and  $IRT_L$  values is stated in annex in Tab. C. A similar trend is in force, the amount of values is also affected by the level of rates of compulsory social security contributions and health insurance.

Fig. 2: ERT in years 1993-2014. Source: own calculations

The form of equations of regression line, as well as the coefficient of determination, is shown in Fig. 2. Since the regression line is descending,  $\beta_1 x$  is negative for a taxpayer with the average income and income amounting to 0.5-fold of the average wage. The disadvantage in this case is less explicitness of equations, for  $R^2$  is only 0.0679 in case of a taxpayer with income amounting to 1.5-fold of the average wage.

In an appendix to this paper in Tab. C, there is calculation of absolute increments, relative increments and growth factors of *ERT*. The most of negative values occur in the case of taxpayers with lower-than-average income, on average, their *ERT* decreased by 0.23% each year. The average absolute increment for a taxpayer with average incomes shows also the negative values  $-0.087\%$ .

## 5 CONCLUSION

In terms of development of income tax it is possible to summarize several crucial moments. Apart from the year 1993, when the law was created, these are undoubtedly years 2005 and 2006.

In 2005 the tax bonus was introduced. This step was beneficial namely for low-income groups. A year later, some of tax allowances were replaced by tax credits. Unlike the item for dependent child, these have not got a character of a tax bonus. While tax allowances are more favorable for taxpayers with average and above-average incomes, tax credits on the other hand are more favorable for low-income taxpayers.

The year 2008 is considered to be another important moment. In most cases, there were reductions in the tax rate, but on the other hand, tax base was increased, because in case of income from employment, it is not gross salary after deduction of premiums, but super-gross wage. Changes concerned also the amount of tax credits that went upwards, they were often even several times higher. Reduced tax rates and increased tax credits in most cases resulted in a reduction of the tax burden. In many developing countries, the effects of even the most

progressive income tax on distributional outcomes are likely to be small compared to the effects of more important taxes on consumption, such as the value-added tax and excise taxes (Bird, Zold, 2005). Although at first glance the income tax rate might seem to be the same for all, due to the existence of tax allowances and tax credits its real amount is different. Therefore, it is recommended to assess the effective tax rate in the assessment of the tax burden. In most cases, the personal income tax is the progressive tax (Schneider, Jelínek, 2005).

On the effective tax rate also have an impact changes in social policy, inflation or phase of the economic cycle. The question of taxation is not only economical, but often also a political dimension of topic. It is usual that during the recession tax burden is reducing, while increasing the period of expansion. Political decisions and preferences focusing with policy aimed at selected groups of people in a large extent influence the legislation governing personal income tax.

## **PROFESSIONAL COMPETENCY REQUIREMENTS ON CONTROLLERS IN THE CZECH REPUBLIC: AN EMPIRICAL STUDY**

*Bohumil Král, Libuše Šoljaková*

### **Abstract**

The article describes the outcomes of the project whose purpose is – on the basis of the “Draft for a Common Statement” – to state generally accepted requirements for the professional competence of managerial accountants and controllers. The paper concludes that, despite the fact that Draft is only the first step, it brings substantial contributions: it has led to a better understanding of the differences which accompany this profession’s development in different parts of globe. It enables better identification of common features, but also differences in profiles and professional orientations of professional accountants, auditors and professional accountants in business, and of managerial accountants or controllers whose quality professional development is the principle aim of this project.

The important part of the project is the empirical research focused on changing the requirements of managers and controllers, and mapping the current situation in the Czech Republic in this area. The research compares the opinions of two groups of respondents – experts, who are responsible for the professional competence development of controllers on the one hand, and managers and controllers operating in a business environment on the other hand. The paper provides results relating to following areas: the general content of controllers’ activities, controllers’ authority and responsibility, requirements for controllers’ education, professional skills and practical experience, ethical aspects of management accounting as well as the quality assurance of the controllers’ work.

*Key words: professional competence, controller, management accountant, developmental tendencies*

JEL classification: M21

### **1 PREFACE**

Business environment, company management and company managers’ professional competence development create closely interdependent “inter-connected bowls”. The substance of business process plays prime role; its recognition influences the quality of company management and it is an inspiration source for the development of education, skills, experience and ethical pre-conditions of managers. But, this process has also its important feedback; education of managers impacts the quality of company management which can cultivate business environment.

It is apparent that the substance of business environment has changed substantially in the last few years and these changes also have impact on how companies are managed, including the instruments and methods used. It is not easy to generalise the most important general tendencies profiling this development, in our opinion they are the following:

- Approaching company management as a system which connects organization, planning, control, decision making, motivation and information functions;
- Developing it on a multi-dimensional view of the business process leads to an ever stronger integration of all the relevant aspects of its management: not only of strategic but also tactical and operational perspectives, product, responsibility,

activity based, customer and territorially oriented sections also and its financial and non-financial sides; and

- The interdependence of each of the above sections then influenced by the emphasis placed on the need for an interdisciplinary view of the managed entity.

Also changes in business environment and global crisis manifest itself in the growing pressure to competence of experts who are responsible for it.

All these changes have the impact also on the work of controllers and managerial accountants. This pressure is apparent in many regards. Primarily, it is demonstrated by new requirements of companies and other entities in which the ability and necessity of qualitative changes in the work of these experts have been stressed.

## **2 AIM OF THE PAPER**

In this regard, the aim of this paper is to describe a project whose general orientation is to

- Specify requirements for education, skills and experience but also for professional approaches, values and attitudes of these experts; and – consequently
- Create a framework for the definition of quality standards for the work of these experts.

The project was initiated in the middle of 2011 by the International Group of Controlling (IGC). However, shortly after the first version of the Draft for a common statement development, whose aim was to define the project framework, it was stopped as an international project and it was recommended to national bodies to realise it on national bases.

The “Czech version” of the project has been running since the beginning of 2012 at the Faculty of Finance and Accounting of the University of Economics, Prague. It has used the outcomes of the IGC team and it has extended them in two principle lines, on the basis of:

- The development of revised project’s framework which comes from literature sources and from the requirements of professional bodies; and
- Empirically oriented research, whose aim is to map the principle requirements of the professional competence of controllers/managerial accountants.

The paper describes by an evaluating way revised “Draft for a Common Statement” and empirical research focused on changing the requirements of managers and controllers and mapping the current situation in the Czech Republic in this area.

## **3 LITERATURE REVIEW**

Most research (Kaplan, Cooper, 1998, Burns and Yazdifar, 2001, Merchant, 2003) confirms the significant role of quality financial management in the changing environment which is influenced by the following tendencies: the inter-disciplinary nature of company management, emphasizing its strategic perspective, its multidimensionality, and the integration of all substantial aspects of purposive business management including inter-relationships (but also divergence) between the user and processing areas of quality information systems (Simons, 2004, Parker, 2002, Merchant, 2003).

This situation has a significant impact not only on the substance of the company management control system, including its information support (Carruth, 2004), but also on the professional education, skills, experience and ethical values and attitudes of financial managers. Some authors devote special attention to controllers or managerial accountants.

For example Kaplan (1998) states that ICT development especially has enabled these experts to be liberated from routine data processing, which gives them the opportunity to

- Spend less time on standardized statements of development and – subsequently – to devote more attention to analyses and interpretation of submitted information;
- Communicate more intensively companies' aims and means of their fulfilment with those people from departments who participate in the realization of the aims; and
- Shift part of its work form the area of comparison of actual and desired company results to the area of decision-making about the future course of the business process.

Also, according to Grandlund and Lukka (1998), controllers should not act as internal information support providers only, but more as business partners who are co-equal members of decision-making teams.

Zralý (2007) reacts to the changing role of managers, controllers and managerial accountants and the interactions among them by suggesting the approach be titled the “controlling convergent concept”.

All the above-stated changes in the content of controllers'/managerial accountants' work have also manifested themselves in new requirements of their professional competence and capabilities. Before, they were required to have adequate knowledge, skills and experience of the management accounting instruments and methods, and their implementation and use in the framework of company information systems. Recently, they are expected to be able to use this knowledge, and these skills and experience more as means to successive aims – to integrate on an interdisciplinary basis management accounting information with the other non-financial and qualitative data, to have the capability to justify, interpret and present ascertained results, to give adequate information support for decision-making and to be able to strengthen companies' synergistic effects through the communication and integration of the relations they develop and cultivate (see for example Burns and Yazdifar, 2001, Yasin, 2005, Hoper, 1980, Horváth, 2006, and Zralý, 2007).

Moreover, according to many research outcomes, the level of soft skills (the ability to argue, interpret and present discovered results and to connect financial information with intangible and “invisible” sections of business activities) and the necessity to perceive professional approaches, values and attitudes are important; those aspects are undervalued in all respected materials devoted to the professional competence development of financial managers (Yasin, Bayes, Czuchry, 2005, Pierce and O'Deam, 2003, Grandlund and Lukka, 1998, Jablonsky, Keating and Heian, 2004).

All these changes find expression in the reactions of universities and economically oriented professional bodies which feel the necessity to implement these requirements into university curricula and into certification systems of professional competence development.

#### **4 RESEARCH METHODOLOGY**

Comparison is the principle method which permeates the project solution. It manifests itself in the following sections:

- In comparison of already existing standards which define requirements for professional competence of controllers and management accountants, and literature sources which are interested in impact of business environment changes on education, skills, experience and ethical values of these experts; this comparison is used especially in the 5th chapter of this paper;
- In comparison of these developing requirements with actual business practise; and

- In comparison of how this practise is perceived by experts who are responsible for the controllers' and management accountants' professional competence development and by those who actually operate in company practise; these both dimensions of comparison are used in the 6th chapter of this paper.
- Besides this principle method, the project solution is also based on
- Descriptive methods which are used especially in definition of requirements for the professional competence development;
- Mathematical and statistical methods used in the expression of trends and relations which are the subject of investigation of the empirical part of project; due to required length of paper the tables and graphs which enables to formulate and support conclusions stated in the 7th chapter are not presented in the paper; nevertheless, they are available for interested parties and they will be commented during the paper presentation;
- Generalization which is used in the formulation of the project conclusions.
- All above stated methods are integrated in system approach. Also it is used in the following three sections:
- In the content of solved topic where it has been the intension of researches to investigate all substantial issues of the controllers' and management accountants' professional competence in their mutual relations;
- In expression of relations between investigated sections and the project conclusions; and
- In the integration of general and empirical part of the project.

The aim of the empirical phase of research which follows the definition of conceptual general outcomes is to map how the above stated tendencies manifest themselves in the recent requirements of professional competence of controllers and management accountants; moreover, the question has been analyzed from two view angles:

- From the view-point of experts who are responsible for their professional competence development in the pre-qualification stage;
- From the view-point of managers and controllers/managerial accountants operating in a business environment.

The research should give a comprehensive answer to the question to what extent the changing requirements of the professional competence of these experts are perceived in practice and reflected by institutions which are responsible for their universal education.

With regard to this aim the questionnaire was developed in two versions:

- a version concisely titled "**A controller/management accountant should be...**", designated for the first group of experts; and
- a version concisely titled "**A controller/management accountant is...**", designated for the second group.

The respondents of the second group are randomly selected companies operating in the Czech Republic (number of employees over 100, turnover over €50m and sales also over €50m). Companies from various industries are included in the sample.

Regarding the content and structure of both versions they are identical to a significant extent. Their basis was derived from the above stated analysis of the "Draft for a Common Statement". However, other materials have been also used as inspiration sources, especially:

- IFAC International Standards for Professional Accountants (IFAC, 2003);
- Revised Model Accounting Curriculum (UNCTAD, 2011);

- Syllabuses of the specializations “Accounting and Company Financial Management” (Major) and “Controllership” (Minor) taught at the Faculty of Finance and Accounting of the University of Economics, Prague;
- Education and certification programmes of professional competence development of both the Chamber of Auditors and Union of Accountants professional bodies operating in the Czech Republic; and
- Education and certification programme of the British Associations of Chartered Certified Accountants (ACCA) and Chartered Accountants of England and Wales (ICAEW).

A relatively broadly focused questionnaire, based mostly on questions, required answers on a scale from 1 (strong disagreement) to 5 (strong agreement), but – to a lesser extent – also required Yes or No answers and open answers. It investigated the experts’ opinions in the following problem areas:

- The position of controllers/management accountants in the organizational charts;
- The structure of departments of controllership/management accounting;
- The relationship of these departments to accounting, tax and other departments;
- The general content of the controllers’/management accountants’ activities;
- Areas and extent of the controllers’ authority and responsibility;
- The specific content of the controllers’/management accountants’ activities;
- Requirements for education;
- Requirements for professional skills and practical experience;
- Controllers’/management accountants’ role in ethical aspects of business.
- The selection of potential candidates for a controller / management accountant positions;
- Quality assurance of the controllers’/management accountants’ work.
- The intention of the research team was to work with the questionnaire in two stages:
- The aim of the first stage was to verify the questionnaire’s understandability and completeness in individual interviews with 20 – 30 representatives of both groups of respondents; and
- On the basis of this phase, analyze both questionnaires to formulate a structure which would be appropriate for their electronic distribution and assessment.

## **5 PROJECT GENERAL OUTCOMES**

The principle aim of the project was more complicated than it might appear *prima facie* – due to specifics of the profession of controller or managerial accountant and also due to territorial differences of their role in company management.

The requirements for competence of broadly defined profession of professional accountants are harmonised relatively unambiguously on the basis of the IFAC International Education Standards (2003) and in the area of education. They are even specified by the UNCTAD Model Accounting Curriculum (2011); however, they are the instruments of harmonisation which are oriented primarily to auditors as professional accountants. With regard to their specific role in the framework of the accounting profession it is apparent that the requirements for their professional competence development will be different from experts whose principle focus is to optimise companies’ activities “from the inside”.

Moreover, unlike auditors whose activities in the public interest have been the subject of legislative treatment, analogous legal harmonisation of the requirements for managerial competencies has been perceived to be not only useless but even harmful with regard to the creation of barriers for the free movement of experts.

Additionally, the historical development differences in the areas of managerial control and applied managerial approaches manifests itself by the fact that these experts have different titles in different parts of the globe, but they are also endowed with different levels of authority and responsibility and they operate in different levels of a company hierarchy.

Consequently, the work on the project could not commence with an immediate discussion about quality standards; the project team decided to develop an initial general paper defining the conceptual foundation of the project, its aim, content, structure and consensual terminology. The “Draft for a Common Statement” which represented the first stage of the project solution became the subject of discussion by national IGC members.

### **5.1 Common statement intention**

The intention of the common statement was to generate internationally valid definitions of controlling and the controller's work.

These definitions serve several purposes:

- They can help internationally operating companies to assign tasks, competencies and responsibilities to controllers and management accountants according to their function and role in central or decentralized units of a company;
- They can sharpen the "image" of the controller and the understanding of his partnering function with managers;
- They help to devise and validate the curriculum of educative organizations and make their programs meet the needs of the companies which hire controllers and
- They point out to prospective controllers if the institution they want to choose for their education will cover contemporary topics and teach the relevant topics in depth.

### **5.2 Preamble**

Controlling is defined in the statement as the work a manager (of every hierarchical level) performs to keep his business under control. This job includes awareness of financial performance and the controller's and management accountants' job is to enable managers to execute their controlling functions.

The profession is usually called "Controller" in Continental Europe whereas in English speaking countries it is called more frequently "Management Accountant".

- In the Institute of Management Accountants (IMA) and CIMA publications the term "Management Accountant" is used;
- The IGC uses the term "Controller";
- The IFAC sees management accountants as one group of "Professional Accountants in Business".

Especially for the reason to find consensus, the statement suggests simplification in the sense that controller and management accountant are synonyms.

*Although we supported this simplification for many reasons, we suggested an adjustment of primary orientation of controlling. The first sentence actually stresses the importance of **financial performance** which is understood very narrowly – see, for example, IAS Framework (2007) – especially in connection with factors influencing profit only; we suggested using “performance” only. This term*

- *Better reflects that not only the financial, but also the non-financial section of performance is important for the companies' success; and*
- *It is in the compliance with CIMA's terminology (Management Accounting. Official Terminology, 2000).*

### **5.3 Mission**

The statement defines controlling as an intrinsic part of management. In an organization, all people with the power to make decisions (managers) are also responsible for keeping their part of the organization under financial control. Financial control is understood especially as business control. This includes financial stability and transparency, sound and informed decision-making, forward focus on financial success, and a holistic view of the business and of the resulting financial issues (Horváth, 2006).

Consequently controllers are defined as the supporting partners for managers in business questions. They are involved when managers do not have enough time or knowledge to fulfil their controlling task.

Controllers prepare and use instruments, methods and key figures in a manner that enables managers to take decisions and to recognize their own responsibilities for results, processes and communication. The focus is on the financial success of the organization and on the performance of its parts. Also, controllers assist all other employees when they control their results, processes and communication with the help of support-systems and appropriate tools.

In our opinion, also stated mission contents the narrow orientation of the controllers' activities on financial section of undertaking only. This is the reason why we suggested the adjustments which would extend the controlling understanding like a part of management oriented to not only financial but also non-financial part of business and its control.

Also, the third paragraph of the mission does not reflect – in our opinion – the substance of a controller added value for the company's success; we suggested changing the second question in sense: "As the system of management control has become too complex recently, controllers should support managers especially with the execution of information, but also communication, advisory and service functions of this system".

### **5.4 Dimensions**

According to the Statement, it is necessary to differentiate five principle dimensions in the controllers' job: profession, function, processes, roles and job title. However, their detailed description and evaluation go beyond the scope of this paper.

### **5.5 Personal requirements for a controller/management accountant**

In relation to the abovementioned framework, the Statement also defines personal requirements which a controller should have. The Statement stresses especially the following:

- Controllers should be the economic conscience of their entities and represent its values.
- Controllers should think and act future-oriented. To do so, they develop methods for the identification and evaluation of opportunities and risks.
- Controllers should design and maintain the controlling systems and provide for a uniform data base. They work with standardized systems and instruments on recurring questions, with customized systems and instruments on specific questions.
- Controllers should be able to support and moderate the development of all performance-related and value-oriented plans of the entity. They build systems to measure the entity capability and performance. These orient themselves both towards the conditions of the business activity as well as to the requirements of the relevant interest groups in a comprehensible way. Controllers also use benchmarks for verification. Managers determine content and level of objectives in the entity units they are responsible for.

- Controllers should prepare internal reports according to the needs of managers to run the organization with equitable valuations. If the rules for external reporting contradict the internal use and purposes, controllers prepare the data to reconcile the internal and the external valuations and explain the differences in a comprehensible way.
- Controllers should be responsible to the board for the examination of the plausibility of plans and investment proposals that were prepared by others.
- Controllers should define and/or coordinate the period, content, procedure and methods of the complete planning process. They compile the required comparisons between targets and actual results as well as the variances. They interpret the results, determine the causes and effects, and provide recommendations for corrective action. They devise the management information system and develop it further.
- Controllers should present and interpret the data by an unbiased way to managers. They take care that the reports correspond with the possibilities of the respective managers to influence the results. They instruct and further train the management of all levels in the use and interpretation of the data.
- Controllers should work with reliable key figures and reference values (actual-/ plan-/ forecast-/ values). When aggregating data they consider the respective decisions.
- The controller should not pass on confidential information and not make use of it for illegal purposes or in order to damage the organization.
- Controllers should be loyal to their organization. They are open-minded towards the needs of their customers, the managers. They actively seek out interaction with their managers and suggest improvements and corrective actions also when not asked to do so.

In our opinion, this part reflects in a very comprehensive and understandable way controllers'/management accountants' personal pre-conditions. This is the reason we suggested adding only one paragraph, corresponding with the above stated ethical section of controllers' activities: he/she should support and communicate the necessity of adhering to professional values, ethics and attitudes in the activities of an entity.

## **6 EMPIRICAL RESEARCH RESULTS**

The research is in the stage in which:

- 27 interviews with experts of the first group were conducted and evaluated; 21 of them participated in the first stage (they also judged the understandability and completeness of the questionnaire) and responded to questions of "A controller/management accountant should be ..." questionnaire; and
- 74 interviews with experts of the second group were conducted and evaluated; 5 of them participated in the first stage and responded to questions of "A controller/management accountant is ..." questionnaire.

The evaluation of the questionnaires brought the following results.

### **6.1 Controllers' position in the companies' organizational charts**

The present research did not produce an unambiguous response regarding questions of controllers' position in companies' organizational charts, desired structure of the departments assuring controllers' functions, or their relations to accounting, tax and other departments engaged in various aspects of companies' financial management.

In our opinion, it is not only the difficult generalization of progressive tendencies but also the different Anglophone and Germanic approaches to these questions which are applied in the Czech business environment which can be the main reasons for this ambiguity.

Nevertheless, most respondents of both groups supported a solution in which controllers or management accountants act under the supervision of the chief financial officer and stressed that these experts should not have straight-line authority and responsibility, so that they can act more like “the company’s economic conscience”.

## **6.2 General content of the controllers’ activities**

Regarding the general content of these experts’ activities, both groups of respondents were almost unanimous regarding the desired content of the controllers’/management accountants’ work. The correctness of data which are processed subsequently into the output information used in the managerial control and the successive quality, availability and transparency of the information rendered to company management belong into the responsibility of these experts.

In compliance with the above stated role of the company’s economic conscience, both groups of respondents also agreed that a controller/management accountant should not bear primary responsibility for the company’s financial results; nevertheless, we can notice slightly higher level of average and mode of responses provided by the second group of respondents, i.e. managers and controllers. In our opinion, it is possible to interpret in a sense that while the first group strictly reject this responsibility for financial results, in practice controllers earn a part of their bonuses based on the results. Nevertheless, this tendency comes more from the necessity to communicate interest for the company’s results across all company employees, regardless of whether they directly influence them or not.

## **6.3 Areas of the controllers’ authority and responsibility**

In relation to above stated general content of the controllers’ activities, the questionnaire has also investigated desired and actual areas of the controllers’ authority and responsibility.

The results show the respondents’ agreement with the opinion that a controller should be equipped with an adequate level of authority and responsibility in the areas in which he/she serves as:

- Coordinator of activities connected with the company’s aims and means of their fulfilment formulation;
- Expert preparing scenarios of future solutions for management;
- Methodist who is responsible for company directives on pricing, costing, budgeting and management accounting development and who also pays attention to their adherence;
- Expert facilitating and supporting communication between departments in all areas of company management which require coordination;
- Communicator who is responsible for transferring reached results to the relevant management levels and someone who should comment on, explain and interpret these results to managers; and finally
- Expert who should participate substantially in the regulations of a company financial management development including the system of remuneration and motivation.

What is remarkable is that the results in the areas of coordination of activities connected with the company aims and means of their fulfilment formulation are significantly different. According to the first group, the role of these experts is crucially important in this area; however, according to the opinion of experts from companies, controllers do not support this area very intensively. In their view, controllers are more focused on the technical and process

activities of controllership and information support of management, and they are not involved so much in general questions of strategy formulation and implementation.

Also, a relatively low agreement exists between both groups of experts regarding whether a controller should act as an originator of an information system or its parts. Conversely, both groups found a consensus that a controller should not have the authority to influence source allocation (e.g. he/she should not decide about the sold products volume and structure, accept make-or-buy decisions or about the development of customer or distribution channels).

Approximately 25 % of respondents mark the financial results value of 4 or 5. The sub-results for this group in relation to areas of controller activities are interesting. The average value of this group for the area of the scenarios preparation is 2.72; for the decisions on resource allocation it is only 2.61. That means a discrepancy between responsibility for financial result and power to influence them.

#### **6.4 Specific content of the controllers' activities**

Regarding the specific content of the controllers' activities, the research has acknowledged the quite crucial role of controllers in ensuring the aims of target information i.e. in planning and budgeting on the strategic, tactical and operational levels, including processing and presentation of forecasts, estimates and expectations. The respondents' answers also stressed the importance of "traditional controllers' task" – adequate information support in business factors (fixed assets, inventories etc.) acquisition and management of business phases (research and development, purchasing, production, logistics, sale etc.).

Surprisingly, substantially lower agreement exists regarding controllers' participation in the management accounting system and connected internal reporting system development. The respondents also did not find strong agreement in response to the question "To what extent should controllers bear responsibility for the quality of company project management, risk identification and management and organization structures development?"

We can also notice a fundamentally different answer to the question whether a controller should assure quality information support in the areas of business factors acquisition and business phases management between experts from academia and practice. Nevertheless, after analysing the data, the difference in this opinion may be caused by the sample of respondents; the companies included in the pilot part of the research have a relatively simple business cycle and these factors didn't apply to them.

#### **6.5 Requirements for education**

The research also focused on the educational requirement of controllers. Regarding the structure of these requirements, the questionnaire came from the structure of knowledge defined by the IFAC International Education Standards as well as the UNCTAD Revised Model Accounting Curriculum; as it has been already mentioned that also the aims, content and structure of initial (pre-qualification) programmes of Chamber of Auditors, Union of Accountants and ACCA, as well as the abovementioned syllabuses of the specializations of Accounting and Company Financial Management and Controllership taught at the University of Economics, Prague were taken into the consideration.

Both groups of respondents highlight the requirement of financial accounting and reporting, management accounting and corporate finance knowledge. What is surprising is that the second group even prefers knowledge of financial accounting over management accounting one. According both groups of respondents, taxation, internal control systems, business administration and information and communication technology are other areas of controllers' knowledge relevant to their work. On the other hand, knowledge of law, auditing, marketing

and international aspects of business have low importance for the controllers' activities, according to both groups of respondents.

The research also examined the correlation between the importance of the controllers' activities and the requirements for their education. The correlation coefficient is 0.49. The research does not confirm a very strong dependence on the importance of controllers' activities and requirements for education. The respondents that gave a high value to the importance of controllers' activities do not support this opinion for education.

### **6.6 Requirements for ICT competencies**

Currently, controlling and management accounting practice is very influenced by ICT; this tendency has been stressed in many of the abovementioned sources. This has been the reason why we devoted one special part of our questionnaire to this issue.

Generally, the responses of both groups acknowledged the fact that the development of ICT has changed the substance of controllers' work and –conversely – controllers are required to participate actively in the development of the ICT system.

Regarding more specific areas of investigation, the questionnaire tried to ascertain the role of controllers in the area of ICT, especially whether they act as users of ICT only or whether they also participate actively in ICT development. According to both groups, controllers are considered mainly ICT users rather than originators and verifiers of processing and user quality. Not very surprisingly for us, both groups also agreed with the statement that controllers should not serve as managers of ICT projects.

### **6.7 Requirements for professional skills and practical experience**

The research also focused on the relation between technical skills and soft skills (professional skills and practical experience). Their structure is derived from the overview that is mentioned especially in IFAC International Education Standard 3 – Professional skills, but also from the other sources, mentioned in the section devoted to educational requirements.

Both groups of respondents consider the stated soft skills to be important for controllers' activities; nevertheless, technical skills have slightly higher values. What is interesting is that the respondents of the first group consider soft skills to be more relevant in comparison with managers'/controllers' responses. In our opinion, the principle reason for this is the fact that, recently, the soft skills of controllers do not reach required level yet in the Czech Republic. Moreover, managers operating in business are still not convinced about their importance.

### **6.8 Controllers' role in ethical aspects of business**

According to the results of the research, both groups of respondents generally agree with the hypothesis that it is important for a company to define, enhance, support and communicate effectively ethical principles and rules of how they are carried out.

On the other hand, the research confirms quite a poor level of application of ethical principles and rules in business. This fact is quite apparent from the comparison of responses of both groups to the answer, whether controller participates in the development of ethical company standards, codes and guidelines: according to the first group of experts, it is very important to incorporate these standards into company standards, codes and guidelines. However, this importance is not followed by the recent situation declared by second group of respondents.

What is quite unsatisfactory, is the role of controllers in the process of ethical aspects of undertaking enforcement. While first group of respondents (and also standards and guidelines devoted to ethical aspects of professional accountants' activities) evaluate this section of controllers' work as quite important, according to the second group of respondents, recent situation in companies shows great possibilities for improvement in the future.

## **6.9 Human resource management**

The section devoted to human resource management is concentrated in two problem areas:

- The selection of potential candidates for a controller position; and
- The attention which is devoted to controllers' continuing professional development.

The questions relating to the selection of potential candidates for a controller position provide especially interesting outcomes.

First: education and practical experience are considered to be more important than personal values and communications skills for both groups of respondents; but, the difference is small and confirms the high importance of communication and presentation skills.

Second: relatively high importance is also given to language knowledge; to some extent, the mode given by the group of managers of controllers is 5. The reason is probably due to the fact that a many companies in the sample belong to multinational corporations, and effective communication with higher levels and other network members has a great importance.

Analysis of the area devoted to controllers' continuing professional development confirms that both groups of respondents consider professional development quite crucial for the quality of controllers' work. Management enables the continuing professional development of its controllers to some extent, especially when the company controllers are actively searching for such opportunities. However, according to the second group of respondents, company management does not pay adequate attention to whether controllers enhance their professional competence – especially if controllers are passive in this regard.

Both groups are unanimous that most controlling departments consist of a stable team of experts, one which does not change very much, and that is quite important for the quality of the team's work. Respondents also found an agreement that remuneration of controllers seems to be slightly higher than the average companies' level.

## **6.10 Quality assurance of the controllers' activities**

Data gained from the part of questionnaire devoted to quality assurance confirm the necessity of regular evaluation of controllers' work. On the other hand, answers to the open question "How is the controllers' work evaluated?" were very general, for example by vague explanation "the evaluation is realised on a mother company level". In this regard, it seems to us that development of quality standards for this group of experts could enhance the general awareness of how to assure the future quality of the profession.

## **7 CONCLUSIONS**

Although the outcomes of the project investigated the situation in the Czech Republic, in our opinion it already brings inspirations both in the area of general usage of the "Draft for a Common Statement" ideas, as well as the outcomes of the empirical research.

Regarding generalization of the "Draft" ideas, it is apparent that it is the first, but nevertheless an important step on the road whose general aim is not only to define, but also to enforce into practice and assure (more non-formal than supported by legislation) recognition of quality standards for managerial accountants' and controllers' work. Its content has already contributed to a better understanding of the differences which accompany the development of this profession in different part of the globe. It also enables better identification of common features and differences in profiles and professional orientations of auditors and professional accountants in business and of managerial accountants or controllers.

Consequently, the Draft content creates a solid outcome for the development of the first set of “Standards of good practice”, and discussion materials which can inspire by examples of “best practice”, all of which should contain:

- Definition of aims, content and structure of pre-qualification education including requirement for assessment of acquired level of knowledge;
- Determination of requirements for professional skills of these experts including how they are acquired;
- Definition of ways to gain practical experience including the manners and methods of verification whether the experiences have been really accomplished;
- Development of a discussion paper which would define the aims, content, structure and ways to verifying the continuing professional development of these experts; and
- Development of a code of ethics as a principle instrument to enforce professional approaches, values and attitudes in the work of managerial accountants and controllers.

Concrete suggestions regarding the individual abovementioned problem areas should be derived from the results of empirical research. Already investigations made in the Czech environment have brought some important stimuli for the controllers’ professional development management:

- Controllers are required to be responsible primarily for the availability and transparency of the information rendered to company management; on the other hand they should not be responsible primarily for company’s the financial results;
- In the area of requirements for education, both groups of respondents strongly highlight the knowledge of financial accounting and reporting, management accounting and corporate finance; in the ICT area, the controller is considered to be mainly a user rather than an originator and verifier of processing and user quality;
- In the area of requirements for professional skills and practical experience, both groups of respondents consider soft skills to be important; nevertheless, they perceive technical skills even more relevant for the controllers’ professional competence; the recent situation in the Czech Republic in worse in the area of soft skills of controllers as company managers are not convinced about their importance;
- Both groups of respondents also confirm how important for a company it is to define, enhance, support and communicate effectively ethical principles and rules of undertaking; on the other hand, the research also confirms a very poor level of their application in practice; this is the reason why this aspect should be incorporated into the quality standards as a very important one;
- Both groups of respondents consider professional development to be quite crucial for the quality of the controllers’ work; in this regard, management enables its controllers to continue their professional development, but it does not always verify whether controllers enhance their professional competence;
- The statistical results of quality assurance of the controllers’ work confirm the necessity of evaluating controllers’ work. On the other hand, answers to open questions such as “How is the controllers’ work evaluated?” were very general.

## **PROJECT OPTION VALUATION: A CASE STUDY**

*Eva Kramná*

### **Abstract**

The objective of the company is to create wealth by initiating and managing investments that generate future cash flows that are worth than the costs of the investment. Effective capital budgeting can improve both the timing and the quality of asset acquisitions. It influences financial performance and health of the company. The purpose of this paper is to provide a detailed economic analysis of the investment project valuation by using traditional Net Present Value and flexible real options method. The purpose of this study is to analyze and verify the application of the real options methodology for investment decision making.

*Keywords: real options, net present value, flexibility, investment decision-making*

JEL Classification: M21

### **1 INTRODUCTION**

Investment decision making is essential and integral part of the financial management. Investment is usually connected with large capital expenditure from which the company expects high return on investment. Strategic investments are long term, influenced by a lot of internal and external factors and mostly accepted for constantly changing conditions. When company evaluates an internally generated investment project, one of the first step in the process, is the valuation of the opportunity. Using right tool to valuation will make better investment choices. A lot of approaches for projects valuation can be found nowadays. Without a doubt the best known and the most popular approach used for valuing investment opportunities is the Net Present Value (NPV) method which relies on discounted cash flow techniques as pointed by Brealey and Myers (2014). However, growing number of academics and practitioners have demonstrated that DCF valuation techniques do not capture some of the facts of today's business world. Inadequancies incorporated in traditional methods described Schwarz and Trigeorgis (2004), Copeland and Tufano (2004). Critics have argued that traditional techniques can, at times, lead to incorrect capital budgeting decisions. Mun (2006) presents that use of traditional discounted cash flow model are flawed because the model assumes a static, one-time decision-making process while the real options approach takes into consideration the flexibility and uncertainty in valuation. Myers (1984) suggests to view the investment project from the real options perspective rather than traditional financial theory. Koller, Goedhard and Wessels (2010), Guthrie (2009), Mun (2006), Damodaran (2011) propose modifying opportunities for growth of company on the basis of real options.

This paper considers the flexible investment project valuation. The purpose of the paper is to analyze and verify the application of the real options methodology for investment decision making. In the paper the investment project valuation by net present value and real options is demonstrated. The framework of real options is introduced theoretically and in terms of case study it is demonstrated how it can be implemented valuation of investment opportunities, especially those that bear high risk and uncertain future cash flow.

The remainder of this paper is organized as follows. Section 2 compares two main approaches to value investment projects with focusing on real options calculations as well as input parameters. Section 3 briefly describes objective and methodology of the paper. Section 4

presents the results of the analysis. The main ideas based on the results are discussed in section 5. Finally, section 6 concludes.

## **2 FLEXIBLE PROJECT VALUATION**

This section discusses the link between traditional net present value (NPV) calculations and real options approach from the theoretical and practical point of view.

### **2.1 Traditional and flexible models**

As a basis for understanding of real options application, it is essential to clarify differences and similarities between traditional decision analysis (NPV) and real options analysis (ROA). Net present value of the project is the difference between the present value of the future cash flows of an investment and capital expenditure of investment. The formula for calculating NPV can be written as:

$$NPV = C_0 + \frac{C_1}{1+r}, \quad (1)$$

where  $C_0$  is capital expenditure (cash outflow),  $C_1$  is expected future cash flow of an investment,  $r$  represents costs of capital.

By definition of NPV rule, all projects with a net present value greater than zero is able to accept. (Brealey & Myers, 2014) Although NPV is well known and used method, researches find out that it ignores the irreversibility of investment project as well as the value of flexibility to revise decisions after a project begins (Trigeorgis, 1998).

The relatively new approach that can help to overcome these limitations and provide more accurate valuation than the static discounted cash flow approaches by quantifying a project's embedded options called real options. (Schwartz, 2013) The concept of real options has the potential to capture the value of flexibility to revise management decisions made in the future with the advantage of better information (Rogers, 2009). As pointed by Schwartz (2013), the flexibility can be a considerable component of value for many investment projects and the framework of option pricing provides a powerful tool for analyzing such flexibility. According to Smith and Trigeorgis (2004) and Trigeorgis (2005) the strategic NPV can be expressed as follows:

$$\text{Strategic NPV} = NPV + \text{option premium}, \quad (2)$$

where NPV is the net present value of the investment project and option premium represents value of flexibility operation intervention.

### **2.2 Real options models**

For real option pricing can be used many tools but most of them are suitable only in specific situations. The most important and commonly used concepts in modern financial theory are Binomial and Black-Scholes model, as mentioned by Brealey and Myers (2014). Each of them has its own advantages and disadvantages. Key assumption that distinguishes both methods is underlying asset price development. Black-Scholes model is based on assumption that the underlying asset price follows stochastic process. On the other side, the fundamental of binomial model is discontinuity of time. The binomial model takes the risk-neutral approach to valuation. It assumes that underlying asset value can only either increase or decrease during time until option expires worthless. (Mun, 2006)

The model defines two approaches through which it is possible to determine the option value, replication and hedging strategy. Replication strategy is based on the fact that the portfolio

consists of underlying (risk) asset,  $S$ , and risk-free asset,  $B$  so that the portfolio replicated the underlying asset price development. (Zmeškal, 2013)

Portfolio value,  $C_t$ , at the beginning at the time  $t$ ,

$$a \cdot S_t + B_t = C_t, \quad (3)$$

portfolio value,  $C_t$  in the end at the time  $t+dt$  by increase of assets,

$$a \cdot S_{t+dt}^d + B_t \cdot (1+r)^{dt} = C_{t+dt}^d, \quad (4)$$

portfolio value,  $C_t$ , in the end at the time  $t+dt$  by decrease of assets,

$$a \cdot S_{t+dt}^u + B_t \cdot (1+r)^{dt} = C_{t+dt}^u, \quad (5)$$

where,  $S$ , is the value of underlying assets,  $a$ , the quantum of underlying assets,  $B$ , is the value of risk-free asset,  $C$ , is the value of the derivative,  $r$  is risk-free rate,  $u$  ( $d$ ) increase (decrease) underlying assets value index.

By solving all above mentioned equations the unique general relationship for option pricing is gained. The equation for the option pricing by assuming risk neutral probability of growth,  $p$ , according to the Zmeškal (2013) could be simplified as follows:

$$C_t = (1+r)^{-dt} \cdot [C_{t+dt}^u \cdot (p) + C_{t+dt}^d \cdot (1-p)]. \quad (6)$$

In american options pricing is necessary to take into account the possibility to exercise the option till maturity and to modify the equation as follows:

$$C_t = \max[VH; (1+r)^{-dt} \cdot (C_{t+dt}^u \cdot p + C_{t+dt}^d \cdot (1-p))]. \quad (7)$$

One of the important calculations is estimation of input parameters  $p$ ,  $u$ ,  $d$ . Assuming continuous price development of risk-neutral environment, i.e. mean value of the asset has to be equal to the price of the asset at the risk-free payoff,  $\Delta t = T/n$ , then:

$$S \cdot e^{r\Delta t} = p \cdot S \cdot u + (1-p) \cdot S \cdot d, \quad (8)$$

and variance of the proportional price change of asset is equal to  $\sigma^2 \cdot \Delta t$ , i.e.

$$p \cdot u^2 + (1-p) \cdot d^2 - [p \cdot u + (1-p) \cdot d]^2 = \sigma^2 \cdot \Delta t. \quad (9)$$

The last condition is:  $u \cdot d = 1$ .

By solving above equation the up and down probabilities can be expressed as

$$\begin{aligned} u &= e^{\sigma\sqrt{\Delta t}}, \\ d &= e^{-\sigma\sqrt{\Delta t}}, \\ p &= ((1+r)^{\frac{T}{n}} - d) \cdot (u - d)^{-1}. \end{aligned} \quad (10)$$

### 2.3 Input parameters of real options models

Real options depend on six basic variables. They are:

- The value of underlying asset – the value of underlying asset is able to determinate as the expected present value of cash flows from investment. An increase in the present value of the project will increase the NPV a therefore the real option will also increase. (Copeland & Antikarov, 2003)

- The exercise price – it corresponds to capital expenditure of the investment. Typically, it represents prospective costs of investment, namely for real call option it is capital expenditure at the start of the project, for sell options it is capital expenditure of savings or residual value at the end of the project. A higher investment cost will reduce NPV and therefore the real option will also decrease. (Copeland & Antikarov, 2003).
- The time to expiration of the option – it is the time during which management may decide to act, or not act. A longer time to expiration will allow us to learn more about uncertainty and therefore the real option will increase. (Koller, Goedhard & Wessels, 2010)
- Volatility of the value of the underlying asset – it is a measure for uncertainty as to the change in value over time. Volatility is usually given as variance or standard deviation of future cash flows from real assets. An increase in uncertainty of the environment will increase the real options value. (Copeland & Antikarov, 2003) It exists a lot of methods for volatility determination. From my point of view, methods based on historical values should be applied if the underlying asset is traded in the market and there are plenty of correct data from the past and it is able to assume that the future will evolve like the past. Because real options are rarely traded the alternative is to use the volatility of such asset that significantly correlated with the underlying asset and is traded on the market. Another appropriate possibility is to use historical volatility typical for the selected sector.
- The risk-free rate of interest over the life of the option – it equal to risk-free interest rate used for financial options. An increase in the risk-free rate will increase the time value of money advantage in deferring the investment costs and therefore it will increase real option. (Koller, Goedhard & Wessels, 2010) In my opinion, the approximation of the risk-free interest rate should be based on the current market data because the fundamental for estimating the market investment value are market data and their expected development. This should correspond to a risk-free interest rate.

#### **2.4 Sensitivity analysis**

Sensitivity analysis tests how the project's value responds to changes in key inputs as mentioned by Koller, Goedhard and Wessels (2010). From the investor's perspective sensitivity analysis can focus on which inputs to investigate further and monitor more closely. It can also draw attention to any incorrectness in determined inputs for option pricing. Very simple tool is considered Tornado diagrams. It provides decision makers a quick overview of the risks involved. Tornado diagrams help visualize these factors whose uncertainty drives the largest impact on the project value. (Koller, Goedhard & Wessels, 2010)

### **3 OBJECTIVE AND METHODOLOGY**

The article concentrates on the project's valuation under risk and flexibility. The main aim is to determine the effectiveness of the company's investment by using traditional method Net Present Value (NPV) and flexible method real options. The purpose of this study is to analyze and verify the application of the real options methodology for investment decision making.

The research has examined the research questions concerned applicability and process of real options methodology:

1. Does real options theory represent a suitable tool for evaluation of investment?
2. What are the input factors and parameters for real options valuation and how is possible to determine input parameters relevantly?

The real options framework is tested on selected company. The input data for investment valuation are obtained from the balance-sheets, income statements and internal materials of the company XY. The company XY is analyzed from the 2010 to 2013. Firstly, the value of the project by NPV in three scenarios is determined. The strategic and SWOT analysis helped to identify real option. Hereafter, the real options methodology for investment valuation is used and strategic NPV value is calculated.

## **4 RESULTS AND DISCUSSION**

In the following section the application of real option methodology for assessment of investment effectiveness is presented.

The case study concerns evaluation of investment project of the company XY specialized in production, processing and installation of concrete armature. The company's aim is to bring high-quality products to its customers. Therefore, management considers the purchase of new technological equipment for the production of so called 3D-stirrups. The use of this technology will bring material reduction and improving of technical characteristics. It is necessary to maintain technological competitive advantage and market position. The implementation of new technology will bring the possibility of increasing production capacity to realize shorter delivery times of individual contracts.

Management expects from the innovative solution the following positive effects:

- increase number of customers and market expansion,
- maintenance utility product's characteristics and reducing costs simultaneously,
- increase product quality,
- production efficiency and maintenance of market position,
- possibility to expand to other countries.

### **4.1 Valuation of investment project by traditional method**

Capital expenditures include purchase of 3D bending and cutting automated line including accessories. The planned values of revenues and costs are based on estimated contract development and business calculations. The prediction of project cash flow is quite difficult to estimate because it is influenced by many factors. It is therefore necessary to approach with caution to estimation of future revenues, especially with relation to the current situation in building-construction market. Therefore, it is taken into account the possible pessimistic scenario assumes slower growth in revenue of 10% compared with neutral scenario. The company is also aware of several times higher revenues. The optimistic scenario assumes 10% higher growth in revenue compared with neutral scenario. The neutral, pessimistic, optimistic scenarios are summarized in the Tab.1.

Tab. 1 – Cash flow of the investment. Source: Kramná, 2014

<b>Cash flow scenario (in thousand CZK)/Year</b>	<b>2014</b>	<b>2015</b>	<b>2016</b>	<b>2017</b>	<b>2018</b>	<b>2019</b>	<b>2020</b>	<b>2021</b>	<b>2022</b>	<b>2023</b>
Neutral	-1229	154	542	696	928	1141	1438	1582	1642	1783
Pessimistic	-1581	-364	-100	62	317	631	1115	1260	1323	1462
Optimistic	-778	600	853	1009	1249	1467	1762	1905	1960	2103

The sum of the cash flows is discounted by weighted average cost of capital and the final net present values for neutral, pessimistic and optimistic scenario are presented in the following Tab. 2.

Tab. 2 – Net Present Value of the individual projects scenarios. Source: Kramná, 2014

<b>Scenario</b>	<b>Criterion of the project effectiveness</b>	<b>Value (in thousand CZK)</b>	<b>Assesment of economic effectiveness</b>
Neutral	NPV > 0	2 151	Efective
Pessimistic		-2 400	Non-effective
Optimistic		5 604	Efective

The results show that in case of neutral and optimistic scenarios, the project will be economically efficient for the company and its implementation will contribute to the growth of the business value. However, in the case of fulfillment of the projected cash flows in the pessimistic variant the project is not effective to implement.

The traditional NPV method assumes a fixed implementation projects strategy with definite financial plan. With regard to the changing business environment, it is necessary to take measures in business activities. The change of the strategy during the project implementation can influence the actual project value. This flexibility value can be included in the project value by application of real option.

#### **4.2 Valuation of the investment project by real options**

Flexibility is the right of the management to expand to the markets in which they operate in case of growth number of contracts. In case of unfavorable estimated number of contracts the technological equipment can be sold.

The nature of the project and results of the SWOT analysis confirm that the project is flexible and is related with some degree of risk in forecasting cash flow. From this point of view, it is appropriate to apply real options methodology for investment valuation.

##### **Growth options – new markets**

Project opportunities arise from the possibility of obtaining new markets due to increasing of product technological norm. Expanding activities in new markets will bring additional revenues to company. It is call option where underlying asset is the net present value of future

cash flows from the expansion into the new market. The production increase is estimated to 20%. Exercise price is the capital expenditure associated with entry into the new market. The incursion into new market is connected with an increase of direct costs (20%) and additional costs for promotion of new armature type, finding of new customers, distribution costs of products and provision of tax consultant service. It represents american call option because the company has the possibility to enter into new markets at any time during the working life of technological equipment. Time to expiration of the option is 10 years. The parameters required to use Binomial model are shown in the Tab. 3.

Tab. 3 – Basic input parameters. Source: Kramná, 2014

Parameter		Characteristics	Value
Underlying asset	$S_t$	Net present value of future cash flow	6 069
Excercise price	X	Capital expenditure of project	8766
Volatility of the underlying asset	$\sigma$	Volatility of project	0,38
Maturity	T	Time of the project extending	10
Coefficinet of up movements	u	Up movements	1,8523
Coefficinet of down movements	d	Down movements	0,5399

Based upon these inputs, the Binomial model provided following value (Fig. 1) for underlying asset during the time of 10 years.

Fig. 1 – Underlying asset value. Source: Kramná, 2014

The value of underlying asset is able to increase by coefficient of up movement  $u$  with probability  $p$  and decrease by coefficient of down movement  $d$  with probability  $1-p$ .

The following Fig. 2 illustrates the intrinsic value of real call option at any point in time.

Fig. 2 – Intrinsic value of real call option. Source: Kramná, 2014

Real call option is preferable to apply only if it has intrinsic value, i.e. the difference between the current price of the underlying asset and the strike price is positive.

Valuation of real options assumed risk-neutral approach. As the basis for the approximation of the risk-free rate is used current yield to maturity of 3, 5 and 10 year bonds. The summary of risk free interest rate and risk-neutral probabilities of up and down movement is presented in the Tab. 4.

Tab. 4 – Risk-neutral probabilities and riskless interest rate. Source: Kramná, 2014

<b>Parameter</b>	<b>2014</b>	<b>2015</b>	<b>2016</b>	<b>2017</b>	<b>2018</b>	<b>2019</b>	<b>2020</b>	<b>2021</b>	<b>2022</b>	<b>2023</b>
Risk-free interest rate (%)	2,10	1,82	2,67	1,27	1,98	2,78	2,67	3,69	3,63	3,97
$p$	0,37	0,36	0,37	0,36	0,37	0,37	0,37	0,38	0,38	0,38
$1-p$	0,63	0,63	0,63	0,64	0,63	0,63	0,63	0,62	0,62	0,62

Afterwards, the option value by replication strategy is determined. It is based on the assumption that the option price at maturity equals pay-off function. To establish the option price at each node is possible by reverse process from its realization to the initial value.

Fig. 3 – Option to growth. Source: Kramná, 2014

The value of growth option is 5 612 thousand CZK. The option value quantified the possibility to expand into new market. Exercising the option right to expand production to foreign markets will increase the value of investment.

Strategic present value of the investment, i.e. the sum of the net present value of the investment plus the value of the real call option, is 3 212 thousand CZK.

$$\text{Strategic NVP value} = -2400 + 5612 = 3212$$

The results confirm that incorporating the right to expand into new market make the investment favorable.

### Sensitivity analysis

Sensitivity analysis provides information about the sensitivity of each factor on the selected parameter. The value of the investment is affected by many factors, i.e. production capacity, selling product's price, price of basic raw materials, the level of fixed costs and also external economic conditions such as interest rates, exchange rates, etc. Selected risk factors are assessed on the following Fig. 4 in descending order according to their influence on the option value.

Fig. 4 – Tornado diagram. Source: Kramná, 2014

The results of the sensitivity analysis show that key risk factors are variable costs of the project. Decrease of variable costs by 1% growth option value of 148 thousand CZK (increase of 2,6%). The option value increases with the growth of production and price. Relatively small changes in option value evocates the maturity of option.

Nevertheless, this research is connected with some potential limitations. The problem related to the application of the real options methodology in practice could occurs when the underlying asset price is not known from the market. In this case the underlying asset value is calculated as the present value of future cash flow from the underlying investments. On this account the underlying assets is linked with other real options input parameters.

The results showed that in the case of pessimistic scenario the project seems to have no added value for company. However, when evaluating investment it is appropriate to take into consideration all factors and possibilities that the project create during its life. These issues could considerably affect the final project value. Real options approach has the potential to capture the flexibility value of the project. Application of the real options can improve the rationality of investment decision-making. The advantage of the real options model is especially train of thought that not says only whether to accept or reject an investment but when and under what conditions to realize it. The application of real options techniques provides long-term competitive advantage though better decision-making. On the basis of these results, I agree with Miller and Kelber (2015) that real options results should guide decision-makers to choose the best course of action, not necessarily to provide an “exact” option price.

In terms of these results, real options seem to be a useful tool for determining value of investment projects with higher volatility and flexibility.

## 5 CONCLUSION

Traditional capital budgeting methods are often insufficient to justify investment in nowadays turbulent and changing environment. Further, when the investment is evaluated, questions often arise concerning the optimal timing of the investment decision. Real options application

represents suitable tool to evaluate these issues. In this paper real options approach has been used in investment project valuation. The main aim of this paper was to analyze and verify the application of the real options methodology for investment decision making. The results confirmed that ability of company to change the course of investment has its own value. In the case study was the option to growth calculated. The possibility to expand into new market when the conditions were favorable became valuable. The results showed that real option added value to the investment project. It is able to confirm that a project with negative net present value can have a positive influence on the business value.

One of the problems with the real options applications in practice is the correct determining of the input parameters. For this reason the case study showed how to determine input parameters for real options model.

## **VALUE ADDED TAX RATES APPLIED TO LABOUR-INTENSIVE SERVICES AND IMPACT OF THEIR CHANGES ON THE VAT REVENUE**

*Kateřina Krzikallová, Regína Střilková*

### **Abstract**

VAT rates changes, especially an application of reduced rates to labour-intensive services (restaurant and catering services, hairdressing services, minor repairing of shoes and leather goods and minor repairing of bicycles) in the European Union and the Czech Republic is a long term discussed topic. The aim of the paper is quantification of an assumed impact of potential transfer of selected services from the standard to the reduced VAT rate on the VAT revenue in conditions of Moravian-Silesian Region of the Czech Republic. The data for the analysis were obtained by the questionnaire research that was carried out among suppliers of these services, the General Financial Directorate and the Czech Statistical Office. While processing the paper there were used mainly the methods of comparison analysis and descriptive statistical methods. On the one hand, it was found by the analysis that this possible legislative change would lead to the drop of the VAT revenue up to 85 million CZK per a year, depending on the category of the services. On the other hand, it would bring positive aspects, especially an increasing of investment in business development by suppliers of those services. Last but not least, it could prevent price increasing during the planned introduction of the cash transactions fiscalization in the restaurants.

### **1 INTRODUCTION**

Value Added Tax forms the most important part of national budgets revenues of the Member States of the European Union. Therefore, the problem of VAT rates application has been a long discussed topic in the Czech Republic and throughout the European Union. Generally, the current trend in the European Union is rather an increasing of VAT rates, which has a negative impact on the household consumption (Široký & Střilková, 2015).

Anyway, Bye, Strom, and Avitsland (2012) found by the research made in Norway that general and uniform VAT system covering all goods and services without exemptions is welfare superior to current and former non general and nonuniform Norwegian system. Similar results were obtained by Buettner and Erbe (2014) when they quantified the estimates of the effects of repealing the VAT exemption of financial services in Germany.

Nevertheless, the Czech Republic has introduced the second reduced VAT rate in the 10% level since the beginning of 2015, which is applied to selected types of goods (e.g. baby food, medicines and printed books).

In addition, the Czech Republic has been considering for a longer time in accordance with the Council Directive 2009/47/EC of 5 May 2009 amending Directive 2006/112/EC as regards reduced rates of value added tax, the application of a reduced VAT rate (now the first reduced rate on the 15% level) for the selected labour-intensive services for which there is still applied

the standard rate. Specifically, the restaurant and catering services, hairdressing services, minor repairing of shoes and leather goods and minor repairing of bicycles. (Chamber of Deputies of the Parliament of the Czech Republic, 2014). For the last time, the possible legislative amendment was discussed under Amendment No. 1341 of September 16, 2014 of Parliamentary press 251 of the amendment to the VAT Act which was published after its approval in the Collection of Laws of the Czech Republic in the Chapter 108 with No. 262/2014 Coll. However, this amendment was rejected again. For more about legislative process since 2009 see Randová and Krajňák (2009b).

The Government of the Czech Republic is going to gradually introduce a new tool in the fight against tax evasion, cash transactions fiscalization, since January 2016 (for more information about implementation of this system in Croatia see Tot & Detelj, 2014). The problem of tax evasion is dealt in detail also by Manea & Manea (2011). The cash transactions fiscalization will be related to the restaurants and hotels in the first stage. Ministry of Finance, in this context, has been considering transferring of restaurant services (excluding supply of alcoholic beverages) from the standard to the first reduced VAT rate to prevent excessive price increases (Kreč, 2015).

Unlike the Czech Republic, a majority of the Member States applied the reduced rate at least to some of the above mentioned services. Studies carried out in terms of these countries evaluated that this legislative change did not always lead to the anticipated positive effect, especially in terms of pricing policy of these services suppliers and state budgets. More positive indicators were generally reported in the area of business investment or increasing of profit but less into increasing of employment in the selected sectors. Another approach to the empirical analysis of impact of taxes other than income taxes on the corporate investment bring Buettner, Wamser (2009). Jensen and Schjelderup (2011) have also focused in their research to indirect taxation and tax incidence under nonlinear pricing.

These included e.g. the application of a reduced rate to restaurant services in France, where the beneficial effect was also reflected in an increase in employment (for more information see, e.g. Ministry for the Economy, Industry and Employment France, 2010 or Ministère de L'Artisanat du Commerce et du Tourisme, 2012). Furthermore, Finland, where the price reduction was reflected mainly in large companies, suppliers of hairdressing services and restaurants that were a part of an association of suppliers of restaurant services MaRa (see Kosonen, 2013 or Kosonen and Harju, 2013). In case of Belgium, there was an increase in number of jobs and business investment (for more information see Goos, Konings and Breemersch, 2013). In Germany, the VAT rate applied to restaurant services was reduced in 2010, which led to an increase of investment in the sector and a slight increase of job vacancies (Lomas, 2010). The reduction of VAT rates in the sector of hotel and restaurant services was also considered in Italy. The results of the study showed an increase in consumption of accommodation services, a slight decrease in prices and increase of new jobs. Despite the positive aspects, however, there would be a decline in VAT revenues (Manente and Zanente, 2010).

The paper is focused on quantification of impact of possible transfer of above mentioned selected labour-intensive services from the standard to reduced VAT rate on VAT revenue in the conditions of Moravian-Silesian Region of the Czech Republic.

## **2 THEORETICAL BACKGROUND**

VAT is a general consumption tax which the taxpayer, the final consumer pays included in the price of purchased goods and services (James, Nobes, 2010). Fundamental characteristic and unquestionable advantage of VAT is its neutrality, it does not reflect the income situation

of the consumer (Široký, 2008). The VAT payer pays tax on the output of the taxable supply, while claiming deduction of the received taxable supplies in order to realize this taxable supply (Platteeuw & Pestana, 2011). Every supplier of goods or services pays the tax only on the value that he added by his or her activity.

The general provisions regulating the issue of VAT rates applied in the Member States of the European Union are contained in Articles 93 to 130 of the Council Directive 2006/112/EC of 28 November 2006 on the common system of the value added tax (hereinafter referred to as VAT Directive) and its relevant Annexes. From the provisions referred that the supplies of goods and services are usually subject to the standard VAT rate of at least 15% (Annacondia & Corput, 2013). Furthermore, the Member States are allowed to apply one or two reduced rates of at least 5%, but only for a limited range of goods and services. As also reported in their publications, e.g. Široký (2013) and Hemmelgarn (2013), most Member States use specific exceptions to these rules. This is usually application of reduced or zero VAT rates on goods and services satisfying the basic needs (Kubátová, 2010).

Application of reduced VAT rates on labour-intensive services has been an actual topic for a longer time. The labour-intensive services have limited ability to innovate (they cannot benefit from technological progress as much as other sectors) and therefore have a relatively high costs per unit of labour. This sector is under high competitive pressure and employs a lot of young people and people with low qualifications (European Commission, 2011).

In this context, within the originally three-year experiment there was adopted Council Directive 1999/85/EC concerning VAT on labour-intensive services (category minor repairs of bicycles, shoes and leather goods, renovations and repairs of private dwellings, cleaning in private households, domestic care services and hairdressing), which allowed since 1 January 2000 to apply a reduced VAT rate to certain specified labour-intensive services, but only for an experimental period so that it could be possible to test the impact, in terms of job creation and in combating the "black" economy. Originally a three-year experimental period was extended several times until the end of 2010.

The European Commission had to prepare a report for evaluation of this experiment to the European Parliament. The required evaluation report was prepared in May 2007 by a company Copenhagen Economics as a study on reduced VAT rates applied in the Member States of the European Union "Study on Reduced VAT applied to Goods and services in the Member States of the European Union" (hereinafter CE study). A group of independent economic experts examined the impact of reduced VAT rates and exemptions on locally supplied services, particularly in relation to job creation, economic growth and the proper functioning of the internal market. Key results showed, as stated in Copenhagen Economics (2007), that the economic impact of the transfer of services from standard to reduced VAT rate envisaged an increasing of productivity, gross domestic product, employment, wages and lower prices of services. Higher wages and lower prices should bring an increase in consumption in the EU, which would lead to an increase in demand for these goods and services. This study also assumes that SMEs will be able to enter the market thanks to the released barriers, through which the large companies have the opportunity to keep prices unreasonably high, the opportunity to enter the market. Other assumptions include the shift from a so-called gray economy and "do it yourself activities" into the legal taxable sphere. Based on the results of this report and other consultations, the European Commission concluded that the application of reduced VAT rate for labour-intensive services which are intended for the local market, poses no real threat to the functioning of the internal market.

For these reasons, Council Directive 2009/47/ EC of 5 May 2009 amending Directive 2006/112/EC as regards reduced rates of value added tax (hereinafter "Directive 2009/47/

EC") which entered into force on 1 June 2009. Directive 2009/47/ EC allows the Member States of the European Union to include the selected services within a reduced tax rate without a time limit. In addition to the previously mentioned services, there are also a restaurant and catering services and delivery of books on any medium.

Even if the Directive 2009/47/ EC was adopted during the Czech presidency of the Council of the European Union, paradoxically it has not been yet fully implemented to the Czech legislation.

The proof of the persistent relevance of the VAT rates topic in the European Union also reveal are two public discussions that the European Commission launched to this given subject.

First, in 2010 was launched a consultation entitled "Green Paper on the future of VAT. Simpler, more robust and efficient VAT system." (European Commission, 2010) followed by debate in 2012 entitled "Review of existing legislation on reduced VAT rates". The purpose of these public consultations was according to the European Commission (2012) to collect relevant opinions, evidences and recommendations of the general public, especially among professionals in order to help the European Commission to develop reflection in this field. The results of those discussions, similarly to the results of the CE study from 2007 led to the recommendations for the Member States to apply the reduced VAT rates for selected commodities and services, including the labor-intensive ones which are intended for the local market, for more information see Copenhagen Economics (2007).

### **3 OBJECTIVES AND METHODOLOGY**

The goal of this paper is to quantify the foreseeable impact of a potential transfer of selected labour-intensive services from the standard to reduced VAT rate on VAT revenues in the conditions of the Moravian Silesian-Region of the Czech Republic.

The data for the primary empirical research were obtained by the questionnaire research carried out among suppliers of these services in the Moravian-Silesian Region of the Czech Republic. Moravian-Silesian Region has been chosen for the research due to the seat of the authors' university and easier availability of respondents. The individual categories of the respondents included suppliers of the labour-intensive services, to which is not according to the Directive 209/47/EC a reduced VAT rate is not applied. Especially restaurant and catering services, hairdressing services, minor repairing of bicycles, shoes and leather goods. Last but not at least, mainly for the more advanced analysis was made using the data from the Czech Statistical Office and the General Financial Directorate of the Czech Republic (GFD).

On the one hand the questionnaire contains the actual data for the taxable period 4<sup>th</sup> calendar quarter of the 2010 or in case of month taxable period - December 2010. On the other hand it contains the data that are presupposed by the VAT payer in case of the transfer of these services from the standard to the reduced VAT rate (Randová & Krajňák, 2013). Respondents who were not registered to VAT reported the data that would be demonstrated in a situation if they were VAT payers.

For the analysis that is contained in this paper, was prepared using the data included in the questionnaire related to VAT liability. Specifically: sales excluding VAT, costs excluding VAT, output tax according to VAT rates, input tax according to VAT rates and tax liability. Presupposed data of the respondents took into involved aspects of changes in labour productivity, number of employees, labour costs, trade margin, and investment in business development or potential increase of demand of their services.

For more information about impact of potential VAT rates changes on the behavior of suppliers of these services, see Randová, Krajňák (2012b), for more about the pricing policy of restaurants see e.g. Randová, Krajňák (2012a), about their investment decision Randová, Krajňák (2012c) or for more information about results in the categories of hairdressing services, minor repairing of shoes, leather shoes and bicycles see Randová, Krajňák (2013) and Randová, Krajňák, and Friedrich (2013).

### **3.1 Determination of the sample of the respondents**

Before starting the very research it was necessary to determine the sample size (number of respondents) in such a way to get results to at least average reliability and accuracy (Sudman, 1976). The process of determination of the sample size was in detail expressed in Randová, Krajňák (2013).

Tab. 1 - Population and sample size according to the subgroups. Source: authors' calculations according to data from the Czech Statistical Office

Population	Sample size (number of respondents)
Restaurant Services	161
Hairdressing Services	84
Minor repairing of shoes and leather goods	36
Minor repairing of bicycles	36
Total	317

The size of the population reaches up to 317 respondents, the size of particular subgroups of the population is determined according to the proportion of suppliers of restaurant services, hairdressing services, minor repairing of shoes and leader goods and minor repairing of bicycles. The data about number of suppliers of these services were obtained from the Czech Statistical Office (Randová & Krajňák, 2013).

### **3.2 Procedure of recalculating of VAT liability change of the respondents**

The data provided by the General Financial Directorate contained information about the VAT liability of suppliers of the analyzed services in total for each calendar year, but they were not classified according to each tax period. As it has been already mentioned, the respondents provided data for the last tax period of the year 2010 (a month or a quarter, depending on the VAT payer type).

For the comparability of data and for achieving the aim of this paper, the recalculation was made of the data obtained by the questionnaire research on the data per a year. The real and estimated VAT liability of each respondent for the referred tax period was at first multiplied by the number of VAT returns that the respondent submits per a year (four in case of quarterly VAT payer and twelve in case of monthly VAT payer). Subsequently, the average real and estimated VAT liability by individual categories of the respondents was calculated. The identified average real and estimated VAT liability was multiplied by the number of respondents in each category. In that way, it was found the recalculated sum of real and estimated VAT liability of the respondents was determined for the year that the questionnaire research was made (2010).

The change of average recalculated VAT liability (coefficient) in the year that the questionnaire research was made (2010) was calculated as ratio of recalculated estimated and recalculated real yearly VAT liability of all respondents according to equation (1)

$$\Delta VAT(LR)_0 = \frac{\Sigma VAT(LR)_0^e}{\Sigma VAT(LR)_0^r}, \quad (1)$$

where  $\Delta VAT(LR)_0$  is recalculated average yearly VAT liability change of the respondents in the year that the questionnaire research was made (coefficient),  $\Sigma VAT(LR)_0^e$  is recalculated sum of estimated VAT liability of all respondents in the year that the questionnaire research was made,  $\Sigma VAT(LR)_0^r$  is a sum of recalculated real VAT liability of all respondents in the year that the questionnaire research was made.

### **3.3 Procedure of recalculating of VAT liability change (potential VAT revenue of the Moravian-Silesian Region)**

Then, the data about real reported yearly VAT liability (a potential VAT revenue) for the all Moravian-Silesian Region of the Czech Republic obtained from the General Financial Directorate were multiplied by the coefficient (a recalculated average VAT liability change) in each year. The same coefficient was used because of the fact that owing to the persistence of the global economic crisis, there is not expected a sharp change in the behavior of the respondents, suppliers of the services or their customers. Since the VAT rates were different in each analyzed period, to reflect this fact the recalculated VAT liability of the each analyzed year  $VAT(L)_x$  was determined according to equation (2)

$$VAT(L_x^e) = \Delta VAT(LR)_0 \cdot VAT(LR)_x \cdot \left( \frac{VAT(R_x^s) - VAT(R_x^r)}{VAT(R_0^s) - VAT(R_0^r)} \right), \quad (2)$$

where  $VAT(L_x^e)$  is the recalculated estimated VAT liability of the analyzed year,  $\Delta VAT(LR)_0$  is the recalculated average yearly VAT liability change of the respondents in the year that the questionnaire research was made (coefficient),  $VAT(LR)_0$  is real VAT liability of the analyzed year,  $VAT(R_x^s)$  is VAT standard rate of the analyzed year,  $VAT(R_x^r)$  is reduced VAT rate of the analyzed year,  $VAT(R_0^s)$  is standard VAT rate of the year of questionnaire research was made,  $VAT(R_0^r)$  is reduced VAT rate of the year that the questionnaire research was made.

Procedures for data processing and analysis by mathematical and statistical methods are recommended e.g. by Anderson, Sweeney, and Williams (2011), Ashenfelter, Levine, and Zimmerman (2003), Jacques (2013) or Newbold, Carlson, and Thorne (2013). For another statistical approach to taxes evaluating see also e.g. Friedrich, Maková, and Široký (2012).

## **4 RESULTS**

This part of the paper contains deeper analysis of changes of VAT liability of all of selected categories of labour-intensive services suppliers. Especially the impact of potential transfer of these services from the standard to the reduced VAT rate on the VAT liability of the suppliers and a potential impact on VAT revenue in conditions of Moravian-Silesian Region of the Czech Republic.

### **4.1 Calculation of an average change of VAT liability (potential VAT revenue of Moravian-Silesian Region)**

By recalculating the data obtained by the questionnaire research, it was found that suppliers of services in the sample of Moravian-Silesian Region declared following changes in the average VAT liability, as shown in Tab. 2.

Tab. 2 – An average change of VAT liability per a year and respondent in Moravian-Silesian Region in the year of questionnaire research in 2010. Source: Questionnaire research.

Suppliers of labour-intensive services	Average real VAT liability (CZK)	Average estimated VAT liability (CZK)	Average change of VAT liability (%)
Restaurant services	543.678,47	218.341,39	60
Hairdressing services	87.870,18	5.021,09	94
Repairing of shoes and leather goods	46.152,67	- 13.084,33	128
Repairing of bicycles	85.401,89	- 7.597,67	109

As it is clear from results in Tab. 2, it was found by questionnaire research that suppliers of restaurant services would estimate an average VAT liability decrease by 60 % in comparison with the originally declared liability, suppliers of hairdressing services by 94 %. Suppliers of category repairing of shoes and leather goods would expect creation of an excess VAT deduction, therefore, they would assume an average VAT liability decrease by 128 % and suppliers of repairing of bicycles by 109 %.

The procedure of recalculating of VAT liability change of the respondents is contained in the Chapter 3.2. The results of the calculation of the coefficient according to equation (1) are shown in Tab. 3.

Tab. 3 – The change of average recalculated VAT liability of the respondents (coefficient). Source: authors' calculations according to the questionnaire research.

Suppliers of labour-intensive services	$\Sigma VAT(LR)_0^r$ (CZK)	$\Sigma VAT(LR)_0^e$ (CZK)	$\Delta VAT(LR)_0$ (coefficient)
Restaurant services	87.532.234	35.152.964	0,401600217
Hairdressing services	7.381.095	421.771	0,057142089
Repairing of shoes and leather goods	1.661.496	- 471.036	- 0,283501134
Repairing of bicycles	3.074.468	- 273.516	- 0,088963684

Through a process referred to in Chapter 3.3 of the paper, using equation (2) the recalculation was done of really declared VAT liability (potential VAT revenue of the Moravian-Silesian Region) to VAT liability that would have been declared in the case of the mentioned legislative change in individual years in the selected categories of analyzed services in the conditions of Moravian-Silesian region. The quantification was made for the period of years 2005 to 2013.

First the results of the category restaurant services will be shown.

#### 4.2 Results of the restaurant services category

As we can see in Fig. 1, the transfer of restaurant services from the standard to the reduced VAT rate would have meant an important decrease of VAT liability (a drop of the potential VAT revenue).

Fig. 1 – Real and recalculated estimated VAT liability of restaurant services. Source: authors' calculation according to the questionnaire research and GFD.

Fig. 2 shows the recalculation of VAT liability decrease of the suppliers of restaurant services in Moravian-Silesian Region. The decrease is reflected in the range of 40 to 85 million CZK annually. The biggest change would arise in case of the mentioned legislative change in 2012.

Fig. 2 – Change of VAT liability of restaurant services. Source: authors' calculation according to the questionnaire research and GFD.

### 4.3 Results of the hairdressing services category

It is clearly evident in Fig. 3 that the transfer of hairdressing services from the standard to the first reduced VAT rate would mean a significant reduction of VAT liability of these services suppliers and thus a decrease in VAT revenue in terms of Moravian-Silesian Region.

Fig. 3 – Real and recalculated estimated VAT liability of hairdressing services. Source: authors' calculation according to the questionnaire research and GFD.

Fig. 4 expresses the recalculation of VAT liability decrease of the suppliers of hairdressing services in Moravian-Silesian Region. The decrease is reflected in the range of about 1.5 to 4.3 million CZK annually. The biggest change would be arise in case of the mentioned legislative change in 2007, when there was also expressed the highest real VAT liability. This case illustrates very clearly the influence of the economic crisis that began in 2008. In this year, there was high decrease of the real VAT liability and after a temporary growth in 2009 it fell down again and this trend continued until 2013.

Fig. 4 – Change of VAT liability of hairdressing services. Source: authors' calculation according to the questionnaire research and GFD.

#### **4.4 Results of the category of minor repairing of shoes and leather goods**

Fig. 5 shows a clearly evident the drop of both the real and estimated VAT liability of suppliers of minor repairing of shoes and leather goods. The significant decrease of VAT liability occurred in 2009 and the trend continued until 2013. On the one hand, it can be caused by the ongoing economic crisis or, on the other hand, the decrease could happened due to reduction of prices of new goods in which case the customers prefer buying the new goods than letting the older ones repaired.

Fig. 5 – Real and recalculated estimated VAT liability of repairing of shoes and leather goods.  
Source: authors' calculation according to the questionnaire research and GFD.

Fig. 6 shows the biggest decrease of recalculated VAT liability of the suppliers of minor repairing of shoes and leather goods in the Moravian-Silesian Region, which reflects quantification of a potential transfer of these services from standard to reduced VAT rate. However, regardless of this assumption, there is a clear influence of more factors, see comments to Fig. 5. The decrease of VAT liability is reflected in the range of about 13 thous. CZK to 5 million CZK per a year.

Fig. 6 – Change of VAT liability of minor repairing of shoes and leather goods. Source: authors' calculation according to the questionnaire research and GFD.

#### 4.5 Results of the category of repairing of bicycles.

The last category for the analysis is suppliers of repairing of bicycles. This category, unlike previous categories, demonstrates very balanced results. Fig. 7 shows that a potential transfer of these services from the standard to the reduced VAT rate would cause a significant reduction of VAT liability, actually an occurrence of excessive deductions in all analyzed years.

Fig. 7 – Real and recalculated estimated VAT liability of repairing of bicycles. Source: authors' calculation according to the questionnaire research and GFD.

As it has been already mentioned in the comment to the Fig. 7, the change of VAT liability in case of transfer of these services from the standard to the reduced VAT rate was relatively balanced in each of analyzed years. The change of VAT liability was approximately between 7.1 million CZK to 8.6 million CZK.

Fig. 8 – Change of VAT liability of repairing of bicycles. Source: authors' calculation according to the questionnaire research and GFD.

## **5 DISCUSSION AND CONCLUSION**

VAT is a substantial part of tax revenues in the Czech Republic. The issue of application of reduced VAT rates on the selected labour-intensive services is a long term discussed topic in the Czech Republic. That is why the authors have also decided to focus on the analysis of influence of this possible legislative change on the VAT revenue. Owing to the location of the respondents the analysis has been focused on the conditions of the Moravian-Silesian Region so far. Although it is clear at the first sight that this legislative change would have a negative impact on the VAT revenue, in the opinion of the authors it should be useful when deciding about the application of VAT rates to take into account other aspects such as investment into the business.

Anyway, the decrease of VAT liability of restaurant services suppliers and potential VAT revenue is reflected in the range of about 40 to 85 million CZK annually. In case of suppliers of hairdressing services is the decrease is shown in the range of about 1.5 to 4.3 million CZK annually when the biggest change could be seen in 2007 and 2008 because of the visible influence of the global economic crisis.

The biggest decrease of VAT liability is expressed by the category of minor repairing of shoes and leather goods (change of VAT liability in the range of 13 thous. to 5 mil. CZK). This situation appears independently on the recalculation of VAT liability in the case of VAT rates changes, but it is a phenomenon that is predominantly caused by other factors, e.g. the economic crisis or change in the consumers' behavior. The category of repairing of bicycles demonstrated very positive influence on VAT liability on the suppliers of these services in

each of analyzed years. It would bring excessive deductions. The change of VAT liability in this category was approximately between 7.1 million CZK to 8.6 million CZK.

According to the authors' opinion, the government should transfer at least restaurant and catering services to the first reduced VAT rate, since a reduced VAT rate is applied to most of their inputs, which leads in high proportion to their high VAT liability. Even if it may be a subjective view, this legislative change could help to reduce tax evasion in a form of reduction of revenues and avoidance of exceeding a turnover for compulsory registration to VAT. Particularly in the situation when the limit for the compulsory registration is maintained at the level of one million CZK for twelve consecutive calendar months (for more about threshold limit value for the VAT registration see Sobotovičová, Blechová, and Janoušková, 2013). The potential legislative change might also lead to the elimination of price increase in restaurants during the planned introduction of the cash transactions fiscalization.

The authors are also aware that the results of this paper represent only one of possible ways of quantification of the impacts of this possible legislative change on VAT revenue. This problem has been analyzed in a lot of the Member States and each analysis brought different results. Compare for example Goos, Konings, and Breemersch (2013) and Lomas (2010) in case of Germany or in case of Finland see Kosonen (2013) and Kosonen and Harju (2013). Due to this reasons, in their opinion, this problem deserves further research.

## **PREDICTIVE ABILITY OF THE INDEX OF CREDITWORTHINESS**

*Michal Kuběnka*

### **Abstract**

The creditworthy models shall define the level of financial health of analysed economic entity. As well as the bankruptcy models the creditworthy models are usually made of a combination of chosen ratio indexes and assigned weights. Models are, in several cases, based on the points system. In case of bankruptcy models the accuracy of their prediction can be verified on samples of companies that went into the insolvency or even bankrupted. The question is how to evaluate the accuracy of creditworthiness models evaluation. This text presents the created methodology and results of research focused on the creditworthiness index accuracy evaluation. The goal is to set the index of creditworthiness accuracy on the base of own methodology. For this purpose the economic data of 1260 companies from the processing industry sphere were analysed.

*Keywords: creditworthiness, index of creditworthiness, creditworthy models, ROE, implicit costs, EVA*

JEL Classification: G24, G33

### **1 WORLD OF CREDITWORTHY MODELS**

The company used to be evaluated by several stakeholders who are economically linked to the company. In the sphere of finances it mostly means the business partners, current or future owners and current and future creditors. The financial analysis that evaluates the company mainly based on chosen absolute and ratio indexes are the tool for evaluation of a company in the financial sphere. The company is usually separately evaluated by ratio indexes in the area of profitability, liquidity, indebtedness and activity. Particular indexes can show antagonistic indicia on the financial health of analysed entity. For example the high indebtedness versus high profitability, wrong liquidity versus high property turnover etc. Thus the financial analysis can be completed with one of several creditworthy models that can evaluate the financial situation of company by one grade. The creditworthy models are various:

- Kralicek's Quick test - original version (see more in Kralicek, 1993),
- Kralicek's Quick test - modified version (more in Vochozka, 2011),
- Grünwald's index (see more in Grünwald & Holečková, 2007),
- Rudolf Doucha's Balance analysis I., II., III. (see more in Doucha, 1996),
- Tamari risk index (see more in Růčková, 2001, Sedláček, 2001 ),
- KAMF model (see more in Kraftová, 2002),
- Index of creditworthiness (see more in Zalai, 2010),
- IN99 (see more in Neumaierová 2002),
- IN05 – bankruptcy & creditworthy model (see more in Neumaierová, Neumaier, 2005)

The model accuracy was defined only for IN99, IN05 and Tamari risk index from all of them. As for the creditworthy model IN99 the authors state (according to Neumaier, 2002) the

accuracy of 47%, i.e. there is the probability of 47% that the company classified in the creditworthiness category reaches in the following accounting period the positive economic value added (EVA). It is the case when IN99 reaches the value higher than 2,07. The model includes also the so-called grey zone (resulting value within the interval  $\langle 0,684; 2,07 \rangle$ ) in which it is not possible to unambiguously decide on the financial company health. In case of  $IN99 < 0,684$  the company does not produce any economic value added. Initially the models accuracy was at 85% at the moment of its creation.

Values of bankruptcy & creditworthy models IN05 can be also divided in three intervals, in the bankruptcy zone, grey zone and the creditworthiness zone that is linked to the positive value of EVA. If IN05 exceeds the limit 1,60, the analysed company is not likely to bankrupt at the probability of 92 % and shall create a value with the probability of 95 %. The grey zone of interval  $\langle 0,90; 1,60 \rangle$  indicates that the company has 51% of bankruptcy probability and that it shall reach the positive EVA at the probability of 71 %. If the analysed company does not reach the value of IN05 of 0,90 at least, it is directed towards the bankruptcy with the probability of 97% and with the probability of 76 % it reaches the negative value of EVA.

The accuracy verification, i.e. the predictive ability of Tamari risk index, was performed with a sample of financial data of 130 companies from the year 1958. Subsequently, with a time distance of 2 years, the index value was compared between years 1958 and 1960. From the below shown table 1 it results, among others, that 52 % of companies classified in the category “low” went bankrupted in two years. The insufficiency of this research is based on the fact that there is no information on how much the companies ranked as “high” in following years were really creditworthy (i.e. if they reached the positive profitability and in what amount).

Tab. 1 – Tamari risk index – prediction accuracy. Source: Sedláček, 1998

Index	Number of companies for 1958	Change of the risk index after 2 years – number of companies in 1960			
		high	middle	low	Activity stopped
High	59	45 (76 %)	12 (21 %)	-	2 (3 %)
Middle	50	16 (32 %)	25 (50%)	6 (12 %)	3 (6 %)
Low	21	2 (10 %)	3 (14 %)	5 (24 %)	11 (52 %)
Total	130	63	40	11	16

The author of this text has not met any other creditworthy model at which the predictive ability is measured in any way, it means for example:

- To compare if the entity classified under the category “creditworthiness” had any financial problems in following periods (outstanding debts after the maturity day, insolvency, bankruptcy),
- To find out if the entity classified under the category “wrong financial health”, “insolvency risk” etc. had really such problems in following periods or not,
- To compare if the entity under the category “creditworthiness” achieved the positive economic value adder or the positive profitability at least in following periods.

The goal of this article was to set the accuracy of the index of creditworthiness on the base of own methodology, and to evaluate its predictive ability.

The question is where is the border of ROE for author of IC model for classification for bankruptcy or creditworthy. The setting in tab. 3 seems logical but the author could have different view on financial stability (characteristic features of creditworthy and bankruptcy). Also another creditworthy models have not set the criteria for verification of accuracy of model. The question is where is the border for classification of company into category “creditworthiness” and “noncreditworthiness”?

In contrast, bankruptcy models have clearly defined criteria for a successful prediction (bankruptcy occurred in the future or not?), Probably because it dealt with a number of authors to explore and improve their accuracy. Between the best-known and most frequently discussed in the literature include Beerman’s discriminant function (see more Sedláček, 2009), Beaver’s bankruptcy model (Beaver, 1966), Altman’s Z score (Altman, 1968), Altman’s Z’ score (Altman, 1993), Altman’s Z’’ score (Altman, 2006), Taffler index (Agarwal & Taffler, 2007) and IN95 (Kislingerová&Neumaierová, 2000).

## **2 METHODOLOGY AND DESCRIPTION OF ANALYSED SAMPLE**

The determination of the financial model accuracy is typical for bankruptcy models. As the recent researches show there is a series of factors that can fundamentally influence the accuracy of tested models. Kuběnka (2014, p. 364) notes, regarding this matter, that the accuracy of the existing models may be decreased for several reasons:

- the author created the model on a small sample of heterogeneous firms,
- the author failed to consider the differences and specificities of the sector in which the model should be applied,
- in determining the accuracy of the prediction model the author did not consider the possible disparity of the success of the prediction derived from the size of the analysed entities,
- both market conditions and legislation change with the passage of time, while some models are several decades old.

For the maximum accuracy the sample of companies dealing in one branch was chosen, from the branch of processing industry. In order to get the higher homogeneity of the sample 501 companies, with annual turnover over 1 billion CZK, and 759 companies, with annual turnover over 300 mil. CZK, were chosen, i.e. 1260 companies in total.

For the reason that it was possible to export all input financial data necessary for calculation from the MagnusWeb database of the company Bisnode the Index of creditworthiness was chosen. The index of creditworthiness (hereinafter abbreviated as “IC”) has the following form:

$$\mathbf{IC = 1,5X_1 + 0,08X_2 + 10X_3 + 5X_4 + 0,3X_5 + 0,1X_6} \quad (1)$$

where:  $X_1$  = Cash Flow / Total liabilities and Equity

$X_2$  = Total Capital / Total liabilities and Equity

$X_3$  = EBIT / Total Capital

$X_4$  = EBT /Revenues

$X_5$  = Inventory /Total Assets

$X_6$  = Equity/Total Capital

The calculated value of IC of analysed company must be compared with following evaluation scale (tab. 2).

Tab. 2 – Index of creditworthiness – evaluation scale. Source: Vochozka, 2011

Result	Rating	Company
$IC \in < 3 ; \infty )$	extremely good financial position	creditworthiness
$IC \in < 2 ; 3 )$	very good financial position	
$IC \in < 1 ; 2 )$	good financial position	
$IC \in < 0 ; 1 )$	problematic financial position	
$IC \in < - 1 ; 0 )$	bad financial position	bankrupt
$IC \in < - 2 ; - 1 )$	very bad financial position	
$IC \in < - \infty ; - 2 )$	extremely bad financial position	

It results from the evaluation scale that with growing IC the creditworthiness of company increases. That is why the value from 1 up to 7 will be assigned to particular evaluating intervals, whereas the value 7 shall represent the highest creditworthiness, see the table 3.

The IC model accuracy will be evaluated based on the calculation of IC value for particular companies based on final accounts of 2012. The result will be compared with economic results of these companies in following year 2013. More specifically, based on the fact if the company achieved the positive return on equity (abbr. ROE) and in what amount in the following year. The following situation will be assessed:

$ROE < 0$	Owners get no remuneration for their invested capital, the company is classified under the category “active”
$ROE \in < 0; r_f >$	Owners do not reach the evaluation of their capital even not at the level of risk-free evaluation (risk-free rates, $r_f$ )
$ROE \in < r_f; r_e >$	Profitability of equity exceeds the risk-free evaluation but does not reach the level of implicit costs of equity ( $r_e$ )
$ROE > r_e$	Company achieves the positive EVA, it generates the economic profit.

Tab. 3 – Created system of grades for IC and ROE. Source: author

Index of creditworthiness (IC) 2012		Return on Equity (ROE) 2013		
Result	Assigned grade	Result	Assigned grade	Generating of EVA
$IC \in < - \infty ; - 2 )$	1	X	X	X
$IC \in < - 2 ; - 1 )$	2			
$IC \in < - 1 ; 0 )$	3			
$IC \in < 0 ; 1 )$	4 $\Rightarrow$	$ROE < 0$	4	NO
$IC \in < 1 ; 2 )$	5 $\Rightarrow$	$ROE \in < 0; r_f >$	5	NO
$IC \in < 2 ; 3 )$	6 $\Rightarrow$	$ROE \in < r_e; r_f >$	6	NO
$IC \in < 3 ; \infty )$	7 $\Rightarrow$	$ROE > r_e$	7	YES

If the company generates the economic profit ( $ROE > re$ ) and is active and solvent at the same time, then it is creditworthy. That is why the company, that achieves the positive EVA in 2013, will be assigned with the grade 7. With decreasing ROE value the assigned grade shall decrease up to the value of 4, see the table 3. The purpose of assigned IC grades for 2012 and of ROE grades for 2013 is to quantify the prediction (year 2012) and the reality (year 2013) with a distance of one year. The prediction inaccuracy will be expressed as the difference between grades.

### 3 APPLICATION OF IC AND DETERMINATION OF MODEL ACCURACY

IC was applied on the sample of 1260 companies from the processing industry and the total frequencies of achieved creditworthiness of these companies for 2012 are shown in the following table 4. Subsequently the IC model accuracy is determined based on comparison of these values and the ROE value achieved in the following year 2013.

Tab. 4 – Rating of companies pursuant to IC in the year 2012. Source: author

Grade	Frequency	Financial situation	Company classification	Economic value added
1	31	extremely bad	bankruptcy	- EVA
2	22	very bad		
3	77	bad		
4	304	problematic	creditworthy	
5	330	good		
6	208	very good		
7	288	extremely good		
Sum:	1260	x	x	+ EVA

All analysed companies were active one year later and showed no symptoms of collapse (insolvency, bankruptcy). From this point of view IC should include most of companies rather into the category “creditworthiness” (it means from category “problematic” to category “extremely good”) than into the category “bankruptcy” (from category “bad” to “extremely bad”). Nevertheless the fact that the company does not show any collapse symptoms is not sufficient to determine the company as being creditworthy. The good financial situation, including the satisfying profitability, is expected from such company. The table 4, in its absolute value, and the following fig.1 in its percent expression, show that the used IC has, at first sight, a very good predictive ability regarding the fact that only 10% of companies were classified into the category “bankruptcy”. The categories “good” up to “very good” comprise 66 % of tested companies.

Fig. 1 – Results of IC application in the year 2012. Source: author

The ROE value was calculated based on financial statements of same companies for the year 2013 and then compared with the risk-free rate  $r_f$  and the value of implicit costs of equity  $r_e$  for the branch of processing industry. According to MPO (2014) the  $r_{f2013}$  is 2,26 % and the  $r_{e2013}$  is 12,11 %. The average value of ROE of analysed set of companies was 13,76 %,  $ROE_{max}$  385,05 %,  $ROE_{min}$  -107,73 %, median ROE 10,23,%,  $\sigma$  - standard deviation 28,18, variance ROE 794,48. By comparing of achieved values of ROE of particular companies, with critical limit 0 and rates  $r_f$  and  $r_e$ , the following frequencies were found:

ROE < 0	In 2013 196 companies of 1260 ones were found in loss, which represents 15,56 % of analysed sample. At the same time, these companies are the “active” companies without any payment troubles. That is why this category was used as the equivalent of IC within < 0 ; 1 with designation as “problematic“,
ROE $\in$ <0; $r_f$ >	86 entities, i.e. 6,83 % of companies achieved the positive appreciation of equity but not exceeded the appreciation going over the risk-free rate $r_f$ for the branch of processing industry, the companies achieve the profit in their accounts,
ROE $\in$ < $r_f$ ; $r_e$ >	433 of companies, i.e. 34,37 % exceeded the $r_f$ value but not covered the value of implicit costs of equity, they do not show any economical profit,
ROE > $r_e$	545 of companies, i.e. 43,25 % achieve the positive EVA and generate the economical profit.

Table 5 shows final results of accuracy of creditworthiness determination in the year 2012 using the creditworthy model Index of creditworthiness. The column “Fault” represents the difference between the reality (degree of ROE in 2013) and the calculated value (degree of IC 2012).

Tab. 5 – IC 2012 vs. ROE 2013 Source: author

Row	Fact is:	Fault	Frequency	In percent	
1	5 degrees worse	-5	0	0 %	
2	4 degrees worse	-4	0	0 %	
3	3 degrees worse	-3	3	0,29 %	
4	2 degrees worse	-2	16	1,57 %	
5	1 degree worse	-1	99	10 %	Σ 61 %
6	<b>fact meets prediction</b>	<b>0</b>	<b>415</b>	<b>41 %</b>	
7	1 degree better	1	99	10 %	
8	2 degrees better	2	241	23,65 %	
9	3 degrees better	3	107	10,50 %	
10	4 degrees better	4	20	1,96 %	
11	5 degrees better	5	6	0,59 %	
12	6 degrees better	6	13	1,28 %	

The figure 2 shows the frequency of accurate prediction of IC and the frequency of variation degrees between IC 2012 and degrees of achieved value of ROE in the following year 2013. The scheme shows that the frequencies have no standard distribution.

It exactly determined the model of creditworthiness of a company for the following year pursuant to the table 5 as well as the figure 2 for 415 companies, i.e. 41 % of analysed sample (line 6). If we take the variation +/- 1 degree as the accurate result of IC, the accuracy of the IC model would be at 61 % (line 5 + 6 + 7). If we are even more benevolent, and we accept also the variation +/- 2 degree, then the IC model correctly define the creditworthiness for 870 companies of 1260, which is 85 % (line 4 up to 8). Fault median is 1, fault standard deviation  $\sigma$  is 1,3420 and fault variance 1,8024.

The Index of creditworthiness for 2012 classified 288 companies at the highest level of creditworthiness (degree 7), of which 220 achieved the positive economical profit (positive EVA), i.e. 76,39 %.

This results is comparable with presented accuracy of the model IN99 (based on the positive value EVA) amounting to 47 % at the prediction accuracy verification for this model in the year 2002 and the accuracy IN05 in the sphere of creditworthiness prediction (based on the positive value of EVA) amounting to 95 %.

Fig. 2 – Accuracy of IC model. Source: author

#### **4 CONCLUSION AND POLEMIC ON RESEARCH RESULTS**

The chosen methodology plays the key role in determination of creditworthy model accuracy. The bankruptcy models were made based on mathematical and statistical methods, as for example multidiscriminant analysis, linear discriminant analysis, probit analysis, neural networks, etc. are, and based on the fact if the chosen companies went bankrupted in one or two years following their financial statements analyses (of if they were in financial troubles).

The creditworthy models (or their evaluating parameters and evaluating scales) were created by intuition and thus it is difficult to verify their accuracy in evaluation of which companies can be considered as creditworthy and which one not. There is probably the only one exception, the Czech models of husbands Neumaier, for whom the creditworthy company is such that generates the economic profit (positive EVA) and their creditworthy models IN99 and IN05 work on this base. These two models try to classify as “creditworthy company” only such companies that are going to generate a value for the owner.

The different methodology was chosen for determination of chosen creditworthy model accuracy within this research. The creditworthy company means a company that does not show any symptoms of wrong financial health and was active in the year 2013 (all of 1260 companies of analysed sample fulfilled this condition). Within the creditworthiness four intervals (see the table 3) were created, based on the achieved ROE value. Only one interval includes companies generating the economical profit and thus represents the highest level of the creditworthiness. This scale was compared to the evaluation of companies using seven degrees of the creditworthy index from the previous year 2012.

The Index of creditworthiness accurately predicted the creditworthiness degree at 41 % of companies. It made a mistake by one degree (of seven degrees evaluation scale of IC) in 20 % of examples and by two degrees at 25,22 % of companies. The fault standard deviation is 1,3420 of evaluation degree. With the benevolence of difference by one degree, the accuracy of model grows up to 61 %. With the benevolence of difference by two degrees the accuracy reaches 85%. The knowledge of this accuracy with two-degree benevolence can make a difference in case the company is evaluated by IC in seventh degree (the highest degree of creditworthiness). In such case there is probability of 85% that the company is going to generate the profit in following year.

These results are not directly comparable with the accuracy of model IN99 (47 %) and IN05 (95 %) as these predicate only the positive EVA. If we are focused, as for IC, only on the prediction ability of EVA, the accuracy of model is 76,39 % pursuant the chosen methodology of research.

The creditworthiness of companies was set in comparing ROE vs.  $r_e$ . Controversial can be the way of  $r_f$  and  $r_e$  setting. The author of this paper used the Neumaier's method (used Ministry of Industry and Trade). Application of different method for  $r_e$  setting can probably generate dissimilar  $r_e$  value. The effect can be different border for EVA. Research of these effect should be the object of further research.

## **BANKRUPTCY PREDICTION AND QUALITATIVE PARAMETRES: THE OHLSON'S MODEL AND ITS VARIANTS**

*Dana Kubičková*

### **Abstract**

The recent developments of the global economy have affected the thinking and decision-making of many economic entities. The attention of them has shifted to various methods and tools that allow reliable identification of companies' financial situation and stability and effectively affect them. This has led to increased focus on prediction models. But the financial situation and effectiveness of companies has at present been affected by new factors, the original factors change in their intensity; in addition to financial characteristics, various qualitative characteristics are gaining ground. The construction of new prediction models is thus associated with efforts aimed at involving parameters outside of financial statements. A method that offers opportunities for applying new parameters is the econometric method of logit regression that has made it possible to include discontinuous and qualitative values in the analysis. One of the lesser-known bankruptcy prediction models is the model of Professor J. A. Ohlson. Its creation is based on the logistic regression method and exists in many variants that have resulted from the verification of its reliability in different national economic environments and in different periods. The objective of this paper is to characterize such model and its variants and related research questions.

*Keywords: Bankruptcy prediction models, Ohlson model, logit regression analysis*

JEL Classification: M21, G32

### **1 INTRODUCTION**

The recent developments of the global economy have affected the thinking and decision-making of many economic entities. Company managers, owners, investors, and other stakeholders have shifted their attention to various methods and tools that allow reliable identification of companies' financial situation and stability and effectively affect them. More than ever before, there has been a strong demand after such methods and tools that could indicate potential problems in advance, thus making it possible to adopt corrective measures before any critical events actually occur. In terms of the financial theory, this has led to increased focus on various tools in the form of prediction models, explored since the 1960s or the 1930s, as appropriate. Using appropriately selected indicators, these models should predict whether a company would be successful within its further business activity or whether it would face serious problems. Originally, these models had been developed with a view to identify potential financial problems in the future. Consequently, they have been referred to as bankruptcy prediction models. However, the general practice later required more detailed characteristics of an overall financial situation – not only information about potential financial problems, but also the specification of the degree of financial health/soundness. This prompted the creation of financial standing models, models that measure the financial health of a company.

Various attempts at creating such models started to emerge more in the 1950s and 1960s, developed by researchers from different countries, who relied on the specific conditions of their respective economies, thereby creating models intended for their given environments.

The underlying idea behind the construction of these models was the comparison of the financial situation characteristics for companies that thrive and for those that experience financial problems resulting in the end of operation. The comparison of identified differences for both groups became the basis for the model construction. The financial situation characteristics were usually described and compared by means of financial ratios based on accounting data (Klečka, Scholleová 2010). In terms of mathematics, the multiple discriminant analysis (MDA) became the basis for identifying such characteristics as well as the intensity of their impact. The aforementioned process allowed emergence of various bankruptcy and financial standing models used today: Altman Z-score, IN index of Ivan and Inka Neumaier, Taffler model, etc.

On the one hand, authors of these models currently focus on older models, where the prediction reliability is verified under existing conditions, with the models being adjusted accordingly. On the other hand, new models are being developed, reflecting the new conditions of company operations as well as the advancement in economic modeling and development of mathematical processes applicable for this purpose (Shumway, 2001). The financial situation of companies is affected by new factors, original factors change in terms of their intensity; in addition to financial and quantified characteristics, various qualitative characteristics are gaining ground. The financial situation is significantly affected by such factors such as market position, long-term contracts, past developments in the form of court disputes, profit generation, but also the company history, etc. Consequently, the construction of new models is associated with various efforts aimed at increasing the number of parameters included in the financial situation identification as well as efforts aimed at involving parameters outside of financial statements.

These parameters cannot be appropriately identified by means of the method that has been used for the derivation thereof (MDA). Another significant limitation of the method also consists in the fact that the resulting model value must be further classified and limits must be defined that separate healthy companies, “grey area” companies, and companies headed to bankruptcy (Divišová, 2013). All these factors represent reasons why focus has been shifting to other processes, some of which were also known previously; however, there was no sufficient need to address the integration of non-accounting and qualitative characteristics, etc., for example. The econometric method of logit regression is a method that offers opportunities for applying new parameters within the assessment and provides unambiguous answers in terms of the characteristics being examined.

The logit regression method is a method that expands the range of characteristics involved within the financial situation analysis and assessment (Režňáková, Karas 2014). One of the models that apply this method for deriving the characteristics included in the model is the model of J. A. Ohlson. The model was created in 1980, relying on accounting data – similarly as other models. However, the logit regression method also made it possible to include several characteristics that were not based on accounting data. The derivation of such characteristics and the specification of weights thereof relied, once again, on the comparison of prosperous companies and companies experiencing financial difficulties.

The basic model of J. A. Ohlson of 1980 has gradually been updated in reaction to further development of conditions and findings arising in connection with the application of the model, thereby resulting in new model variants. Indicated close relation to national conditions, in which companies operate, was reflected in the construction of models for individual economies (United States, Turkey, China, Iran, etc.). Verified significant sensitivity of the model to signals dating back to the period, in which the model was derived, resulted in the construction of updated variants (1993, 2003, and 2010). The Czech economic literature does not mention the Ohlson model as often as the Altman Z-score; consequently,

there is no sufficient information about the model effectiveness. Therefore, the objective of this paper is to introduce various variants of the Ohlson model published so far.

## 2 LOGIT REGRESSION

Logit regression (sometimes also referred to as “logistic regression”) is used for statistical evaluation of various data in situations where regression and discriminant analyses are not suitable. Regression analysis itself is a technique that determines the relation of a dependent variable  $Y$  and one or more independent variables  $X$ :  $Y = b_0 + \sum b_i x_i$

Linear regression analysis assumes a continuous dependent variable. However, discontinuous variables are often analyzed, with discrete, dichotomous values – binary (0;1) (bankruptcy vs. prosperity) or probability, etc. Independent variables  $X$  may be discrete, continuous (e.g. company age, liquidity), multi-criterial (e.g. company size, indebtedness), as well as binary (e.g. court disputes, long-term contracts).

In case we assume that there are  $n$  realizations of the dependent variable  $y_n$  (financial problems 1 = yes 0 = no for  $n$  companies), then the following applies:

$y_i = 1$  with the probability of  $p_i$  and  $y_i = 0$  with the probability of  $1-p_i$ ,

The quotient  $Q = p_i / (1 - p_i)$  compares the probability of 1 and the probability of 0. The values of the quotient are within the interval of  $<0; +\infty$ ). In order to obtain values from the entire interval  $(-\infty; +\infty)$ , it is necessary to use logarithmic transformation:

$$\eta_i = \ln (p_i / (1 - p_i)) \tag{1}$$

In order to create a logit model, it is assumed that the variable  $\eta_i (y_i)$  has linear dependence on the independent variables  $x_1, x_2, \dots, x_k$ . The resulting relationship can be described in the form of a linear dependence equation:

$$\eta_i (y_i) = \beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + \dots + \beta_k x_{ki} , \quad \text{where } i = 1, 2, \dots, n \tag{2}$$

The resulting value  $\eta_i (y_i)$  may be both positive and negative. Consequently, it is necessary to apply the above mentioned logarithmic transformation  $\eta_i = \ln (p_i / (1 - p_i))$  to the calculation. The matrix notation of the equation is as follows:

$$\eta = \beta X \tag{3}$$

where  $\eta (\eta_1, \eta_2, \dots, \eta_n)$  are the dependent variable values,  $X$  is the matrix with  $n \times (k+1)$  of independent variables;  $\beta (\beta_1, \beta_2, \dots, \beta_k)$  are the inquired model parameters (variable weights). Adjustments to the equation (1) lead to the relationship for the probability  $p_i$ , as follows:

$$\begin{aligned} \ln (p_i / (1 - p_i)) &= \beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + \dots + \beta_k x_{ki} , & (4) \\ p_i / (1 - p_i) &= \exp \beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + \dots + \beta_k x_{ki} \\ p_i &= \exp \beta_0 + \beta_1 x_{1i} + \beta_2 x_{2i} + \dots + \beta_k x_{ki} / (1 - p_i) \end{aligned}$$

The resulting matrix notation for the probability calculation is as follows [Šedivá 2012]:

$$P = \left( \frac{1}{1 + e^{-Q}} \right)$$

The result gives the probability for the given event – i.e. dependent variable  $Y$  (i.e. potential bankruptcy) – to occur [Liao 1994].

### 3 CHARACTERISTICS OF THE OHLSON MODEL VARIANTS

#### 3.1 Structure of the Ohlson's model

J. A. Ohlson constructed the basic model in 1980; it relied on the corporate data in the United States that reflected the situation of the 1970s and 1980s (Ohlson, 1980). It ultimately gives the probability (ranging from 0.00 to 1.00 or from 0% to 100%, as appropriate) that the assessed company would in fact experience financial problems, with a predetermined period of time (i.e. one year, two years, or five years). It comprises nine financial ratios based on accounting data identified from the group of analyzed companies as most sensitively reacting to future financial problems. Weights are attributed to individual indicators, with their values being integrated within the resulting variable Q based on the following relationship:

$$Q = \beta_0 + \beta_1 * x_1 + \beta_2 * x_2 + \beta_3 * x_3 + \beta_4 * x_4 + \beta_5 * x_5 + \beta_6 * x_6 + \beta_7 * x_7 + \beta_8 * x_8 + \beta_9 * x_9 \quad (5)$$

Where  $\beta_1, \dots, \beta_9$  are weight coefficients for individual characteristics (financial and other ratios  $x_1, \dots, x_9$ ),  $\beta_0$  is a constant by which the sum of weighted values of indicators is increased.

The characteristics ( $x_1, \dots, x_9$ ) included in the model are constructed as follows:

$$X_1 = \log \frac{\text{total assets}}{\text{GNP price-level index}}$$

$$X_2 = \frac{\text{total liabilities}}{\text{total assets}}$$

$$X_3 = \frac{\text{working capital}}{\text{total assets}}$$

$$X_4 = \frac{\text{current liabilities}}{\text{current assets}}$$

$$X_5 : \begin{cases} X_5 = 1, & \text{if total liabilities} > \text{total assets,} \\ X_5 = 0, & \text{if total liabilities} < \text{total assets} \end{cases}$$

$$X_6 = \frac{\text{net income}}{\text{total assets}}$$

$$X_7 = \frac{\text{funds provided by operations}}{\text{total liabilities}}$$

$$X_8 : \begin{cases} X_8 = 1, & \text{if the sum of net income for the two previous periods is less than 0} \\ X_8 = 0, & \text{if the sum of net income for the two previous periods is more than 0} \end{cases}$$

$$X_9 = \frac{NI_t - NI_{t-1}}{|NI_t| - |NI_{t-1}|}$$

where:  $NI_t$  is the net income for the current period and  $NI_{t-1}$  is the net income for the previous period, and  $|NI_t|$  and  $|NI_{t-1}|$  are the absolute values of the net income for current / previous period.

However, Q is only an interim result that must be applied in the probability calculation relationship [Šedivá 2012]:

$$P = \left( \frac{1}{1 + e^{-Q}} \right) \quad (6)$$

#### Assessment of the resulting variable:

P describes the probability that bankruptcy occurs for the company being analyzed; it may have different values from the interval of (0; 1) or 0% to 100%, as appropriate. The

probability calculation relation also suggests that the higher the value  $Q$  as the sum of values of individual indicators, the higher the propensity to bankruptcy; on the other hand, low  $Q$  values characterize stable situation:

- If  $Q < 0$ , then  $P \rightarrow 0$  ( $P$  converges to 0);
- If  $Q > 0$ , then  $P \rightarrow 1$  ( $P$  converges to 1);
- If  $Q = 0$ , then  $P = 0.5$ .

The aforementioned relations may be used to estimate the significance of individual indicators for the model construction. The indicator significance is characterized by positive or negative value – negative impact of an indicator with positive value, as it reduces the total  $Q$ . On the other hand, negative indicator value has a positive effect, as it increases the total  $Q$ . The indicator weight relates to the significance of the characteristic measured by the given indicator.

The fact that the calculation results in immediate information about the company bankruptcy probability rate was considered the main benefit of models derived by means of logit regression by Ohlson (and probably the only benefit, according to the author himself). It does not require any artificial scales for the result interpretation, it allows more precise characterization and layering of the measured characteristics, and eliminates the problem of extreme values. The probability of 50% is the limit for determining whether a company is headed for bankruptcy or whether it is financially sound. However, it is also suitable to add the so-called “grey area” to the aforementioned distribution, covering the interval of 45% to 55%. This potentially eliminates the assessment insensitiveness around the 50% limit.

### **3.2 Ohlson’s Model 1980**

The original 1980 study of Ohlson did not feature just one model; it comprised three model variants and one additional variant: data from financial statements of selected companies were divided into the following three sets: data from financial statements one year prior to bankruptcy, data from financial statements of surviving companies, and data from financial statements two years prior to bankruptcy. Two statistical characteristics – average and standard deviation – were identified for these subsets and each indicator. The logit regression method was then applied. Ohlson used data from the period of 1970-1976 for his study. He worked with a relatively large sample of companies – 2163 companies in total, with 105 failing companies and 2 058 financially sound companies (Ohlson, 1980). The objective was not to find new, special indicators of financial distress, but to rely on simplicity and application of experiences gained so far: first six indicators were used, because they appear in most publications dealing with financial situation assessment / bankruptcy prediction.

In the followings years, Ohlson’s prediction function was verified in other economic environments as well – in the United States, Turkey, Iran, and other countries, also with longer period of time from the model creation (Kupilík, 2013). The results of such verifications brought important findings that later encouraged the creation of other model variants. Subsequent verifications suggest that, in terms of the three variants of the original 1980 model, the first model, with the prediction horizon of one year, should best predict the development of a company.

In all three variants, the highest weight and negative impact is attributed to  $x_2$ , which describes the company indebtedness level. Significant impact is also attributed to  $x_5$ , which describes excessive debt of a company from another perspective (total liabilities greater than total assets); however, corrects the impact of the indebtedness indicator through its negative

value. Significant positive impact on the overall financial situation (high weight) is associated with  $x_8$  (net income in the past two years) and  $x_6$  (expressing return on assets after taxation).

#### **a) Ohlson Model (1980) 1**

The first model should predict bankruptcy within the period of one year. In case the resulting model value is more than 50%, the given company is at risk of bankruptcy or serious financial problems (as appropriate) in the current or the following year. The model form is as follows:

$$Q = -0,407 x_1 + 6,03 x_2 - 1,43 x_3 + 0,0757 x_4 - 2,47 x_5 - 1,83 x_6 + \\ + 0,285 x_7 - 1,72 x_8 - 0,521 x_9 - 1,32 \quad (7)$$

The highest weight and negative impact is attributed to  $x_2$ , which describes the company indebtedness level. The highest positive impact is associated with  $x_6$  (expressing return on assets after taxation) and  $x_8$  (net income in the past two years). On the other hand, the lowest impact is associated with  $x_4$  that describes liquidity (reciprocal of current liquidity).

#### **b) Ohlson Model (1980) 2**

The second model of the original study was supposed to predict bankruptcy for the period of next two years. The following should apply: in case the results suggest bankruptcy for a company, it should not take place during the current year, but rather during the next year and the year after that.

The model varied from the first variant by the weights of individual indicators reflecting their significance in terms of the financial problems prediction. It slightly reduced the importance of  $x_2$  (indebtedness level), while increase the weight of return on assets ( $x_6$ ). On the contrary, the weights of  $x_4$  (reciprocal of current liquidity) and  $x_7$  (debt coverage) were significantly increased. The negative impact of  $x_9$  (income growth dynamics) changed to positive, similarly as for  $x_7$  (debt coverage). Furthermore, the constant amount changed, while also changing from positive to negative impact (negative value to positive). The calculation equation is as follows:

$$Q = -0,519 x_1 + 4,76 x_2 - 1,71 x_3 - 0,297 x_4 - 2,74 x_5 - 2,18 x_6 - \\ - 0,780 x_7 - 1,98 x_8 + 0,4281 x_9 + 1,84 \quad (8)$$

#### **c) Ohlson's Model (1980) 3**

The third model included in the original study was supposed to predict company bankruptcy / serious financial problems one or two years in advance. It is expressed as follows:

$$Q = -0,478 x_1 + 5,29 x_2 - 0,990 x_3 + 0,062 x_4 - 4,62 x_5 - 2,25 x_6 - \\ - 0,521 x_7 - 1,91 x_8 + 0,212 x_9 + 1,13 \quad (9)$$

Compared to the first variant, the weight of  $x_2$  (indebtedness level) decreased, with simultaneous increase in the weight of  $x_6$  (return on assets) and slight decrease of impact of  $x_3$  (working capital to assets ratio). The assessment of impact of  $x_7$  (debt coverage) changed from negative to positive, with other minor changes of weighted coefficients.

### **3.3 Ohlson's model 1993 (for USA)**

In 1993, the models of Altman and Ohlson were tested in order to determine whether the respective model parameters changed over time compared to the original variants. A new variant was constructed for the purpose of the testing, using 99 failing companies and 1 980 prosperous companies, with data from the period of 1981-1990. Once again, the data set intentionally omitted companies from the sector of transportation and finance. Two variants were constructed; the first one should have predicted bankruptcy one year in advance, with the second one predicting bankruptcy two years in advance.

Original indicators and their calculation were used in the new model; changes occur in terms of weights attributed to individual indicators and in the constant included in the calculation.

**a) Ohlson's model 1993 - 1**

In terms of this model for prediction of problems within one year, the weight and negative impact of indebtedness indicator ( $x_2$ ) significantly declined. The weight and impact assessment of  $x_5$  (excessive debt level) and of  $x_9$  (income development in the past two years) changed. A different weight was attributed to  $x_8$  (net income in the past two years), also changing from negative to positive.

$$Q = -0,1659 x_1 + 1,7518 x_2 - 0,8496 x_3 + 0,035 x_4 - 0,2911 x_5 - 2,5018 x_6 - 2,362 x_7 + 0,9512 x_8 - 0,5192 x_9 - 2,2473 \quad (10)$$

**b) Ohlson's model 1993 - 2**

With regard to this variant intended for prediction of developments two years in advance, the weight and negative impact of  $x_2$  (indebtedness indicator) further declined, whereas the weight and positive impact of  $x_3$  (working capital to total assets ratio) increased. The positive impact of indicators  $x_7$  (debt coverage) and  $x_8$  (net income in the past two years) increased. Moreover, the constant declined considerably.

$$Q = -0,1639 x_1 + 0,8749 x_2 - 2,0623 x_3 - 0,2224 x_4 - 0,0916 x_5 - 6,1045 x_6 - 1,6608 x_7 - 0,1286 x_8 - 0,3576 x_9 - 0,7325 \quad (11)$$

**3.4 Ohlson's model 2003 (for USA)**

The 2003 model is based on the test results under different conditions in 1993 and the following years and on the finding that indicators and coefficients are sensitive to the conditions and period, from which they originated. According to the performed calculations, the model accuracy decreases: being the highest in the period closest to the variant creation period (1988-1991), gradually declining going forward (1992-1999). Compared to another logit regression-based model (Zmijewski), for which the accuracy for both samples fluctuated around 80%, the accuracy of the Ohlson model did not exceed 50% for either data set. This means that the original Ohlson model failed to indicate the company development correctly in 50% of all cases. Therefore, the authors decided to recalculate the model in 2003, based on the verification results of the model by Zmijewski. The work was associated with deliberations on whether it is necessary to link prediction to bankruptcy or whether it would be more useful to focus the model to the prediction of a "moderate variant" – i.e. the financial distress prediction. The new variant construction relied on a relatively large sample of 1059 companies, of which 153 were in financial distress. A verification set was compiled to test the new model – with a similar number of companies / failing companies.

This resulted in three new sets of coefficients. The first one was derived from the entire sample, the second one from the subset with unstable companies only (i.e. with financial problems), and the third one from the subset with industrial companies only (both healthy and in financial difficulties).

**a) General model** – it was derived from the entire sample, with the following structure and weights:

$$Q (2003) A = -0,777 x_1 + 3,224 x_2 - 0,323 x_3 + 0,589 x_4 + 0,041 x_5 - 2,86 x_6 - 2,854 x_7 + 0,372 x_8 + 0,206 x_9 \quad (12)$$

Compared to the previous model of 1993, the constant was omitted for this and other two variants, whereas the weights of individual indicators were adjusted. Significant changed occurred in this first/general variant in terms of the weight of  $x_1$  (company size) and  $x_7$  (debt

coverage), with positive impact on the result. On the other hand, higher weights and thus also a negative impact were attributed for  $x_3$  (working capital to assets ratio) and  $x_6$  (ability to cover liabilities). The weight/negative impact increased considerably for  $x_2$  (indebtedness indicator), whereas the impact of  $x_4$  (current liabilities / current assets) changed from negative to positive.

**b) Model for failing companies** – it was recalculated from the set of companies that showed serious financial problems (failing companies):

$$Q(2003)B = -0,881 x_1 + 3,931 x_2 + 0,054 x_3 + 0,166 x_4 + 0,645 x_5 - 0,548 x_6 - 2,886 x_7 + 0,656 x_8 - 0,3 x_9 \quad (13)$$

Compared to the first (general) variant, the weights and impact direction of nearly all indicators changed for this variant. However, this variant does not use a constant either. High negative impact is still attributed to  $x_2$  (indebtedness level), with opposite – i.e. negative impact- attributed to indicator  $x_3$  (working capital to total assets). In case of  $x_5$  (excessive debt indicator), the impact assessment changed from positive to negative, similarly as for  $x_8$  (net income for current / previous year).

**c) Model for industrial companies** – it was composed for industrial companies from the set of failing and healthy companies, with the following structure:

$$Q(2003)P = -0,706 x_1 + 2,204 x_2 - 1,25 x_3 + 0,455 x_4 + 0,553 x_5 - 3,79 x_6 - 4,591 x_7 + 0,157 x_8 + 0,309 x_9 \quad (14)$$

In terms of its weights and significance, the structure of this model goes back to the first variant of this year. Compared to the first variant, a lower weight is attributed to  $x_2$  (indebtedness), with higher weight associated with  $x_3$  (working capital to assets). Higher negative impact is attributed to  $x_5$  (excessive debt) and  $x_7$  (debt coverage).

The new variants eliminated the low reliability of the original Ohlson model. The prediction accuracy of the three new model variants increased. The testing confirmed, once again, that prediction accuracy is higher for models, the derivation of which is closer to the period, from which the tested data originate. The test results also led to the finding that recalculated models are not sensitive to the area of activity, i.e. that they can be used to predict financial distress for companies from various sectors without any significant impact on the prediction reliability. Furthermore, the final assessment unambiguously focused on the prediction of serious financial problems, and not bankruptcy / end of company operations.

### **3.5 Ohlson's model 2009 (for Turkey)**

This model resulted from the testing of the Ohlson model variants under the conditions of Turkish economy, as the results of applying existing variants were not sufficiently reliable. Therefore, a new variant was created, based on the analysis of a relatively small set of Turkish companies (70). Using logit regression, a model was constructed that used the same indicators and the method of their calculation; however, the weights and importance (positive, negative) for the overall financial situation assessment changed:

$$Q = -0,228 x_1 + 7,186 x_2 - 0,073 x_3 + 0,613 x_4 - 1,714 x_5 + 3,264 x_6 - 4,187 x_7 + 0,438 x_8 - 0,154 x_9 - 4,582 \quad (15)$$

Compared to the general model of 1993, this model uses a constant once again, which complements and standardizes the sum of all other indicators. However, the constant amount significantly increased. Moreover, the weights of nearly all indicators increased. Furthermore, the impact direction of selected indicators changed:  $x_4$  (current liabilities to current assets) and

particularly  $x_6$  (return on assets), with change of nearly ten units. Importance (weight) of  $x_7$  (debt coverage) significantly increased.

### **3.6 Ohlson's model 2010**

In 2010, the Ohlson model was recalculated again- by economists from the University of Queensland in Australia. They tried to find new weights – not only for the Ohlson's model, but also for the Altman Z-Score, and the models of Zmijewski, Shumway, and Hillegeist. Following their verification and recalculation, a new model was created based on the results, in which indicators used in all of the five aforementioned models were used.

Compared to other modifications, the calculation used much larger sample of companies for the calculation of new models: 50 611 companies, of which 887 failing companies, and 49 724 financially healthy companies. Data from the period of 1980 to 2006 were used. The model constructed by analysts of the Australian University looks as follows:

$$Q(2010) = -0,17 x_1 + 3,69 x_2 - 1,87 x_3 + 0 x_4 - 0,54 x_5 + 0,03 x_6 - \\ - 0,06 x_7 + 1,16 x_8 - 1,02 x_9 - 7,2 \quad (16)$$

Compared to the 1993 model, which can be considered as the last “international variant, impact direction and weight of  $x_6$  (return on assets) changed. Moreover, the impact direction of  $x_8$  (income development in the past two years) changed as well. The indicator  $x_4$  (current liabilities to current assets) was excluded from the model, as it was assigned a zero weight. The weight of  $x_7$  (debt coverage) changed significantly, while the weights of other indicators only changed marginally. The constant also significantly increased, outweighing changes in other indicators through its negative value.

### **3.7 Ohlson's model 2010 (for China)**

Chinese economist Ying Wang and American Professor Michael Campbell created the Ohlson model variants for the Chinese economy (Wu, Gaunt, Gray, 2010). Using data from Chinese companies from the period of 1998 to 2008, they constructed (similarly as Ohlson in 1980) three model variants, with different period of prediction of bankruptcy / serious financial problems.

#### **a) Ohlson's model 2010 (for China) 1**

This model is to predict financial problems one year in advance. While the number of indicators remains identical with the original model, their weights were set as follows:

$$Q(2010C1) = -0,8983 x_1 + 0,9546 x_2 - 0,9234 x_3 + 0,00248 x_4 + 2,9508 x_5 - 0,0109 x_6 - \\ - 0,033 x_7 + 3,2088 x_8 + 0,5871 x_9 - 1,3128 \quad (17)$$

Compared to the original variant of 1980, different weights were attributed to individual indicators. The most significant change (significant reduction) took place for  $x_2$  (indebtedness). In case of  $x_4$  (current liabilities to current assets), the weight was reduced very significantly, with the resulting indicator value converging to zero. The indicator  $x_6$  (return on assets) was significantly reduced as well. Moreover, the change of impact direction (from positive to negative) and a significant weight increase for  $x_8$  (income development in the past two years) are also important. Change in the impact direction; however, with a lower intensity (weights), also occurred for  $x_7$  (debt coverage) and  $x_9$  (income growth dynamics).

#### **b) Ohlson's model 2010 (for China) 2**

This model is to predict problems two years in advance; the weights of individual indicators, which remain the same, were set as follows:

$$Q(2010C2) = -0,2786 x_1 - 0,2152 x_2 - 0,2132 x_3 - 0,0207 x_4 + 1,4666 x_5 - 0,00755 x_6 - 0,0541 x_7 - 4,157 x_8 - 0,9292 x_9 - 5,5238 \quad (18)$$

Compared to the second variant of 1980, weights of nearly all indicators were significantly modified:  $x_2$  (indebtedness indicator),  $x_3$  (working capital to assets) and  $x_5$  (excessive debt). Furthermore, there were changes in the impact direction of indicators:  $x_2$  (indebtedness indicator),  $x_4$  (current liabilities to current assets),  $x_5$  (income development), and  $x_7$  (debt coverage). Very low weight was attributed to  $x_4$  (current liabilities to current assets), and  $x_6$  (return on assets). Moreover, the constant increased nearly four times.

### c) Ohlson's model 2010 (for China) 3

According to this model, problems should be predicted one or two years in advance. While the indicators and their calculation remain identical, their weights were set as follows:

$$Q(2010C3) = -0,5974 x_1 - 0,4991 x_2 - 0,4699 x_3 - 0,00164 x_4 + 2,0091 x_5 - 0,01 x_6 - 0,042 x_7 + 3,7182 x_8 - 0,1823 x_9 - 2,48 \quad (20)$$

Compared to the 1980 model variant constructed for the same purpose, different weights were attributed to individual indicators. The most significant change – considerable decrease – occurred for  $x_2$  (indebtedness). In case of  $x_4$  (current liabilities to current assets), the weight was reduced very significantly, with the resulting indicator value converging to zero. The indicator  $x_6$  (return on assets) was similarly reduced. Moreover, significant change of impact direction (from positive to negative) and significant weight increase for  $x_8$  (income development in the past two years) are also important. There was a less intensive change for  $x_7$  (debt coverage) and  $x_9$  (income growth dynamics).

### 3.8 Ohlson's model with adjusted set of indicators (Ohlson 2010 for China U)

The construction of these new variants for the Chinese economy resulted from doubts whether the number of variables included in the model is justified, and whether all indicators in fact contribute to the model sensitivity. With a view to increase the explanatory power and simplify the model application, three new alternative models were constructed with only five variables/indicators selected from the original model; the calculation method is identical. Five indicators were selected for the new variants:  $x_2$  (indebtedness),  $x_3$  (working capital to assets),  $x_4$  (current liabilities to current assets),  $x_5$  (excessive debt), and  $x_8$  (income development in the past two years). The constant is also used. By assigning weights to individual indicators, three model variants were constructed for the Chinese economy – varying in the time horizon for prediction of problems, as in the previous case:

**a) Ohlson's model 2010 for China U1** – it determines the probability of financial problems within the period of one year, with the following weights for individual indicators:

$$Q(2010CU1) = -0,9925 x_2 - 0,9865 x_3 + 0,00237 x_4 + 3,3802 x_5 + 3,11 x_8 - 7,5113 \quad (21)$$

**b) Ohlson's model 2010 for China U2** – it determines the probability of financial problems in the course of two years, with the following indicator weight structure:

$$Q(2010CU2) = -0,1404 x_2 - 0,1591 x_3 - 0,0231 x_4 + 1,5255 x_5 + 4,2852 x_8 - 7,4331 \quad (22)$$

**c) Ohlson's 2010 for China U3** – it determines the probability of financial problems in the course of one or two years, with the following indicator weight structure:

$$Q(2010CU3) = -0,417 x_2 - 0,4086 x_3 + 0,00177 x_4 + 2,1839 x_5 + 3,8624 x_8 - 6,7685 \quad (23)$$

The verification has demonstrated that the results of these models with only five variables do not significantly differ from the results of nine-variable models. None of the three variants differs in the determined impact direction of individual indicators. Weights vary by up to 0.5 or three times the initial variant (U1), as appropriate,  $x_4$  is relatively reduced more due to low amount. The lowest weight for all three model variants is attributed to  $x_4$  (indebtedness), while the highest weights for all variants are attributed to  $x_8$  (income development in the past two years).

### **3.9 Ohlson's model 2011 (for Iran)**

The Ohlson model of 2011 for Iran resulted from the testing of the four most famous bankruptcy prediction models (Ohlson, Zmijewski, Shumway, and Altman) for the economy of Iran (Grice, Dugan, 2003). The application of these models promoted the construction of a new Ohlson model variant. It relied on a data set for more than 1 500 Iranian companies, of which 142 ended their activities due to financial problems; no financial / transportation companies were included. The model applied the set of nine indicators and a constant, only attributing new weights to indicators based on the conditions of the Iranian economy:

$$Q(2011) = -0,14 x_1 + 14,58 x_2 - 2,92 x_3 - 0,6 x_4 - 0,17 x_5 - 1,4 x_6 - \\ - 2,6 x_7 + 3,79 x_8 - 0,25 x_9 - 12,87 \quad (22)$$

Compared to the original model of 1980, weights of  $x_1$  (company size),  $x_5$  (excessive debt),  $x_6$  (return on assets),  $x_7$  (debt coverage), and  $x_9$  (income growth dynamics) are lower. On the other hand, higher weights were assigned to  $x_2$  (indebtedness),  $x_3$  (working capital to assets),  $x_4$  (current liabilities to current assets), and  $x_8$  (income development in the past two years). Changes in the impact direction occurred for  $x_4$ ,  $x_7$ , and  $x_8$ . Moreover, the constant increased nearly ten times; it is deducted from the sum of indicators, similarly as for the original model.

This is the last known variant of the Ohlson's model.

### **3.10 Comparison of the variants**

Based on comparison of all the model variants can be concluded, that the variants of Ohlson's model do not vary in the construction of included indicators. They vary in the weights attributed to individual indicators, in the constant and in the number of indicators included within individual models (some models). Furthermore, some differences exist for individual variants in terms of the fields / industries, for which they are intended, and the purpose / time horizon, in which they predict potential problems. The following Table No 1 allows the comparison of construction of all the variants, particularly the coefficients of individual indicators, including the numbers and types of indicators.

The construction of each additional variant was associated with higher degree of knowledge relating to the application of bankruptcy / prediction models, which were immediately applied and reflected in the new variants. Particularly significant is the identification of the factor of time and local (national) conditions, under which a model emerged / analyzed companies operate, similarly as gradual elimination of differences arising from industry-related specificities of company operations. Furthermore, the experience with the scope of included indicators may be considered significant in terms of the construction and development of additional models, as it proved that the prediction reliability of models with a lower number of appropriately selected indicators does not differ from models with a higher number of indicators.

Tab. 1 – Overview of coefficients used in the Ohlson bankruptcy prediction model

1993/1	-0.1659	1.7518	-0.8496	0.035	-0.2911	-2.5018	-2.362	0.9512	-0.5192	-2.2473
1993/2	-0.1639	0.8749	-2.0623	-0.2224	-0.0916	-6.1045	-1.6608	-0.1286	-0.3576	-0.7325
2003A	-0.777	3.224	-0.323	0.589	0.041	-2.86	-2.854	0.372	0.206	0
2003B	-0.881	3.931	0.054	0.166	0.645	-0.548	-2.886	0.656	-0.3	0
2003P	-0.706	2.204	-1.25	0.455	0.553	-3.79	-4.591	0.157	0.309	0
2009 T	-0.228	7.186	-0.073	0.613	-1.714	3.264	-4.187	0.438	-0.154	-4.582
2010	-0.17	3.69	-1.87	0	-0.54	0.03	-0.06	1.16	-1.02	-7.2
2010 C1	-0.8983	0.9546	-0.9234	0.00248	2.9508	-0.0109	-0.033	3.2088	0.5871	-1.3128
2010 C2	-0.2786	-0.2152	-0.2132	-0.0207	1.4666	-0.00755	-0.0541	-4.157	-0.9292	-5.5238
2010 C3	-0.5974	-0.4991	-0.4699	-0.00164	2.0091	-0.01	-0.042	3.7182	-0.1823	-2.48
2010 CU1	0	-0.9925	-0.9865	0.00237	3.3802	0	0	3.11	0	-7.5113
2010 CU2	0	-0.1404	-0.1591	-0.0231	1.5255	0	0	4.2852	0	-7.4331
2010 CU3	0	-0.417	-0.4086	0.00177	2.1839	0	0	3.8624	0	-6.7685
2011 I	-0.14	14.58	2.92	-0.6	-0.17	-1.4	-2.6	3.79	-0.25	-12.87

Similarly important is the finding that it is more useful to focus on the prediction of serious financial problems than on bankruptcy and/or end of company operations/existence.

#### 4 SUMMARY AND CONCLUSION

Virtue of its design the Ohlson's model is ranked to those model which use also qualitative parameters for the assessment of the financial situation of companies and moving towards bankruptcy Positive for its construction is also unambiguous interpretation resulting values without additional scales. The emergence of different variants of this model is the deepening of past experience with the application of predictive models, which when used in other conditions than where originated, did not produce reliable results. Different conditions of use are to be understood on the one hand as different national economy, and on the other hand as different period as compared to the one in which it was created. The variants of this model do not vary in the included indicators. They vary in the weights attributed to individual indicators, in the constant, and in the number of indicators included within individual models (some models).

Despite the benefits of Ohlson's model construction the concept of its structure and derivation of its variants and their comparison raises some questions. One of them is whether it is possible to sufficiently capture the other conditions by a change in the weight of ratios that are

included in the model. These different conditions can be manifested also (or maybe better) through other indicators than which are included in Ohlson's model.

Another question may relate to construction of indicators included in the model. The inclusion of the absolute value (even if it is corrected price index and converted to a logarithmic value) usually leads to a distortion resulting values.

A problem that does not concern only to this model is the usage of indicators based on accounting data for indicating financial situation and predicting next development of it. It is assumed the usage of data based on national accounts. If the model is used in different national economic, this is different from accounting, in which model was created, the result could not be reliably due to this different way of financial statements compilation. Has already application of older models finds out that accounting does not give reliable information about the financial situation (Altman, 2002). The differences between Anglo-Saxon and continental accounting are mentioned as one of the reasons of decreasing the reliability of their prediction. Although the accounting is currently in a number of countries under the influence of international accounting harmonization, the extent of their use is usually small and is not the same in all national areas. On the other hand usage the International Accounting Standards provides a different set of accounting data and led to the different prediction of the further firms' development (Kubičková, 2012). The prediction ability and reliability of these models can in these conditions decrease even under the data source, not under the really financial condition. This problem Ohlson's model does not solve.

Another general problem that arises from the comparison of different variants of Ohlson's model is the question which other qualitative indicator determine the future development of the company. In the construction Ohlson's model these indicators are included, but only to a limited extent and in substance on the border of qualitative and quantitative/financial ones (size of the firm, previous two-year development of profit, overload loan). Determine the other qualitative characteristics (market share, the age of the company, innovation etc.) and the way how to include them in the model construction is the task of further investigation.

The assessment ability of Ohlson's models was compared with ability of the other models in many research projects (Klečka, Sholleová, 2010, Divišová, 2013, Kubičková, 2015). The results showed that there are differences as compared to the models of the same origin (Altman Z-score) and compared with models of different origins (IN 05, Taffler model, Grünwaldův model). The verification of these results and its reasons can be the research question for the other projects.

## **MEASURING AND EVALUATING THE INVESTMENT PERFORMANCE OF PENSION FUNDS**

*Petr Kupčák*

### **Abstract**

This article focuses on the impacts various performance of pension funds to the amount of lifetime pension in selected European countries. Comparison of the performance of pension funds is determined by means of the Sharpe ratio in the time period 2005 - 2013. This paper aims to identify and assess the impact of the Sharpe ratio on the payment of lifetime pensions in postproduction period. It is necessary to differentiate data of pension companies with conservative investments and more risky investments in the empirical analysis. This distribution is made in order to fulfillment of paper objectives. I identified the different influence of the Sharpe ratio for conservative and risky investments on lifetime pension. The results of pension funds from Visegrad countries demonstrate weak performance in comparison with Sweden, Switzerland and the Netherlands. Conclusion of the paper is focused on evaluation performance of pension funds with an emphasis on changes in the amount of the lifetime pensions paid out by Czech pension company. The results of the article identified the importance of measuring and evaluating the investment performance because increase of the nominal appreciation of 1 percentage point will cause a change of lifetime pension of 28 %. This is a substantial increase in pension for participants in postproduction period.

JEL Classification: G22, H55, L25

### **1 INTRODUCTION**

The ageing population is a major problem for pension systems in many European countries. Pension systems are divided into several pillars. The first pillar function mainly as a pay as you go system (so called „PAYG system“). Private pension companies are part of the second and third pillar, which are based on the accumulation of assets of participants and their assets are invested by pension companies in the financial markets.

Investments of pension companies are very specific because their assets are intended for the payment of pensions. It represents a very long investment horizon corresponding to the certain risk profile of investments. For this reason, the author of the paper decided to focus on the performance of pension companies in selected countries. Author used method of Sharpe ratio in order to a comparison of pension performance. This method compares the nominal appreciation of the assets with the risk-free interest rate and this difference weighs standard deviation. (Sharpe, 1994)

### **2 THEORETICAL BACKGROUND**

Performance of pension funds is monitored and evaluated by the World Bank and The Organisation for Economic Co-operation and Development (OECD). The method of Sharpe ratio was used in the publication of the OECD: Financial Performance of Pension Fund: An

Exploratory Study. In this study compare multiple tools to assess the performance and recommend using of Sharpe ratio. (Walker & Iglesias, 2010)

The performance of pension companies was explored with using the Sharpe ratio researchers CERGE-EI, Mr. Schneider and Hlavac. They identified large differences in the performance of pension companies in Central Europe. (Hlaváč & Schneider, 2011)

Mr. Chov and Lai (2015) used the method of Sharpe ratio to measure the performance of equities. They evaluates Sharpe ratio as one of the modern manner of measuring portfolio performance because includes the risk profile of the investment. (Chow & Lai, 2015)

Sharpe ratio can take of positive and negative values. When assessing of negative results Sharpe ratio we have to consider the size of the standard deviation of returns in each case. The cause is that a large standard deviation overestimates the results. (Grable & Chatterjee, 2014)

There are many indicators for evaluating the performance of financial institutions. Comparative studies show that there are significant differences between the indexes. There are many indicators for evaluating the performance of financial institutions. Frequently used are these indicators: Sharpe ratio, Traynor ratio, Information ratio and Sortino ratio. For evaluating the performance of pension funds is recommended Sharpe ratio. (Bansal, Garg, & Saini, 2012)

The above-mentioned authors did not deal with a guaranteed pension funds and non-guaranteed pension funds. I divided the nominal performance data into two groups. The first group consists of data from guaranteed pension funds and the second group consists of data non-guaranteed pension funds. This separation is important because guaranteed pension funds are a favorite in Czech Republic and Slovakia but investment performance have better non-guaranteed pension funds.

The methodology of the calculation Sharpe ratio is the same as used the above-mentioned authors, however, the results are different because time period contains credit crunch. Evaluation of performance of pension funds is performed using calculation of the lifelong pension. The importance of Sharpe ratio of pension companies on the amount of lifetime pensions has not been examined.

### **3 OBJECTIVES AND METHODOLOGY**

The main objective of this paper is to estimate the influence the Sharpe ratio of pension companies on the payment of lifetime pensions in postproduction period. The secondary objective of this paper is to highlight the differences in performance of pension funds from the Visegrad countries and Switzerland, Sweden and the Netherlands.

The first step in the project was to collect data on investment performance of pension funds in selected countries in the period 2005 - 2013. I focused on the Visegrad countries (Czech Republic, Slovakia, Poland and Hungary) and Sweden, Switzerland and Netherlands. Sweden, Switzerland and the Netherlands were added to analyse because I wanted to show a differences between a developed and less developed fully funded system (Visegrad countries). Summary of input data is in Tab. 1.

I performed a selection countries according to the Melbourne Mercer Global Pension Index. Based on this index is the Netherlands pension system considered one of the best pension systems in the world. The Netherlands pension system has a rating B plus with Australia in 2014. Sweden and Switzerland has a rating of B, Poland has a rating of C. Slovakia, Hungary and the Czech Republic have ratings E. Melbourne Mercer Global Pension Index indicates the

country with the evaluation of E as a country with a poor pension system that may be in the early stages of development or a non-existent system. (Mercer, 2014)

Data was obtained also for the risk-free interest rate in the time series 2005 - 2013 in the selected countries from database of the Eurostat. The paper using two alternative specifications for the risk free asset: a short-term local rate (SIR) and a long-term local rate (LIR). (Eurostat, 2014)

Tab. 1 – Overview of the input data for the period 2005 - 2013. Source: Local associations of pension companies

<b>Countries</b>	<b>Number of pension companies</b>	<b>Average rate of return in %</b>	<b>Standard deviation rate of return</b>
Czech Republic	11	2.05	0.80
Slovakia	6	2.16	2.24
Poland	13	7.38	9.72
Hungary	17	4.45	12.90
Switzerland	10	4.14	6.70
Sweden	4	7.08	11.26
Netherlands	2	7.33	10.77

I obtained pivotal data from these associations and governmental organizations:

- Association of pension companies in the Czech Republic. (APF CR, 2014)
- Hungarian Financial Supervisory Authority. (HFSA, 2014)
- Investments office. (Investments office, 2014)
- Pensioenfonds ABP. (Pensioenfonds ABP, 2014)
- The Organisation for Economic Co-operation and Development. (OECD, 2013)
- Ministry of the Treasury in Poland. (Steindl, 2013)
- Swedish National Pension Fund - AP1, AP2, AP3. (Swedish National Pension Fund – AP1, AP2, AP3, 2014)

The second step in the project was to estimate the Sharpe ratio. The Sharpe ratio is the average rate of return minus the risk-free return, divided by the standard deviation of the return. Sharpe ratio (SR) is determined according to the following formula No. 1.

$$SR = \frac{R - R_f}{\delta} \quad (1)$$

$R$  – Nominal rate of return

$R_f$  - Risk-free interest rate

$\delta$  - Standard deviation

Data of performance were divided into two groups: non-guaranteed and guaranteed funds. Non-guaranteed funds (NF) include a portfolio which is very conservative and consists

mainly bonds and treasury bills. It is usually the funds that are managed by strict regulation. Guaranteed funds (GF) represent investment portfolio with a high percentage of shares, usually in combination with bonds.

I determined values Sharpe ratio for individual countries, groups of countries (Visegrad countries vs. countries with developed fully founded pension systems) and for guaranteed and non-guaranteed pension funds.

I calculated accumulated amount of money through equation of long-term savings No. 2. (Joshi, 2008). Prerequisites were to determine the monthly deposits in the amount of 2 000 CZK and time savings of potential participant for 40 years.

$$s = m * v * \frac{(1 + i)^n - 1}{i} \quad (2)$$

*s* - Accumulated amount of financial resources

*m* - Number of deposits in one year

*i* - Annual interest rate

*v* - Regular deposit amount

Based on the amount of accumulated financial resources of potential participants, I determined the amount of lifetime pensions. Lifetime pensions are paid in the base period and in the period after base period until the end of life of potential participant. The basic period is the time taken to reach the upper age limit. The upper age limit for the potential participant is determined based on reaching retirement age in the Czech Republic. The upper age limit is unchanged. The upper age limit was used median life expectancy according to mortality tables of the Czech Statistical Office. (Czech Statistical Office, 2014)

These mortality tables are the basic parameters for creating the mortality tables of pension funds. Pension funds can change parameters of the mortality tables (extend life expectancy by adding additional parameters).

I used the formula of early paid pension by the pension companies on the Czech market with an expected median payment period of *r* years. I used the selected formula from the pension plan IV pension company AXA. The reason was that the pension company AXA is a multinational company operates in several selected countries and the calculation of pensions in the Czech pension companies are on a similar basis because pension plans must be approved by the Czech National Bank. (AXA pension company, 2014)

The annual amount of lifetime pension is expressed formula No. 3.

$$P = \left( \frac{(1 + j)^n}{1 + 0.5j} \right) * \left( \frac{j}{(1 + j)^n - 1} \right) * C \quad (3)$$

*C* - The total amount of financial resources

*j* - Minimum appreciation

*n* - The period of draw pensions

The author used these simplifying assumptions. The retirement age of potential participant is 67 year and the technical interest rate is 1 %. Life expectancy is extended by 4 points (sum of all parameters) in order to achieve real results. The author used the mortality tables for men because men have a shorter life expectancy and the differences in the amount of life annuity will be reflected more.

## 4 RESULTS

### 4.1 Sharpe ratio of selected countries

This section discusses the main results of a portfolio performance analysis of pension funds that consists in estimating Sharpe ratio. Overview of results Sharpe ratio is in Tab. 2.

Tab. 2 – Sharpe ratio of selected pension funds. Source: The author's research

Selected countries	SR LIR	SR SIR	SR NF	SR GF	Average SR	Average SR
<b>Czech Republic</b>	- 2.09	0,11	x	- 0.99	- 0.99	-0.45
<b>Slovakia</b>	- 1.19	0.10	- 0.34	- 0.75	-0.55	
<b>Poland</b>	0.20	0.29	0.24	x	0.24	
<b>Hungary*</b>	- 0.45	-0.40	- 0.12	- 0.72	-0.42	
<b>Switzerland</b>	0.33	0.48	0.41	x	0.41	0.42
<b>Sweden</b>	0.36	0.47	0.41	x	0.41	
<b>The Netherlands</b>	0.38	0.49	0.44	x	0.44	
<b>Average SR</b>			0.17	-0.82		

\* *Second pillar was closed in 2010*

The author described in the article: *Reform of the third pillar of the pension system in the Czech Republic after 1 year of operation* (Gottwald & Kupčik, 2014) the position of the pension system in the Czech Republic. We have noted that the new pension participant funds contain very few participants and their assets are not invested in accordance with their statutes. For this reason, the results of Sharpe ratio Czech Republic do not include data of non-guaranteed pension funds.

Sharpe ratio of guaranteed funds (- 0.82) is lower than Sharpe ratio of non-guaranteed funds (0.17). This is due to strong restrictions on the investment of pension funds and very conservative investments mainly in a government bonds. Sharpe ratio of guaranteed funds (Czech Republic, Hungary and Slovakia) in a comparison with domestic government bonds with a maturity of 10 years is negative. Savings and investments for retirement should have a long-term horizon, for this reason, it is a very bad result for pension companies

The results are better by non-guaranteed funds only with the exception of Slovakia and Hungary, where this is caused by the negative political influences. It is very important to highlight the excellent results of the non-guaranteed pension funds in Poland (0.24), Sweden (0.41), Switzerland (0.41) and the Netherlands (0.44). Pension funds overcame from these countries the interest rate government domestic bonds with a maturity of 10 years.

The Hungarian pension funds have even the worst performance of all the selected countries. Polish pension funds have worse performance than the Swedish pension funds, but it must be said that Polish pension funds have the best performance from the Visegrad countries. The countries with developed fully funded system have higher Sharpe ratio (0.42) than the Visegrad countries (-0.45). The large difference is mainly due to several reasons. Especially small investment limits, progressive investment portfolios, other culture and mentality people and investors. The Netherlands (0.44) achieves the best results of all the selected countries.

### 4.2 Lifetime pensions

Sharpe ratio depends largely on risk (volatility expressed as standard deviation). For this reason, Sharpe ratio is variously sensitive to changes in investments with stable revenues

(small standard deviation) and variable income (large standard deviation). From the research data is obvious that pension companies from the Czech Republic and Slovakia have common a very low standard deviation of returns (indicated in Tab. 1). Other countries are characterized by dynamic investments with a large standard deviation. Based on the above is distinguished influence of Sharpe ratio on lifetime pension for conservative and dynamic investments.

### **Influence of Sharpe ratio on lifetime pension for conservative investments**

Pension funds in the Czech Republic and the Slovakia have very low Sharpe ratio, nominal appreciation of the assets and a very small standard deviation of returns. This is due to extremely conservative investments of pension funds. These countries have common data: risk-free interest rate of 2.99 % and standard deviation of 1.52. On the basis of these informations have been calculated Sharpe ratio and according to the methodology have been calculated accumulated financial resources and lifetime pension. I have processed detailed results in Tab. 3.

Tab. 3 – Overview of auxiliary results. Source: The author's research

<b>Sharpe ratio</b>	<b>Rate of return in %</b>	<b>Accumulated financial resources in CZK</b>	<b>Lifetime pensions in CZK</b>
0.007	3.0	1 809 630	8 711
0.336	3.5	2 029 207	9 768
0.666	4.0	2 280 612	10 978
0.995	4.5	2 568 728	12 365
1.325	5.0	2 899 195	13 956
1.654	5.5	3 278 535	15 782
1.984	6.0	3 714 287	17 879
2.313	6.5	4 215 166	20 290
2.643	7.0	4 791 243	23 063
2.972	7.5	5 454 156	26 254
3.301	8.0	6 217 356	29 928
3.631	8.5	7 096 381	34 159

Fig. 1 – Influence of Sharpe ratio of conservative investments on lifetime pension. Source: The author's research

The regression equation of the Fig. 1 has an exponential form:

$$y = 8541.5e^{0.3775x} \quad (4)$$

From the above formula No. 4 is evident that the size of the lifetime pensions is low sensitivity to changes in the values of Sharpe ratio. We have to compare equation of No. 4 and 5 then is evident a smaller slope of the tangent of equation No. 4.

#### **Influence of Sharpe ratio on lifetime pension for dynamic investments**

Pension funds in the Poland, Hungary, Switzerland, Sweden and Netherlands have high value of Sharpe ratio (except Hungary), nominal appreciation of the assets and a standard deviation of returns. This is due to dynamic investments of pension funds. These countries have common data: risk-free interest rate of 4.04 % and standard deviation of 10.27. On the basis of these informations have been calculated Sharpe ratio and according to the methodology have been calculated accumulated financial resources and lifetime pension. I have processed detailed results in Tab. 4.

Tab. 4 – Overview of auxiliary results. Source: The author's research

Sharpe ratio	Rate of return in %	Accumulated financial resources in CZK	Lifetime pensions in CZK
0.045	4.5	2 568 728	12 365
0.093	5.0	2 899 195	13 956
0.142	5.5	3 278 535	15 782
0.191	6.0	3 714 287	17 879
0.240	6.5	4 215 166	20 290
0.288	7.0	4 791 243	23 063
0.337	7.5	5 454 156	26 254
0.386	8.0	6 217 356	29 928
0.434	8.5	7 096 381	34 159
0.483	9.0	8 109 179	39 034
0.532	9.5	9 276 480	44 653
0,580	10,0	10 622 221	51 131

Fig. 2 – Influence of Sharpe ratio of dynamic investments on lifetime pension. Source: The author's research

The regression equation of the Fig. 2 has an exponential form:

$$y = 10826 e^{2,6539x} \quad (5)$$

From the above formula No. 5 is evident that the size of the lifetime pensions is high sensitivity to changes in the values of Sharpe ratio.

## 5 DISCUSSION

Walker and Iglesias (2010) in the article: *Financial Performance of Pension Fund: An Exploratory Study* described performance of pension funds on Latin American countries, Central and East European countries. They had identified a similar performance of pension funds in the Netherlands (Sharpe ratio - SIR 0.39; Sharpe ratio - LIR 0.14) in accordance with my results. Different results have achieved pension funds in Hungary (Sharpe ratio - SIR 0.3; Sharpe ratio - LIR 0.43). Data of Hungarian pension funds are from the time period 1998-2007. The credit crunch struck pension funds assets in 2008 (the size of the nominal appreciation of conservative funds -1.1 %, balanced funds -11.9 %, dynamic funds -21.5 %). It is evident that the Hungarian pension funds under pressure from bad investment results and negative political influence to get into a difficult situation. This situation culminated when 95 % of participants in pension savings returned to the PAYG system in 2010.

Hlaváč and Schneider (2011) in the article: *Financial Performance Pension Funds in Central Europe: Why are the worst czech funds?* described performance of pension funds in the Czech Republic, Bulgaria, Croatia, Hungary, Poland and the Slovak in the different time period. They identified from selected countries, the highest performance of Polish pension funds in the time period 2000 - 2010 (Sharpe ratio - SIR 0.13; Sharpe ratio - LIR 0.15). The results are worse compared, because results are for the various time periods time, however, it is evident tendency of Polish pension funds that they achieve the best performance of the Visegrad countries.

One of the the determinants of Sharpe ratio is a risk-free interest rate. I estimate the problem in defining the risk-free rate because in my opinion on the current financial market does not exist risk-free asset. For purposes of comparison the performance of pension funds across various countries, I used as a riskless assets of local government bonds because they express a certain degree of credibility and they can used as a common denominator for all the selected countries.

## 6 CONCLUSION

I compared in this article performance of pension funds in Visegrad countries (Poland, Hungary, Czech Republic and Slovakia) with Sweden, Switzerland and the Netherlands.

Measuring the performance of pension funds were conducted with using the Sharpe ratio and evaluation of the performance was focused on comparing the amount of lifetime pensions.

Sharpe ratio of guaranteed funds (- 0.82) is lower than Sharpe ratio of non-guaranteed funds (0.17). This is due to strong restrictions on the investment of pension funds and very conservative investments mainly in a government bonds. Sharpe ratio of guaranteed funds (Czech Republic, Hungary and Slovakia) in a comparison with domestic government bonds with a maturity of 10 years is negative. These pension funds have their portfolios consisting mainly of government bonds. Pension funds failing to diversify their portfolios and thus does not create added value for the participants in the form of higher returns over the risk-free interest rate.

Non-guaranteed pension funds have great results of Sharpe ratio only with the exception of Slovakia and Hungary, where it is caused by negative political circumstances. Excellent results of non-guaranteed pension funds have in Poland (SR 0.24), Sweden (SR 0.41), Switzerland (SR 0.41) and the Netherlands (SR 0.44). These pension funds overcame the interest rate government domestic bonds with a maturity of 10 years. Sufficient degree of portfolio diversification generates for participants additional revenue over the risk-free interest rate. The structure of the portfolio has a higher volatility than a portfolio composite

only of government bonds but investments for retirement have a long horizon and short-term fluctuation is compensated by long-term growth of markets.

The results of the Sharpe ratio of pension funds from Visegrad countries demonstrate weak performance (SR -0.45). Exceptions are Polish pension funds that achieve high performance mainly due to the low regulation, economies of scale (financial resources in a total volume of 640 billion CZK) and dynamic investments. Polish pension market have intervened legislative changes. Consisting primarily of reduce the contribution to the second pillar from 7.3 % to 2.3 % and the seizure of government bonds by the State. All Visegrad countries suffered in the monitored period negative political intervention.

The indicator Sharpe ratio includes the risk profile of the investment. I have identified from the available data, two segments with various volatility of returns.

The first segment consists of countries Czech Republic and Slovakia. Pension funds from these countries invest very conservatively. It is reflected in the low standard deviation of their returns. Changes of the Sharpe ratio cause small changes in the lifetime pensions paid out of the pension funds. If the risk profile of investments will not change and risk-free interest rate also remains constant, so we can conclude for example: if the Sharpe ratio 0.336 increases by 10 %, the interest rate will change by 0.05 percentage points and lifetime pension increases only by 1.2 %.

The second segment consists of countries Poland, Hungary, Switzerland, Sweden and the Netherlands. Pension funds from these countries invest very dynamic. It is reflected in the high standard deviation of their returns. Changes of the Sharpe ratio cause big changes in the lifetime pensions paid out of the pension funds. If the risk profile of investments will not change and risk-free interest rate also remains constant, so we can conclude for example: if the Sharpe ratio 0.336 increases by 10 %, the interest rate will change by 0.34 percentage points and lifetime pension increases by 9.3 %.

Generally, the amount of lifetime pensions depends mainly on the size of the nominal appreciation of the assets which reach pension funds. Based on the obtained data and results is evident that increase of the nominal appreciation of 1 percentage point will cause a change of lifetime pension of 28 %.

The above results demonstrate the importance of monitoring and evaluating the performance of pension funds, because small changes in the performance of pension funds cause very large changes in the amount of lifetime pensions.

## **THE ECONOMIES SCALE OF AGRICULTURAL PRODUCT PROCESSING COMPANIES LISTED ON STOCK EXCHANGE IN HOCHIMINH CITY AND HANOI, VIETNAM**

*Le Thanh Tung, Pham Thi Quynh Nhu, Nguyen Hai An*

### **Abstract**

This study applied the Cobb-Douglas production function to identify economic efficiency of 18 agricultural product processing companies listed on the Stock exchange in Ho Chi Minh City (HOSE) and Hanoi (HNX) in such sectors as fisheries, rubber and sugar in the period 2009-2013. The method employed FEM and REM models using panel data. The results showed that performance of all and each sector in this study has increasing returns to scale. In particular, firms in the sectors of fisheries and rubber primarily relied on raising capital to increase their output value, while those in the sugar sector mainly increase labor to improve their output value. Finally, the paper also provides some policy implications to improve the efficiency of capital and labor in the agricultural product processing companies.

*Keywords: economics of scale, listed companies, agricultural processing companies*

JEL Classification: J43, Q13

### **1 INTRODUCTION**

According to the data from Vietnam General Statistics Office (GSO) in 2013, the agricultural sector contributed 18.4% to Vietnam's GDP. Besides, the agricultural industry provided jobs for 25.16 million employees (accounted for 46.9% of total labor force) and about 60.4 million people are living and working in rural areas (about 46.8% of total population). The role of agricultural industry is essential in the Vietnam economy. Therefore, the industrialization and modernization of agricultural and rural sector attracts a lot of attention. Particularly, the center of cohesion between industrialization and modernization is to connect and transform raw materials and outputs of agricultural sector to inputs of industrial sector. Thenceforth, the production value chain for agricultural product manufacturing and processing firms is formed to enhance the industrialization and modernization of agricultural industry in Vietnam.

Currently, for the case of agricultural product processing companies in Vietnam, the sectors of rubber, sugarcane and fisheries play the most important role. These companies provide goods not only for domestic market, but also for exporting markets such as USA, Japan, South Korea, China, Malaysia, India, etc. Due to their characteristics of production, the agricultural manufacturing need to utilize lots of labor, capital and materials for increasing their outputs. However, their most common mistakes is to select outputs that cause labor shortage or surplus and utilize capital ineffectively that results in capital shortage. Therefore, it is essential and indispensable to conduct deeper study and analysis on effectiveness of input utilization (capital, labor) in production and business activities at companies.

This paper studied the economics scale of agricultural companies listed on HOSE and HNX from 2009 to 2013. The research used panel data regression with quarterly data. The research objective is to answer two questions: (i) What kind of economics of scale for each sector and all sectors (ii) Does capital or labor determine the increase in output of each sector and all sectors? Finally, this paper also suggests some solutions to enhance the efficiency of management to better utilize capital and labor at agricultural product processing enterprises.

## 2 LITERATURE REVIEW AND MODEL RESEARCH

The studies about economics of scale at levels of firms, regions or whole economy have been implemented in many countries in the world. Many types of production function have been proposed to illustrate the relationship between output and inputs, and the most common is Cobb–Douglas production function. The production function theory was developed by Charles Cobb and Paul Douglas (1928) after verification using the conditions of the US economy. The Cobb – Douglas production function stated that output (Q) depends on labor (L) and capital (K). In addition, the relationship among the variables of production functions is determined by level of science, technology and management that are called Total Factor Productivity (TFP).

In recent decades, many studies have successfully applied Cobb – Douglas production function into economics of scale research in such fields as industry, trading and service. A study of Ingene and Lusch (1999) with the application of Cobb – Douglas function for trading sector in USA showed that for the case of all grocery stores, return to scale remains constant while the small grocery stores have increased returns to scale. Hossain et al. (2004) also studied returns of scale for 21 sectors in Bangladesh. The results showed that only 14 sectors have increasing returns of scale while 7 sectors have diminishing returns of scale. Yuan et al. (2009) used Cobb-Douglas function in research of energy consumption in China, the result showed that improvement in technology declines the energy intensity of industrial sector by 6.3 percent per year. Hossain and Al-Amri (2010) also applied Cobb-Douglas function in Oman for 9 important sectors in industry. The research found that there are 7 sectors with increasing returns of scale and 2 sectors with decreasing returns of scale.

Based on Cobb-Douglas production function, the research model about economics of scale for the case of agricultural product processing company listed on HOSE and HNX will be written as follows:

$$Q_{it} = AK_{it}^{\alpha}L_{it}^{\beta} \quad (1)$$

If  $\alpha + \beta > 1$ , this production function has increasing returns to scale. 1% increase in inputs (labor, capital) results in more than 1% increase in outputs.

If  $\alpha + \beta = 1$ , returns to scale of the function remains constant. If inputs (labor, capital) increase by 1%, outputs increase by the same level of 1%.

If  $\alpha + \beta < 1$ , the function has diminishing returns to scale. If 1% increase in inputs (labor, capital) improves the outputs less than 1%.

After transforming both sides of the equation (1) into logarithm form, we have the following equation (2):

$$\ln Q_{it} = \ln A + \alpha \ln K_{it} + \beta \ln L_{it} + \varepsilon_{it} \quad (2)$$

$$i = 1, 2, 3, \dots, n$$

$$t = 1, 2, 3, \dots, m$$

Where: Q is total output of the sectors, A represents TFP, L is quantity of labor, and K is quantity of capital.  $\alpha$  and  $\beta$  denote the output elasticity on labor and capital respectively. When conducting regression model using panel data,  $i$  denotes  $i^{\text{th}}$  firms ( $i: 1 \rightarrow n$ ) and  $t$  denote time ( $t: 1 \rightarrow m$ ).

### 3 METHODOLOGY AND DATA

#### 3.1 Econometrics method

To accomplish the research objectives, this paper applies panel data regression with two methods of FEM and REM, and then uses the Hausman test for selecting appropriate method.

According to Gujarati (2004) and Gujarati and Porter (2009), panel data regression model is written as following:

$$Q_{it} = \beta_1 + \beta_2 X_{2it} + \beta_3 X_{3it} + \dots + \beta_k X_{kit} + u_{it} \quad (3)$$

Assume that the slope coefficients are unchanged across companies but intercepts vary across units. Thenceforth, model (3) can be rewritten as follows:

$$Q_{it} = \beta_{1i} + \beta_2 X_{2it} + \beta_3 X_{3it} + \dots + \beta_k X_{kit} + u_{it} \quad (4)$$

The difference in intercept may reflect the features of each company in terms of managerial philosophy or managerial style. Model (4) is known as the Fixed Effects Model (FEM). FEM is appropriate for the study using sample with short period.

In the Random Effects Model (REM), instead of treating  $\beta_{1i}$  as fixed, we assume that it is a random variable with a mean value of  $\beta_1$  (without  $i$  denotation). The intercept for a specific company can be represented as follows:

$$\beta_{1i} = \beta_1 + \varepsilon_i; \quad i = 1, 2, \dots, N \quad (5)$$

Where,  $\varepsilon_i$  is a random error term with a mean value of zero and variance  $\sigma^2_{\varepsilon}$ .

It can be understood that the companies in the sample are derived from a larger sample set and have a common mean of intercept ( $\beta_1$ ). The individual difference in intercept value of each company is reflected via the error term  $\varepsilon_i$ .

Substituting equation (5) into equation (4), we obtain:

$$Q_{it} = \beta_1 + \beta_2 X_{2it} + \beta_3 X_{3it} + \dots + \beta_k X_{kit} + \varepsilon_i + u_{it} \quad (6)$$

$$Q_{it} = \beta_1 + \beta_2 X_{2it} + \beta_3 X_{3it} + \dots + \beta_k X_{kit} + w_{it} \quad (7)$$

Where:

$$w_{it} = \varepsilon_i + u_{it} \quad (8)$$

The equation (7) is called Random Effects Model (REM). The composite error term  $w_{it}$  is constituted of two components:  $\varepsilon_i$  denotes the cross-section or individual-specific error term, and  $u_{it}$  denotes the combined time series and cross-section error term.

#### 3.2 Data

The study used quarterly data for the period from the first quarter in 2009 to the end of fourth quarter in 2013. Each company has the number of observations of 20 quarters. Data are derived from transparent reports, quarterly and yearly audited financial reports. The samples were surveyed at 9 fishery firms, 5 rubber firms and 4 sugar firms listed on HOSE and HNX. Total observations is 360 (20 periods multiplied by 18 firms). When conducting the research model, all data are transformed to natural logarithm form.

## 4 RESULTS AND DISCUSSION

### 4.1 Firms' Returns to Scale by sectors

This section estimates firms' returns to scale by sectors for the case of 9 fishery companies (180 observations), 5 rubber companies (100 observations) and 4 sugarcane companies (80 observations). Regression methods with panel data are employed using FEM and REM model. The regression results are presented as follows.

Tab. 2 - Regression Results by Sectors (Fishery - Rubber – Sugarcane)

Variables	Dependent variable: LnQ					
	Fishery Branch		Rubber Branch		Sugarcane Branch	
	FEM	REM	FEM	REM	FEM	REM
C	-1.351*	-1.569*	0.952	0.340	1.112	0.844
LnL	0.524**	0.479**	0.540**	0.432**	0.876**	0.480**
LnK	0.764**	0.806**	0.521**	0.628**	0.408**	0.766**
R <sup>2</sup>	0.859	0.850	0.877	0.812	0,822432	0.691
Adjusted R <sup>2</sup>	0.840	0.848	0.843	0.808	0,758140	0.683
F-statistics	45.718	501.498	26.385	209.589	1279218.000	85.950
Probability	0.000	0.000	0.000	0.000	0.000	0.000
Hausman test	0.301		0.167		0.005	
Observations	180		100		80	

*Note:* \*\* and \*: significant at 1% and 5% respectively

After conducting regression analysis for each sector, Hausman test is also applied to determine whether FEM or REM is appropriate. Table 2 shows that P-value of fishery firms equals to 0.301 and that of rubber branch is 0.167; that is, these values are more than 0.05. Therefore, for the case of fishery and rubber sectors, REM is more suitable than FEM. In contrast, the Hausman test for sugarcane sector with P-value = 0.005 < 0.05 indicates that FEM is more appropriate than REM.

**Tab. 3 - Results of Production Function by sectors (Fishery - Rubber – Sugarcane)**

Industry	Production function using equation (2)	Production function using equation (1)
Fishery	$\text{Ln}Q = -1.569 + 0.807\text{Ln}K + 0.479\text{Ln}L$	$Q = 0.208K^{0.807}L^{0.479}$
Rubber	$\text{Ln}Q = 0.34 + 0.629\text{Ln}K + 0.433\text{Ln}L$	$Q = 1.405K^{0.629}L^{0.433}$
Sugarcane	$\text{Ln}Q = 1.112 + 0.408\text{Ln}K + 0.876\text{Ln}L$	$Q = 3.089K^{0.408}L^{0.876}$

Table 3 shows that all the three sectors have increasing returns to scale with  $(\alpha + \beta) > 1$ . In particular, the value of fishery industry, rubber industry and sugarcane is 1.286, 1.061 and 1.285 respectively. The rubber enterprises have the lowest increasing returns to scale. The results also show that the production function of fishery and rubber industries has contribution of capital higher than that of labor (due to the coefficient  $\alpha > \beta$ ). On the other hand, the contribution of labor toward output in sugarcane industry is larger than that of capital (due  $\alpha < \beta$ ). Additionally, in terms of Total Factor Productivity (TFP), the sugarcane industry was the highest (3.089), followed by the rubber industry (1.405) and the fishery industry (0.208).

#### **4.2 Returns to scale of all firms in three sectors: Fishery, Rubber and Sugarcane**

18 enterprises in all three sectors with 360 observations are used for calculating returns to scale. Results from panel data regression method using FEM and REM are presented in Table 4.

**Tab. 4 - Regression results of all firms in three sectors**

Dependent variable: LnQ				
Variable	FEM		REM	
	Coefficient	t-statistics	Coefficient	t-statistics
C	-1.759**	-3.181	-1.719**	-3.198
LnL	0.167*	2.566	0.171**	2.655
LnK	0.937**	16.727	0.932**	17.297
R <sup>2</sup>	0.670		0.653	
Adjusted R <sup>2</sup>	0.650		0.651	
F-statistics	32.699		336.135	
Probability	0.000		0.000	
Hausman test	0.3017			
Observation	360			

*Note: \*\* and \* : significant at 1% and 5% respectively*

The result of the Hausman test indicates that REM is better than FEM with p-value of 0.3017. From Table 4, the production function for the case of all firms in three sectors is written as follows:

$$\begin{aligned}\ln Q &= -1.719 + 0.171 \ln L + 0.932 \ln K \\ Q &= 0.839 K^{0.932} L^{0.171}\end{aligned}$$

The results indicate that for the case of all firms in three sectors, there exists increasing returns to scale with the value of  $(\alpha + \beta)$  higher than 1 ( $\alpha + \beta = 1.103$ ). The coefficient of  $\alpha = 0.932$  is higher than  $\beta = 0.171$ , which indicates that the increase in output is mainly due to capital while the contribution of labor is limited. The value of Total Factor Productivity (TFP) equal to 0.839 reflects the contribution of technology and management to the firms' outputs in all three sectors.

## 5 CONCLUSION AND POLICY IMPLICATIONS

This research applied panel data regression method using FEM and REM to estimate production function for the enterprises listed on HOSE and HNX in three sectors including fishery, rubber and sugarcane in the period of 2009-2013. Generally, this paper has contributed to the existing theoretical framework literature in two main ways: (1) it provided an experimental evidence about the operation of firms in Vietnam, an emerging economy in Asia; (2) it also supplied some useful policy implications in SMEs area in developing countries.

In particular, the research results indicate that the enterprises in three sectors and each sector have increasing returns to scale. It is also found that the fishery and rubber sectors primarily rely on the increase in capital to improve the quantity of outputs while the sugarcane sector mainly uses more labours to increase output value.

Therefore, the results partly show that the growth pattern of Vietnamese enterprises in the period of 2009 –2013 is chiefly dependent on capital leverage. Therefore, when the government decided to contractionary monetary policy, raise interest rates, reduce money supply and credit growth in this period immediately, a lot of enterprises had difficulties in their production activities. This is considered as an obvious evidence for the growth model that primarily relies on credit and banking system in Vietnam in the past period.

From the findings, this research proposes some policy implications to improve production and business management in the future:

**Firstly:** Because Vietnam has abundant labor force, the enterprises need to focus on labor-intensive production to boost up their output. Furthermore, firms should pay special attention to labor productivity factor to increase the contribution of labor to firms' output. Firms should organize training, retraining and advanced training activities to improve qualification and skills, as well as arrange and utilize labours for appropriate jobs.

**Secondly:** Firms should continuously invest in innovation, technology improvements to increase the contribution of science and technology to outputs. Moreover, the advanced methods of production methods and organization should be actively applied to improve outputs value. Additionally, the connection between enterprises and the agricultural sector should be tightened to diversify processing products in order to construct a strong value chain in processing agricultural products industry for domestic consumption and export.

**Thirdly:** Capital-intensive production model should be adjusted into model with harmonious combination of labor and capital; henceforth, the effect of diminishing marginal productivity of capital can be inhibited. Moreover, firms need to be less reliant on capital to reduce the dependence on banks' credit growth and the increase in the economy's money supply.

**Fourth:** The policy makers need to establish medium- and long-term development orientations and plans for firms in each sector and the whole economy. Besides, the management agencies in each sector should also provide consultancy for firms on an appropriate specific model. On that basis, firms will construct their production and business plans to take best advantage of inputs, thereby enhance their competitiveness in the market, create more jobs as well as contribute to economic growth in the future.

On the other hand, this study also had limitations too among them followings can be mentioned: the research sample is quite small because there are only 18 firms in three sectors in agricultural in Vietnam and the study period only is from 2009 to 2013. The future study might develop more by adding more companies in these sectors in Vietnam and take data in longer period to make this topic be more better.

## **Abstract**

This study aimed at examining the current transparency extent of financial information of listed companies on the Vietnamese stock market, under evaluation by investors upon investigating 178 listed company samples on Ho Chi Minh Stock Exchange. The questionnaire assessed the transparency index built on the OECD Corporate Governance Principles (2004) on information disclosure and transparency. This study also explored the role of creditors (based on the financial leverage) and audit firms toward the transparency extent of financial information of Vietnamese listed companies. The study results showed that, according to the judgment of investors, the transparency extent of financial information of Vietnamese listed companies was just at fair good point, factors of financial leverage and audit firms also affected to the transparency extent of the listed companies' financial information.

*Keywords: Transparency, disclosure, financial statement, leverage, audit firms, Vietnam.*

JEL Classification: G32, M41, M48

## **1 INTRODUCTION**

The Vietnamese stock market has operated for nearly 15 years. For the stock market, the information is an indispensable factor when carrying out investment activities. Particularly, the financial information plays a very important role in the decisions of investors. However, the Vietnamese stock market in recent years has been operating inefficiently. The public and investors lost confidence in the quality of information, especially financial information that the listed companies published because of a series of crash or suspended trading of listed companies. The security of the audit firms on the quality of the information is no longer much trusted. All those matters are derived from the fact that the financial information is presented and published with a lack of transparency.

In the report of Corporate Governance Scorecard 2012, the International Finance Corporation (IFC) of the World Bank concluded that the financial statements' quality of the top 100 companies listed on the Vietnamese Stock Market (including Ho Chi Minh and Hanoi) went down in all of the fields. Financial Statement is one of the weak points that were emphasized; there was a common lack of transparency in sharing information about how the company was run (From IFC, 2012). IFC's Corporate Governance Scorecard marked these 100 companies with an average score of 42.5%. Although the report of "Corporate Governance Scorecard from IFC" in 2013 said that the Vietnamese listed companies also had the positive efforts in 2013 and had improved scores in all aspects of evaluation, they had been very low when compared to other countries in the ASEAN region. Experts pointed out that transparency and Corporate Governance that were weak were two main reasons why Vietnam lost points in the evaluation.

Basing on the foresaid comments, this paper aimed at analyzing how the financial information of listed companies was announced, what extent of disclosure and transparency was. At the same time, this study examined the role of creditors and audit firms toward the transparency extent of financial information of Vietnamese listed companies. On this basis, the article proposes solutions and policy recommendations to enhance the transparency of financial information of listed companies in particular, and of other public companies in general. With this goal, following this introduction, section 2 will present the theoretical backgrounds related to the study content. A brief presentation of research methodology and research data was mentioned in section 3 and the results of the study and discussions were stated in section 4. Finally, this article gave some conclusions and suggestions to enhance the transparency of financial information of the Vietnamese listed companies.

## **2 LITERATURE REVIEW AND THEORETICAL FRAMEWORK**

### **2.1 Literature review**

Researches on the transparency extent of financial information disclosure and the factors that affect the information transparency have brought about many different results. For example, Bushman et al. (2001) analyzed the information transparency of listed companies based on two groups of factors: the transparency of financial information and transparency of governance information. Through the study, Bushman et al. concluded that transparency in corporate governance closely related to legal mechanisms, while financial information transparency related mainly to economic policies. Archambault J. and Archambault M. (2003) studied the model of factors affecting the information transparency of the companies. At the corporate level, the experimental results of the authors said that most of the factors reflecting the characteristics of finance and operational processes of the businesses would affect the level of information disclosure in general and financial information in particular. In addition, the authors also indicated that the financial disclosure decision for a company was complex and influenced by many national and corporate factors.

Cheung et al. (2005) examined the extent of information disclosure and transparency of listed companies in two markets of Thailand and Hong Kong. Empirical results showed that financial characteristics explained some of the variation in the degrees of corporate disclosure for firms in Hong Kong but not for firms in Thailand. Michael et al. (2006) came up with the model of the level of information transparency. This study formalized the transparency was the most important criteria for evaluating the financial statements in views of external users. In addition, Bert (2006) referred to the difference in the perception of investors and the report makers on the transparency of financial statements. Bartley et al. (2007) showed that auditor fees had effected firm transparency. Improving the auditing standards made to increase the accounting disclosure of public companies (Zhou, 2007; Sami & Zhou, 2008). Phillips et al. (2010) showed that company managers had the desire of setting financial statements based on accounting standards, while investors and creditors are in favor of establishing financial statements based on the rules. The Report on Corporate Governance Scorecard of the International Finance Corporation (IFC, 2012) presented the issues related to information transparency and corporate governance of listed companies on the Vietnamese stock market. Through survey findings and research data of 100 listed companies on the Vietnamese stock market, the research showed that the listed company provided less information publicly and the quality and transparency declined. The listed company “lowered standards of information disclosure, provided only general and incomplete information for the market.”

## 2.2 Theoretical Framework

### *Definition of financial information*

In term of the accounting information systems, the financial statements are considered the output of the accounting information system processed and provided by the accounting systems or in term of accounting information the users, financial statements provide a source of financial information useful for making economic decisions. Within the scope of this study, the term “financial information” at small scale means similar to “information on the financial statements”. Thus, the article used the term financial information that means information on the financial statements.

*Financial information relates to cash flows, results and (balance sheet) positions associated with them. The information has a direct link with the financial registration system and can be historical or prospective. Financial information is expressed in monetary units and can be measured exactly. (Nivra, 2008, p.10).*

### *Definition of financial information transparency*

Below is a summary of definitions of information transparency and financial information transparency in the previous studies (Table 1)

Tab. 1 - Summary of definitions of information and financial information transparency.  
Sources: Summary of previous studies

Number	Research	Definition of financial information transparency	Research perspective
1	Basle (1998)	Financial information transparency was announced to the public the timely and reliable information to ensure that information users can accurately assess financial situation and results of banks, business activities and associated risks	In banking activities
2	Vishwanath & Kaufmann (1999)	Information transparency was complete, reliable and timely information on publishing and easy access for the public on such adequacy, reliability and timeliness of information	In financial markets
3	Robert Bushman et al. (2001)	Financial information transparency was the availability of specific information about the company to investors and outside shareholders.	Company perspective
4	Kulzick (2004)	Financial information transparency means information disclosure must ensure the following characteristics: the information must be accurate, consistent, relevant, complete, clear, timely and convenient	Information users
5	OECD Corporate Governance Principles (2004)	Relating to information disclosure and transparency: “Information disclosure must be timely and accurately in all important matters relating to the company, including financial status, operational status, ownership and corporate governance”.	Corporate governance
6	Bert. (2006)	Transparency of financial information was the disclosure of financial information must be useful and timely, and the disclosed information must be reliable, comparable and comprehensive.	In perspective of certified accountant

From the above-mentioned concepts, according to the authors’ opinions:

**“Financial information transparency is that provision of financial information must be reliable, timely, accurate, complete and consistent in the manner in which the public can access easily and conveniently.”**

### ***Measuring the extent of financial information transparency***

Throughout the research results of authors and organizations around the world, criteria for measuring information transparency extent and financial information transparency extent can be summarized in Tab. 2.

Tab. 2 - Summary of criteria for measuring the extent of information transparency and financial information transparency. Sources: Summary of previous studies

No.	Research	Measuring transparency extent of financial information
1	Vishwanath & Kaufmann (1999)	Using the criteria of concept of information transparency including attributes such as accessibility, comprehensiveness, relevance, quality and reliability of information.
2	Standard & Poors (S&P) (2002)	Using T&D Index, this index was based on the investigation of listed companies about disclosing information with 02 main topics consisting of Information about its ownership structure, shareholder rights and financial information, operations of the company.
3	Bushman et al. (2001), Jeffrey & Marie.Archambault (2003)	Using CIFAR index, which the center of analysis and international finance research (IAAT - International Accounting and Auditing Trends) built in 1995, consisting of 90 items of financial and non-financial information published in Annual Report of the listed companies.
4	Cheung et al. (2005)	Building a questionnaire based on the OECD management principles to measure the level of information transparency.
5	Lin et al. (2007)	Using index "ranking system of information transparency and disclosure ITDRS". These were index of rating information transparency and disclosure of listed companies built in Taiwan. This index included 88 published items.

### ***Factors affecting financial information transparency***

Through the results of previous studies, it can be generalized the model of factors affecting transparency of information in general and financial information in particular in Tab. 3.

Tab. 3 - Summary of factors affecting the extent of information transparency.Sources: Summary of previous studies

No.	Research	Factors affect to transparency index of financial information	Research perspective
1	Meek & Gray (1995), Zarzeski (1996)	Export sales, financial leverage and company size	Company
2	Robert Bushman et al. (2001)	Law affecting transparency in corporate governance; economic policy affecting transparency extent of financial information where enterprise size affects transparency extent of financial information	Company
3	Jeffrey and Marie Archambault (2003)	Power distance determination, individualism, preventing instability, neo-patriarchal, education, religion	Cultural system
		<b>Politics:</b> law, media	National system
		<b>Economics:</b> development, inflation, capital markets <b>Finance:</b> ownership, listing status, dividends, auditing, financial leverage <b>Operate characteristics:</b> company size, industry, export revenues.	Company
4	Cheung et al. (2005)	<b>Finance:</b> company size, financial leverage, financial position, collateral asset and efficiency of asset. <b>Corporate Governance:</b> ownership concentration, board structure and board size.	Company

### ***Theoretical backgrounds***

Theory of asymmetric information firstly occurred in the 1970s. Asymmetric information in the stock market occurred when one or more investors knew private information or

information announcement that others did not know (Akerlof, 1970; Kyle, 1985). When the managers act as their short-term interests, deliberately conceal or delay the information disclosure, the investors will suffer the disadvantages. If this situation occurs frequently, investors will fall into the adverse selection. The market will survive the bad stocks and the prices will be lower than those are willing to be paid by investors. Therefore, the stock market has a risk of the collapse.

Following *Asymmetric information, Agency theory* (Jensen & Meckling, 1976; Fama, 1980) appeared in the context of business administration associated with the studies of the behaviors of employers and employees through the contracts. Agency theory is often used to explain the information transparency and increase the voluntary disclosures of the manager (Hossain, 1995; Bushman & Smith, 2003). The behaviors of the agent (manager) increase the transparency and disclosure extent of information when they consider the benefits and costs of the disclosure. If the contract between the owners and the managers is efficient and the interests of the managers are assured, they will act entirely in the interests of owners and increase the transparency extent to serve the interests of the owners.

### 3 RESEARCH METHODOLOGY

#### 3.1 The study process

The process of research was carried out as follows:

- **Firstly, Materials researching, modeling and scale building** included (1) Materials researching (2) Building research hypotheses, and (3) developing the first questionnaire as a basis for building scale.
- **Secondly, Qualitative research** was carried out through group discussion: each group consisted of 20 people conducting questionnaire discussions or direct interviews with experts in the field of securities, finance, and accounting.
- **Finally, Quantitative research** was conducted through direct interviews and random sampling with the sample size of 178 listed companies and 1,780 survey questionnaires. This step was carried out through scale testing by Cronbach alpha and EFA factor analysis to evaluate the reliability of the scale and choose the best scale reflecting the transparency extent of financial information of listed companies.

This study process was summarized through the following diagram:

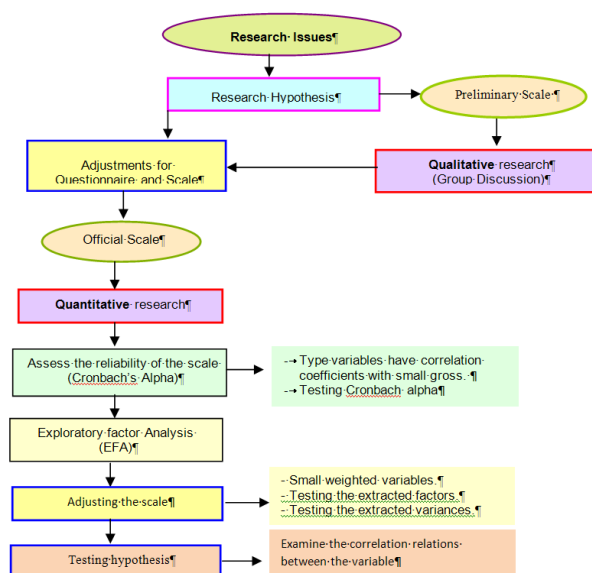

Fig. 1: Study Process

### **3.2 Measurement of the financial information transparency extent of the listed companies**

This paper used the disclosure and transparency scores extracted from a survey instrument designed to rate disclosure practices of publicly listed companies by using the OECD Corporate Governance as an implicit benchmark. In this OECD, the paper used six components on disclosure and transparency Principles to design the questionnaire.

### **3.3 Hypothesis and Measurement of the impacted factors**

Beside dependent variable is the financial information transparency extent of the listed companies measured by collecting data from surveys of investors, the independent variables include of the financial leverage and audit firms built into the hypothesis measured as follows:

#### *(1) The financial leverage*

The role of creditors was considered through the financial leverage in this study. Some previous studies stated that the company, which had a high financial advantage, would publish more information than the company would of a low financial leverage. Ahmed and Courtis (1999), Robert et al. (2003) had found that when firms had a high financial advantage, they would be more supervised from the related parties. Creditors will require businesses to provide more information to ensure their interests. Managers will persuade creditors to loan by publishing more information to reduce the cost of debt. Through *agency theory*, it can be seen that this is the way that the managers reduce the agency costs. To enhance the level of disclosure and transparency of information will reduce the asymmetry of information between creditors and managers, thereby reducing agency costs.

***Hypothesis H1: Companies with high financial advantage, their extent of financial information transparency is higher.***

*The financial advantage variable (LEV)* was calculated as the ratio of total debt and total assets (the calculation that Cheung et al (2005) and experts selected in qualitative researches):

#### *(2) Audit firm variable*

Many studies showed that the financial statements might be affected by the fact that whether listed companies were audited by large or small-sized audit firms (Fargher et al., 2001; Archambault, 2003; Zhou, 2007; Sami & Zhou, 2008). According to the agency theory, Jensen and Meckling (1976) said, reaching out to the large and prestigious audit firms as a way to reduce capital costs - costs of agency (in case the company wanted loans) or to reduce agency costs and increasing role in monitoring the behavior that managers can make. Using the large audit firms is an affirmation with the shareholder of audit results' transparency and the reliability of financial information that corporate disclosure

*Audit firm variable (AUD)* was used to distinguish the size and reputation of audit firms that listed companies hired to be the independent audit firm to audit financial statements for the year ended on December 31, 2012. This variable was nominal variables so this topic used dummy variables to replace and to consent that company was audited by Big 4 denoted by one, whereas (Non Big 4) was zero.

***Hypothesis H2: Company that was audited by one of Big 4 issuing published more information than other companies (Non Big 4).***

### 3.4 Research data

#### *The sample*

The sample consists of listed companies on the Ho Chi Minh Stock Exchange (HOSE). Although Vietnamese stock market has currently two exchanges including Ho Chi Minh Stock Exchange (HOSE) and Hanoi Stock Exchange (HNX), in which HOSE's operating time and scale are longer and larger than HNX's.

On HOSE, the market capitalization was close to 805.679 billion VND, representing nearly 90% of the total market capitalization (total value of capitalization on the Vietnam stock market was 902.992 billion VND), the transaction value accounted for 84% of the whole market. (Data was accessed from vietstock.vn on July 10, 2013). In addition, according to the World Bank (Report Corporate Governance Scorecard 2012, IFC, 2012), HOSE was the main stock market in Vietnam. It can be seen that the choice of HOSE ensured the representation, and might reflect the operations of the Vietnamese stock market.

On HOSE, there were 308 listed companies (HOSE's website on July 10, 2013). We excluded the listed companies started in 2012 and 2013 (because of short operation time, insufficient information for the research) and 23 companies in the field of banks and finance (since their financial statements were prepared in accordance with their special regulatory environment). Of the 269 companies, the researchers selected 178 listed companies to include in the sample for the formal quantitative research.

#### *Data collection*

The researchers carried out a survey to collect investors' opinions on financial information transparency of the listed companies that they invested. After surveying and selecting, there were about 1,700 responses from 178 listed companies (about 15 listed companies had respondents from 11 to 15 responses, 22 listed companies had from 5 to 7 responses and remaining listed company had an average of 10 responses). Transparency extent of each listed company was calculated by taking the average of the surveys (average of 10 responses/a company).

## 4 FINDINGS AND DISCUSSIONS

### 4.1 Preliminary results (discussing with experts - Qualitative method)

Discussions about "*The impact of financial leverage and audit firms toward the financial information transparency of the Vietnamese listed companies*"

Tab. 4 - Summary of assessing the impact of these factors to the financial information transparency of Vietnamese listed companies. Sources: Results discuss with expert.

<i>Factors</i>	Impact levels										
	No impact (1)		Little impact (2)		Impact (3)		Strong influence (4)		Power influence (5)		Total
	Number of answers	%	Number of answers	%	Number of answers	%	Number of answers	%	Number of answers	%	No. of answers
1. Financial leverage	0	0%	0	0%	10	50%	9	45%	1	5%	20
2. Audit firms	0	0%	0	0%	8	40%	5	40%	4	20%	20

Tab. 4 showed that most of the reviews said that the factors mentioned in the paper affected from the level of influence to very strong influence, in which, the financial leverage was

evaluated with the level of the strong and very strong influence, accounted for 50%. Audit firm was evaluated with the level of strong and very strong influence, accounted for 60%.

#### 4.2 Official results by quantitative method

In this step, we used SPSS software as a tool to support and process information about the survey results from investors.

##### *The credibility and value of the scale of transparency of financial information of listed companies.*

The scale was designed to assess the financial information transparency according to the investors' views with 17 questions. After three times running Cronbach  $\alpha$ , the results were shown in Tab. 5

Tab. 5 - Result of evaluating the reliability of scales – After running Cronbach  $\alpha$  for three times. Sources: Author's calculation

Reliability Statistics	
Cronbach's Alpha ( $\alpha$ )	The number of items
.78	13

Tab. 5 showed that the scale of financial information transparency of listed companies was composed by 13 observed variables after the third analysis with coefficient  $\alpha = 0.78 > 0.6$  ensuring the necessary reliability. In addition, the correlation coefficients of the variables with total of remaining variables were  $>0.3$ . In general, the scale (including 13 questions) had enough reliability and a pretty good basis to measure transparency extent of financial information of listed companies in the research.

##### *Results assessing the scale value - exploratory factor analysis (EFA)*

Next, the authors continued to carry out the exploratory factor analysis (EFA) to determine the focused questions to clarify the assessments of the transparency extent of companies in the sample. In addition, EFA was carried out to determine whether the questions clarified each characteristics and concept of financial information transparency or not. The results were shown in Table 6.

Tab. 6 - The test results of KMO and Bartlett's Test and evaluating scale value of transparency extent. Sources: Author's calculation

Kaiser-Meyer-Olkin Measure of Sampling Adequacy	.752
Bartlett's Test of Sphericity	Approx. Chi-Square
	1241.358
	Sig.
	.000

Observed variables	Measurement attributes of transparency index of financial information			
	Component E (Convenient and timely)	Component A & B (Full and consistent)	Component D (Trust)	Component C (accurate)
Q. 17: High transparency index of financial information	.779			
Q. 16: Information can be equal other investors	.756			
Q. 15: Web regularly and fully updated	.723			
Q. 14: Timely financial statements	.658			
Q. 13: Investors have multiple channels to know information	.646			

Q. 4: Full and good quality financial statements	.653	<b>.467</b>		
Q. 3: Transparency at cross ownership		<b>.807</b>		
Q. 7: All methods of accounting are accepted by accountant		<b>.769</b>		
Q. 5: Using and compliacing with Vietnamese accounting standards and reaching international accounting standards		<b>.489</b>		
Q. 11: Independent auditors are selected objectively			<b>.984</b>	
Q.12: Publishing service remuneration is not related to accountant			<b>.983</b>	
Q. 9: Full acceptance of financial statement				<b>.906</b>
Q. 10: Accuracy and consistency financial statement				<b>.867</b>
<b>Extracted variance</b>	<b>70.883%</b>			
<b>Eigen-value</b>	<b>4.530</b>			

From Tab. 6: KMO was to test conditions of carrying out EFA that were satisfactory: KMO coefficient= 0.752 > 0.5 and Sig. = .000 < 0.05 with high significance level. Thus, EFA was appropriate to be implemented for these factors. In the next table, there were four factors that were extracted with a total extracted variance of 70.883% > 60%. This showed that the overall scale that contributed to measurement of the transparency extent of the listed companies' financial information was larger than private parts and error. This proved that scales were a good explanation for measuring transparency extent of financial information of listed companies. In terms of load of observed variables, all observed variables had load factors varying from 0.467 to 0.984 (> 0.4).

### ***Descriptive statistics results***

Table 7 showed the statistic results of financial information transparency extent of listed companies in the research samples. The average of transparency extent of listed companies was 3.7 points, a fair good point. The gap between companies with the lowest transparency extent and the highest ones was pretty far. Thus, under judgments of investors, there were companies that were highly evaluated in term of transparency by investors; however, there was a lack of companies' transparency as evaluated by investors.

A deep analysis of transparency characteristics showed that the characteristics of completeness, consistency, reliability, timeliness and convenience of financial information had an average point similar to a general transparency extent, at a fair good point. However, the accuracy of the information had an average point that did not equal remaining characteristics, at a fair good point.

Tab. 7 - Transparency extent of financial information of listed companies in the research samples. Sources: Author's calculation

Variables	N	Minimum	Maximum	Mean	Std Deviation
Transparency extent	178	2.8	4.4	3.72	.2889
Completeness - Consistency (Component A & B)	178	3.00	4.75	3.77	.3620
Accuracy (Component C)	178	1.50	4.75	3.57	.4468
Reliability (Component D)	178	1.00	5.00	3.70	.9825
Timeliness and convenience (Component E)	178	2.90	4.46	3.77	.2639

### ***Results of testing in research model***

#### *Testing hypotheses*

Method of testing the hypotheses (the use in Archambault's study, 2003) was presented in Table 8:

Tab. 8 - Analysis technique and testing method of research hypothesis. Sources: Author's studying

No.	Variables	Measurement variable	Hypotheses	Testing method
1	<b>Financial leverage (LEV)</b>	The ratio of total debt on the total value of assets	H1	Testing of Pearson correlation coefficient
2	<b>Audit firm (AUD)</b>	Big 4 and Non Big 4	H2	Testing of different Independent T-test

### ***Results of testing hypothesis***

This paper primarily used the parameters testing to test the hypothesis. Results of testing the hypothesis were carried out as follows.

#### **(1) The results of testing the hypothesis of financial leverage**

***Hypothesis H1:*** Companies with higher financial leverage, their extent of financial information transparency is higher.

With parameters testing, this model conducted Pearson correlation coefficient and the results were presented in Table 4.6.

Tab. 9 - Correlation between Financial Leverage Variable and transparency extent Variable.  
Sources: Author's calculation

Variables		Financial Leverage
<b>Parameter Testing</b>	Pearson correlation	0,133*
	Sig. (1-tailed)	<b>0,038</b>
(*) : Correlation in the sense 5%		

It can be seen from Table 4.6 that there was a positive correlation between the financial leverage and transparency extent with a sense at 5%. Therefore, hypothesis H1 was accepted with reliability of 95%. It is concluded that companies had greater financial leverage, the higher the extent of financial information transparency was. This result was consistent with the findings by Ahmed and Courtis (1999), Jaggi and Low (2000).

#### **(2) Audit firm hypothesis**

***Hypothesis H2:*** Companies that were audited by one of the big audit firm (Big 4), the audit conclusion was based on more reliable evidence, published more information than others that were audited by small audit firms (Non Big 4).

For this hypothesis (testing between quantitative and qualitative variables), the testing was conducted through the intermediary hypothesis:

***Hypothesis H2a:*** Transparency extent of companies audited by large audit firms (Big 4) and the companies audited by other audit firms (Non Big 4) are the same.

Parameters testing was carried out by testing differences of Independent T-test; the results were shown in Table 10.

Tab. 10 - Testing the differences between variables of companies audited by Big 4 and companies audited by Non Big 4 with transparency extent. Sources: Author's calculation

Descriptive statistics				
Audit firms	Quantity	Average	Standard deviation	Std. Error Mean
Non Big 4	129	<b>3.691</b>	.2999	.0264
Big 4	49	<b>3.824</b>	.2345	.0335
			Transparency extent	
			Equal variances assumed	Equal variances not assumed
Levene Testing	F		4.027	
	Sig.		<b>.046</b>	
T-test	t		-2.800	-3.123
	Sig. (2-tailed)		.006	<b>.002</b>

The value of Sig. = 0.046 < 0.05 of the Levene testing showed that the variance

The value of Sig. = 0.046 < 0.05 of the Levene testing showed that the variance between the two types of audit firms are different. The t-test at the Equal variances had value Sig. = 0.002 < 0.05 so hypothesis H2a is rejected, which means “*Transparency extent of companies audited by large audit firms (Big 4) and the companies audited by other audit firms (Non Big 4) are not the same*”.

In addition, reviewing descriptive statistics: average values of transparency index of companies audited by Big 4 are always larger than companies audited by Non Big 4. Therefore, H2 was accepted. This result was consistent with the findings by Fargher et al. (2001), Archambault (2003) but differed from findings by Wallace et al. (1994), Ahmed and Courtis (1999).

In conclusion, the two theories were accepted.

**Hypothesis H1:** *Companies with higher financial leverage, their extent of financial information transparency is higher.*

**Hypothesis H2:** *Companies that were audited by one of the big audit firms (Big 4) had audit conclusion based on more reliable evidence, published more information than other companies audited by small audit firms (Non Big 4).*

### 4.3 Findings discussions

Through the above-mentioned analysis, we can see the transparency extent of listed companies' financial information has improved more than before because of the strict rules related the information disclosure and high sanctions, however, it was still low, or at a fairly good extent. In addition to a number of listed companies complying with the rules in the publication and presentation of information, there are still a lot of listed companies that do not perform the information disclosure well.

The testing results of correlation coefficient between the dependent variable (transparency extent) and each independent variable have a significant explanation. Therefore, it can be concluded that there is a relationship between the financial transparency extent of listed companies and financial leverage and audit firms (Non Big 4 or Big 4). From the foresaid results, discussions are given as follows.

- The correlation between the financial leverage and financial information transparency extent of listed companies showed that many listed companies on the stock market, usually joint-stock companies, and their debts mainly borrowed from banks or credit organizations. When they loan, one of the most important requirements that the credit department of the bank requires is that companies provide financial statements with full information. In addition, these statements must be audited by the big and

prestigious audit firms. Thus, the firms with high debt ratio in the capital structure will receive more supervision of the involved parties than the businesses operating primarily in equity. Creditors will require these businesses provide more information to ensure their interests. According to the agency theory, agency costs will increase in correspondence with the debts in the capital structure of the company. Managers will persuade creditors to loan by disclosing more information to reduce interest expenses. The companies with more debts have an awareness to enhance the information transparency to make creditors feel secure, loan and evaluate them well, so that they can achieve the interest expenses lower than normal. Therefore, companies often try to create a financial information transparency in order to reduce the supervision cost of creditors and limit debt recovery or continue new loans.

- For audit firms factor: Correlation between audit firm factor and transparency extent of financial information shows that large audit firms try to build their reputation and quality as well as improve the usefulness of the financial statements by requiring their customers give more information. The big audit firms have many customers, less economic dependence on a few individual customers, and their customers choose them since their reputation has been established on the market and for investors. Meanwhile, the small ones often has economic dependence on the clients, if they lose any clients, it will be difficult for them, so they often ignored requirements of providing more information. According to the agency theory, choosing a large and prestigious audit firm is a method to reduce the cost of capital - agency cost and to increase supervisory role for behaviors that managers can do to adjust information for their benefits. According to the theory of asymmetric information, financial statements audited by a large and prestigious audit firm are reliable for information seekers due to the imbalance information between inside and outside objects of company. On the stock market, external objects are typically investors that tend to base on accounting information as an important material for economic decisions (such as lending decisions of banks, signing of economic contracts or stock purchasing or investing in new companies). Choosing a large audit firm is a signal or an affirmation about transparency of audit results and reliability of publicized financial information for shareholders.

## **5 CONCLUSIONS AND RECOMMENDATIONS**

### **5.1 Conclusions**

This study was carried out with hard efforts to examine whether the relationship between financial leverage and audit firms actually affect the transparency extent of financial information of Vietnamese listed companies so that the conclusions and policy recommendations given can have more persuasive basis and evidence.

The study results showed that, under the evaluations of investors, transparency extent of financial information of listed companies on Vietnamese stock market only achieved a fair good extent. Upon judgment of investors, there were companies that were highly evaluated in term of transparency by investors, but there was lack of companies' transparency. The gap between companies with the lowest transparency extent and the highest ones was fairly far. This showed that there was uneven transparency extent of listed companies. Among the features that create transparency of financial information, accuracy of the information is the most underrated compared to characteristics of completeness, consistency, reliability, timeliness and convenience.

Correlation of financial leverage, audit firm variables and transparency extent of testing results showed that financial leverage, audit firms affected to transparency extent of financial information. These results proved and confirmed the significance of the agency theory or the theory of asymmetric information in the Vietnamese stock market. The results also confirm the supervision of managers and creditors interacts together and the supervision improvement will make the process of information disclosure better and increase the transparency extent. The audit firms are also a positive factor in increasing the transparency extent of financial information. Therefore, the auditing quality control is an important factor in the process of finding solutions to promote the listed companies' transparency.

## **5.2 Recommendations**

The recommendations were made to suggest a number of policies relating to subjects that have a direct or indirect relationship to enhancement of the financial information transparency of the Vietnamese listed companies.

### ***For listed companies***

*Listed companies should:*

- Enhance responsibility awareness of the listed companies in increasing the transparency extent of financial information, develop a company information system especially management information system, and improve the quality of enterprise accounting system.
- Perfect the system of corporate governance in which the Board must strengthen supervisory activities by using prestigious audit firms to protect the rights of shareholders, limit abuse of right or taking private benefits from managers. The board must also develop a code of conduct and ethics in businesses as well as improve the relationship with shareholders, investors and the public. This is considered as a good method to signal to the market for investors to distinguish good and bad securities.

### ***For The State Securities Committee and Ministry of Finance***

- To complete the rules on information disclosure and contents presented in the financial statements.

The study results also showed that the size and reputation of audit firms affected the transparency extent of financial information. This shows that the auditing quality is highly evaluated by the investors when considering the transparency extent of financial information. Auditing should be paid much attention in order to contribute to enhancing the transparency. Therefore, the Ministry of Finance should:

- Enhance the auditing quality or improve the quality standards of the auditing firms when carrying out the audit of listed companies, and issue the full national audit standards and gradually approach with international auditing standards in order to improve the quality of audits.
- Issue regulations in which audits must commit and ensure the independence of the auditors, as well as strengthen the role of the auditors as the independent verifier of financial statements.
- Improve the professional standards, national accounting and auditing rules in order to ensure providing the appropriate, accurate and timely information on all significant financial matters of the company for the investors.
- Strengthen the sanction measures for violations of information disclosure obligations and the lack of transparency of published information on the stock market, particularly the differences before and after auditing results with great value. Ministry of Finance

or the State Securities Commission Securities should give specific provisions on kinds of penalties for violations of published financial information.

### ***For other stakeholders***

Financial leverage may affect the transparency extent of financial information according to evaluations from the investors. This means the creditor has a significant role in making business provide more information that contributes to increasing the financial information transparency. Results also showed that managers would enhance the transparency extent when they owe more, because it helped them reduce the cost of capital. Therefore, the creditors should strengthen the supervision more tightly with the companies that are their debtors. The strict supervision by the creditors, banks or credit organizations are a pretty good solution to enhance the financial information transparency of the listed companies. In addition, organizations such as banks and other lending institutions, and investors should supplement requirements on corporate governance to their customers.

Audit firm variable shows that investors highly evaluated the role of audit firms in monitoring activities of managers. Audit firms that belong to Big 4 group were highly evaluated by investors although previous scandals can affect investors' trust. However, the survey results also showed that Vietnamese audit firms group was highly rated. The gap of transparency extent of listed companies audited by Big 4 and listed companies audited by Non Big 4 is not highly different (3.82 point compared to 3.69 point). This showed that investors also had a certain confidence on the audit results from audit firms outside the Big 4. Hence, audit firms need to improve the audit quality to enhance public confidence in their audit results.

## **PATIENT SATISFACTION AS PART OF MEASURING PERFORMANCE UNDER THE CONDITIONS OF HEALTH FACILITIES**

*Vanda Lieskovská, Silvia Megyesiová, Mária Grullingová, Diana Horvátová,  
Anton Korauš*

### **Abstract**

The paper deals with the issue of performance measurement in medical establishment with the concentration on the criterion of patient satisfaction. After the presentation of alternatives for measuring performance it justifies the importance of monitoring patient satisfaction. Satisfaction includes among the wealth generating non-financial of performance measurement of health facilities.

It deals with as well with monitoring patient satisfaction in an international comparison. The contribution follows the conclusions of several studies devoted to the problem of patient satisfaction (Kotler 1997, Sardana 2003, Sharma and Chacha 2004, Raftopoulos 2005, Wilson 2007, Kamarasamy 2012, Ramez 2012).

Consequently, it focuses on the patient in the context of reforms of health care of SR and the importance of evaluation of customer satisfaction. It justifies the substantiation of monitoring and evaluation of patient satisfaction. Patient satisfaction is seen as one of the indicators of quality of health care. Patient satisfaction is assessed in terms of health insurance companies, but also in terms of providers of health care. With an example of a selected health facility are presented partial results of the measurement of patient satisfaction. The conclusions of the survey provide to management of a selected health facility arguments for improving managerial activities. The results help to identify the areas of patient dissatisfaction as well. The survey does not serve only to verify the quality and satisfaction of existing health services, but also to detect changes that may positively affect the quality of healthcare services in the future and a better reputation of the medical institution.

### **INTRODUCTION**

In today's highly competitive environment is for any business subject important to be able to responsibly manage its performance. One of the important problems of modern management is therefore a performance management not only of business but also of health facilities. The performance is seen as a comprehensive system of financial and non-financial indicators, among which runs the interactions. While financial indicators provide particular insight into the past, non-financial indicators have the ability to terminate the prospects of a business. In the present paper we will focus on one particular indicator and thus the patient and his

satisfaction. Increasing of patient-perceived added value can only babble a competitive advantage to specific health care facility.

## **1 THEORETICAL BACKGROUND**

Performance measurement systems play a key role in the development of corporate strategy and evaluating the achievement of organizational goals. In today's highly competitive environment is for any business important to be able to responsibly manage its performance. One of the important problems of modern management is therefore a performance management organization. The performance is seen as a comprehensive system of financial and non-financial indicators, among which runs the interactions. Financial indicators accurately reflect past activities and serve a retrospective view of the competitive position of the company. They can fairly accurately predict the short-term development of the company.

Enterprise, respectively any entity operating in the market providing health services is performing from a long term view, when reaching a predetermined performance targets defined in the strategy. Enterprise performance management is the process by which management of the enterprise affects firm performance towards achieving the objectives. Mentioned issues are dealt in their work by authors as Wagner (2009), Vlachynský (1993), Zalai (2007), Varcholová (2007), Neumaierová-Neumaier (2002).

The history of the used indicators and approaches to the evaluation of business performance dates back to early last century. Measurement of business performance was initially oriented to detect profit and its relation to the amount of capital invested. This was reflected by indicators of profitability ROI, ROA, ROE. Later, the performance evaluation expanded to other indicators of market value and the end of the century it was economic value added (EVA). Explanatory power of traditional performance indicators was based on the view of information obtained in the past. These, however, did not provide an objective view on the growth performance of the company in the future. Currently, the best known and most sophisticated performance measurement systems are methods of Six Sigma Tkač, Lyocsa (2010), DEA Cooper, Seiford, Tone (2006). Inaccuracies in measures of financial performance led to innovations in performance measurement. Therefore, when considering the future success of the enterprise started using approaches favoring measurement of business performance in terms of increasing its value.

According to Varcholová (2007), critics of traditional financial measures argued that the success factors in many sectors been more intangible assets in the form of intellectual capital and customer loyalty, than hard assets based on the financial statements.

That is why there has consequently focused attention on the measurement of non-financial indicators such as no tangible assets (intangible assets), intellectual capital to balanced scorecard systems that integrate financial and non-financial measure. The main advantage of the use of non-financial performance indicators compared with financial indicators is closer link to long-term corporate strategies. Proponents of modern concepts of measuring corporate performance affirm that the recovery in the non-financial indicators, there will be some improvement in financial performance.

Among the wealth generating non-financial indicators to measure the performance of health care facilities we can include therefore, patient satisfaction, employee satisfaction, innovation, quality, and so on.

Despite the fact that patient satisfaction is only one of the possible indicators of performance measurement in the present paper we will focus our attention on quality and patient satisfaction, which will be seen in close interconnection.

### 1.1 Health policy of European countries and concentration on patient

Swedish organization Health Consumer Powerhouse has issued since 2005 EHCI ranking that compares different setting of health policy in the European countries. The focus of attention is a consumer of health services. Final evaluation refers to the extent of the orientation on the patient's needs. It is an independent monitoring of health care in 36 countries. On January 27, 2015 was the eighth edition that was published and it was the comparison of key values in health care. Results are presented through the first graph.

Fig. 1: EHCI 2014 total scores  
Source: Health Consumer Powerhouse

The methodology of comparison is adjusted each year, therefore year comparisons do not necessarily reflect objective changes. Despite several shortcomings in the sources of comparable data, however EHCI provides at least a card of health care systems. As is clear from the above, Slovakia was placed in 2014 with the number of points 665 as 21<sup>st</sup>, which is a positive step compared to 2009, where it gained a score of 560 and reached 28<sup>th</sup> rung. The issue of monitoring patient satisfaction also applies in international comparison and offers the opportunity to identify priorities on which the health policy-makers should focus. Despite some reservations about the data and methodology there is used a valuable feedback.

### 1.2 Quality of service and patient satisfaction

Czech Technical Standard EN 15224 of 2013 in paragraph 0.1.4: defines quality as the degree of fulfillment of the requirements of inherent characteristics, which are: corresponding

appropriate care, availability, continuity of care, effectiveness, efficiency, equality, evidence-based work, **care focused on the patient**, including physical, psychological and social integrity, patient engagement, patient safety, timeliness and availability

In any organization is the base of marketing and its principles achieving customer satisfaction. Satisfaction is a feeling of a person. The result is a comparison of performance or results of purchase with the expectations of a particular person. (Kotler, 1997) The concept of customer satisfaction is characterized by (Wilson, 2007) the fact that it can vary over time, may be complex, but also may be a result of a combination of experience before, during and after the time at which it is measured. Reasons for patient satisfaction may be difficult to explain, especially when it comes to services that are not tangible. The reasons for the dissatisfaction of the patient can be expressed more easily than the reasons for its satisfaction

Quality of health care is an important part of maintaining an effective model of health care. Therefore, it is now expected that doctors do not only treat their patients, but also play an important role in the prevention and patient education to a healthy lifestyle. If the objective is to improve the quality of health care it must continuously be conducted the evaluation of patients, how they perceive the different dimensions of the service provided. Experience of patients are a useful basis for improving the quality of health care services (Morrow et al., 2010), and patient satisfaction is an important indicator in evaluating the quality of national health care (and Sajid Baig, 2007).

Identification of factors leading to increasing the patient satisfaction can also help managers in their efforts to improve existing services (Tucker, 2002). Generating patient satisfaction and building a strong health care system is essential for improving the quality of life and prosperity of the whole society. Customer satisfaction is a complex concept, and therefore it is difficult to define. Over the years have been created various definitions (Dimitriades, 2006). The study of Giese and Cote (2000) found that in marketing was generated about 20 definitions of the concept within 30 years (1970 to 2000). More than half a century, scientists in research activities in the health sector have been seeking to define "patient satisfaction". Stewart et al. (1979) in their study found that the satisfaction of the patient has a significant effect on a relationship between patient and physician throughout the treatment process. The current researches are trying to find a new look at the question of how patients perceive the services and try to obtain information on the reasons for patient satisfaction. This information is the basis for developing strategies of companies, which can provide a competitive advantage.

## **2 MATERIALS AND METHODS**

The health sector is among the most problematic and also the most difficult reformable fields of public life. Although there is a considerable discrepancy between the expectations of patients and the volume of available resources, it is necessary to appreciate the efforts to change the system - health care reform.

In the context of national policy from 2005 onwards, the Ministry of Health developed quality indicators for the evaluation of health care provision which are the part of the Government Regulation 752/2005. One of these indicators is the "patient satisfaction", where is ranked the provision of medical care and patient perception of care, which is carried out by questionnaire survey, according to the methodology of health insurance in place to ensure the representativeness of each department. Other entities providing information on patient satisfaction is the Institute for Economic and Social Reforms (INEKO) in collaboration with

Transparency International Slovakia. The project partners were DÔVERA health insurance company, Ltd. and Union Health Insurance Ltd.

When choosing it is possible for a candidate of information to modify according to his won interest some indicators, facility and expertise. In the category of indicators is among other indicators also a category of PATIENT SATISFACTION. There are covered many different attributes to which they have the opportunity to make their own opinion addressed respondents who visited the health facility and therefore have personal experience of being recorded. Ranking the satisfaction is on five grade scale, while the ranking 1 is the satisfaction and dissatisfaction is marked by 5. Below final figure thus expressed more satisfaction, while a higher score means lower satisfaction. The structure of the problem areas that are monitored and evaluated by patients in the category of patient satisfaction is following.

**Patient satisfaction**

Overall patient satisfaction  
The behavior of physicians of the department  
Information about your disease and examinations by the attending physician  
The behavior of nurses in the department  
Care of physicians in the department  
Care of nurses in the department  
Quality of accommodation in the department  
Quality of meals in the department  
Quality of cleaning in the department  
Provision of health care  
Information from the attending physician on the next steps during the home treatment  
Information from nurses on the next steps during the home treatment  
Improving the health status after hospital discharge

Fig. 2 – Attributes category patient satisfaction by INEKO

As in the case of INEKO, even if the case of selected health facilities was used a similar methodology for measuring patient satisfaction. Between the months of October, November 2014 was conducted research on patient satisfaction survey. The questionnaire survey of the content and wording of the questions followed the recommendations scoping criteria in terms of methodology of INEKO.

There were 365 respondents taking part in the survey. For the purpose of statistical treatment were appropriate 290. From specialized clinics were evaluated 237 questionnaires and 53 respondents rated patient satisfaction in the context of hospital beds. The condition was hospitalization for more than 4 days. Ranking the patient satisfaction were on the five grade scale, the grade 1 meant satisfaction and dissatisfaction was marked by 5. Below final figure thus expressed more satisfaction, while a higher score means lower satisfaction. For the management of selected health facilities was important to determine whether:

1. there are some statistically significant differences in the evaluation of patient satisfaction of individual clinics in terms of age and sex of the respondents?
2. there are significant differences in ratings of attributes of patient satisfaction?

Subsequently were formulated the hypothesis

H1: There is statistically significant difference in the satisfaction based on gender

H 2: There is a statistically significant difference in the satisfaction based on age

Tests were carried out by means of SPSS software. When processing the data, we used nonparametric tests, since we assume a normal distribution of test variables will not be met. When assessing patient satisfaction in terms of gender, we used the Mann Whitney test.

Respondents who evaluated patient satisfaction with selected hospital were divided by age into three groups. The first age group represented patients aged 18-40 years, the second group were patients from 41-62 years and the third group comprised patients older than 63 years.

Within the hospital were studied 22 clinics and 6-bed compartments. During the evaluation we have worked with selected outpatient clinics and departments that have approximately the same frequency of questionnaire responses, suitable for processing. If we were working with variables that have more than two variations, we used nonparametric ANOVA and Kruskal-Wallis test for significance level 0, 05.

### 3 RESULTS

For the management of selected health facilities was important to determine whether:

- there are some statistically significant differences in the evaluation of patient satisfaction of individual clinics in terms of age and sex of the respondents?
- there are significant differences in ratings of attributes of patient satisfaction?

Gradually, we verified the hypothesis

H1: There is statistically significant difference in the satisfaction based on gender

Tab. 1 - Results of patient satisfaction of inpatient care by gender

	<b>Men</b>	<b>Women</b>	<b>p-value Mann_Whitney Test</b>
regimen	1,48	1,56	0,953
doctor approach	1,18	1,19	0,684
communication with nurse	1,45	1,48	0,733
treatment	1,19	1,29	0,541
care	1,32	1,26	0,392
hygiene	1,55	1,39	0,222
room equipment	1,82	1,68	0,485
Food	1,82	2,11	0,331
Orientation	1,91	1,84	0,663

*Source:* created by authors

As is clear from the above, in no case was confirmed a statistically significant difference in responses regarding patient satisfaction of inpatient care hospital facilities selected by sex.

In the case we monitored patient satisfaction on various surgeries by sex, we found that statistically significant differences in responses by gender arised in two cases. It is a time of waiting for the results of examinations and evaluation of satisfaction with office hours. Men achieve higher score in evaluation what means that they are less patient than women. Even with surgery hours in clinics men are less satisfied than women. The results are presented in Table 2.

Tab.2 - Output Surgeries Gender

H 2: There is a statistically significant difference in the satisfaction based on age

We found using the analysis that the most satisfied with inpatient care are the oldest patients in the age group over 63 years. With the declining age has risen dissatisfaction of patients. Most were dissatisfied patients in the youngest group of respondents aged 18-40 years. Statistically significant differences emerged when assessing satisfaction with time spent in waiting rooms, differences were also in satisfaction with waiting time for test results and in satisfaction with office hours. Younger patients had reservations to communicate with a doctor and a willingness to explain the necessary information relating to health. Interesting was also to find that younger patients had major problems with orientation than older patients. The results are presented in Table 3 and 4.

Tab.3 - Statistically significant differences in the evaluation of patient satisfaction based on age

food	1.60	2.00	2.4	0,548
orientation	2.43	1.83	1.75	0,052

Source: created by autors

Nevertheless, the hospital management found that in the age group 18-40 years was manifested the greatest dissatisfaction about awareness of ongoing treatment. In the age groups of elderly patients the satisfaction was higher.

The data obtained provide a far wider range of patient satisfaction ratings. We may compare the different parameters, depending on several factors. Whether for hospital care, or bed departments comparing attributes of satisfaction of various departments, as well as surgeries. We may follow in the case of questionnaire extension the patient loyalty as well. The ideal is to identify patient satisfaction at regular intervals. The information obtained can significantly facilitate to management to reassess besides patient view to improve internal processes as well as to increase employee activities, what ultimately also results in meeting the financial goals of the organization.

#### **4 DISCUSSION**

Quality of health care is closely connected with satisfaction. Quality generally involves two basic dimensions, which is the "voice of customer" and "voice of the process". It concerns about therefore subjective gathering of feedback from users and objective quality measurement using appropriate indicators. A holistic approach to the patient, based on satisfying all its needs, significantly influences their satisfaction. Among other things it eliminates stress in hospital and has a positive impact on the survival of the patient's pain.

Monitoring patient satisfaction has in the quality management system its utmost importance:

- serves for the evaluation of the quality of work of individual departments
- Provides information on the quality and equipment of departments
- Provides a basis for organizational changes
- Monitors the effectiveness and impact of the changes made to the quality of care in terms of patients
- It provides a basis for comparison of subjective quality of care in different hospitals.

The importance of measuring patient satisfaction are realized by not only health insurance, but also all hospitals. Modification of the questionnaire survey in the spirit of the vision should focus on the principles of:

- The concentration on the relationship doctor and patient
- Individualized approach to care and awareness throughout the whole time
- Care based on knowledge
- Participation of patients in decisions about their own care
- The minimum time for inclusion in the diagnostic and treatment process
- Communication, information, coordination at all levels
- Sufficient financial performance
- Inclusion of means of measuring processes, satisfaction, financing and results results
- Continuous improvement and reduction of losses in all processes and services
- The modeling work and cooperation in the relevant area.

As is clear from the above, patient satisfaction is devoted to solve to several subjects. Whether it is health insurance, independent institution, directly or healthcare providers. Nevertheless, a consistent methodology is not present, a comprehensive approach and sometimes a representativeness of research samples. However, it should be accepted the efforts of obtaining feedback from the patients and the wider public. Customer satisfaction is very closely intertwined with the quality of health services provided. As a result of findings

could be more intensive detecting of changes that may be reflected in a better quality and increase of customer value added.

## CONCLUSION

Determination of patient satisfaction is very closely associated with several activities. Whether it's ability to correctly name the research problem, interpret research objectives, formulate research questions, process appropriate project design, to ensure the credibility of the research to the ability to correctly interpret findings to management. It is necessary, however, to perceive the same restrictions of patient satisfaction research. It is useless to measure patient satisfaction if their expectations are unreal and can not be met. In case we find that the expectations of patients are unreal, it is just the research that should uncover such facts. The health care provider should with the help of appropriate communications inform and familiarize patients with the restrictions in service. Patients' expectations before making health services constitute one of the most important elements of patient satisfaction. The expectation, however, is very difficult to manage. That is more important to conduct research in the right direction for help of activities before research. Research should unify three complementary types namely: quantitative, qualitative and mixed research. The sample should be collected from the potential, not only current patients of health care facility. Ultimately consistently it should be directed to the creation of such methodologies and systems of indicators that would allow international comparisons of performance of hospitals in which would be included the measurement of patient satisfaction too.

# **THE EFFECTS OF CORRUPTION ON FIRM PERFORMANCE: EVIDENCE FROM VIETNAMESE FIRMS**

*Ly Thi Minh Pham, Hang Thi My Hoang, Trang Thu Be, Phuong Thi Thuy  
Le, Mai Hoang Nguyen*

## **Abstract**

This paper investigates the effects of corruption on firm performance in Vietnam. Using the panel data of Vietnamese Small and Medium Enterprises (SMEs) conducted in 2005, 2007, 2009 and 2011, we find that corruption has positive effect on firm revenue and labor productivity. Employing the network, owners' previous working experience, innovation process and investment experience as explanation variables, we show that this result holds under several regression specifications. We further document that location is also the most important factor affecting the relation between corruption and firm performance: firms in big cities tend to pay more bribes and generate more revenue. Meanwhile, firm size has an insignificant impact on the probability of corruption. We provide several explanations for these findings and also have some investigations the Vietnam's institutional environments.

## **1 INTRODUCTION**

Corruption recently has become one of the most severe problems in both democratic and emerging economies, which is defined as a result of market failures (Friedman et al. 2000; Acemoglu and Verdier, 2000). In general, corruption is defined as illegal transactions or misuse of public resources/services for private benefit (Gaviria 2002, Gbernkorn 2012, p3). Corruption is also described as an amount of money pay for bureaucrats in order to get better access to government services or smooth operations of regulations which resulted in change in firm performance (Athanasouli, Antoine & Skilias, 2012). Besides, corruption can be defined as the cost of purchasing government contracts or simply the involuntary tax paid by the firms to government officials for purchasing different contracts. According to Rand and Tarp (cited in Tam 2014), corruption can be defined as bribery or unofficial payments. This concept was also first defined by Solo (1989) and supported by (Friedman et al. 2000) and Johnson et al (2000). Based on the basis literature and availability of the data, the concept of corruption is defined as bribery or unofficial payment.

Assessing the impact of corruption and firm performance has been one of the central debates in the economic, politic and academic agenda, and the effect of corruption on firm performance differentiate on long-term basis and short-term basis, as well as vary from countries to countries. Generally, most studies show that corruption is considered as an important factor to slow down economic growth, distorting investment, impeding the efficiency of public services and inequality around the world (Bolgarian, 2011; Wang and You, 2012; Keefer and Knack, 1997; Ades and Di Tella, 1999; Méon and Sekkat, 2005; Shleifer and Vishny, 1993). Corruption has been identified as a critical issue for the growth of many economies: Greek, Cameroon, Turkey and a major impediment for the implementation

of necessary structural reforms (Ayaydin & Hayaloglu, 2014; Gbetnkoum 2012; Athanasouli, Goujard & Sklias 2012).

There have been many researches and experiments that investigate this relationship at country level (Ades and Di Tella, 1999; Méndez and Sepúlveda, 2006; Ahlin and Pang, 2008), but there is a lack of empirical research focusing on examining the relationship between corruption and firm performance at the micro level, where the role of SMEs can be considered as both sufferer and driver of corruption. Especially, in developing countries, bribery or unofficial payment becomes the most common problems, which account for 20% of their revenue (Djankov et al. 2002). In Vietnam, the country has experienced a high level of corruption (i.e., ranking 119 out of 175 globally in the Corruption Perception Index 2014) has defined corruption is the continuing serious problem for the economic development of the country (Corruption Perception Index 2014). According to USAID and VCCI (2010), more than a half of Vietnamese firms in the survey on Vietnam Provincial Competitiveness Report, confirmed that unofficial payment is deemed popular for carrying out business smoothly in Vietnam.

To the best of our knowledge, there is a lack of available data and experimental researches focus on investigating the relationship between corruption and firm performance and a shortage of capacity to deal with the endogeneity of corruption measurement, which requires further specific quantitative researches to quantify. By using data achieved from a collaboration study conducted by the Center Institute for Economic Management (CIEM), Institute of Labor Science and Social Affairs and University of Copenhagen with 2600s firms in 10 different cities and provinces in Vietnam, this paper attempts to provide an empirical analysis of the comprehensive relationship between corruption and firm performance based on micro-level data of SMEs across cities and provinces in Vietnam in the period from 2005 to 2011. The paper builds on this existing literature and contributes two main empirical analyses which doesn't discuss in previous studies. First, it examines the association between corruption and SMEs performance in Vietnam and identifies the most affected factors among firms' characteristics: innovation, investment, firm size, and location. Second, the detailed analysis of the multifaceted impact of corruption on the firm level and the contextual effect of corruption at the sector level allows new policy conclusions to be drawn.

The rest of the paper is organized as follows. Part II presents an overview of the literature on the relationship between corruption and firm performance. Followed is Part III which describes data and Part IV presents methodology. Part V presents the empirical results and discussion of the effects of corruption on firm performance. Section V presents main conclusions and policy implications.

## **2 LITERATURE REVIEW**

Firms' performance has been a central topic of firms' profit maximization (Ayaydin & Hayaloglu 2014), which can refer to increase in sales, revenue, employment growth, labor productivity, investment and innovation. Shleifer et al. (1993) also defined firm performance based on four main indicators: labor productivity, technical efficiency (TE), import-export, and profit. According to a recent study from the data of European Countries developed by Kachanova (2012), firms performance is mainly measured by the increase in sale revenue and labour productivity. Moreover, their business performances usually much depend on market shares, contracts which they can win from their competitors or get cheaper inputs by approaching public servants or bureaucratic. Thus, these firms can increase their sale revenue, have a better access to inputs or loans which can leverage their performance.

The relationship between corruption and firm performance and their measurements might

vary due to the collected data available and different theories and practices. Theoretically, the literature has identified the effects of corruptions on firm performance into two main consequences. The first consequence of the effects is that corruption shows positive impacts on firm performance. It has been supported that corruption could increase economic development because bribery is considered as 'commercial wheels' to overcome bureaucratic delays and increase incentive for government authorities to work (Ayaydin & Hayaloglu 2014). Additionally, Rock and Bonnett (2004) revealed that bribery and unofficial payment contribute to economic development and firm growth in East Asian countries. At the macro level, some studies have indicated that bribery can be a rapidity of the 'commerce's wheels' or 'a lubricant' in some special cases which results in promoting the development of firms in aspects of creating the favorable conditions for SMEs overcome bureaucratic fences and timely delayed processes (Wei, 1998 cited in Athanasouli, Goujard & Sklias 2012). This argument is also supported by the research conducted by Dabla-Norris, Gradstein, and Inchauste (2008) with the evidence of 41 countries. At the micro level, a study across China's firms revealed that firms with external resources have better performance than the internal ones in dealing with administrative procedures, which directly influences to firm performance (Hallward-Driemeier et al. 2004). Wang and You (2012) stated that corruption could contribute to firms' growth. In a research for the case of enterprises in China, Jiang and Nie (2014) concluded that there is a positive impact of corruption on performance of private firms, but this impact is not statistically significant for the case of state-owned enterprises. Therefore, at both macro and micro level, corruption appears positive effects on the performance of firms (Dreher and Schneider 2010). These effects tended to be accelerated in the shadow economies with shortage of legal regulations and instruments (Misati 2010). It can be said that from above studies, corruption is cost effectiveness of firm performance and economic growth.

The second consequence is that corruption has negative impacts on firm performance. In the existing literature, several empirical studies on the relationship between corruption and economic growth reveal significant negative. These results indicate that corruption tends to discourage innovative activities and damper firm performance, which are consistent with other findings that the lower perceptions of corruption may lead to higher increase in economic development (La Porta et al., 1999; Ales and Di Tella, 1999; Treisman, 2003). These empirical researches indicate that corruption as a severe impediment on growth which lower level of investment and higher government negotiation cost to secure contracts or licenses, especially in the countries having high level of FDI inflows (Pradhan, 2000). Kochanova (2012) shows that bureaucratic corruption negatively affects both the sales and labor productivity growth of firms. The World Bank (2003) shows that corruption is considered as one of the most obstacles of firm growth and social development in terms of reducing in sale revenue and technical efficiency. Recently, many researches have found that bribery has distorted business environment and damaged firm performance as the results of a lack of transparent regulation and a weak legal system. This argument is also supported in several studies of Latin American countries (Dal Bo & Rossi, 2007; Laeven & Woodruff 2007). However, in many researchers by North (1990), Shleifer and Vishney (1993), Romer (1994), corruption is proved to be an obstacle to economic growth. Fisman and Svensson (2007) stated that bribery is considered as taxes on firms, and the conclusion is that higher bribery results in reduction in firm growth. In a research using a sample of 46 countries, Mo (2001) concluded that higher level of corruption may result in lower economic growth. Mauro (1995) also concluded that corruption inhibits economic growth in long run due to the distortion of resource allocation. Méndez and Sepúlveda (2006) investigated the impact of corruption in long run economic growth. They concluded that corruption at low level increases growth rate; however, that of high level is detrimental to economic growth. The

negative effects of corruption on firm performance again examined in across sectional study in Greece (Athanasouli et al., 2012). The study reveals that performance of the firms including investment and innovation mostly depended on government public services, taxes and quotas (Beck et al., 2003; Athanasouli et al., 2012). Most interviewees in the survey confirmed that their business activities are connected with government lobbies and bribes and small firms seem to suffer more from corruption than other medium ones. However, the relationship between corruption and firm growth may vary across industries and countries, which is needed to be defined by further experiments. In short, in some countries and regions, corruption might impede economic growth by discouraging investment, innovation, wasting resources, distorting the tax collection and hampering the implementation of regulation and legal transparency.

The existing literature about the effects of corruption on firm performance showed that there are inconsistent results across countries and regions. The question of whether there exists a critical value that the effects of corruption turn out from positive into negative relationship and vice versa has initiated a lot of debate. While some studies indicated that corruption tends to hurt economy and distort the firm performance, others showed that corruption acts 'commercial wheels' to push up firm performance. Some researchers investigated that corruption fosters firm performance at low levels of economic development and becomes disadvantageous to firm performance at the higher level of economies (Méndez and Sepúlveda, 2006; Neeman et al., 2008; Méon & Weill, 2010). Meanwhile, some research stated that corruption has no impact on firms' performance. In a research by World Bank (2003), corruption has negative impact on firms sales but this impact is statistically insignificant. In the research of firms in Latin America and Caribbean, Murat Şeker & Yang (2014) found that bribery has significant negative impact on firms growth. However, a research at firm level by Asiedu and Freeman (2009) found that there is no evidence for the impact of corruption on investment growth rate.

In Vietnam, several studies investigating on the impacts of corruption and firms performance presented contradict results. Rand and Tarp (2010) used panel data from 1,661 Vietnam SMEs and concluded that bribe and informal payments have damaged firm performance. In other research, Nguyen and Dijk (2012) also investigated the relation between corruption and firm growth for private firms and state-owned enterprises (SOEs) in Vietnam and demonstrated that corruption negatively hampers the growth of private sector, but corruption does not impede the state sector performance (Nguyen and Dijk, 2012). Other survey conducted by Vietnam General Statistics Office and the Chamber of Commerce and Industry of Vietnam from 2009 to 2011 indicated that each company in the sample average pays from 460 to 600 million VND unofficially, but they still earned an average of 512-646 million VND for pre-tax profits each year (The Saigontimes 2014). It means that the benefits from corruption are positive. The most recent study, Nguyen et al. (2014) investigate the relationship between corruption and firm performance in term of formalization and reveal the urban firms is more likely to involve in corruption than those located in the rural ones and informal firms tend to pay bribes more than formal one.

### **3 DESCRIPTIVE STATISTICS**

#### **3.1 Sampling**

The data is achieved from four SME surveys conducted in 2005, 2007, 2009, and 2011. These surveys cover more than 4000 manufacturing enterprises in 10 provinces (Ho Chi Minh City, Ha Noi and Hai Phong, Long An, Ha Tay, Quang Nam, Phu Tho, Nghe An, Khanh Hoa and Lam Dong). For purpose of the study, the authors divided study areas into two main groups:

big city group (HCMC, Hanoi and Hai Phong) and rural city group (Long An, Ha Tay, Quang Nam, Phu Tho, Nghe An, Khanh Hoa and Lam Dong). The purpose of this study is to examine the effect of corruption on firm performance under the variance of location and firm size and firm age. Using panel data, the sampling was adjusted over time to accommodate the rapidly changing business environment in Vietnam, other aspects, including the questionnaires, were maintained virtually identical. After data cleaning and checking consistency of time-invariant variables between the four surveys, we achieved a strong balanced panel of 2006 observations in each year.

### 3.2 Descriptive data

Table 1 summarizes descriptive statistics for the key variables. The number of observation is 663 which achieved from a strong balance panel data of 2600 firms in the survey. Three dummy variables include Innovation, Investment and Location which their mean values are 0.291, 0.707 and 0.449, respectively. In which, Innovation received maximum value at 1 if the firms introduce new product and new technology, otherwise at 0. Similarity, if Investment equals to 1, which means firms, invest new capital and vice verse. During study period, on average, firms introduced 2 times innovation and 7 investment. For location, if firms located in Hanoi, Ho Chi Minh city and Hai Phong city, Location equals to 1 and vice verse. Corruption variable is a value from 1 to 4, which mean the frequency of firms bribe is range from 1 to 4 times in the study period with a mean value is 2.011, indicates that the average of firm paying bribe in this study is 2 times. As can be seen from the table, the maximum value of SMEs size is 300 employees. Additionally, the total revenue growth ranges from 1.825 to 12.060 (billion Vietnam Dong).

Tab. 1 - Descriptive statistics. Source: Calculation from data

<b>Variable</b>	<b>Obs</b>	<b>Mean</b>	<b>Std. Dev.</b>	<b>Min</b>	<b>Max</b>
Corruption	663	2.011	0753	1	4
Innovation	663	0.291	0.455	0.00	1.00
Investment	663	0.707	0.455	0.00	1.00
Location	663	0.449	0.497	0.00	1.00
Firm_Size	663	20.137	31.176	0.00	300
Indt_thuc	663	6.207	1.491	1.825	12.060

Table 2 compares the mean of corruption affecting on firms' performance between rural areas and urban areas. The results show that firms in rural areas those who have lower level of corruption also have the lower growth rate of real sale. Meanwhile, enterprises in city have more corruption behaviors that will have higher growth rate of real sale.

Tab.2 – Comparison of enterprises in rural areas and city. Source: Calculation from data

<b>Location</b>	<b>Real Sale</b>	<b>Corruption</b>
Rural areas	5.874	0.898
City	6.614	0.916

Table 3 reports the correlation coefficients between variables. The relationship between

Revenue Growth and Firm Size is highly positive correlated (0.7580) while the measures of location and investment is a significant negatively correlated (-0.720). All remaining variables have positive correlation with corruption, but their relationships are insignificant.

Tab. 3 - Correlation among variables. Source: Calculation from data

	<b>LnRe</b>	<b>Corruption</b>	<b>Investment</b>	<b>Innovation</b>	<b>FirmSize</b>	<b>Location</b>
LnRe	1.000					
Corruption	0.2233	1.000				
Investment	0.2221	0.0399	1.000			
Innovation	0.2637	0.0927	0.0837	1.000		
Firm_Size	0.7580	0.2132	0.2270	0.2967	1.000	
Location	0.2430	0.0219	-0.720	0.1218	0.2145	1.000

From the figure 1, it shows that access to public services is the main reason for SMEs in Vietnam doing corruption. Following is to deal with tax and tax collectors and other purposes. Other reasons with nearly the same percentages are to get licenses and permits, to gain government contracts and to deal with customs. The percentages around these reasons do not significantly change from 2005 to 2011.

Fig. 1 - What is the Bribe payment used for?. Source: Calculation from research data

For the frequency of corruption, on average more than a half of corrupt firms involving from 2 to 5 times of unofficial payments for one year. The next significance is only once for corruption. Only 5.43% corrupt firms have pay more than 10 times.

Tab. 4 - Frequency of corruption. Source: Calculation from data

Frequency	Percentage
Only once	22.32%
2-5 times	59.73%
6-10 times	12.52%
More than 10 times	5.43%

For the probability of corruption varies depend on the size of firm. The micro enterprises tend to be more likely to have unofficial payment and bribes. Next, small enterprises are less likely to corrupt. Meanwhile, the least significant probability of corruption is medium enterprises. This indicates that the probability of corruption is not conditional on firm size, or firm scale does not much influence on probability of corruption.

Tab. 5 - Probability of corruption by firm size. Source: Calculation from data

Firm size	Probability of corruption
Micro enterprises	55,8%
Small enterprises	43.9%
Medium enterprises	0.3%

#### 4 THE HYPOTHESIS AND MODEL SPECIFICATION

Vietnam is a developing country faced severe problems of the lack of legal instruments and weak regulation compliance. As a result, there is a higher share of bribe payments amongst firms. These things probably come from Vietnam's business cultural, "corruption" as an instrument to smooth business' activities, otherwise, firms will face difficulties in getting contracts and business growth in the short term. Payment of bribes is considered as a part of firms' operative costs. However, in the long-run, corruption will hamper firms growth and it should be eliminated to ensure the level playing field of business in the economy. Regarding to our reliable data on bribers involvement of Vietnam SMEs We, therefore, argue that firms will be more likely to be higher growth if they have previously been engaged in corruption in an attempt to smooth their activities in short-run. The main research questions are:

- (1) Does payment of bribes in the previous period will be positively associated with firms performance in the current period?
- (2) What factor has the most influence on firm bribes?

To examine this research question, we test 2 hypotheses.

*H1: Corruption foster firms performances in the short-run.*

*H2: The firms located in big cities have to be engaged more in bribery.*

To test the hypotheses, the model will be explored below:

*Model: The effects of corruption on Revenue Growth (LnRe)/ Labor Productivity (LnLP)*

$$\text{FIRM PERFORMANCE (LnRe, LnLP)} = \beta_0 + \beta_1 * \text{CORRUPTION} + \beta_2 * \text{INNOVATION} + \beta_3 * \text{INVESTMENT} + \beta_4 * \text{LOCATION} + \beta_5 * \text{FIRMSIZE} + \beta_6 * \text{FIRMAGE} + \mu$$

*Model* is estimated by using OLS regression to test the effects of corruption on firm performance. In this model, firm performance includes increase in sale revenue (LnRe) and labour productivity (LnLP) as the dependent variables. Independent variables include Corruption, Innovation and Investment, other Control variables are Firm size and Location. Dependent variables are constructed by dividing revenue by GDP deflator coefficient for each year, then take the natural logarithms of real sale (LnRe) and the natural logarithms of real sale growth divided by number of workers (LnLP). This measurement is also applied by Kochanova's paper (2012) in investigating the impact of bribery on firm performance in the Central and Eastern European countries.

To measure the effect of corruption at the firm level, there are several methods. Svesson (2001) investigate the impact of corruption indirectly by collecting cost data of the provision of public services. Another way is more directly by estimating graft for firms with the same line of business (Svesson 2002). In another research, corruption at firm level is to measure by answering the question "On the average, what percent of revenues do firms like yours typically pay per annum in unofficial payments to public officials?". Corruption here is also defined as a binary variable which equals to 1 if a firm spent at least 2% of its revenue to government officials and 0 otherwise (Asiedu and Freeman 2009).

Similarly, with respect to our research, in the context of Vietnam SMEs survey we ask enterprises about whether they have to pay unofficial payment or not and if yes, how often they have to pay. The questions are asked for all enterprises. Along with this, we also have information on economic and labour status. Thus, we can estimate the influences of corruption on firms' performances.

Tab. 6 - Variable definitions. Source: Summary from data

<b>Variables</b>	<b>Definition</b>
LnRE	Natural logarithms of real sale growth
LnLP	Natural logarithms of real sale growth divided by number of workers
CORRUPTION	Frequency of involving bribes in the previous year. CORRUPTION=1 if enterprises had to pay just only once. =2 if they involved in bribes from 2-5 times, =3 if the times of unofficial payments from 6-10 times, and CORRUPTION=4 if they had to p
OWNER EXPERIENCE (IV)	Indicates the previous main work status of owners, if they had ever worked for State owner enterprises, OWNER EXPERIENCE=1, otherwise OWNER EXPERIENCE=0.
NETWORK (IV)	Dummy variable. Network indicates the participation of enterprises in business association. If yes, NETWORK (IV)=1, otherwise NETWORK (IV)=0.
INNOVATION	Dummy variable. Innovation is measured by the probability of introducing new product, new technology or improving current products. If yes, INNOVATION=1, otherwise INNOVATION=0.
LOCATION	Dummy variable. The location of firms. If firms locate in Hanoi, Hochiminh city and Haiphong, LOCATION=1, otherwise LOCATION=0.
FIRM SIZE	Number of firm's employment

INVESTMENT                      Dummy variable. The investment stats of firms since last survey.  
If yes, INVESTMENT=1, otherwise INVESTMENT=0.

## 5 EMPIRICAL RESULTS

The overall findings present a positive relationship between bribe payment and firms' performance including Revenue Growth and Labour Productivity.

### 5.1 The effects of corruption on firm performance

#### *The effects of corruption on Revenue Growth (LnRe)*

To quantify this relationship between corruption on firm performance in correlation with other firms' characteristics and firm performance indicators, an empirical model of OLS regressions is used to test for the relationship of the dependent variables LnRe (Revenue Growth). The testing results are reported in Table 7. Column 2 of the table reports the testing results of the model in the nested case, which includes Corruption, Innovation, and Investment as explanatory variables and Firm size, Location as control variables. From Column 3 to Column 6 of each table report the results of the model with the change in the explanatory variables and control variables, the details are presented in Table 7 below.

Notes: \*\*\*, \*\* and \* significant at 1%, 5% and 10% level, respectively; Standard error in parentheses;

From Table 7, revenue growth is seen to be significant positively associated with bribe payment, which can be also explained by other explanatory variables such as innovation, investment, firm size, and location of the firms. The results indicate that corruption has a significant positive impact on firm performance in the sense of the revenue growth in the six models tested above respectively (.2318; .3317; .3923; .2553; .3926; .2481, significant at 1%). It implies that firm involved in corruption will have higher revenue growth than firms do not

involve. Additionally, the effect was likely to be different due to firm characteristic such as firm size, location and the type of firms which indicates that in some cases, corruption can be a motivation to promote firm performance. These issues can be explained that firms involved in paying bribe or unofficial payment can gain benefits from better access to government services or inputs of their production and earn more contracts from government and partners which resulted in revenue growth. In the study on Chinese firms, Wang and You (2012) also provide firm-level evidences of the relation between corruption and firm growth under the financial development. The results show that corruption is likely to contribute to firms' growth if financial markets are underdeveloped. Obviously that, under certain circumstances, corruption in developing countries will have positive impact on firm performances.

However, when we use other explanatory variables as Investment, Innovation, Location, the level of corruption seems to be less and less significant. It implies that Innovation and Investment can help firms improve revenue growth and directly reduce the level of firm bribes, simultaneously. The level of corruption appears in the lowest of the nested case where including only 3 explanatory variables (Corruption, Innovation, Investment) and 2 control variables (Firm size, Location). The highest value of corruption (Column 5) appears in the test of the relationship between the Revenue Growth and Corruption, Location only. This underlines the fact that although corruption has a significant effect on firm performance if firms located in big cities, regardless of no introduction of investment or innovation. In Column 1, with the introduction of the innovation process and investment, the coefficient of bribe payment turns out to be slightly less significant (reduces from .2553 to .2318, at 1% significant). It may infer the fact that, along with corruption, the process of innovation and investment activities also enhances the firm performance. The frequency of corruption on real sale will be reduced because corruption is not only the factor affecting firm performance.

Interestingly, firm location shows the highest positive impact at the value around 1 in both nested and un-nested cases which are .0526 (model 1), 1.0775 (model (4), 1.1898 (model 5). This underlines that location has a significant effect on firm performance, which indicates that firms in three big cities (Hanoi, HCMC and Hai Phong) seem to perform better with the higher level of corruption. The result can be interpreted that location is one of the most significant factor influencing on the firm performance. Firms in big city such as Hanoi, HCMC and Hai Phong tend to pay more bribes to get better access to government services or inputs to generate higher real revenue. Another reason is that, government system in big city has more power to require firms to pay unofficial or extra payment to get services. Otherwise, in big cities, probably, a lot of companies are established every year, which leads to crowd in accessing to public services. Therefore, firms want to get services quickly and they are willing to pay unofficial payments. Yankovskyy (2003) has the same conclusion that firms located in the Capital, Center have engaged more in the probability of corruption. This is because that firms in the centre are force to queue in order to access to public services.

Besides, firm size presents a less effect on firm performance. This can be explain that in the short period from 2005 to 2011, the firm size had not changed much and they report a little effect in these models. Interestingly, the firms, which are not, applied innovation process and investment in urban areas reveals higher level of corruption than the applied ones, but lower level of corruption than firms who are not applied in rural areas. In this case, bribery to the officials has a positive effect on the firm's exporting performance, which is also supported by the concepts of corruption as 'grease the wheels' as well as 'sand the wheels' mentioned in the literature review.

### ***The effects of corruption on Labour Productivity (LnLP)***

In this part, we test the effects of corruption on the firm in the aspect of labor productivity.

The result is presented in Table 8. From the table, we can see that the labour productivity of the firms is indirectly affected by corruption. Overall, the result reveals that the effects of corruption on firms labour productivity and their effects reveal less significance than their effects on the revenue growth in the previous part.

Tab. 8 - The relationship between corruption and firms' labor productivity. Source: Authors' calculation

Observations	663	663	3440	663	663	636

Notes: \*\*\*, \*\* and \* Significant at 1%, 5% and 10% level, respectively; Standard error in parentheses;

Corruption, a proxy variable presents for the frequency of firms paying bribes is also a positive determinant on the performance of firms. This underlines that the firms have more motivations involving in government lobby or unofficial payment to get better access to government services and training which can enhance their employees' productivity, then increase the firms performance. This result is also consistent with the previous part. Three explanatory variables (Corruption, Investment, Innovation) are positive coefficients and two control variables: Firm size and Location report a positive relation. Interestingly, in both cases, firms' location remains the most significant influent factor with the highest coefficients moving around 0.45, at 1% significant. This can be explained that firms in three big cities like HN, HCMC and Hai Phong are higher involving in paying bribery and unofficial payments in order to access better trainings from government or attract more talented or qualified employees which directly influenced to labor productivity of firms.

Since Corruption, Innovation, Investment and Location are inter-related with the positive sign for labor productivity and report a higher level of corruption, the positive relationship may imply that policy obstacles are found in the big cities where have better available government services and resources for the firms. It also indicates that approach bureaucracy often get better access to government support program and production inputs, which in turn enhances their productivity. Our results of the model 1 and 3 also indicate that bribery and unofficial payment, investment and innovation have positive spillover effects on the labor productivity of the firms, which is indeed an empirical result. In this case, the intercept coefficient is quite high and also consistent with the previous findings. Besides, firm size shows very little effect,

which implies that in the short period (from 2005 - 2010), these firms might not have enough time and capacity to increase their firm sizes. These results somewhat corroborate with the findings of McArthur and Teal (2002) for the African firms. In this case, bribery to the officials has a positive effect on the firm's exporting performance, which is also supported by the concepts of corruption as 'grease the wheels' as well as 'sand the wheels' mentioned in the literature review. It also corroborates the finding of Chavis (2006) with suggestion the paying of bribes does not seem to vary with firm size.

In the context of Vietnam economy, the business environment in Vietnam is not really creating favorable conditions for enterprises to perform business activities. In addition, complex procedures, cumbersome apparatus, lack of coordination, and civil servants are not associated with specific individual responsibility, which are also considered as reasons for corruption of firms increase. It is very popular in Vietnam, firms involving in bribery could be more easy to access to certain inputs, training or process administrative procedure timely, which help firms reduce cost of production, cost of transactions, then indirectly impact on firms' revenue growth. Especially, in Vietnam, for some export-import firms, the requirements of several clearances and licensing from the government bodies cause the increase in corruption to secure their business; therefore positive effects of corruption are likely to be obvious, as bribe-paying firms can obtain licenses and clearance relatively more easily. These issues are also relevant with the finding of Misati (2000), which also confirmed that the shortage of legal regulations and instruments tended to be accelerated in the shadow economies. On the other hand, due to the introduction of the innovation process and investment activities, the level of corruption might reduce slightly which leads to an interesting question of how much cost and benefit of corruption on firm and society in the certain period. Thus, we can conclude that for the country with the high level of corruption, bribery and unofficial payment might provide incentives for firm in doing their business in terms of increase in their revenue. However, another aspect of corruption may reveal inefficiency, which are not covered in this study.

From above analysis, it can be concluded that there is a significant positive effect of corruption on firm performance in the study period from 2005 to 2011. In the short term, corruption might enhance the accessibility to inputs resource fully, increase market share or win big contracts, which directly increase in the revenue growth. It can be seen that, the results of our study are consistent with the research of Hanoteau and Vial (2012) on Indonesian manufacturing industry. This also assesses the impact of corruption at plant-level on output and productivity growth. In the view of an Asian paradox, the finding is that corruption in the form of bribes and indirect tax payments, has a positive and statistically significant effect on firms' performances.

Corruption is still ambiguous and difficult to measure and its effects on an economy in the short period. In policy analysis and impact assessment, omitted variable is often a problem that is also relevant to this case of corruption. The method on instrumental variable (IV) is exploited with new variables as Owner Experience and Network are created. An assumption for Owner Experience and Network is made which are correlated with the explanatory variable Corruption and uncorrelated with error term ( $u$ ).

## **5.2 Does Corruption endogeneity?**

The following part, we address the endogenous problem of our corruption measurement by using the two-stage least square (2SLS) and the Durbin-Wu-Hausman (DWH) test for endogeneity, under-identification test and Weak IV to test for weak instrumental variables. The results are reported of the two-stage least square (2SLS) and three above testing results. In the first stage, Corruption is used as dependent variable, with exogenous variable in the right

hand side including Innovation, Investment, Firm Size, Location and Network, Owner Experience are used as IVs of this testing. The results are consistent with previous testing model with positive significant effects. It also supports for the conclusion that we made in the previous Model, all above explanatory variables relevant to firm performance show a significant positive effect on firms' level of corruption, in which, Investment, Innovation and Network reveal the highest significant level. The details of testing are presented in the Table 9 below:

Tab.9-Two stages least square and a Dubin-Wu-Hausman test

Weak instrument robust tests (Wald F-stat)	6.29	5.43

Note: \*\*\* denotes at the 1% level or lower; \*\* denotes 5% level; \* denotes 10% level

The first stage is used to quantify the level of corruption using OLS regression with frequency of corruption as a dependent variable. Other variables include Innovation, Investment, Owner Experience, Network as independent variables while Location, Firm size as control variables.

The results are reported in Table 9. It is clearly shown in the table that all variables have insignificant positive effects on the frequency of corruption. In which, Innovation, Investment and Location are also found to be less significant in bribe payment. When their P-values reveal significantly high which allow us to accept the Null Hypothesis as we can conclude that these coefficients are insignificant. It underline the fact that, having better access to credits, funds or technology, trainings and licenses, can promote the process of innovation and investment activities within firms, which tend to reduce level of firms' bribe. Interestingly, results of the analysis indicate that location is insignificantly on the frequency of corruption. Overall, these results reveal three important characteristics of the bribe paying firms including innovation, investment and location.

The second stage presents an estimation of Firm Performance as the dependent variable using estimated residual getting from the 1<sup>st</sup> stage, with the exogenous variables on the right hand side. We found that Corruption, Investment, Innovation and Location to be significant when assessed as independent variables against Firm Performance as a dependent variable. In the context of this research, some contributors for firms' bribe might be omitted such as pre-working experience of the firms' owners (Owner Exper) or social network of firms (Network) such as the participation of enterprises in business association. To consistently estimate our model, we must find Instrumental Variables (IV) that satisfies certain properties including uncorrelated with error term and correlated with Corruption variable. We dominate 2 instrumental variables (IV) namely Network and Pre-work of owners. The first IV indicates that if enterprises are the members of business association, they have more connections, transactions with other businesses and agencies, leading to higher the frequency of bribe. For Pre-work of owners, if previously the owners work for State Owner Enterprises, they might have habit of paying more extra money to smooth their business activities. It can be partly explained by the culture of developing countries like Vietnam. While firm in urban areas with high demand of innovation and investment, the level of corruption is more likely to be higher than those who in the rural areas. The result is also consistent with the previous testing result. However, the magnitude of the effects is quite different. While corruption seems to be the highest factor influenced to the firm performance.

Besides, the Dubin-Wu-Hausman (DWH) test is conducted by using the residuals from the first stage regression for testing whether those residuals are significant in the original OLS equation. The result of DWH test indicates that they are significant, we failed to reject the Null Hypothesis which eliminate the endogeneity problem. In addition, the tests for under-identification and weak instrumentation are both satisfactory. Following this, the effects of corruption on firm performance are assessed, in combination with other explanatory variables in the estimated model. So the IV regression estimators are more preferable.

## **6 CONCLUSIONS**

The effects of corruption on firm performance have attracted much attention and initiated debate across countries and regions. Theoretical and empirical results indicate that corruption is widespread in both developed and developing countries, which hamper the growth prospects at the country level. However, the impacts are contradict and more complicated at the industry and firm levels. The effects depend on the level of the development of each country, characteristics of firms, business environment, policy, regime and institutions, which require more specific study to quantify.

Based on the Vietnamese firms' characteristics of the collected data, the findings reveal that there is a causal positive relationship between corruption and firms' performance in Vietnam. The findings contribute several importanta points to theoretical and empirical result on assessing the impact of bribe payment on performance indices Vietnamese SMEs. First, to

measure effect of corruption on firm performance based on two important indicators of firm: Revenue Growth and Labor Productivity. Besides, the effect is also measured based on four other factors: innovation, investment, firm size and location. Second, the results reveal that there is a significant positive relationship between corruption on firm performance and a strong inter-correlation between corruption, innovation, investment and location to the performance of firms. Among these factors, location presents for big cities (Hanoi, Hai Phong, HCMC) reveals the highest corruption levels while the firm size is likely to less influential on the relationship between corruption and firm performance in the short period of the study. Thus, we might conclude that there is a complexity in the system of policies or bureaucratic in Vietnam which potential raise the level of corruption which may increase the firm performance in the initial stage in the short period.

# **THE IMPACT OF FAMILY CONTROL ON PROFITABILITY, LEVERAGE AND LIQUIDITY: EVIDENCE FROM THE CZECH MANUFACTURING INDUSTRY**

*Ondřej Machek, Jiří Hnilica, Daniela Kolouchová*

## **Abstract**

Family businesses represent an important portion of the Czech economy. However, the role of family companies has been neglected in the past research. This paper deals with the differences in return on assets, debt ratio and cash liquidity between family and non-family businesses. To explore the differences, we use the matched-pair investigation approach. On a sample of 271 firms from the Czech manufacturing industry, we show that the differences are statistically significant in 2007 and 2012. The results suggest that Czech family businesses operating in the manufacturing industry are more profitable, carry less debt and have a higher liquidity which is consistent with prior research carried out in other countries.

*Keywords: family business, performance, Czech Republic, manufacturing*

JEL Classification: L22, M10

## **1 INTRODUCTION**

The fact that for many the phrase “family business” connotes a small or medium-sized company with just a local significance does not reflect the powerful role that family-controlled enterprises play in the world economy. They are not just companies like Walmart, Samsung, Tata Group, or Porsche, but they account for more the 30% of all companies with sales in excess of \$1 billion (Kachaner, Stalk, and Block, 2012). In most countries, regardless of company size, family business account for a major share of business ((Astrachan & Kolenko; 1994 (United States); Gallo & Estape, 1992 (Spain); Martinez, 1994 (Chile); Maury, 2005 (western Europe); Owens, 1994 (Australia); Reidel, 1994 (Germany)). Family businesses are thus significant in terms of employment, turnover, added value, investments and accumulated capital (Allouche, Amann, Jaussand, and Kurashina, 2008).

Therefore it is no wonder that interests of academicians have been attracted towards studying family businesses. However it is important to mention that family business as an academic discipline is relatively new – it was first anchored by establishing Family Firm Institute in 1986 and by issuing the first number of Family Business Review in 1988 (Sharma, Chrisman, and Gersick, 2012), a scholarly publication devoted exclusively to exploration of the dynamics of family-controlled enterprise.

Family businesses represent the major share in economies around the world (Allouche et al., 2008). However, in the Czech Republic, the true role of family businesses has never been mapped. In this article, we explore the differences in return on assets, debt ratio and cash liquidity between family and non-family businesses operating in the manufacturing industry. To explore the differences, we use the matched-pair investigation approach.

## **2 THEORETICAL BACKGROUND**

What we know is that the Industrial Revolution led to establishment of many manufactures that remained in family control after the death of the founder such as herb liquor producer Becher (1794), confectionery company Fiedor (1840), furniture manufacturer Thonet (1841), Moser glass works (1857), piano manufacturer Petrof (1865), or shoe manufacturer Bata (1894). With the collapse of the Austro-Hungarian Empire, Czech family owned firms were rapidly developing (Hanzelková, 2004). Family businesses such as Bata or the largest engineering company of the former Czechoslovakia Kolben and Daněk (ČKD) were the backbone of the economy.

In most countries family businesses account for a major share of business and significantly influence employment, turnover, added value, investments and accumulated capital (Allouche et al., 2008). Current research activities on this topic suggest that about 70% – 80% of enterprises are family businesses, with however quite significant ranges based upon different definitions – e.g. in Denmark the possible range goes from 36% to almost 95% (Mandl, 2008).

In the Czech Republic the role of family businesses has been neglected. Some research has been conducted at VUT Brno, BIBS, Masaryk University, and University of Economics, Prague (Koráb, 2008; Hanzelková, 2004; Odehnalová & Olševiřová, 2009; Machek, Brabec, and Hnilica, 2013, Machek & Hnilica, 2013, Machek, Hnilica, and Brabec 2014). The newest study has been published by Forbes in May 2014 (Mašek et al., 2014) in which 50 biggest Czech family enterprises are just ranked in terms of averaged sales and EBITDA, i.e. no deeper scholarly research has been realized.

As an emerging field the family business discipline has been establishing especially in the two following directions:

- Defining family business: The very definition of family business is crucial because usually the research outcomes do compare family and non-family businesses from many perspectives. In spite of the fact that there is no unanimous agreement upon it each definition of family business include three dimensions (Massis, Sharma, Chua, and Chrisman, 2012):
  - one or several families hold a significant part of the share capital;
  - family members retain significant control over the company, which depends on the distribution of capital and voting rights among nonfamily shareholders, with possible statutory or legal restrictions;
  - and family members hold top management positions.
  - Researchers (e.g. Carney, 2005) conclude that due to unique institutional legal contexts in states across the globe it makes no sense to come up with a definition that could be universally applicable. Nevertheless each study must explicitly state what is understood under the family business because different definitions do lead to different findings (Westhead & Cowling, 1998).
- Performance differences between family and non-family businesses: Most empirical investigations find superior financial performance of family businesses compared to non-family ones (e.g. Anderson & Reeb, 2003; Craig & Dibrell, 2006; Kachaner et al., 2012) whereas others investigate both financial and non-financial dimensions of performance such as growth or alternative qualitative indicators.

The results are often interpreted by more effective management due to familial nature of businesses, with the followings emphasized:

- Reduction of agency costs within family businesses: The separation of ownership and control in companies may lead to agency costs, i.e. because the interests of owners (principals) and hired managers (agents) are not the same managers may act in order to maximize their own utilities instead of those who hired them (Fama & Jensen, 1983). This separation is mitigated in family businesses as managers in family businesses (often family members or family “friends”) act more like stewards (Carney, 2005; Davis, Schoorman, and Donaldson, 1997).
- Long-term orientation of the shareholders’ family: The intention of family business owners is usually to preserve the family inheritance for its transmission to following generations. This leads to better investment policies in comparison to non-family businesses (James, 1999; Stein, 1989).
- Reduced levels of debt in balance sheets: Modern corporate finance considers a judicious amount of debt as a good thing because through financial leverage it may create value. On the other hand debt decreases room to maneuver if a setback occurs. Family firms are very risk averse and as a result carry less debt (Kachaner et al., 2012; McConaughy, Matthews, and Fialko, 2001) – therefore they do not need to make big sacrifices to meet financing demands during recessions.
- System of values: Values shared across family business stakeholders (such as managers, owners, employees, suppliers) generate synergistic effects (Habbershon & Williams, 1999).

In the Czech Republic, and post-communist countries in general, the family businesses have been getting an issue recently especially due to “succession issues”. While by the beginning of 1990’s we could hardly speak of any family businesses (with possibly an exception of those somewhat drawing upon the heritage of their predecessors who ran their own family businesses before the nationalization), then some 25 years later it is quite common that owners (fathers and mothers) already have transferred their businesses to their heirs or have at least started considering it.

Manufacturing industry is the largest Czech sector of economic activities, representing almost 50% of the whole Czech economy (Hnilica, Machek and Hanuška, 2014). It is composed of individual divisions (as classified by CZ-NACE system) out of which the following divisions represent approximately 60% of the industry: manufacture of fabricated metal products, manufacture of machinery and equipment, manufacture of food products, manufacture of rubber and plastic products, and manufacture of motor vehicles, trailers and semi-trailers. Other divisions are less important, so the authors do not list all of them.

### **3 METHODS**

To date, there is no database of Czech family companies and businesses have no legal obligation to disclose whether they are family companies or not (Machek & Hnilica, 2013). In order to identify family companies we used the surname matching principle (Machek et al., 2014; Hnilica and Machek, 2015).

In order to analyze the differences between family and non-family firms we used the matched-pair investigation method (see e.g. Allouche et al., 2008; McConaughy et al., 2001; or Menéndez-Requejo, 2006). This methodology systematically compares family and non-family businesses which have the same operating conditions. First, pairs of businesses which match in their industry and size are established. Subsequently, a paired t-test is applied in order to compare the differences in means of selected variables.

To create the pairs, we assigned to every family company operating in the manufacturing industry a set of non-family manufacturing companies with the closest number of employees. If there were multiple companies with the same headcount, we selected the company with the closest turnover. This way, we eliminated differences due to firm size. After having eliminated observations with incorrectly disclosed accounting data (see e.g. Tyll and Pohl, 2014), we obtained a final sample which contains 271 pairs of large and medium-sized family and non-family firms.

After having created pairs of businesses, we applied Student t-tests to determine the statistical significance of mean differences (the null hypothesis is that the average difference of means is zero) of selected indicators:

- Return-on-assets (EBIT / Assets),
- Debt ratio (Debt / Assets), Interest coverage ratio (EBIT / Interest expenses),
- Cash ratio (Cash / Current liabilities).

Similarly to Allouche et al. (2008), we use two years (2007 and 2012) to avoid overdependence on a single year of data. The first year represents the situation before the arrival of the 2008 economic crisis which had a significant effect on the Czech economy. The latter year (2012) represents the year when the Czech economy has already recovered.

## 4 RESULTS

Tab. 1 displays basic central tendency (mean, median) and variability (standard deviation) features of the data in this study. Return on assets, debt ratio and current ratio are presented separately for family and non-family businesses and for both years under consideration.

Tab. 1 - Descriptive statistics for 2007 and 2012

	Return on assets [%]		Debt ratio		Current ratio	
	FB	NFB	FB	NFB	FB	NFB
<b>2007 (N = 271)</b>						
Mean	7.673	6.524	0.523	0.564	0.480	0.305
Median	6.000	4.905	0.532	0.563	0.140	0.130
Standard deviation	8.426	6.781	0.226	0.248	1.130	0.471
<b>2012 (N = 271)</b>						
Mean	4.873	3.868	0.477	0.536	0.489	0.373
Median	3.820	2.940	0.461	0.497	0.170	0.110
Standard deviation	6.655	7.335	0.263	0.372	0.774	0.659

Note: FB = family businesses; NFB = non-family businesses

Source: Authors

Tab. 2 displays the results of Student's paired t-tests on the matched pairs dataset. Return on assets shows significant difference between family and non-family businesses which is valid for both periods. This indicates that family firms are comparatively more profitable from the point of view of shareholders and creditors. The debt/assets ratio shows significant difference

in favor of non-family businesses, which means that family firms carry less debt. The difference in cash/short-term liabilities ratio significantly favors family firms, which suggests that family companies are more careful regarding their financial policy.

Tab. 2 – Matched-pair investigation results

	Return on assets		Debt ratio		Current ratio	
	Difference	<i>p</i> -value	Difference	<i>p</i> -value	Difference	<i>p</i> -value
<b>2007</b>	1.149	0.080*	-0.041	0.055*	0.175	0.019**
<b>2012</b>	1.005	0.095*	-0.059	0.037**	0.116	0.075*

Note: \*\* - Significant at 5% level; \* - Significant at 10% level

## 5 DISCUSSION

Prior to discussing the results, it should be noted that the authors are aware of the fact that all firms operate in the manufacturing industry, so the results can't be generalized to all industries. While the manufacturing industry represents approximately 50% of the whole Czech economy (Hnilica, Machek and Hanuška, 2014), the results are predicative to a certain extent, but it should be stressed that all results concern only family and non-family businesses from this sector, as well as large and medium-sized companies.

The choice of return on assets (ROA) reflects the fact that it has been the most widely used indicator of profitability in past studies on performance gaps between family and non-family firms (Machek, Hnilica and Brabec, 2014). Indeed, according to the past literature, family firms do best when their performance is assessed by ROA, a measure that is not as influenced by financial structure as ROE (Wagner et al., 2015). The results suggest that Czech manufacturing family businesses are more profitable, which is consistent with past literature. The most important factors which could explain such difference are related to agency problems and to a long-term perspective. Family relationships are supposed to reduce agency costs and allow for a better dissemination of knowledge and personal motivation of the owner to achieve better financial performance. Factors such as loyalty, trust, quick and flexible decision-making, stability, and a common interest to build a positive reputation of a family firm may together contribute to a greater profitability of a family business. However, it should be noted that higher profitability may not necessarily imply higher efficiency (Gorriz and Fumas, 1996). From the financial point of view, Sraer and Thesmar (2007) suggest that several factors affect profitability, namely, firms are more profitable if their production process uses less capital, labor productivity is higher, and wages are lower. The analysis does not allow discovering which of these factors play the major role.

From the point of view of capital structure, the results suggest that Czech family firms operating in the manufacturing industry use less debt than their non-family counterparts. This is consistent with the hypothesis that family businesses have a stronger reserve against debt than non-family firms which is supported by prior research. However, it is still not clear cut what exactly drives the capital structure decisions of family firms. One of the possible reasons is the risk-aversion due to the fact that a possible loss of family control over a company, together with a strong interest to care about the reputation of family firms, may lead to a lower use of external resources (debt). Of course, there are other factors than family control which affect capital structure as well. Among the most important ones, we should mention

firm size and industry (which was however mitigated by the matched-pair approach used in this study), firm age (older firms tend to use more debt than younger firms) and structure of assets (for instance, the proportion of tangible and intangible assets, see e.g. Ampenberger et al., 2013).

The differences in liquidity are also important since the Czech manufacturing family businesses had a significantly greater current ratio than non-family businesses from the sample. These results can be explained by the above-mentioned hypothesis on a greater risk-aversion of family firms. Broadly speaking, liquidity ratios are a measure of financial policy of firms; a greater liquidity indicates a more conservative, yet less profitable position; lower levels of liquidity indicate a more risky but more profitable financial policy. The risk-aversion of family businesses is reflected in a more conservative financial policy which is accompanied by employing more short-term financial resources (cash) to cover short-term obligations, or by employing less short-term liabilities and more long-term debt, everything else being equal. However, it should be noted that only one measure of liquidity (current ratio) was used in the analysis. Other measures, such as quick ratio or cash ratio, would provide more detailed information on the structure or liquid assets (for instance, inventory or cash and cash equivalents).

## **6 CONCLUSION**

Family firms belong to the most important organizational forms of businesses. Their differences from companies owned or managed by independent professionals, among which we may cite the trust and loyalty, may have beneficial effects on efficiency and profitability. On the other hand, some factors like conflicts among family members, or conflicts between work and family, may harm the profitability. In the Czech Republic, the issues of family business have been neglected in the academic literature to date.

In this study, we used the matched-pair investigation to observe the differences in return-on-assets, debt ratio and cash ratio on a sample of 271 pairs of family and non-family firms. The authors are aware of the fact that the methodology is not based on random sampling so the results cannot be generalized to all companies in the Czech Republic. The study shows that family firms from the sample exhibit a greater return on assets (profitability), lower debt ratio (leverage), and higher current ratio (liquidity).

However, it should also be noted that the study has several limitations. Although the manufacturing industry represents the largest part of the Czech economy, the results may not be valid in other important sectors of economic activity, such as wholesale and retail, construction, or transportation and storage. The second limitation is the size of analyzed companies. The sample of firms contains only large and medium-sized companies, while most family businesses are supposed to be small or micro-companies (European Commission, 2009). The third limitation concerns the years under observation. The data covered two years (2007 and 2012) in order to avoid dependence on one year of data. However, a longer time series would certainly have a greater predictive ability.

With respect to these limitations, rather than drawing general conclusions, we can acknowledge that the results suggest that there exist differences between Czech family and non-family firms which are consistent with prior research carried out in other countries.

However, further analysis is warranted in order to make general conclusions on performance gaps between family and non-family firms. The further research will be focused on building a

greater database of family firms. Especially small firms must be included to the sample since their importance in the economy is crucial (see e.g. Dasan, 2013). The future research will focus on the reasons *why* family businesses actually are more profitable, prefer less debt and have greater liquidity. Such an analysis will have to be qualitative in nature.

## **HOW TO PREDICT POTENTIAL DEFAULT OF CULTURAL ORGANIZATIONS?**

*Ondřej Machek, Luboš Smrčka, Jiří Strouhal*

### **Abstract**

Cultural industries have received increasing academic attention over the past decades. The prediction of default represents a vast area of finance and accounting. Since the companies operating in these industries are considered to be very specific, the performance of classical methods of default prediction is questionable. This paper explores the possibilities of using methods of default prediction in the area of companies operating in cultural branches. On a sample of 3,158 observations of companies operating in the Czech cultural sector, we develop the use of multiple discriminant analysis and logistic regression to predict the financial distress of these companies. The results suggest that these methods can have a high predictive ability, provided the coefficients are accurately estimated.

*Keywords: bankruptcy indicators, culture, financial performance, distress*

### **1 INTRODUCTION**

The sector of cultural industries has in the last three decades become a highly monitored specific economic area. This is connected with numerous facts, one of which is the deep societal changes which have occurred in the most developed countries over the last 50 years. A marked rise of demand for “entertainment” was characteristic even for a part of the 20s and 30s in the 20th century, although during this time this was a demand socially limited to the extremely wealthy and the wealthy echelons of society, whereas the demand among lower income brackets was satisfied with what was essentially folk art in the form of cinematography. A growing demand beginning on the 50s of last century and lasting essentially to the present is, however, characteristic in developed countries in its mass character and insofar as it is highly structured. The entertainment of our time is usually highly innovative, it works with constant emendation of technologies, it is subject to fashions and constant changes, and it has lost the style-creative characteristic for art until the first half of last century. The growing demand has brought about the formation of what is truly an essentially industrial structure in this sector, which has led to the emergence of entirely new branches, such as programming of computer games and applications for mobile devices. If we have mentioned the style-creative role of art lasting until the first half of the 20th century, then our century is characterized by a new style-creativity, where entertainment and productions of the cultural industry express social life, inter-human relationships and numerous other social facts.

The emergence of an evolution of creative industries has become the subject of numerous surveys, and it would be unsuitable here to treat this problem in a more comprehensive manner – it has been explained many times. In this regard, we can refer especially to the work of Florida (2002), Holden (2004), Hesmondhalgh (2007); from the Czech environment might be mentioned comprehensive study of Cikánek et al. (2009). Although the views of individual authors differ in many respects, a core of sorts is always formed by activities which are commercial and at the same time artistic or entertaining.

The significance of creative industries for the economic development of the European Union and specifically also the Czech Republic can be documented by Němec (2013): “*According to our approximate calculations made on the basis of CSO data, cultural and creative industries contributed more broadly to the CR GDP in 2010, almost by 4.9 % (of which cultural industries accounted for 1.9 % and creative industries 3 %).*”

The prediction of financial distress represents a vast area of finance and accounting. However, due to the specifics of cultural companies, the possibilities of using the methods of default prediction, especially in the Czech Republic, remain relatively undiscovered. Although there exist some models adapted to the Czech environment (such as the Altman’s Z-score), their predictive ability for the companies operating in cultural industries is questionable and needs to be tested.

The goal of this paper is to analyze the possibilities of using methods of default prediction in the area of companies operating in cultural branches and to develop a set of coefficients which allow a sufficient predictive ability of such methods. We will present the use of multiple discriminant analysis and logistic regression to predict the financial distress of these companies and test their predictive ability.

## **2 SAMPLE ANALYSIS**

We will focus more comprehensively on the methodology of predicting financial distress, and then on a definition of the data sets and finally on the analysis itself and the results thereof.

### **2.1 Methods Predicting Financial Distress**

Numerous statistical methods are used for the prediction of financial distress. The following can be mentioned:

- One-dimensional (univariational) analysis (e.g. Beaver, 1966);
- Multiple discriminant analysis (e.g. Altman, 1968);
- Multiple logistic regression (e.g. Doran, 1989);
- Neuron networks (e.g. Etheridge and Sriram, 1997);
- The method of support vector machines (e.g. Hui and Sun, 2006);
- Models that take into account the evolution of firm’s financial health over time, such as terminal failure processes (Du Jardin, 2015).

For specific sectors, other methods can be applied, such as the general equilibrium analysis to predict bank and their clients’ default (see e.g. Machek et al., 2014). Most often, the methods are based on the values of financial ratios. While it is known that accounting information is not always reliable (see e.g. Tyll and Pohl, 2015), it is perhaps the most practical source of information that the users of bankruptcy prediction models can quickly obtain.

Multiple discriminant analysis (MDA) is a statistical method which is used in economics not only in the theory of investment but also for the assessment of banking house client credibility, especially in the area of predicting financial distress. It began to be used especially after the publication of Altman’s paper (1968). MDA is a statistical technique used for classifying a certain object into previously given classes in dependence to the values of several factors. The first step is the formation of so-called training aggregates, i.e. observation aggregates where the class to which they belong is known. The formation of a decisive rule, which enables univocal classification of objects into one of the classes, occurs. In the case of a linear discriminant function, the decisive rule has the shape of a linear combination of several signs. The output of linear MDA, therefore, is an aggregate of discriminant coefficients, including a linear member. The discriminant function (the decisive rule, also the

Z-score) has the following shape in the case of the n-sign (in this article  $Z_k$  will continue to denote the discriminant function for businesses in the culture sector in the Czech Republic):

$$Z_k = a_0 + a_1x_1 + a_2x_2 + \dots + a_nx_n \quad (1)$$

where  $a_i$  is the discriminant coefficient,  $x_i$  is the value of the sign and  $n$  denotes the number of signs.

Multiple logistic regression is another statistical classification method which enables the prediction of category variables on the basis of independent variable values. Probability-describing outputs are modelled with the aid of logistic functions. The output of logistic regression is the probability that the given object belongs to a different class, i.e. the logarithm of proportion of probability that the given object belongs to a certain class, and the probability that it belongs to another referential class. Expressed formally,

$$L_k = \ln\left(\frac{p}{1-p}\right) = a_0 + a_1x_1 + a_2x_2 + \dots + a_nx_n \quad (2)$$

where  $L_k$  will continue to signify the score for businesses in the culture sector in the Czech Republic,  $p$  denotes the probability that the objects fall into a certain class,  $a_i$  denotes the regression coefficient,  $x_i$  is the value of the sign and  $n$  denotes the number of signs. The regression coefficients thus reflect the effect of independent variables on the relative probability that the object falls into a certain class as against the referential class.

The advantage of the above-mentioned approaches is their simplicity and fast and practical applicability for the classification of objects into classes. A clear disadvantages that it is an approximation of reality which is almost always burdened by a certain error and should therefore not be utilized mechanically, but rather in the context of deeper analysis (Neumaierová and Neumaier, 2014).

In this regard, it should also be mentioned that subjects from the culture sector are usually considered highly specific for various reasons. Firstly, their financing usually does not fulfill standard concepts insofar as multi-source financing occurs in numerous areas. Therefore, turnovers for sold products and services (turnovers from ticket sales in the given case) are only one of the incomes, often by no means the main one. This aspect can often transpire to be problematic in the case of application of methods to the “culture” sector, for placing it into a context for deeper analysis appears to be almost impossible here. In the following passages we will show that input data are necessary for the implementation of analytical methods, whilst we will see that none of these data touch the specific problems of the branches which, for the purpose of simplification, we have defined as “multi-source” financing, with the awareness that the real range of particularity is substantially larger and is connected with both economically impalpable terms such as “fashionability”, “artistic value”, “individuality of taste” or “national feeling”. From the economic perspective this aspect is analysed by Kislingerová (2012).

On the other hand, these terms may necessarily play a significant role in the case of “creative” industries, but not in relation to past data. The preceding data are always given as firm and will withstand essentially standard economic research. An important moment, however, is the ability of the prediction and whether the models would – at least theoretically – fail in a larger degree than usual, which should be given by uncertainty in the issue of incomes dependent to non-economic decision-making processes. What is at issue is that incomes dependent on political or other decisions should in essence be of higher risk as regards prediction of acquisition or non-acquisition thereof than funds from ticket sales or collected in another economically definable manner. As we will demonstrate later on specific results, it seems that these funds are with high probability at least as predictable as standard incomes.

## **2.2 Specifying the Dataset**

Data from the Bisnodecompany, or more precisely the MagnusWeb interface working over the Albertina database, were used. On the basis of available data, companies with at least five employees and doing business in the CZ-NACE 90 were selected. In general, creative, artistic and entertainment activities, especially the scenic arts, supportive activity for the scenic arts, artistic creation and operation of culture facilities belong here.

The acquired sample of companies has been cleared of unusable observations (incorrectly reported data, such as zero or nonsensically high indicator values), by which the number of observations was reduced to a total of 3,158 cases. This sample was divided into two classes – “safe” and “distress”. The “distress” class included observations among which events of the “bankruptcy”, “inability to repay”, “forfeiture recorded” and “negative equity” types were recorded. The remaining companies were classified as “safe”. A training aggregate for MDA and logistic regression was gained from this sample.

The condition of five employees ensures that an adequately representative number of companies will be contained in the sample; at the same time, individual activities with a dominance of artistic creation among which the concept of default caused by entrepreneurial activity can be conceived only with difficulty have been eliminated. The acquired number of subjects is marked, among others, clearly due to the fact that trading companies in this sector emerge once only as production grounds for specific performances or a smaller number of performances; in the event of failure, they depart from the economic environment fairly rapidly; contrariwise, in the event of success they continue for a longer period.

## **2.3 Employed Methodology**

MATLAB (Statistics Toolbox) software was used for classification – specifically, the following functions:

- discriminant functions for multiple discriminant analysis;
- the `mnrfit` function for multiple logistic regression.

The results were subsequently verified on other companies circulating in the culture sector, and comparison with other bankruptcy models – Taffler’s model (Taffler and Tisshaw, 1977) and Altman’s model (the modified version for 2000)– was also undertaken; verification of ability to predict default over a longer period – which we consider to be an especially interesting attempt towards a logical conclusion as regards higher riskiness of multi-source financing (under the assumption that one or more financial sources are dependent on political decisions connected with handling public funds or on the decisions of sponsors) – was also undertaken. In contrast to classical models, the so-called “grey zone” was not defined, for its univocal delimitation is impossible with respect to the available data, and a warning signal, i.e. classification into the grey zone area, can be provided by a  $Z_k$  or  $L_k$  value approaching zero. This applies especially in the context of the time development of these indicators. From the nature of the classes, moreover, the requirements for classification into the “safe” class are relatively strict: Negative equity is sufficient for classification of a company as “distress”.

The fact of negative equity is among the numerous specifics of subjects in the culture sector. This of course does not concern all entrepreneurial activities. However, in the NACE-CZ 90 category, the appearance of negative equity will, with a high degree of probability, be relatively common. Especially among productions, there are no grounds to expect other real assets besides gathered know-how. In this regard, it represents rather a potential than a real knowledge or capability advantage on the market. Moreover, it is not the property of a trading company or other subject – producer which is at issue, but ability and potential gained on a contractual basis in the form of providing services or performances by the carriers of this

know-how. As we can see, the position of the producer is very weak and vulnerable in this sense, and investors are no doubt aware of this. If the main asset of a production is the right for temporary utilization of abilities on the basis of contractually bound creative and other workers – carriers of know-how required for creating a cultural good, we must then consider this entire sector as extremely risky from an investor's perspective.

But let us return to the basic assumption that, even given maximally “creative” accounting, it is not possible in the case of a production – unless a strong investor injects capital into the business – to achieve a state of affairs where the trading company (producer) would not be in a state of over-indebtedness, i.e. that its liabilities would not exceed its assets. As we have argued above – in the bounds of our assumption, this is given to a significant extent by the logic of doing business in this sector as such. From the perspective of insolvency law, this is one of the few situations where the expression of Section 3 para. 3 of Insolvency Act is justified – where over-indebtedness is indeed defined as a situation in which the sum of the debtor's liabilities exceeds the value of its property, although when fixing the value of its property, account is taken of further administration thereof, possibly of the further operation of its business if it can reasonably be assumed, whilst bearing in mind all circumstances, that the debtor will be able to continue in the administration of property or in the operation of the business. In recent times, several analyses have been undertaken of situations resulting in insolvency proceedings, from which it stems that this expression is misused more often than it is used (Smrčka et al., 2013; Schönfeld et al., 2014). This is to say that entrepreneurial subjects which fulfill the condition of over-indebtedness as one of the forms of debtor bankruptcy have a tendency not to make their bankruptcy public and utilize the largest possible timeframe either for attempts to rescue the company by means of high-risk trades, or contrariwise for excision of property from the creditors' reaches. Both of these approaches have the same result for the creditor – minimization of the recoverability of their receivables.

This all means that over-indebtedness can be a fairly standard state of affairs in numerous companies or any other organizational structure used as a legal form of activity in the area of the creative industries, culture or artistic creation. Despite this, we will retain as valid the rule that negative equity is a reason to classify a subject into the “distress” group.

For classification, the same signs which appear in Altman's bankruptcy model (see Altman, 1968 and Altman, 2000) were used,

- $x_1$  = net working capital / assets
- $x_2$  = retained earnings / assets
- $x_3$  = EBIT / assets
- $x_4$  = total equity / total liabilities
- $x_5$  = sales / assets

Sign  $x_1$  expresses the hypothesis that companies with a deteriorating financial situation will have rather a negative liquidity expressed with the aid of net working capital. Sign  $x_2$  reflects the stability of the company, for it contains retained earnings from previous years. Sign  $x_3$  is the level of a company's asset viability when abstracting from tax influences and capital structures. Sign  $x_4$  expresses the extent to which the company's assets can lose their value before the company's liabilities exceed the value of its assets and the company becomes unable to repay. Sign  $x_5$  is the classic asset turnover and thus measures the efficiency of the company's asset usage.

We can find even here several problematic moments or parameters which we should perhaps relativize whilst taking into account the particularity of the branch. For instance, “retained earnings from previous years” is a concept in numerous legal forms utilized in this area of the problem, for the entire system of multi-source financing is in essence usually fixed so that no

undivided profit arises, and if so, it should be conserved in the form of marginal reserves. It applies that injections from public funds secure the remainder of financing for estimated incomes from turnovers and from sponsoring or supplementary entrepreneurship, as the case may be. Under the concept of “remainder”, it is most certainly impossible to expect that some or other “surplus”, i.e. profit, is to be generated.

Despite this, we have decided also in this case to retain all parameters in the original form insofar as prior to proceeding to the expression of an adjusted bankruptcy model, it is necessary first to test its standard form. Moreover, as we will speedily show, a significant moment of each model is the expression of decisive rules.

#### 2.4 Multiple Discriminant Analysis

The decisive rule can be expressed with the aid of acquired coefficients. The resulting classifying functions have the following forms, and the resulting Z-score can be expressed with the aid of the following function:

$$Z_k = 0.142 + 1.615x_1 + 1.03x_2 + 0.437x_3 + 0.001x_4 + 0.013x_5 \quad (3)$$

If the value of the function is higher than 0, the business is classified into the “safe” category. Otherwise, it is possible to classify it into the “distress” category. We can define the above-mentioned “grey zone” as an area of results approaching zero insofar as the more the result approaches zero, the more problematic the subject.

#### 2.5 Logistic Regression

The regression function for the natural logarithm of the proportion of probability can be expressed with the aid of the following function:

$$L_k = -0.32 + 2.905x_1 + 2.083x_2 - 0.839x_3 + 0.277x_4 + 0.624x_5 \quad (4)$$

The statistical significance of the estimated coefficients is described in the following table. It is clear that the estimate is relatively precise; only the coefficient at sign  $x_3$  is statistically insignificant.

Tab. 1 – The Statistical Significance of Model Coefficients (Logistic Regression). Source: our analysis

Coefficient	P-value	Standard Error
-0.32*	0.0838	0.189
2.905***	8.348e-11	0.447
2.083***	3.414e-11	0.314
-0.839	0,110	0.525
0.277***	1.285e-06	0.057
0.624***	2.619e-05	0.148

Note: \*\*\* -  $p < 0.001$ , \*\* -  $p < 0.05$ , \* -  $p < 0.1$

It can be deduced from the relation (2) that the probability that the object falls into the “distress” class is given by the relation

$$P_{distress} = \frac{1}{1 + e^{L_k}} \quad (5)$$

This relation, however, does not have to be utilized in practical applications, for a negative  $L_k$  value signifies that the given probability is higher than 50 %, which suffices for classification into the “distress” category. If the  $L_k$  value is positive, the object can be classified as “safe”.

The following tests were conducted to test the reliability and prediction ability of the models. First, the discriminant ability of the given five signs for business conditions in the culture sector (or more precisely, CZ-NACE 90, i.e. a specific sample of businesses in the culture sector) was tested in the form of a bi-selective pair t-test for a mean value.

## 2.6 Discriminant Ability of the Signs

The discriminant ability of individual signs has to be verified in order to verify the reliability of the model. To verify that the averages of values of individual vary for the “safe” and “distress” classes, a bi-selective pair t-test on a mean value was used on a sample of 321 randomly selected companies in both classes. The results are shown in table 2. The differences in the mean values of all the signs are statistically significant, which is suggested by the highly marked differences in the averages of individual signs in the “safe” and “distress” categories. Financially healthy companies demonstrate higher values in these signs than firms threatened by bankruptcy.

Tab. 2 – Mean Values of the Signs and the Significance Test. Source: our analysis

Sign	Meanvalue „safe“	Meanvalue „distress“	T-statistic
x <sub>1</sub>	0.27	-0.08	8.59*
x <sub>2</sub>	0.03	-0.66	7.14*
x <sub>3</sub>	0.02	-0.31	9.55*
x <sub>4</sub>	5.89	0.50	4.18*
x <sub>5</sub>	1.08	0.79	4.68*

Note: \* Statistically significant ( $p < 0.001$  on the level  $\alpha = 0.05$ ).

## 3 PREDICTIVE ABILITY OF THE MODELS

The predictive ability of the models was tested for one up to four accounting periods (tables 3 and 4). It is clear that the predictive ability drops in time, yet it nevertheless remains relatively high even four years prior to recording a negative event. From the perspective of longer-term prediction ability, multiple discriminant analysis demonstrates a slightly higher success rate in a series of 1-3 %; it is identical in the case of four years until bankruptcy.

Although Altman (1968) suggests not using discriminant analysis for more than a two-year historical period, it is clear that the predictive ability does not fall in a dramatic way in this case of prediction ability. It is evident that the values of all five signs drop with an approaching bankruptcy. The real predictive ability of classic bankruptcy models is also telling for a similar period (Machek, 2014). On the other hand, it is adequate in practical applications of a 1-2 year period for timely detection of a signal of negative development of a company’s financial situation.

Tab. 4 – Predictive ability of the Model (Multiple Discriminant Analysis). Source: our analysis

Number of years until bankruptcy	Number of observations	Number of correct detections		Number of bad detections	
		Number	%	Number	%
1	354	277	78.25	77	21.75

2	306	232	75.82	74	24.18
3	232	155	66.81	77	33.19
4	149	90	60.40	59	39.60

Tab. 5 – Predictive ability of the Model (Logistic Regression). Source: our analysis

Number of years until bankruptcy	Number of observations	Number of correct detections		Number of bad detections	
		Number	%	Number	%
1	354	275	77.68	79	22.32
2	306	219	71.56	87	28.44
3	232	149	64.22	83	35.78
4	149	90	60.40	59	39.60

## 4 DISCUSSION

Multiple discriminant analysis and multiple logistic regression are, in the case of subjects defined as NACE-CZ 90, capable of longer-term prediction of financial distress. The high ability of models to predict financial distress in the sector of subjects operating in the culture sector (CZ-NACE 90 in the given connection) is therefore surprising and it will be apposite to attempt an interpretation of this state of affairs.

A highly probable explanation appears to be the assumption that the influence of multi-source financing and the approaching uncertainty of future incomes connected therewith are lower than we expected at the beginning of the work. One can arrive at this from two related, albeit not identical reasons. The first is the possibility that, of the surveyed subjects, only a minority suffer real dependence to financing from public funds, so the influence of this phenomenon is not large. Although we do not have the possibility to present more detailed statistical data, we consider this to be probable to a relatively small degree. With respect to the CZ-NACE 90 characteristic, we are convinced that the dependence to public budgets must necessarily be marked especially in groups 90.01 and 90.04.

The second possible reason is the variant that financing from public funds – although based on potentially uncertain decision-making of a political type, i.e. an economically irrational method – is adequately reliable and predictable in time as one of the incomes.

The decision as to which of these theses is more correct and corresponds more to the situation is not possible without a series of detailed case studies and especially without the possibility to survey thoroughly the influence and development of individual income layers of subjects accepted into to the surveyed aggregate. As was stated above, we consider the second possibility more probable, i.e. that the irrationality of political decision-making in the public funds sector aimed at culture is constant and in principle predictable thanks to this. A certain role can then be played also by the “enforceability” of support from public funds, when the pertinent subjects react adversely to attempts to change the system and adjustment of subsidy flows, likewise to potential changes in the mechanisms of the division thereof, which then leads to more frequent retention of the status quo than to advancement of changes.

Another possible explanation seems to be the circumstance that support from public budgets is in many cases placed in a truly predictable manner, at least within a certain time horizon – this concerns the places and bodies of the state administration or self-government which proceed along the path of apportionment of long-term grants (three or five-year), which clearly increases the financial stability of the environment as a whole. In other cases, culture facilities are connected directly to the municipal budget, and its fulfillment is decided upon to some degree in advance, which enables adjustment also of activity and costs. Of course, this

then means that such facilities are able to reduce or strengthen their activity in dependence to the degree of certainty the pertinent budget provides to them. Then, however, financial distress could occur only through criminal or extremely irresponsible conduct on the parts of the managers of the production or culture facility.

## 5 CONCLUSION

While companies operating in the cultural sector are very specific and deserve academic attention, the past literature has been particularly silent on the possibilities of default prediction for these companies. In this article, we presented the use of multiple discriminant analysis and multiple logistic regression to predict financial distress and tested their predictive ability. We suggest that when the coefficients of the models are accurately specified and adapted to a particular environment, their predictive ability can be considered high, even in long term.

Several managerial implications arise from the study. Since the application in practice of these models is quick and straightforward (the financial ratios can be obtained directly from the financial statement of a particular firm and the relationships are linear), the models can be used by professionals to predict a potential financial distress of a company, and to take timely measures to avoid it.

The study also has some limitations. In contrast to classical models of bankruptcy prediction, the so-called “grey zone” was not defined. However, a decreasing value of zero of the models’ function, or a value approaching zero, can be and seen as a warning signal.

There are multiple challenges for the future research. First, the predictive ability on an international level should be analyzed as well. While there are undeniable differences of companies operating in Czech cultural industries from other companies, it would be interesting to observe if the same differences exist in other countries, and if the bankruptcy prediction methods (in particular, the multiple discriminant analysis and multiple logistic regression) perform well enough. Second, the cultural industry as defined by this study is relatively broad and it does certainly not capture the great variability in cultural company forms. The development of a model which takes into account such variability would be interesting and could represent one of the directions of the future research.

## **VALUATION OF FINANCIAL ASSETS IN THE INSURANCE COMPANIES**

*Anna Majtánová, Andrea Snopková*

### **Abstract**

Insurance industry is a specific sector of the national economy, which is subject to very strict regulations. Insurance companies are required to keep accounting and prepare financial statements and properly valued financial assets. Accounting information is important for internal users, financial management, financial analysis of insurance companies and external users, i.e. consumers - clients of the insurance company. The aim of this paper is to define and compare the measurement of financial assets in the accounting of insurance companies in theory and practice based on the processing issues of valuation in the context of current national and international legislation. Content of review are two selected insurance companies and analysis of the valuation of financial assets, which is important for the consumer - the client's insurance company, which financial resources are also part of the investment. In this context, the contribution is the output of a research project of Ministry of Education VEGA No. 1/0178/14 "Common the EU consumer policy and its implementation in the Slovak Republic with an impact on consumer education" which is solved on the Department of Marketing, Faculty of Commerce, University of Economics in Bratislava. The results of the analysis demonstrate that individual financial statements of selected insurance companies were developed on the basis International Financial Reporting Standards (IFRS), but in the use of information show disunity reported information. Although each insurance company complied with the mandatory requirements in the individual financial statements, disunity of reported information for the items that each insurance companies considered significant (indicated in the financial statements) was demonstrated at deeper analysis. In the research of the valuation of assets, which accounted for the largest part financial investments in financial assets, the disunity of of data also demonstrated, but it can be stated that in the valuation of financial assets did not reveal a significant differences.

### **1 INTRODUCTION**

Insurance business is a specific sector of the national economy, which is subject to very strict regulations on the part of the competent State, as well as from the European Union. Business entities are obliged to keep accounts in a market-oriented economy and to prepare their financial statements that it informs about their economic activity. Valuing banks, insurance companies and investment banks has always been difficult, but the market crisis of 2008 has elevated the concern to the top of the list of valuation issues. (Damodaran, 2013) The widespread acceptance of International Accounting Standards (IAS) / International Financial Reporting Standards (IFRS) makes it timely to examine their technical determinants as well as their implications for the accounting profession and the process of accounting harmonization. (Carmona & Trombetta, 2008)

Valuation is one of the most important problems of accounting theory and practice. It is a process in which the monetary amount is assigned to the item of the financial statements with

major impact explanatory power of accounting information. Accounting information is important for internal users, financial management and financial analysis of insurance companies. They are also very important input for external users - consumers – clients of insurance companies.

The basic objective of the accounts of insurance companies is to give a true and fair view of the facts that are subject to accounting and financial condition of insurance companies.

The aim of this paper is to define and compare the measurement of financial assets in the accounting of insurance companies in theory and practice from the treatment of the issue of valuation in the context of current national and international legislation.

The contribution examines two selected insurance companies operating in the Slovak market. They have an obligation to prepare individual financial statements in accordance with International Financial Reporting Standards (IFRS).

This knowledge about the valuation of these assets is important for the consumer - the client of the insurance company. His resources are essentially also part of the investment.

In this context, the contribution is the output of a research project of Ministry of Education VEGA No. 1/0178/14 "Common the EU consumer policy and its implementation in the Slovak Republic with an impact on consumer education" which is solved on the Department of Marketing, Faculty of Commerce, University of Economics in Bratislava.

## **2 LEGISLATIVE MODIFICATION OF VALUATION IN THE ACCOUNTING**

"Accounting is a specific scientific discipline with its own subject of examination and methodological means. It can be stated that the accounting and financial statements are the fullest and the most perfect sources of information about the business unit - the insurance company." (Majtánová & Palacká, 2005)

Accounting of insurance companies in the individual member states of the European Union is subject to both national and international legislation and it is defined by Directive 91/674 / EEC of 19 December 1991 on the annual accounts and consolidated accounts of insurance companies. The directive applies to commercial insurance companies, which are based with the aim to make a profit. This group of insurance companies does not cover health insurance companies and Social insurance company.

### **2.1 Transnational legislation**

Globalization causes deepening of international economic relations and the increase in the usefulness of economic information. Accounting entities achieve mutual comparability of financial statements using international harmonization of accounting. One of the instruments of international harmonization of accounting are International Accounting Standards (IAS) / International Financial Reporting Standards (IFRS) and US Generally Accepted Accounting Principles (US GAAP). (Martinière, 2005) International Accounting Standards (IAS) have been developed by the International Accounting Standards Committee (IASC). In 2001, the International Accounting Standards Board (IASB) became responsible for issuing standards and began to use the term IFRS. The aim was to point out the standardization of reporting and not standardization of accounting.

The aim of the International Accounting Standards (IAS) and International Financial Reporting Standards (IFRS) is the comparability of financial data, especially financial

statements. These accounting standards represent a recommendation or guidance for business entities (they are not mandatory).

International Financial Reporting Standards (IFRS) "are one of the instruments of international harmonization of accounting and they are used in preparing the financial statements of business subjects and also in financial reporting, they regulate the methodology of accounting and bookkeeping." (Staríčková, 2013) The International Financial Reporting Standards (IFRS) are composed of certain components, such as introductory provisions, scope and objective of standard, own content in standards, additional submissions and annexes.

Regulation of the European Parliament and of the Council 1606/2002 establishes the obligation for selected companies to prepare consolidated financial statements in accordance with IFRS. Since 2005, the financial statements are obliged to compile companies whose securities are admitted to trading on a regulated market in a Member State. Regulation also provides for Member States selectivity of decision in expanding the use of IFRS to other consolidated financial statements and the individual financial statements. Slovak Republic to take this opportunity in 2005 and 2006.

## **2.2 National legislation in the Slovak Republic**

Slovak Republic, in transition to a market economy, adopted into force of The law no. 563/1991 Coll. on accounting as amended, which was the first independent accounting law in history. It has changed the basic philosophy of accounting. The law comprehensively defined the basic accounting concepts, accounting systems and documents, accounting entries in the books, reporting in the financial statements, valuation of assets and liabilities, inventory of assets and liabilities. This law was designed according to the requirements of Council Directives of the European Union, but because of the close approach to the legal standards of the Slovak Republic with the European Union, the National Council of the Slovak Republic has developed and approved a more progressive legal standard. (Šlosár, 2008)

With effect from the first of January 2003 was adopted the new Act no. 431/2002 Coll. Accounting, as amended, which aim is to achieve complete content comparability with relevant European Union directives. Valid Act is a general legal standard intended for all types of entities. Responsible for determining the specificities in the accounting of different types of entities was the Ministry of Finance of the Slovak Republic, and by issuing measures (validity of measures to thirty-first December 2005).

The methods of valuation of assets and liabilities, as well as the valuation of other assets and liabilities are established for an insurance company, as well as for any other entity in the fifth part of the Act No. 431/2002 Coll. on Accounting as amended. The insurance company is obliged to appreciate assets and liabilities at the date of valuation, which is defined in § 24 paragraph. 1 as (Act No. 431/2002 Coll. on Accounting as amended):

- the transaction date,
- the date on which financial statements preparation,
- to another date in the accounting period.

Act No. 431/2002 Coll. on Accounting, as amended, was revised in October 2013 and changes entered into force on 01.01.2014. In this paper we will point out only the selected changes that have an impact on accounting of insurance companies.

Insurance companies have a duty to impose financial statements covering the thirty-first December 2013 in the register of financial statements. The introduction of the concept of registry of financial statements held in 2012. The amendment introduced new provisions regarding the obligation saving the financial statements in collection of documents

of commercial register. It also introduced the merging obligation to publish a balance sheet, profit and loss statement and information about the auditor's opinion on the financial statements in the Commercial Bulletin.

The various types of assets and liabilities measured at cost, own costs, face value, replacement cost, fair value. Amendment has changed the field of use of market prices and area of quantified estimate.

The fair value can be determined by the market price, qualified estimate or opinion of an expert. Quantified estimate may be used if it is not available market price or fair value is not reflected correctly.

The market price is defined as the final value made public at the stock market on the valuation date according to § 24 paragraph 1 of Act No. 431/2002 Coll. on Accounting, as amended, or as the most numerous price of the tender on the valuation date according to § 24 paragraph 1 or if this price was not declared, so can use the price from the immediately preceding day, the earliest from the tenth day before the date according to § 24 paragraph. 1.

The fair value is determined by quantified estimate in the case if the market price can not be determined reliably. Valuation models based on quantified estimates are based on the present value of future expenditure on property and income from property. Quantified estimate is based most often from the current value of future cash flows from the asset and future cash outflows of assets The discount rate is characterized as internal rate of return required by investors for the type property on the date of valuation.

### **3 GENERAL ASSUMPTIONS AND ACCOUNTING PRINCIPLES**

In the scientific literature, the authors do not match in the definition, classification and nomenclature of individual accounting assumptions and accounting principles. Therefore, we will introduce their the widest definition (Cushing, 1977) and point out the specific accounting principles used in the accounting of insurance companies.

The source of the correct valuation of assets and liabilities in the accounting is assumption of the accounting entity, the assumption of measurement using monetary unit, assumption of constant purchasing power of the accounting entity, the accrual principle, the assumption of preserving of the assets, assumption of periodic survey of income from operations and financial situation of the company. We pay attention to the first three assumptions. The assumption of the accounting entity allows legislative definition of the accounting entity as a bounded whole (natural or legal person), whose duty it is to keep accounts and prepare financial statements. Assumption of measurement using the monetary unit is the obligation of the accounting entity (insurance company) to value assets, liabilities, the difference between assets and liabilities in monetary units applicable in the country where it is based and conducts its business. Accrual principle provides accruals of costs and revenues in the accounting period which they arise.

The application of generally accepted accounting principles in practice is accepted, though not always individual principles are included in the legislation. (Nobes, 2005)

For the primary accounting principle is called the principle of true and fair view, which is superior to all other accounting principles. (Horton & Macve, 1995)

Insurance companies have different financial transactions than most other businesses. Insurance companies make their income in two ways. One is through the premiums they receive from those who buy insurance protection from them and the other is income from the investment portfolios that they maintain to service the claims. (Damodaran, 2013) For the

area of accounting of insurance companies are defined specific accounting principles from which we closer specify only some.

General accounting principle of compensation is applied in the accounting of insurance companies at commercial - liability relationships. It can not be used in compensating of assets and liabilities of insurance.

The insurance company has a duty to respect the principle of the compilation of analytical accounts to synthetic accounts at specified items of assets and liabilities. The compilation of analytical accounts is subject to several requirements that are extended with respect to insurance and reinsurance business in the accounting of insurance undertakings, such as the obligation to keep analytical accounts for technical results from the insurance and reinsurance.

The principle of creation and use of reserves is very important in the accounting of insurance companies. The insurance company is legally obliged to create technical reserves sufficient amount. This is in order to cover future liabilities resulting from insurance and reinsurance business.

The principle of creation and accounting of adjusting entries directs creation of adjusting entries to assets which is not carried at fair value. Impairment of assets is only a temporary nature.

In theory and practice, we can identify valuation principles as the specific rules which apply for selecting a specific price. Currently most applicable principles are the principles of valuation of historical prices, the principle of normal value or their combination. In theory and in practice, we know the other measurement principles, namely (Pakšiová, 2011):

- Imparity principle,
- The principle of lower price in measuring,
- The principle of replacement cost,
- The principle of fixed accounting price,
- The principle of future prices.

#### **4 VALUATION IN INDIVIDUAL FINANCIAL STATEMENTS**

"Financial statements are a structured representation of the facts that are subject to accounting, provided to persons who use such information. An accounting entity prepares financial statements in cases established by this Act and in the structure, which follows the accounting system used in the entity. The financial statements represent a whole." (Act No. 431/2002 Coll. on Accounting, as amended, § 17 paragraph 1). The financial statements must contain the general requirements specified in § 17 paragraph (2), as a business name or name of the accounting entity, identification number, date of preparation and the date on which it is established and more.

Financial statements in accordance with national accounting procedures must contain only three basic components, namely the balance sheet, profit and loss statement, notes.

Since 2006, commercial insurance companies prepare financial statements in accordance with IFRS. The first financial statements according to IFRS compiled by commercial insurance company to the thirty - first December 2006, if the accounting period was the calendar year. The duty of insurance companies in preparing the financial statements in accordance with IFRS was preparing its opening IFRS balance sheet at first of January 2005. The aim of compilation of an opening IFRS balance sheet was the possibility of data comparability.

The transition to the compilation of financial statements under IFRS led to a number of significant changes. (Foroughi & col., 2012) In the issue of valuation we can emphasize a

broader range of valuation base, finding the differences in the valuation of assets and liabilities and their valuation differences from revaluation.

In the International Accounting Standard IAS 1 - Presentation of Financial Statements is defined financial statements as a structured representation of the financial position and financial performance of an entity.

The objective of financial statements is to provide information about the financial position, financial performance and cash flows of an entity that are useful to a wide range of users in making economic decisions. Financial statements also show the results of management's stewardship of the resources entrusted to them. To meet this objective, financial statements provide in connection with the entity, information on (IAS 1 - Presentation of Financial Statements):

- Property,
- Liabilities,
- Equity,
- Revenues and costs, including profits and losses,
- Other changes in equity,
- Cash flows.

Financial statements according to IFRS must include five components, namely the balance sheet, statement of comprehensive income, statement of changes in equity, statement of cash flows, notes.

The concept of the balance sheet is not in the International Accounting Standard IAS 1 - Presentation of Financial Statements since 2009, when it was replaced by the designation statement of financial position. Insurance companies and other accounting entities may continue to use the name balance.

The balance sheet, as the most important part of the financial statements of the insurance company, provides information to users of the financial statements about the financial position the insurance company to the balance sheet date. "The balance sheet is the tabulated form of the composition of view of the business assets (assets) and the composition of the sources of business financing (liabilities) in monetary terms to a certain time." (Krištofik, 2011)

The insurance company must comply the minimum specified range of items in preparing the balance sheet of the relevant standard. Strict requirements on structure and reporting of individual items are not included in IFRS. The supervisory authority of the financial market determines the obligation to report specific items in the Ppn (BIL) 01-04.

"For banks, insurance companies and other financial institutions that do not implement their performance within a clearly defined operating cycle, but it is more appropriate to draw up a balance sheet not in terms of long duration and the short-term assets and liabilities, but in terms of liquidity, such as the presentation of the balance sheet provides the user more reliable and relevant information." (Krištofik, 2011) The insurance companies, as well as other entities, have the obligation to divide assets on current and non-current.

The insurance company publishes a summary of significant accounting principles in the notes, which includes valuation methods in preparing the financial statements and other significant accounting principles according to IAS 1 - Presentation of Financial Statements.

#### **4.1 Valuation of assets of financial investments**

Assets of insurance company are economic resources controlled by an insurance company that:

- It would be guaranteed economic benefits in the future
- They are a result of past events.

An important part of accounting of insurance companies is the issue of financial investments (investments). Necessary component is the acquired assets to identify, to charge and to report according to the sources from which they are acquired.

Financial investments may be paid from foreign sources or from its own sources of insurer. Foreign sources represent financial investment of technical reserves. Technical reserves are primarily formed to cover future liabilities arising from insurance amounts. Value of technical reserves must comply with criteria established by Act No. 8/2008 Coll. on Insurance as amended, and measures taken by financial market supervision. Own funds are equity funds. In the case of financial investments from its own sources, there is no legislative restriction. The insurance company must ensure solvency reporting. The insurance company may use its own and foreign sources for investment in assets, through (Meluchová, 2009):

- Financial investments in real estate,
- Financial investments in commercial companies,
- Other financial investments,
- Financial assets held for trading
- Financial assets available for sale and other equity,
- Financial investments in the name of the insured,
- Deposit by active reinsurance.

## **5 COMPARISON OF VALUATION OF ASSETS IN SELECTED INSURANCE COMPANIES**

In this part of the paper we present the results of research that we conducted on selected insurance companies of the Slovak Republic. The choice of insurance companies was made on the basis statistical comparison of important indicators for example the size of the share capital, size of the financial investments, volume of premium income or profit insurance companies. The aim was to analyze methods of valuation of financial assets. Every asset, financial as well as real, has a value. (Damodaran, 2012) The output we present the results only two selected insurance companies, and INSURANCE COMPANY 1 and INSURANCE COMPANY 2 that mandatory compile individual financial statements according to international standards IAS / IFRS. INSURANCE COMPANY 1 is an institution that plays an important role in the insurance market, the Slovak Republic and the individual variables are at high levels. INSURANCE COMPANY 2 is a company that operates in Slovak Republic shorter period of time and the results are average.

The content of the research was the valuation of assets with a focus on financial investments in financial assets, which we obtained by analyzing information from the accounting of selected insurance companies for the period 2008 - 2013. International Financial Reporting Standards (IFRS) do not determine the binding structure of the individual reports of individual financial statements, but for financial assets we consider in the insurance company:

- Financial assets at fair value through profit or loss,
- Financial assets held for sale,
- Financial assets available-to-maturity
- Loans and receivables,

- Cash and cash equivalents.

### 5.1 Characteristics of selected insurance companies

INSURANCE COMPANY 1 had a total share in the insurance market over 26.00 % in 2013. The share in the life insurance is lower than in the non-life insurance.

The value of assets was recognized in the amount of 2,035,242 thousand EUR in 2008. In 2009 was increase in assets the largest during the period 2008 to 2013, and by 94 518 thousand EUR more. At the end of 2012, the volume of assets achieved value 2,223,291 thousand. EUR and in 2013 had a value 2,245,663 thousand EUR. We observe an increase in value (eg. acquiring of new assets), as well as reduction in the value (eg. depreciation of assets) for each type of asset in the period 2008 - 2013. In the period 2008-2013 were active following items, namely property, plant and equipment ; investment property, intangible assets, equity investments in the subsidiaries and associates, financial assets available for sale, financial assets available-to-maturity financial assets at fair value through profit or loss, loans and receivables, the share of reinsurers on technical provisions, deferred tax claim, active accruals, cash and cash equivalents.

INSURANCE COMPANY 2 is an insurance company, which began to operate by merging the two insurance companies\_. Insurance activities during the period 2008 - 2013 performed as a universal insurance company, whose share of the total insurance market is slightly enlarged\_. The insurance company recorded an increase in the market for life insurance and non-life insurance\_. In 2013 the total share was in the Slovak insurance value around 3%\_. Assets recorded in the amount of 88,585 thousand EUR in 2008. By 2013, total assets increased in the absolute amount of 57,749 thousand EUR. The largest increase in assets occurred in 2010, namely 18 395 thousand EUR.

### 5.2 Financial investments (investments) in financial assets

The largest part of the assets of selected insurance companies in the period 2008 - 2013 consisted of investments in financial assets, which can provide achievability of future liabilities from insurance and investment contracts\_.

Financial assets in the separate financial statements of the selected companies in the period 2008 - 2013 we incorporated into five categories according to the purpose of acquisition, opportunities of merchantability in active markets and insurance companies plans.

Tab. 1 – Overview of the inclusion of financial assets into individual categories. Source: The individual financial statements of selected insurance companies 2008 - 2013 (own processing).

Insurance company	Financial assets available for sale	Financial assets available-to-maturity	Financial assets at fair value through profit or loss	Loans and receivables	Cash and cash equivalents
<b>INSURANCE COMPANY 1</b>	✓	✓	✓	✓	✓
INSURANCE COMPANY 2	X	✓	✓	✓	✓

Table 1 provides an overview of the inclusion of financial assets in individual category. Category of the financial assets available for sale are non-derivative financial assets that are not included in another category or classified as belonging to this category.

Financial assets available-to-maturity include the non-derivative assets with fixed validity and with determined or determinable payments. Each insurance company is willing to hold these assets to maturity.

Another category of financial assets are financial assets at fair value through profit or loss, which insurance companies have acquired for the primary purpose of trading. INSURANCE COMPANY 1 includes in this category:

- Financial assets available for trading
- Financial assets which have been classified as measured at fair value through profit and loss account from the beginning,
- Financial investments in the name of the insured at fair value through profit and loss statement.

The structure of financial assets in INSURANCE COMPANY 2 comprises:

- Debt securities
- Mutual funds,
- Financial investments in the name of the insured.

Loans and receivables are non-derivative financial assets with fixed or determinable payments and they also are not quoted in an active market.

The last category of financial assets insurance companies refer as cash and cash equivalents. They include cash on hand, demand deposits, valuables and other cash equivalents, such as bank overdraft loans.

Table 2 reflects the differences in value of financial assets during the period 2008-2013 in the analyzed insurance.

Tab. 2 - Financial assets in thousands EUR. Source: The individual financial statements of selected insurance companies 2008 - 2013 (own processing).

Year/ Insurance company	Financial assets available for sale	Financial assets available-to-maturity	Financial assets at fair value through profit or loss	Loans and receivables	Cash and cash equivalents	Financial assets together
<b>2013/INSURANCE COMPANY 1</b>	1 079 071	470 993	237 503	146 687	12 422	<b>1 949 676</b>
<b>2013/INSURANCE COMPANY 2</b>	0	65 118	29 641	9 240	481	<b>104 480</b>
<b>2012/ INSURANCE COMPANY 1</b>	1 011 698	522 741	227 640	137 231	12 879	<b>1 912 189</b>
<b>2012/ INSURANCE COMPANY 2</b>	0	59 447	28 169	10 709	373	<b>98 698</b>
<b>2011/ INSURANCE COMPANY 1</b>	904 863	572 108	225 321	145 074	10 368	<b>1 857 734</b>

<b>2011/ INSURANCE COMPANY 2</b>	0	53 524	22 296	10 352	550	<b>86 722</b>
<b>2010/ INSURANCE COMPANY 1</b>	898 858	572 003	218 579	146 783	2 502	<b>1 838 725</b>
<b>2010/ INSURANCE COMPANY 2</b>	0	44 172	22 140	9 989	341	<b>76 642</b>
<b>2009/ INSURANCE COMPANY 1</b>	800 942	588 868	186 805	208 234	7 039	<b>1 791 888</b>
<b>2009/ INSURANCE COMPANY 2</b>	0	42 032	12 892	9 703	592	<b>65 219</b>
<b>2008/ INSURANCE COMPANY 1</b>	686 994	588 853	143 688	216 908	63 454	<b>1 699 897</b>
<b>2008/ INSURANCE COMPANY 2</b>	0	44 846	7 121	8 479	427	<b>60 873</b>

We can state that in terms of the proportion of the volume of financial assets to total assets of specific insurance companies during the period 2008 – 2013, is not as striking difference between insurance companies. All insurance companies allocated the most of available resources in financial assets, which brings them income (interest rate, from the revaluation). This income should cover activity of insurance company, profit of insurance company and provide appreciation of life insurance contracts of insurance.

#### **Determination of fair value of financial assets**

INSURANCE COMPANY 1 determined the fair value of financial instrument using market prices (quoted) in an active market for the financial instrument. If these data were not known in an active market, it is a market for a financial instrument was not active, the insurance company determined the fair value of a qualified estimate. The insurance company has defined a qualified estimate with valuation methods, which included:

- Discounted cash flow analysis,
- Comparison to similar instruments for which already exist the market price,
- Valuation models of options,
- Use of recent executed transactions on normal commercial terms.

Specifically, we characterize the valuation of bonds in each category of financial assets for which to the date of preparation of individual financial statements was not available market rate. Bonds related to financial assets available for sale was valued at fair value, which was calculated using a discounted cash flow with a fixed discount rate. The discount rate is distinguished for government bonds and other bonds included in financial assets available for sale.

Financial assets available-to-maturity represented in INSURANCE COMPANY 2 debt securities whose fair value determined based on the available information in the financial market. In the event that this information was not available (not traded with bonds), the fair value determined using a quantified estimate in the case of the yield curve of bonds. The same

method of determining fair value using market interest rates used for loans and advances to insured.

### 5.3 Analysis in the INSURANCE COMPANY 1

Financial assets INSURANCE 1 consisted of five categories in the period 2008-2013, namely financial assets available-to-maturity, financial assets available for sale, financial assets at fair value through profit or loss, loans and receivables, cash and cash equivalents. The structure and value terms of individual category contains Table 3.

Tab. 3 - Financial assets in INSURANCE COMPANY 1 in thousands EUR. Source: The individual financial statements of selected insurance companies 2008 - 2013 (own processing).

Financial assets	2008	2009	2010	2011	2012	2013

<b>Financial investments in the name of insured</b>	140 294	180 794	209 243	212 808	223 722	230 198
Loans and receivables	216 908	208 234	146 783	145 074	137 231	146 687
Cash and cash equivalents	63 454	7 039	2 502	10 368	12 879	12 422
<b>Financial assets together</b>	<b>1 699 897</b>	<b>1 791 888</b>	<b>1 838 725</b>	<b>1 857 734</b>	<b>1 912 189</b>	<b>1 947 167</b>

In the monitored period, the insurance company allocated most resources in the range of 33.75% - 55.44% into financial assets available for sale, which accounted for mutual funds, shares, other equity, government bonds, corporate bonds and mortgage bonds.

Fixed-income securities included government bonds, corporate bonds, mortgage bonds and treasury bills. Since 2008, the value increased gradually. The objective of investing in securities with fixed income was to ensure the long-term stable income to cover obligations towards the insured.

Securities with variable income accounted for mutual funds, shares and other investments, whose volume during the reporting period decreased in 2012 compared to 2008 by 35 761 thousands EUR. Their share of financial assets available for sale decreased from 6.99% to 1.21%. The insurance company preferred investments in securities with fixed income before investments in securities with variable income in this category. Securities with variable income provided an increase in overall revenue (in the medium and long term) and higher quality of risk diversification.

Investments in the category of financial assets available-to-maturity included only securities with fixed income in the period 2008 - 2013. Among them, the insurance company had in possession government bonds, corporate bonds and mortgage bonds. The aim of investing in this category was consistent with the aim of investing in securities with fixed income in the category of financial assets available-to-maturity.

Financial assets at fair value through profit or loss consisted in the period 2008 - 2013 the mutual funds, hedge - RSU, hedge - SAR and financial investments in the name of insured. An important item was investments for the insured, which accounted investments primarily in share, mixed and bond fund.

To a subgroup loans and receivables included insurance company deposits in banks, loans and advances, receivables from insurance and reinsurance, other receivables and tax assets in the period 2008 - 2013. Their total value had a decreasing trend, while the biggest decrease recorded in 2010 and it about 29.51%. In 2013 the situation changed and the value increased. Deposits in banks represented embedded resources in the banking sector, which were not payable on demand. The least important item was tax assets.

Cash and cash equivalents were the least important item in financial investment in financial assets during the period. The last category of financial assets included cash and demand deposits.

Portfolio of Investments in financial assets can be described as conservative. The insurance company has placed the largest part of their resources in instruments with low risk and high-rated issuers.

INSURANCE COMPANY 1 was able to ensure sufficient funds to meet all obligations (from insurance contracts) through financial investment in financial assets in each year in the period 2008 - 2013. These conclusions are documented by figure 1, which shows that the volume of placement in financial assets exceeds the capacity of technical reserves.

Fig. 1 – Comparison of technical reserves and financial investment in financial assets. Source: The individual financial statements of selected insurance companies 2008 - 2013 (own processing).

#### 5.4 Analysis in the INSURANCE COMPANY 2

Financial investment in financial assets in the INSURANCE COMPANY 2 for the period 2008 to 2013 formed category of financial assets available-to-maturity, financial assets at fair value through profit or loss, loans and receivables, cash and cash equivalents, as outlined in the table 4.

Tab. 4 - Financial assets in INSURANCE COMPANY 2 in thousands EUR. Source: The individual financial statements of selected insurance companies 2008 - 2013 (own processing).

Financial assets	2008	2009	2010	2011	2012	2013
Financial assets available-to-maturity						
<b>Government Bonds</b>	35 839	35 839	39 646	43 085	49 022	52 636
<b>Mortgage bonds</b>	8 178	5 853	4 526	10 438	10 425	12 482
<b>Corporate bonds</b>	679	340	0	0	0	0
Financial assets at fair value through profit or loss						
<b>Mutual funds</b>	1 818	2 912	4 335	5 089	6 372	6 773

<b>Mutual funds (financial investments in the name of the insured)</b>	2 560	7 201	12 410	12 183	15 852	16 955
<b>Government bonds</b>	2 021	2 061	4 670	4 359	5 130	5 097
<b>Business bonds</b>	721	718	725	665	816	816
Loans and receivables	12 505	22 208	25 074	23 309	19 859	19 434
Cash and cash equivalents	427	592	341	550	373	481
<b>Financial assets together</b>	<b>64 748</b>	<b>77 724</b>	<b>91 727</b>	<b>99 678</b>	<b>107 849</b>	<b>114 674</b>

As the largest category we can select financial assets available-to-maturity. From the total financial investments in financial assets consisted from 48.16% (2010) to 69.03% (2008) The portfolio of financial assets available-to-maturity included government bonds, mortgage bonds and business bonds During the reporting period, the value of government bonds increased in 2013 by 16, 797 thousand EUR compared with 2008. INSURANCE COMPANY 2 allocated the most resources into financial assets available to maturity in order to reduce excessive volatility of profit or loss and equity capital.

In 2008, the insurance company allocated to financial assets at fair value through profit or loss 7 120 thousand EUR by mutual funds, government and business bonds. Their value has increased gradually acquisition of mutual funds and bond purchases by 22 521 thousand EUR to resultant 29641 thousand EUR in 2013. The largest part of the reporting period accounted investments in the name of the insured in mutual funds managed by various management companies, such as Spängler IQAM Invest (Austria), THEAM (France), IAD Investments.

INSURANCE COMPANY 2 had allocated resources in the subgroup loans and receivables in term deposit, loans, insurance claims, reinsurance claims and other claims. Cash and cash equivalents represented the least significant item of the financial assets of the insurance company in the period 2008 - 2013, which funds were allocated to current accounts in banks, cash and cash equivalents.

By comparing the volume of financial investments in financial assets with a volume of technical reserves established in Figure 2, it can be stated that the INSURANCE COMPANY 2 was able to secure sufficient funds to meet its obligations where necessary.

Fig. 2 – Comparison of technical reserves and financial investment in financial assets. Source: The individual financial statements of selected insurance companies 2008 - 2013 (own processing).

## 6 CONCLUSION

The implemented analysis shows that individual financial statements of selected insurance companies are prepared based on International Financial Reporting Standards (IFRS), but in the use of information demonstrate disunity of reported information in individual financial statements. Although each insurance company observes the mandatory requirements in the individual financial statements at deeper analysis, showed disunity of reported information for the items that the individual insurance companies considered significant (indicated in the financial statements).

In our research of valuation of assets, which the largest part accounted for investments in financial assets, the disunity of data also occurs, but it can be stated that the valuation of financial assets are not significant differences.

## **SMES' REPRESENTATION ON THE EUROPEAN UNION LEVEL**

*Ivana Mandysová, Karel Šatera*

### **Abstract**

This study is based on SMEs Situation Analysis of small and medium sized enterprises' (SMEs) interests being represented within the European Union (EU) multilevel governing system. It brings empirical research and in order to achieve a better insight into the structure of SMEs representation, to verify legitimacy in general business strategies. The cohesive and pervasive approach of the article derives from qualitative analysis of SMEs' representation sample, including broad spectrum of elements that interconnects different modes of interests representing in expert groups, SMEs representations and associations and European SMEs federations. This study analyzes forms and SMEs' options to push their interests and to enforce the proper EU decision-making process. To fulfill this, the increasing of SMEs' awareness is essential. Based on empirical study and in-depth interviews among the SMEs sample, article finds out what is the current climate for SMEs to be influential within the entire decision-making system. Choosing relevant way leads to less widespread of SME's interests' representation in the whole policy-making process.

*Keywords: Small and Medium Sized Enterprises, European Union, SMEs Interest Associations, Decision-making, EU Policy*

JEL Classification: M1, M16

## **1 INTRODUCTION**

To get access to institutions and actors in the policy-process, the SMEs have to gain legitimacy for its ideas. The company may be more successful, if it succeeds in framing its interests in an inclusive way. Hence agenda-setting is not just about having an issue considered actively by the policy-makers; it is also about how that issue would be defined once it has made its way into the agenda. It could therefore be of interest to study the way how importantly SMEs issues are regarded and how these interests are framed in the EU policy debates and processes.

Framing in this sense refers to the creation of a specific frame around an image of reality. This image involves problems, solutions, and actions within a policy domain. The EU agenda has historically been driven by a search for economic prosperity and global competitiveness. Changes in the global political economy, which enable large, global enterprises increasingly locate their industries outside of the EU, have increased awareness of the importance of SMEs to create and sustain new jobs in Europe (European Community, 2002).

The SMEs interests are therefore framed as "the backbone of the European economy and the most important creators of new jobs and economic growth". The growing concern of European leaders that an ordinary citizen feels left out of the integration process has made the Commission to consider some interests more appropriately to boost than others. The Commission has consequently promoted organizations of the least represented social interests in order to achieve a more balanced participation. Hence, through SMEs, the Commission can

promote growth and jobs in the EU, in the same way as it promotes weak and social stakeholder (i.e. a small enterprise) instead of the large multinational enterprise.

There are over 20 million enterprises in the European Union (EU) in 2007. Only about 43 000 of these are large-scale enterprises, i.e. 0,2 % of all enterprises (European Commission, 2014 a). Hence, the vast majority of enterprises are small and medium-sized enterprises (SMEs). Approximately 90 million people are employed by SMEs. In regards of their policy development, directorate general (DG) Enterprise and Industry of the European Commission (EC) is strengthening the dialogue and consultation with SMEs stakeholders. SMEs prosperity was seen as a crucial factor for achieving higher growth rates, more and better jobs in the EU. SMEs became known as a ‘backbone of the EU’s industry.

## **2 DEFINITIONS AND GENERAL CHARACTERISTICS**

### **2.1 Definition of SME and representation organization, types, source of financing**

Definitions of SME are much depending on criteria such as number of employees and turn over. In 1971, Bolton Report defined SMEs on the basis of number of employees, turnover and an economic definition that was based on the essential characteristics of the small firms. These characteristics were: a small share of the market, operating independently and an owner-managed organization.

Further, EU has also categorized macro, small and medium businesses based on number of employees. According to the EU, SMEs are defined as “any entity engaged in an economic activity, irrespective of its legal form. This includes, in particular, self-employed persons and family businesses engaged in craft or other activities, and partnerships or associations regularly engaged in an economic activity” (Commission Regulation (EC) No 70/2001). Micro and small and medium-sized enterprises are defined as enterprises employing fewer than 250 persons and which have an annual turnover not exceeding EUR 50 million and/or annual balance sheet total not exceeding EUR 43 million.

Tab. 1 - Type of Firms. Source: Commission Regulation (EC) No 70/2001

Type of the firm	Micro	Small	Medium
Number of employees	1-9	10-99	100-499

In the Czech Republic, a company is usually classified as a small and medium sized enterprise when it has up to 250 employees as per Act 47/2002 of 11 Jan 2002 amended 1/2004. It is true that a vibrant small business can make a significant impact on the local economy. Many firms have limited ambitions to grow, but provide an important source of employment in the local communities and give independence and status to their owners. At the same time size, flexibility and fast responsiveness of small businesses allow them to react quickly and change in a competitive environment. Small firms are also seen as a key source of innovation, providing new types of product and services, and new ways of delivering old services.

The representation organizations are defined as organizations that have been set up by and are representing the private sector. They can be distinguished and include SMEs in general, co-operatives and social economy enterprises, craft enterprises, women enterprises, ethnic minority enterprises, young entrepreneurs, high-tech enterprises, family business (European

Commission, 2013 a). However, the representation organizations perform a **range of activities** not only to promote the interest of their members but also support their members. This includes, among others: political lobbying, participation in fairs, exhibitions, networking, fostering cooperation and exchange of information between members, participation in business delegations, providing education and training, counseling and performing research. Support is provided in export, business transfer, starting a business, access to finance, tax policy, social security, environmental laws, health and safety laws, innovation and technology.

Some organizations also focus on more general issues such as reducing administrative burdens. Organizations receive their **finance** from membership fees. Some obtain additional income from selling products or services and government subsidies. Other sources are: European funds, donations, sponsoring and participation in projects (European Commission, 2013 a).

### **3 THEORETICAL BACKGROUND**

Current theory refers mainly to the logic of membership and adopts a 'bottom up' perspective. It asks why and under what conditions members of a group would be willing to form and join an interest association, and what associations have to do in order to recruit and keep members. The main criticism against current theories is that they ignore the social aspect of associations and the possibility to associate in order to achieve 'common goods', such as benefits from the implementation of specific policies (Olson, 1971). However, this discussion is relevant in relation to SMEs at the national and EU level. Once a decision has been made to associate at the national level it is also rational to associate at the European level.

The collective action problems are therefore no more than background factors to the constituency of EU federations (associations of associations), since these European federations, unlike the national associations, draw their membership constituency primarily from those who are already politically active. Hence, participation in an EU federation is means to advance the interests of the national grouping (Aspinwall and Greenwood, 1998).

It is widely accepted that external circumstances and institutional organization have important consequences for interest associations and their possibility to influence SMEs. It is regarded as important to retain a sense of limits as to what interest associations can and do contribute to **policymaking and SMEs** support generally (Cram, 1998). A central feature of the European lobbying system is that, it is essentially a multi-arena, multi-level, decision-making system, in which all actors necessarily participate in a complex series of 'nested games' at both national and European levels. Thus, it is a system of multiple access points created by institutionalized multi-level governance. The fact that there are so many different venues for lobbying means that the EU is a multifaceted policy process (Brodsky and Striteska, 2007).

A policy sub-domain concept, which makes it possible to study interest in different arenas, is useful when **analyzing influence of SMEs on EU policymaking**. It allows for comparison of the influence of an interest between different policy sub-domains, since the influence of this interest can differ between different areas and levels. The EU political system is therefore often described as one, in which no type of interest can routinely dominate due to the highly pluralistic, competitive, complex and multi-level system of networks, which is accessible to a range of interests.

However, according to several authors some interests can prevail over general policies under certain circumstances. According to Greenwood, (Greenwood, 2007) one example is an interest with a highly technical character, with a narrow sectional interest, where the costs are diffused widely across the society. Dominance may also arise where the interest of a particular constituency is uniformed with the broader aim of the European integration and within the climate in which policymaking takes place. This allows for the interest's constituency to define and 'frame' issues from which policy initiatives follows. Furthermore, interest will be widely shared and accepted if it is relevant to a burning issue and promises a successful problem solving (Kohler-Koch, 1997).

Several authors also emphasize that the EU and national institutions play an active role in the SME policy process (Cram, 1998). Institutions are said not just to be 'political arenas', but actors actively shaping norms and values, able to develop their own agenda - not only a structure, in which other actors - SMEs - pursue their goals. The European SME Federations (association of associations) are said to be multilevel actors through the work done at national level by National Associations. EU SMEs Federations keep contacts with the EU institutions and concentrate mainly on the agenda-setting and policy formulation. Hence, these Organizations are specialized in representing SMEs interests at the EU level during the early stage of the policymaking process.

To answer the question how, and to what degree SMEs and its associations can influence the EU policy-making, the mechanisms of influencing SMEs' associations need to be considered. Yet, they are not acting in vacuum, and therefore one also has to reconsider the structure of policymaking on both the national level and on the EU. Euro Commerce was the only federation that mentioned co-operation between different kinds of SMEs' federations, which could indicate a low degree of co-operation between horizontal and sectorial SMEs federations. Without the collaboration between general and sectorial federations, the SMEs' influence would most likely/probably be less far-reaching.

Hence, co-operation between horizontal and sectorial organizations could strengthen the SME representation in the dual EU policymaking structure. Obstacles for SMEs representation are heterogeneous preferences within the federations due to national differences, a division between service - and policy representation and competition between different federations. (Richardson, 2001)

#### **4 OBJECTIVE, EMPIRICAL RESEARCH METHODS AND LIMITATIONS**

The study examines the system of SMEs representation organizations, the cohesive and pervasive approach of the article derives from empirical research and from qualitative situation analysis of representation organizations, including broad spectrum of elements that interconnects different modes of interests representing in expert groups, SMEs representations and associations and European SMEs federations. The purpose is to reveal how these possibilities may affect or enhance SMEs' awareness, push their interests and enforce the proper EU decision-making process. The intention is to analyze current situation by conceptualizing research in this area.

Research is based on qualitative research method. Qualitative research is the process of searching for the essence, based on different methodological traditions, exploring the social or

human problem. For qualitative research it is typical that hypotheses are generated only during the research, trying to understand a new problem.

The reason for choosing this method is that this area is quite complex. It involved the collection and analysis of qualitative data. The main characteristic of the method held was an in-depth insight that has been applied.

It was an empirical study of originally 52 enterprises, but their number has been reduced to 30 in order to get statistically representative sample. SMEs were selected and divided properly by the sector so that the examined companies sample corresponds by its number and structure to NACE classification. Selected companies actively export or import and have more than 5 years of international performance experience. All of them are Czech owned and are located in Pardubice region. Data were obtained by interviews with managers or owners of businesses.

Tab. 2 - Example description. Source: Author.

	Micro	Small	Medium
Surveyed entities	11	14	5

The procedure of empirical data collection: respondents were recorded and then the text has been transcribed literally. 200 pages of text have been obtained. The research has been carried out during the past 2 years. The text confirms or refutes identified questions. Subsequently, the data were processed and analyzed.

The limitations can influence the quality of findings or ability to effectively describe research outcomes. To recognize limitations of research, following factors were found as limitations:

- used sampling technique limits to certain degree ability to make broader generalizations from our results
- qualitative sample technique a priori gathers descriptive data. This could lower ability to make statistical inferences from our sample to the enterprises being studied
- however, the degree to which this reduces the quality of our findings is a matter of debate

The reason for choosing relevant method was huge variety of respondents; hence analysis of different types of received texts seemed better way to get information about the views of respondents, rather than questionnaire. In order to create complex holistic picture of situation, the qualitative method has been selected.

To determine situation regarding SME representations and aiming to provide relevant situation analysis the empirical interviews has been selected. In order to demonstrate it substantive questions were carried out accordingly based summarizing obtained text. For this purpose following relevant clear questions were finally chosen. (See chap. 5.1.):

- *Does your company push your interests via national institutions or via supranational institutions in Brussels?*

- *If it does via supranational institutions, do you practice contact with European Commission and DG Enter or you rather prefer contact with Czech Permanent Representation?*

## **5 RESEARCH OUTCOME AND SITUATION ANALYSIS**

### **5.1 Czech SME – research outcome**

Tab. 3 - Forms of SMEs' Representation Source: Author

	Number of companies	in %
A: We push our interests via national institutions	15	50
B: We push our interests via supranational institutions in Brussels	26	86
Ba: We have regular contact with European Commission and DG Enter	12	40
Bb: We have regular contact with Czech Permanent Representation	18	60

Answers were grouped into A and B groups. In case the answer was B, second question has been asked. These answers were grouped into Ba and Bb groups.

By processing answers, there have been found and described the strongest dependencies: 50 % of companies with international performance push their interests via national institutions only. But majority of sample companies push their interests via supranational institutions in Brussels, which they see as fast and the strongest possibility to influence legislation in progress. They do it via EC Directorate General ENTER (40 %) or via Czech Permanent Representation (60 %). (Tab. 2)

Czech SMEs organizations are represented in all levels of the EU policy-process and SMEs interests have access to both national and supranational institutions. Both UEAPME and BUSINESSEUROPE are Social Partners and all groups have regular contacts with the Commission. Hence the Horizontal SMEs Federations can be seen as an 'included group' in DG ENTER (DG= Directorate General), which additionally is seen as a powerful part of the Commission. However, the distinction between more widely policy-concentrated DGs and more regulative DGs affects SMEs interests negatively since SMEs interests are less represented in the more regulative body.

Financial restrictions are mentioned by the Czech SMEs Associations as a restriction, and this could also be important in this particular case since the Structural Funds could be only seen as an indirect SMEs issue.

The Czech associations are represented in both Czech Republic and Brussels (European Union institutions) and the Czech officials seem interested in promoting SMEs interests in the EU policy-process. However, the Permanent Representation venues seem to be the least

successful. Focusing upon SMEs and their interest associations therefore adds a further dimension to the research on business interests of SMEs.

## **5.2 Mechanisms to test impact of the EU legislation**

The policy-making process in the European Union sees legislative proposals from the European Commission debated both by Members of the European Parliament and by representatives of Member States' governments within the Council of the European Union. And in general, the Commission consults with interested parties both formally and informally before it draws up its proposals, such as the Small Business Act for Europe. So there are opportunities for those affected (or potentially affected) by policy to make their views known at several stages in the process.

For SMEs - often the largest group of enterprises to be affected by new policy - there are clear difficulties in putting their views across to policy-makers. **SMEs do not usually have the resources which large firms dedicate to influencing policy-making or lobbying.** For this reason, the Commission has appointed a SMEs Envoy and encourages an effective and wide-ranging consultation of SMEs as one element of its Think Small First principle. The Commission is also encouraging Member States and regions to adopt similar measures, ensuring greater representation of SME interests at all levels of policy-making. To this end, it has sought to identify and share examples of effective SMEs consultation and involvement in policy-making.

The opinions of SMEs are important when developing new EU legislation or programs that have a direct impact on their operations. The system is called "Listening to SMEs". This is why the Commission, through the Enterprise Europe Network, operates two mechanisms to test the impact of EU legislation and programs i.e., in advance via SMEs panel and retrospectively via the SMEs feedback mechanism.

### **1. In advance via SMEs panels:**

SMEs Panels are organized to consult SMEs about forthcoming EU legislation and policies. The Enterprise Europe Network partners will select suitable SME participants, run the SMEs panels and provide the Commission with the results. The result will be used when preparing new legislative or policy proposals. SMEs panels will be operated in liaison with the SMEs Envoy to ensure that the needs of SMEs are continuously taken into account in EU lawmaking.

### **2. Retrospectively via the SMEs feedback mechanism:**

The SMEs feedback mechanism allows the Enterprise Europe Network partners to collect the views and feedback from SMEs on a broad range of EU policy initiatives, actions, legislation or programs related to the internal market. The typical policy areas where feedback will be requested include the environment, sustainability, employment and social affairs, innovation support, taxation and customs and, in more general terms, better regulation and simplification (European Commission, 2013 b).

There seems to be a general concern about SMEs issues. Still, SMEs' Interest Associations and Federations are not satisfied. UEAPME (Union Européenne de l'Artisanat et des Petites et Moyennes Entreprises i.e. the European Union of Crafts and Small and Medium-sized Enterprises) states that "better regulation" tops the list of the most frequent buzzwords in

Brussels. Additionally BUSINESSEUROPE states that much more should be done for the European SMEs, and EUROCHAMBRES says that it is time to move from “think small first” to “act small first”. Although it might be in their interest to complain, in order to further strengthen their interests and organizational power, there might be some features that complicate the realization of wider representation of SMEs interests in the EU settings.

### **5.3 Large enterprises versus SMEs**

SMEs associations are not acting in a vacuum, and to understand these associations' possibility to influence the EU and national policies, it is important to take the multilevel policymaking arrangement into account. First of all, some of the most important European Union tools for businesses in Europe, such as the Single European Market (SEM) and the Competition Policies, were created with large enterprises in mind. It is a widely held opinion that the creation of the SEM tends to favor big businesses. The SMEs Associations, Federations and the Commission also highlight the problem for **SMEs to benefit from the Internal Market**. We dare to say that „it goes without saying that the Internal Market is yet not a reality for SMEs”. Large enterprises have necessary resources to overcome trade barriers, but not the SMEs.

Legislation is still drafted from big organizations and enterprises' points of view. This is due to the fact that most officials creating legislations come from big administrations or are employees in big enterprises. There is much more focus on big firms in the EU. This focus will however be shifted step-by-step. Competition policy has a special place in the European policy environment, because it defends the essential mobilizing principle of the EU, and collective interests in economic efficiency have been secured through the creation of a common market. There seems to be a tension between competition policy and company support, such as policies to encourage SMEs, since competition policies were mainly created to reduce problems with monopolies and state aids. However, exceptions from competition policies are made for SMEs; instead of them, new legislations should be made for SMEs.

One of the reasons why SMEs are still exceptions is that only eight percent of SMEs are involved in export. Commission takes SMEs into consideration when regulating consumer goods. (Yet one can imagine these concerns to be less influential if the large enterprises are pleased.) Additionally, 90 percent of all SMEs are actually micro-enterprises, with five employees on average. These micro-enterprises account for 53 percent of all jobs in Europe, so they are of great importance to the European economy. However, large enterprises are main employers, when separating micro, small and medium-sized enterprises, with a 32.9 % share. One can therefore argue that there are still incentives for politicians and officials to take great considerations of large firms when creating European economic policies. Hence, there are still some ‘practical barriers’, such as institutional factors and economic importance of SMEs.

### **5.4 Situation analysis**

There is a large variety of SMEs business representation organizations active in the EU, such as trade and professional associations and federations, entrepreneurs associations, representative organizations of the self-employed/sole proprietorships, etc.

The wide range of enterprise constituency is probably also affecting the SME interest representation. Different European federations stand against each other and this could hinder

the possibility of working united for the interest of SMEs. This could thereby weaken the possibility for SME interests to be influential in the policy-process.

Euro centers work to act as a two-way street between SMEs and EU decision-makers to encourage enterprises to interact with policy-makers at the EU level. The policy part is restricted to distributing consultation forms from the European Commission (EC) to the SMEs members in the Network. Hence, there is a direct contact between the EC and the SMEs. Also, a majority of former European International Contractors (EIC) representatives consider the European Commission to be keen to listen to the SMEs. This method can be seen as important since all stakeholders, and not only the organized ones, have a possibility to give their feedback to the Commission. Yet, if the forms are complicated, it is less probable that there is a high degree of SMEs participation. The Enterprise Europe Network (EEN) is considered to be an important tool to promote SME Interests according to both the Commission and the European Parliament (EP), and both institutions have been involved from the very beginning. There is a trend for some parts of the European Commission to bypass Associations and Federations in favor of direct contact with entrepreneurs.

It has been argued that the main problem for business federations is not the creation of federation, but the heterogeneous rather than homogenous association members, as well as the members will to keep some autonomous characteristics. The relationship between these heterogeneous actors affects the possibility for the association to act. Furthermore, one problem with wide federations is the slow and cumbersome 'lowest common denominator proneness' that can be found among associations seeking to represent a membership wide constituency (Greenwood, 2007 and 2001).

Despite the fact that a large member constituency can cause problems, it also gives higher legitimacy in the EU policy-process (Rainer, 2009). A common position from different SME Associations strengthens the legitimacy of SME Interests. The power of Business Interests Associations (BIA) is additionally considered to depend upon the association's capacity to link several levels of the multilevel system. That is, to effectively gather support through lobbying all relevant policy areas, i.e. in both Member States and Brussels (Katz, 2001).

Associations that manage to be present throughout the different policy levels, multilevel players, are considered to be the most successful ones. SME interests need to be supported from a powerful coalition of member governments, EU and national institutions. Interest representation requires becoming influential in policymaking. Resources and market power are said to be yet another important power tool for business interests. However, Greenwood and Webster (Greenwood and Webster, 2010) argue that market power does not automatically translate into political power and claims that it is possible for BIAs with special interests to prevail in certain types of circumstances. Finally, BIAs are not rational actors, which take rational decisions.

Associations do not always understand what they are doing and what the outcomes of their decisions may be, since they are involved in a whole series of policy games at different levels of the national and EU system. This explains why they may appear to settle for sub-optimal choices.

SMEs interests should dominate in general policymaking due to their importance for the European competitiveness, its wide constituency and since its interests can be related to the European integration. Wide variety of national business representations ranges from very small to very large. Some are very experienced and professional in defending the interest of

their members and very well informed about their needs. Others are rather young and still learning. Some have mainly individual enterprises as member, others are umbrella organizations. Given the great variety of business organizations, there is room for a learning process: some organizations are so well developed and experienced that they may offer their knowledge and experience to other organizations.

## **6 CONCLUSION**

To achieve better insight into system of SMEs' representations, it is essential to take into consideration: whether they are sufficiently involved in policy making, which includes development of collective agreements, influencing policy, participation in official committees and standardization committees, whether the organization has an office in Brussels and whether it is a member of European organization. Hence, to analyze how the interests of SMEs are represented in the national and European multileveled policy-process, we examined SMEs interests seem to be considered as important by both European and Czech institutions. As such, SMEs still use the common market to a less extent than large enterprises. However, barriers and problems remain because institutional arrangements were formed especially for large enterprises.

The results show that SMEs are represented by both private and public national associations and by horizontal and sectorial federations. Czech Associations are represented at both national and European level, but it is the horizontal federations that are seen as the 'official' SMEs' organizations by the Commission. The fact that the Commission makes a distinction between horizontal and sectorial federations creates one of important issues for SMEs interests representation since many parts of the policy-process have been designed for sectorial interests. However, the wide constituency in horizontal federations gives SMEs interests legitimacy in general business strategies, but at the same time weakens representation in specific sector policies, since only sector federations are represented in particular industry policymaking.

Funding is however an important issue for the Czech SMEs. Hence if this was unfamiliar for the Czech Associations, arrangement with separated lobbying organizations and EU service providers might be problematic. The results of the EU legislative changes will be felt years after the legislative discussions. This makes the immediate effects of missed opportunities negligible, whereas the long-term consequences may be considerable. SMEs should not be regarded as uninteresting for the EU just because they are uninteresting by its structure. This may indicate that the membership incentives differ among different Czech BIAs.

The analysis and empirical research shows that SME interests can frame the EU economic objectives, but that institutional arrangements and barriers make it difficult for SMEs interests to be influential within the entire EU policymaking system. In addition, SMEs interest representation is mostly horizontal, with a cross-constituency, and EU policymaking is often conducted in sectorial settings. This leads to a less widespread SMEs' interests' representation in the EU policy-process.

## **DECOMPOSITION OF GDP GROWTH AND CONVERGENCE OF SELECTED INDICATORS**

*Silvia Megyesiová, Vanda Lieskovská*

### **Abstract**

The real growth of the gross domestic product (GDP) depends on many factors. The aim of the paper is to find out how the real GDP change depends on the changes in productivity and employment. For analysis the indicators of 28 EU Member States were used. According to expectations the driver of GDP growth is the labor productivity. The crisis influenced the development of the convergence process of selected variables in a negative way. The variability of the employment rate, measured by the coefficient of variation, increased over time rapidly and reached its highest level in 2013. The annual GDP growth from 2000 to 2008 reached almost 2.1 % in EU-28. In the same period the labor productivity grew by 1.1 % annually and the total employment increased only by 0.9% per year. The situation changed dramatically in the recession period. The contribution of the employment to the total GDP change was negative in 2008 – 2013. While the GDP declined by 0.2 %, the total employment dropped in the same period by 0.6 % per year. The productivity in the recession showed a positive development with a moderate increase in the EU-28 by 0.3 %.

*Keywords: productivity, employment, gross domestic product, decomposition*

JEL Classification: E24, O11, O40

## **1 INTRODUCTION**

GDP, productivity, employment or unemployment are the key indicators of macroeconomic stability and sustainable development. Indicators of employment and productivity are often used to determine their individual effects to the total GDP change. For that reason the method called growth accounting was used in this paper to describe the importance of selected variables to the economic growth.

## **2 DECOMPOSITION OF THE GDP GROWTH**

Gross domestic product (GDP) measures economic activity and is one of the core indicators of economic performance. Real GDP change can be broken down into a part which is due to growth in productivity and a part which is due to increase (decrease) in employment. The economic crisis has reversed the process of convergence of the GDP per capita for two years. The recovery of the EU economies is slow; some Member States faces decrease in the real GDP for several years.

### **2.1 Gross domestic product, employment and productivity**

The GDP real growth decomposition highlights the growth in labor productivity and changes in total employment. Productivity is a key source of economic growth and competitiveness (OECD, 2013). In the paper the following formula for the decomposition of GDP was used:

$$GDP = E \cdot \left( \frac{GDP}{E} \right) \quad (1)$$

where

GDP – gross domestic product,

E – total employment (domestic concept),

GDP/E – labor productivity.

The change in GDP, employment and productivity will be expressed in form of relative change indexes of selected indicators in time  $t$  and  $t - 1$ :

$$i_{GDP} = i_E \cdot i_{\frac{GDP}{E}} \quad \text{e.g.} \quad \frac{GDP_t}{GDP_{t-1}} = \frac{E_t}{E_{t-1}} \cdot \frac{\frac{GDP_t}{E_t}}{\frac{GDP_{t-1}}{E_{t-1}}} \quad (2)$$

After taking the logarithm of formula (2) we get:

$$\log i_{GDP} = \log i_E + \log i_{\frac{GDP}{E}} \quad (3)$$

The formula (3) should be divided by  $\log i_{GDP}$  to calculate the impact of each factor, indicator to the total relative GDP change:

$$1 = \frac{\log i_E}{\log i_{GDP}} + \frac{\log i_{\frac{GDP}{E}}}{\log i_{GDP}} \quad (4)$$

Similar analysis has been adopted by Piacentini and Sulis (2000) with the attention on GDP per capita, productivity per employed person and employment calculated over the total population. Due to growth accounting method, when the GDP per capita real growth was decomposed into three components (labor productivity, labor force participation rate and the employment rate), as the main driver of per capita GDP growth the labor productivity was identified (Canada's State of Trade, 2010). Marattin and Salotti (2009) presented a decomposition of GDP per capita growth by five variables, including some supply side and demographic factors.

The annual real growth rates of GDP of all 28 EU Member States with the participation of the two most important economic indicators (productivity and employment) are presented in figure 1.

### 3 CORRELATION AND REGRESSION ANALYSIS

Pearson's correlation coefficient between selected variables of the economic situation of the EU Member States was calculated to discover whether the statement of Pivonka – Loster (2013), that GDP and its growth can be used as a proxy of the country's productivity, is correct.

In years 2000 – 2008 the average annual GDP growth reached in EU-28 almost 2.1 %. In the same period the labor productivity grew by 1.1 % annually but the total employment increased only moderately by 0.9% per year. The situation changed dramatically in the recession period. The contribution of the employment to the total GDP change in 2008 – 2013 was negative. While the GDP declined by 0.2 %, the total employment dropped in the same period by 0.6 %. Only the productivity in the recession showed a positive development with a moderate increase in the EU-28 by 0.3 %. The situation of the decomposition of two selected indicators is visible also from the fig. 1. The total employment significantly influenced the GDP change before the recession, beginning in 2005 till 2008. The real GDP growth in 2001–2004, 2010, 2011, and 2013 was significantly influenced by real labor productivity growth.

In case of Slovakia the impact of the selected indicators is more significant. While in 2000 – 2008 the GDP increased by 6.2 % annually, the productivity grew by 4.8 % and the total employment increased only by 1.3 % per year. It means that the increase in productivity was the main source of economic growth. In time of recession (2008 – 2013) again the productivity caused the economic performance due to an annual real positive change of 1.5 %. In the same time the total employment shrunk by 0.5 % annually.

Fig. 2 – Growth in real GDP and productivity (GDP per person employed), 2000 – 2008.  
 Source: Eurostat, own calculations

Between GDP growth and productivity changes, there exists a statistically significant linear relationship. This linear relationship is evident from the figure 2, where the x-axis represents the annual real change in productivity and the y-axis represents the annual real GDP growth between 2000 and 2008. The Pearson's correlation coefficient between these indexes was as high as 0.827 ( $p < 0.0001$ ,  $p$  value – significance level of the test, correlation analysis). In countries with low GDP per capita the annual increase in GDP was very strong. For example in Romania the GDP annually increased by 6.5 % and the productivity grew by 8.4 %. In Latvia the real GDP grew by 7.4 % each year between 2000 and 2008 which was combined with an annual increase in real productivity by 5.9 %. On the other hand the countries with high GDP per capita reached only a moderate annual GDP growth combined with a moderate productivity change. This concept is very similar to the concept of  $\beta$ -convergence.  $\beta$ -convergence refers to a process in which poor regions grow faster than rich ones and therefore catch up on them (Monfort, 2008).

The correlation between the GDP growth and total employment change was not statistically significant ( $r_{xy} = 0.086$ ,  $p = 0.66$ ). In figure 4 the linear regression of the GDP growth and changes in employment in the EU Member States was investigated. And the results are naturally identical with the correlation analysis of these two selected indicators.

The Pearson's correlation coefficient was statistically significant between the indexes of productivity growth and employment. In this case the relationship was negative, which indicates that if the productivity increases the employment decreases ( $r_{xy} = - 0.488$ ,  $p = 0.008$ ).

Between 2008 and 2013 the Pearson's correlation coefficient of the GDP and productivity indexes reached only 0.33 and was not statistically significant ( $p = 0.07$ ). According the fig. 3 this result was expected. The correlation of the GDP growth and changes in employment was

positively linearly related ( $r_{xy} = 0.737, p < 0.0001$ ). In the period of recession the increase of employment is related with an increase in real GDP, which was not typical before the recession.

#### 4 SIGMA-CONVERGENCE

While  $\beta$ -convergence focuses on detecting possible catching-up processes, Sigma-convergence refers to a reduction of disparities among regions in time (Monfort, 2008). The Sigma-convergence can be analyzed through variability measures like standard deviation or coefficient of variation. The crisis brought to an end a long period during which regional disparities in GDP per head and unemployment were shrinking (EC, 2013). The relative measure of variability, the coefficient of variation was calculated for GDP per capita in

purchasing power standards (PPS), productivity (GDP in PPS to total employment) and for employment rate (rate of the employment to the total population). In figure 5 the coefficient of variation (index, 2000 = 100) is presented for all selected indicators. The variability of the productivity shows a very positive development over analyzed period of time. The labor productivity between Member States was lowest, according to coefficient of variation, in 2013. The positive process of Sigma-convergence in GDP per capita was aborted in 2010, but in 2013 we can see an improvement in the variability of GDP per head. Hopefully this process will continue in the nearest future.

Fig. 5 – Sigma-convergence of the EU Member States. Source: Eurostat, own calculations

## 5 CONCLUSION

Statistically significant linear relationship between GDP growth and productivity changes was discovered at the beginning of the analyzed period (2000 – 2008). The Pearson’s correlation coefficient was positive and as high as 0.827. In countries with low GDP per capita the annual increase in GDP was very strong and was combined with a high real increase in productivity. On the other hand the countries with high GDP per capita reached only a moderate annual GDP growth and also a moderate productivity change. This concept is very similar to the concept of  $\beta$ -convergence in which poor regions grow faster than rich ones and so continues the catch up process. Between 2008 and 2013 the Pearson’s correlation coefficient of the GDP and productivity indexes reached only 0.33 and was not statistically significant. In this case the GDP growth cannot be used as a proxy of the country’s productivity change. In the period of recession the increase of employment is statistically significantly related to the increase in real GDP, which was not typical before the recession. Sigma-convergence process of GDP per capita and productivity over time is positive. There was an increase in variability of the GDP per head in 2010-2012, but the situation changed again in 2013. We evaluate the development of the coefficient of variation in employment negatively. The variability of the employment rate (employment to the total population) increases over time rapidly. An

increase of the total employment in less developed countries of the EU could be associated with an increase of the real GDP and also with a decrease in Sigma-convergence coefficient in the future.

## **COMPANIES' FINANCING THROUGH THE CAPITAL MARKET IN THE COUNTRIES: AUSTRIA, THE CZECH REPUBLIC, POLAND AND SLOVENIA**

*Lucie Meixnerová*

### **Abstract**

The paper deals with comparison of capital markets in four European countries: Austria, the Czech Republic, Poland and Slovenia and primarily in terms of the possibility of obtaining external funding sources. The main quantitative characteristics are analyzed: number of accepted emissions on the stock exchange, the market capitalization of stocks and bonds, trading volume, issue costs and the gross domestic product of selected countries, the comparison is done for the period 2002 – 2014. Research has proved the existence of a positive and statistically significant relationship among trading volume, market capitalization, and the quantity of gross domestic product, i.e. existence of capital markets is essential for the further development of the company and is connected with the performance of the economy as measured by the growth of gross domestic product.

*Keywords: enterprise, external funding sources, market capitalization, stock exchange, stock market, trade value*

JEL Classification: G1, G32

### **1 INTRODUCTION**

The obstacles to the development of small and medium-sized (SMEs) enterprises pertain the lack of capital to finance the business plan. For starting small or medium-sized enterprises is often insufficient equity and obtaining liabilities is usually difficult in the early stages, and that enterprises could fully realize its potential in today's global economy, it must focus on the promotion and development of business activities and to improve the business environment not only for small and medium-sized enterprises as well as large corporations. (Koráb *et al.*, 2008)

Support for successful entrepreneurial activities requires in particular support in financing these activities and one of the possibilities of financing business development is still a little common form of external sources via the capital markets, stocks and bonds.

Based on the research of domestic and foreign research intentions, a gap is considered in research projects on the subject of external sources of corporate financing through the capital market and specifying the forms of external financing should be one of the important themes of business entities. The empirical literature, which is developing rapidly since the early 90s of the last century, supports the hypothesis that economic growth is closely related to the stage of financial development system and hundred years ago (1912), the Austrian economist Joseph Schumpeter established a direct relationship between the well-established financial system and a thriving economy. Financial economists Klaus Weber, Gerald Davis and Michael Lounsbury (2009) later defended the view that „equity markets are also a means of raising capital indicator showing the pulse of the economy and determining its future

development, a mechanism for effective monitoring and support for institutional and social change in the economy.“ The aim of the stock exchange is to provide a market for the buying and selling of shares (securities) that are liquid and open. Especially market reports provide companies with potentially long-term source of information for investment. From the perspective of economic development, it may be an effective mean of circulation assets and realization of development opportunities. In other words, although to be issues of economic development focused on the production of goods, services and trade, as well as relate to institutions in the financial and investment fields. (Moudrý *et al.*, 2007) Autor Lyandres (2007) examined the effects of costly external financing on the optimal timing of a firm's investment that show when by altering the optimal investment timing, costly financing affects current investment and the sensitivity of investment to internal cash flow. Authors (Murado *et al.*, 2014) can be seen the importance of supply of capital for corporate financing as two exogenous events, entry to the EU and the adoption of Euro, caused shifts in equity and credit markets during European integration. Following membership to EU and after the adoption of Euro, it is eased access to equity capital, firms increase equity financing and improved access to international debt capital. Authors (Bris *et al.*, 2014) studied the financing policies of European public corporations prior to the euro crisis from 11 euro countries and a control group of five other European countries for the period 1991–2006, their results showed stronger for large firms, firms dependent on external financing. The authors provided evidence that firms in the euro area increased external financing before the crisis, compared to firms from countries that did not adopt the euro. Their results showed stronger for firms from countries that previously had weak currencies and for firms that have the lowest foreign sales and they are consistent with the view that firms have increased financing because cost of financing decreased. Authors (López-Gracia *et al.*, 2014) provides empirical evidence on the relationship between external financing and cash flow, using a data panel of Spanish listed (unconstrained) and unlisted (constrained) companies covering the period 1996–2010. Their results indicate that cash flow has a significant and negative effect on external financing regardless of the dependent variable selected (that is, variation in debt, debt plus equity or just equity). This negative relationship is stronger (that is, more negative) for listed companies, which in turn implies a stronger substitution effect, as predicted. Authors (Eidenmüller *et al.*, 2015) studied the choice of issuer location and regulatory competition in the European corporate debt market. They found that, countries and that wish to attract bond issues should lower or abolish withholding taxes and in absolute terms, Germany have by far the highest outflow of debt issues, while the Netherlands, the UK, Luxemburg and Ireland see the most inflows (in that order). The main sources of funding can be diverse, and if we consider ways of funding in the economic structure of the company and by according to Czech authors Valach (2011) and Synek (2010), financing businesses realized through internal and external sources or equity and liabilities (Valach, 2011; Synek, 2010; Wöhe *et al.* 2007), when the characteristics of the distribution is perceived by different authors identically. Zinecker (2008) states that the company engaged in the production or provision of services, which implements on the market is affected by income and expenses for a given period of time when the flow is not synchronized. A specific form of external financing is a long-term outside funds, which are determined primarily by long-term bank loans, corporate bonds, leasing debt and other long-term liabilities (Valach, 2011; Synek, 2010; Wöhe *et al.* 2007). Authors Wöhe *et al.* (2007) and Zinecker (2008) add forms of debt financing on industrial bonds, convertible debentures, warrants subscriptions, subscriptions profit, profit and participatory notes, factoring, forfaiting, etc. Identify sources of financing through capital markets, private equity and venture capital are perceived by authors Zinecker (2008), Nývltová *et al.* (2007) and

Valach (2011) as a risk capital, which is inserted into the shares of non-public enterprises to finance the initial business activities, especially for financing projects and developing innovative character with high risk. The impacts of external financing can be seen mainly in obtaining the necessary capital by the company and in stimulating business environment (Nývltová *et al.*, 2007; Mishkin, 2009), further supporting the creation of new companies, companies' growth and higher competitiveness of enterprises and also in the creation of new job vacancies. External financing provides compared to internal financing a range of options, because they can finance any investment project taking into account the current economic situation and adapt to the needs of each individual.

Financing companies through securities (shares and bonds) has a large representation in the world and on the developed capital markets belongs (or it heads towards) to a traditional way of raising funds needed for business development. An important mechanism for the functioning of the financial system is a function of capital, stock exchanges and markets. On the one hand we are dealing here with private equity investors, who invest in cycles, and on the other hand with companies that are eg. forced to raise funds to finance further growth in its vicinity. Offer sources of financing business activities are currently broad and diverse.

Management of company decides how much and in what structure the sources of funding should be available to ensure smooth operation, the company's development and did not disrupt the financial stability of the company, were able to pay its obligations to creditors, owners, state and other entities involved in the development of the company. The way of management company adjusts to the structure of funding sources and one of the key aspects of the firm's choice of specific source of funding can be considered the maturity of capital markets in different countries. Capital markets have various level of maturity in different countries, which determines the ability - the market play its role so as to truly function as an instrument for dynamic growth of economic development. In this context, the individual capital markets are evaluated in terms of their liquidity, which determines the volume of capital available for businesses at certain market, rate of return on the securities corresponding to the expected risk. The capital market is not the only source of funding. The information determined by the behavior of investors, providing businesses with an indispensable tool for financial management and decision-making and capital market are considered to be a necessary part of the financial system. The need for companies to obtain financing sources both on the domestic and international capital markets and the increasing interdependence of national economies and markets, caused by high dynamics of trade in goods, capital, services and transfer of technology and know-how. (Nývltová *et al.*, 2007)

International investment enables fully exploit the income potential of different markets, however, brings not only benefits but also the obstacles, risks and additional costs. The basic feature of capital markets is that it allows the exchange of goods, ie. that there are trading money and all sorts of assets expressing money. Without the ability to obtain the necessary capital in this way the global financial system would have as well as the economic system, a different form than it currently has. (Tirole, 2006; Mishkin, 2009)

Foreign studies dealing with the importance of capital markets as external sources of financing firms mention several benefits that these markets comprise:

- attracting a number of smaller and medium-sized companies on capital markets,
- entry of firms in the domestic and international capital markets,

- providing ongoing support and ensure value for companies and investors,
- promoting local ownership of capital,
- striving for the development of links and systems,
- expanding and cooperation of financial markets,
- creating substantial long-term benefits for economic growth in both regions, and higher economic units.

Given that in the conditions of world financial markets we follow different development of the capital markets, contribution brings an insight into the problems of external financing, including the definition of its specifics. The aim of this paper is to find out whether capital markets characterized by the stock exchange in four European countries surveyed show the same characteristics of development and corporate financing options in the long term and also assess the rate importance of these criteria, depending on the evolution of financial markets in selected countries. Research also questioned the reasons that the company led to the rejection of external financing. In this paper are analyzed capital markets Austria, the Czech Republic and Slovenian, which are part of the European market and are part of the CEE Stock Exchange Group (CEESEG, which is today the largest exchange group in Central and Eastern Europe). For comparison the market was chosen capital market in Poland, because the Polish capital market plays a significant and major role in the region of Central and Eastern Europe and no country experienced such a boom as the capital market in Poland. The stock exchanges in selected countries are Wiener Börse (WB) in Austria, Prague Stock Exchange (PSE) in the Czech Republic, Warsaw Stock Exchange (GPW) in Poland and Ljubljana Exchange Stock (LJSE) in Slovenia and this selection allows us to compare capital markets in four European countries.

In the first part of this paper is briefly presented characterization and comparison of selected indicators of countries (Austria, the Czech Republic, Poland and Slovenia). The second part consists of a quantitative analysis using data of the stock market (market capitalization, trading volume and gross domestic product) and to determine the statistical significance of the estimated parameters, seasonal autoregression model type ARIMA is used. In the final part are analyzed continuity of selected indicators and capital market as forms of external financing.

## **2 ISSUE OF SECURITIES**

When deciding on the placement of the securities issue and deciding on their structure, firm management should consider the following factors:

- identification of funding needs,
- requirements for accepting emissions trading,
- the process of issuing emissions trading,
- costs associated with the process emissions,
- information obligation arising from a quotation,
- market structure and trading system of given market,

- the number of issued securities on the market and the total market capitalization,
- volumes of the transacted securities issues.

### **Issue of shares**

The general goal for the company is the issue of shares to obtain long-term capital, issuance of shares in circulation, the company acquires emitting sources of funding in exchange for the new shareholders becoming co-owners of the company. Capital thus obtained can be used by a company in the market in its field for its business plan wants to raise capital on the stock market, because it is a more viable solution than debt financing - bank loans. Another option is a company that has been placed on a market for a while, but it needs to grow, needs additional capital, while no longer manages with options available to the non-share corporation. The last case is a joint-stock company that has issued shares in the past and now wants to obtain again by another emission additional sources of financing on the capital market. Though all three cases in the literature are known as an initial public offering or IPO (Initial Public Offering), we distinguish IPO as the first two options and the third belongs to the category of SEO as it is usually given by foreign literature. The term SEO (Seasoned Equity Offering) means the emission of additional shares of the company, which already has shares traded on the public market. (Nývltová *et al.*, 2007) Newly issued securities may be placed on the market in private or public way. The decision of the company management on share issue affects several basic criteria and as the most important factor indicates the location of business activities, as if it has in a given market most of its activities and relationships with business partners, there will be more investors willing to put in your company's capital. Liquidity given issue is another aspect that investors take into account, but it depends not only on the issuer, but also on the market, where the issue is reported. Another factor on the side of the market are the actual requirements for the issuer and the issue, charges related to the issuance and other fees for the placing on the market, the regulator charges or depository.

### **Issue of bonds**

The bond issue is the second possibility of external financing companies in the capital markets. Bonds are long-term debt securities with the law of their owners to require at a certain date (in English maturity) par value (nominal, par value) of the bond and coupon payments at the end of a tenure during the terms of a bond with a coupon realization emissions the issuer becomes a debtor and bondholder (investor) the lender. The bonds are traded publicly and non-publicly. Public trading carries a higher liquidity and lower risk, investors purchasing bonds traded on a public market therefore generally require a risk premium in the form of a higher return. The advantage of bonds is the possibility of obtaining a large amount of funds at one time, longer maturity and in some respects even greater prestige and publicity. For a solvent and sufficiently large company is financing through bonds usually the cheapest way of financing and solves them the greatest part of the permanent long-term debt and the advantage of the tax deductibility of interest paid. (Ježek, 2004) In developed countries, especially in the case of small and medium-sized enterprises are often used private issue when the bonds are sold to a small group of predetermined investors, they are not registered as a publicly traded and investors usually require a higher rate of return as a premium for low liquidity. The presence of funding sources on the public market means on the other hand that the company has excellent access to financing, which may be successfully used for the development or expansion of its activities. Public bond issue consists of a set of bonds issued on the same issue terms and the same issue date, maturity and

labeling according to the international numbering system for securities identification (ISIN). If bonds placed on the domestic stock market, they are called domestic bonds. If an issuer chooses to place the bonds on the international market, these bonds are so called eurobonds. At present there are many different forms of bonds, the differences can be found among individual countries. (Nývtová *et al.*, 2007)

## 2.1 Costs associated with the issue of securities

The costs for transacting the issue of securities (stocks and bonds) and resources, which the enterprise gains, are two important factors which need not be equal and have a significant impact on the expensiveness of the whole process and emissions trading market. In a broader sense, the costs associated with the preparation, execution of issue and then costs related to the information obligations and regulations, the origin of the issuer's country, quality of the managers emissions, methods of subscription and the total volume of emissions, regular exchange fees etc. Comparison of markets in terms of charges at expensiveness issue can be found in the the authors Oxera (2006) and Nývtová *et al.* (2007). The costs that the issuer must in connection with the issuance spend depends on many factors.

Tab. 1 showed the stock exchanges in selected countries: Austria – Wiener Börse (WB), the Czech Republic – Prague Stock Exchange (PSE), Poland - Warsaw Stock Exchange (GPW) and Slovenia – Ljubljana Exchange Stock (LJSE) and we could conclude that there is minimal difference between these groups of costs and there is no significant connection. This, however, is not clear to say because with the placement of shares or by issuing bonds on the local or international market, the company must generate sufficient income to cover all taxes and costs for businesses and investors. However, it is not clear to say because with the placement of shares or by issuing bonds on the local or international market, the company must generate sufficient income to cover all taxes and costs for businesses and investors. Issue costs do not arise only by emissions but are also related to a process and trading on the local or international market, the emission processes in the euro area are built on the same principles. The advantage is that it increases the awareness of the company among potential customers and thus to the expansion of business activities.

<b>WB</b>	<b>GPW</b>
5 000 EUR, max. 50.000 EUR	2784 EUR
<b>LJSE</b>	<b>PSE</b>
0,03 % 4.000 EUR, max. 20.000 EUR	1816 EUR

## 3 METHODS

The primary aim of this paper was to determine whether capital markets characterized by the stock exchange in four European countries surveyed exhibit distinct characteristics of the development and financing options of the company in the long term. The comparison was carried out for the period 2002 - 2014.

The basic prerequisites for selection of capital markets in the four countries of the euro area regard to the goal of this work was, that:

- they are european capital markets,
- they are a member of the Federation of European Securities Exchanges (FESE)
- stock exchanges are part of the CEE Stock Exchange Group (CEESEG), excluding the Stock Exchange in Poland.

The starting point for the implementation of the research was carried out documentary analysis of the data, i.e. an analysis of selected indicators Austria, the Czech Republic, Poland and Slovenia. Data was obtained through a database accessible through the website of Eurostat and of the stock exchanges in selected countries: Austria – Wiener Börse, the Czech Republic – Prague Stock Exchange, Poland - Warsaw Stock Exchange and Slovenia – Ljubljana Exchange Stock. Within the analysis, the indicators have been monitored and studied: number of received emissions on the stock exchange, the cost of issuance, market capitalization, trade value and the gross domestic product of selected countries. Qualitative data obtained by primary research has been evaluated using Microsoft Office Excel and SPSS statistical software and methods of analysis, description and comparison.

#### 4 RESULTS

Descriptive analysis confirm the long-term upward trend of gross domestic product (GDP), Fig. 1. It is shown that positive GDP significantly affects the development of stock markets and its growth creates an optimistic atmosphere. In terms of economic advancement two of the analyzed economics Poland and Austria show higher gross domestic product than the Czech Republic and Slovenia, and both economics belong to the small economics. Both markets have specifics of transition economics and it is clear that there is an area for further growth and development of the market. The Polish economy is accompanied by faster dynamics, it was not affected by the global financial crisis, because it is less dependent on exports to other countries and therefore GDP growth is upward pronounced.

Fig. 1 – Development of gross domestic product. Source: own processing by Eurostat

As Fig. 2 shows, the most active in terms of the volume of realized bond issues are considered to be stock exchange in the Czech Republic and Poland. As the number of listed bond issues, the Slovene bond market is insignificant. On the Czech bond market is the number of listed bond issues listed twice smaller than Wiener Börse, but in terms of the volume of realized trading volumes, but in terms of the volume of realized Trade Volume this is one of the most advanced emerging markets in Fig. 3.

Fig. 2 – Number of Issues by bond markets. Source: own processing by the stock exchanges (Wiener Börse, Prague Stock Exchange, Warsaw Stock Exchange and Ljubljana Exchange Stock)

Fig. 3 – Trade value by bond markets. Source: own processing by the stock exchanges (Wiener Börse, Prague Stock Exchange, Warsaw Stock Exchange and Ljubljana Exchange Stock)

By comparing the volume of stock trades, Fig. 4, is a development on the Czech and Slovene capital market low. The volume of transactions completed in 2013 at Wiener Börse is 6 times larger than the Czech capital market, while trading volume on the Warsaw Stock Exchange was in the same period more than 9 times. By joining the European countries and the adoption of legal and regulatory rules, legislative measures changed in 2006 for firms doing business and are using financial and capital markets. Simplified access to capital, were precisely defined rules of functioning capital market-to-market for issuers and investment protection for investors and it is for companies easier to deal with the entry and acting on the capital

markets. (Meixnerová, 2009; Meixnerová, 2011). The period of 2006 - 2007 is characterized by a significant increase in activity on the capital markets and in almost all markets and its characteristics.

Fig. 4 – Trade value by share markets. Source: own processing by the stock exchanges (Wiener Börse, Prague Stock Exchange, Warsaw Stock Exchange and Ljubljana Exchange Stock)

Maturity of the stock market is not only determined by the volume of transactions but also the number of listed issues, Fig. 5. The early stage of the development of capital markets in Eastern Europe (the Czech Republic and Slovenia) was connected with the policy of voucher privatization as an indication of a large number of marketable securities of companies. (Beim *et al.*, 2001) The vast majority of companies, however, did not have the prerequisites for long-term effects on the market and to consolidate ownership structures and slow outflow of companies from these markets. As shown in Fig. 4, we still consider the stock exchange in the Czech Republic and Slovenia to be small. Deficiencies can mainly be seen in the number of quality small and medium enterprises on the capital market, their extension would have significantly increased capitalization and trading volumes mainly on the domestic market, strengthening its competitive position on the market and the growth of the country's GDP influence on the growth of the volume of available funding sources.

Fig. 5 – Number of Issues by share markets. Source: own processing by the stock exchanges (Wiener Börse, Prague Stock Exchange, Warsaw Stock Exchange and Ljubljana Exchange Stock)

As shown in Fig. 6, the market capitalization of shares as a share of GDP has increased development, which was interrupted by a decline in the years 2009 - 2010, that caused the European debt crisis, which has gradually developed since 2009. In the course of funding on the financial market has become for countries and companies too expensive or even impossible. There was not only an increase in government bond yields of many countries, Fig. 3, but funding threatened to get out of control. It is obvious that if the developed space for integration of local markets into the system of international markets will increase their liquidity, they will reduce market barriers and increase trading securities on the market. External sources of financing through capital markets will be more accessible and cheaper for local firms and therefore will not be difficult to enter both the local markets and international markets.

Fig. 6 – Market capitalization of shares on GDP. Source: own processing by Eurostat and the stock exchanges (Wiener Börse, Prague Stock Exchange, Warsaw Stock Exchange and Ljubljana Exchange Stock)

From the previous figure, it is clear that the market capitalization of shares / gross domestic product and trading volumes show nonstationary behavior of a time series and graph of gross domestic product shows a stationary behavior of time series. In an international comparison of interrelationships market capitalization and trading volume and the number of new issuers belong the Czech Republic and Slovenia among the least developed and it can be said that both countries are still insufficiently using the advantage of relatively well-functioning financial system. Strengthening the positions of both countries is still in the indicator of quality of small and medium sized enterprises on the capital market. There is still a concern among the firms about losing control or restrictions in society, dominate negative or no experience on the capital markets or unwillingness to accept the company's demands for greater transparency and the related time and organizational and legislative requirements of the process.

#### 4.1 Correlation analysis between variables

The advantage of the seasonal ARIMA model is that it is able to deal with the problems of seasonality, autoregression, integration and regression routine, therefore dates before to analysis could not be transformed and we used logarithmic data. Tab. 2 shows that statistically significant dependence of the estimated parameters at a significance level of 0.01 and that between all variables is a positive correlation. At LJBS defines significant relationship between logarithms trading volume and GDP and the market capitalization has small interconnection market. At PSE and WB are significant relationships between logarithms market capitalization and GDP, ie. that increasing market capitalization will lead to increase in GDP. In the case of the Czech capital market in terms of market capitalization, we see a slight degree of interconnection with the market. At GPW are significant relationships between logarithms trading volume, market capitalization and GDP and we can be said that the capital market is on a high level and soon could reach the level of advanced capital market. The paper identified statistically significant relationships and their support is tied to supporting the development of the capital market. We can conclude that the more advanced the capital market, the easier it will be for the company to obtain sources of financing on the capital markets. Furthermore, it can be argued that the capital markets countries are irreplaceable and have their own importance and positive influence on the growth of the economic performance of the country.

\*\*\* indicates significance level at 1%

Crucial problem of external financing is firm size, low liquidity of small and medium enterprises (liquidity which facilitates the exchange of securities) and administrative costs

associated with obtaining financial resources or investments. The consequence of these problems is that these companies fall mainly into knowledge based sectors, subject to involuntary acquisitions, mainly due to lack of investment capital. If they could expand the capital markets of these SMEs, there would be a significant increase in business volume and in particular the market capitalization of shares on the market. Attention should also be focused on increasing and enlarging trade, a larger number of quality small and medium enterprises in the capital markets. The increase would be significantly strengthen its market capitalization and trading volumes and competitive position of small capital markets and their trading would be strengthen. Conveniently chosen method of external financing for the company is the decisive criterion: for its success on the market, creating value added, employment and growth potential. Companies that increasingly use capital markets to raise capital, can overcome production records, export successes, direct investment, increase spending on research and development, etc. For increasing and support of external financing through capital markets are improving and strengthening the development of the capital market and particularly the links between the company and the stock exchange. At present, the game about supply of capital involved mainly large national and multinational companies but therefore a gap in capital funding in the least prosperous regions or countries arises. But the important thing is that the opportunity was accessible for the company on the market to use all the tools, which are available to individual entities in developed markets and in my opinion this requirement the local and international capital markets meet nowadays. If companies did not have access to capital markets, they would have to rely on funding from its own resources and bank loans, etc., which would be a limiting factor for the proposed investment, growth and functioning of the company. A fundamental aspect of the significance of capital markets is the maturity of the financial system, which has a positive effect on the prosperity of companies. Existence linking the capital market and companies will contribute to a strong and long-term growth companies, and but also the economy. Financial markets of countries are characterized by good market position, even if some of the variables are analyzed in this paper show low values.

## **5 DISCUSSION AND CONCLUSION**

The importance of capital markets in rapidly growing economies in Europe is an essential aspect of the significance of the capital market for overall growth and prosperity of the company and the country. As an important form of external sources of funding can be considered capital market, which plays an irreplaceable role in local and international markets and is an important element in the further development of the company. The size of the country and the development of capital financial markets where the company operates, should be seen as an advantageous position, because in the current market system increases both liquidity of capital markets and the markets are being integrated into the system of international markets and if there is a market interconnection, we can say that markets are strong and liquid markets will contribute to a strong and long-term growth and greater opportunities and offerings for external financing.

The aim of this paper was to demonstrate that the capital markets in selected countries show the same characteristics. Czech capital market can not still be considered sufficiently liquid, since there is little primary issues, as well as and with it the related lower trading volumes. Indicators of the Slovenian capital market are while maintaining the dynamics of large capital markets low and the market is to still be small. The analysis showed a statistically significant

relationship between the volume of trading on the stock exchange market capitalization and gross domestic product and confirmed that the increase in trading volume lead to a GDP growth of selected countries.

Research findings show that the Czech and Slovenian markets are in an era of globalization and integration of financial markets irreplaceable. Existence of capital markets is essential for the further development of the company and is connected with the performance of the economy as measured by the growth of gross domestic product.

## **THE INFLUENCE OF FOREIGN CAPITAL IN SCOPE OF BUSINESS PERFORMANCE AND INVESTMENT MANAGEMENT**

*Martina Merková, Rastislav Rajnoha, Ján Dobrovič*

### **Abstract**

The paper analyses use of tools, methods, concepts and models implemented by foreign investors, finds out differences between local and foreign firms in obtained business performance primarily, subsequently in scope of investment measurement and management. Research data were processed and valued by chosen mathematical and statistical methods, subsequently we demonstrated an influence of foreign capital on achieved better business performance, used certain practices and manners. The paper defines typical features and specifications of foreign investors against local firms and gives the answers how local firms in transitional economy benefit from the entry of multinational enterprises. The research is interested in the economy of Central Eastern Europe country – the Slovak Republic.

*Keywords: business performance, investment management, foreign direct investment, foreign-owned companies, Slovakia.*

JEL Classification: G31, G32, M2

### **1 INTRODUCTION**

In the last decade the Slovak Republic has been included in the group of attractive countries for foreign investors. This is reflected in various sectors, most significantly in the automotive industry, Slovakia became the largest producer of cars per capita in the world. Up until now, Slovakia has had some comparative advantages such as cheap and skilled labor, low transfer costs and the quality of infrastructure. After declining of FDI inflows in Slovakia during the depths of the global financial crisis in 2009, Slovakia has recorded continuous increasing of FDI inflows next 3 years (UNCTAD, 2013), despite of two facts: FDI inflows in groups of transition and developed economies decreased in 2012 (9%; 32%) and the European Union alone accounted for almost two thirds of the global FDI decline.

The relationship between Foreign Direct Investment (FDI) and economic growth has been a topical issue in vast number of publications. Insufficient domestic capital has been shown in the process of transformation in post-communist countries and a possible solution of this problem appeared the foreign direct investment. FDI brings for the country and its businesses more significant effects. We attempted them to identify and quantify in our empirical research conducted in conditions of the economy in Central Eastern Europe – Slovakia.

### **2 THEORETICAL FUNDAMENTALS**

There are several studies and analyses dealing with FDI issues worldwide or with focus on Central and Eastern Europe countries. The main conclusion in the studies generally finds a significantly positive relation between FDI and economic growth (Caves, 1974). The cumulative level of FDI is particularly high in those countries in which the transformation process was evaluated to be positive (Beyer, 2002). Empirical studies suggest that the fastest growing countries are also the biggest FDI-host countries. In the specific case of transitional countries, FDI may help to achieve modernization, industrial upgrading and improve

productivity by importing foreign technologies, diffusing knowledge and western best practices (Fabry and Zeghni, 2006). On the other hand, through the certain methods of transfer pricing (Rajnoha, Slivková & Dobrovič, 2014) of intangible assets can MNEs affect their profit in individual countries according corporate tax with the aim to increase global performance of whole corporation. In old EU member states was in all cases confirmed negative relationship between corporate tax burden and long-term economic growth (Baranová & Janíčková, 2012). Governments can influence FDI location decisions of firms through capital tax rates, countries with lower tax burdens are FDI net recipients (Lanaspá, Pueyo & Sanz, 2008). FDI is sensitive to the host country tax rates and this sensitivity is greater in developing than in developed countries (Mutti & Grubert, 2004). Transition countries have to deal with the challenge of globalization: all countries, whatever their development level and historical background, have to host inward-FDI to stay competitive (Fabry and Zeghni, 2006). However, Cedidlová (2013) means that Central and Eastern European countries behave conservatively and post-communist outlook is alive, model with strict rules for introducing FDI promotional policies is more suitable.

The analysis of locational advantages offered by the Czech Republic, Hungary, Poland, Romania and Slovakia suggests that investors in these countries are mainly interested in low labour costs coupled with a well-trained and educated workforce and an expanding market with high growth rates in the purchasing power of potential buyers (Gauselmann, Knell & Stephan, 2011). Authors Pavlínek and Smith (1998) in their research deal with FDI in the Czech and Slovak Republics. Pavlínek (2008) discussed about advantages of foreign ownership for Czech enterprises, such as access to investment capital, access to sale and distribution networks of parent companies and technology transfer.

Research concerning the FDI determinants and effects especially in Slovakia is limited. Dow & Ferenčíková (2010) directed their research dealing with specific FDI issues: predicting market selection, entry mode choice and performance to Slovakia. An impact of FDI on Slovak economy also analyzed Hošková (2001), indirect effects of FDI commonly referred to as spillovers and its potential in Slovakia defined Fifeková (2008). Positive impact of FDI in Slovakia was demonstrated in past research with the main objective to identify significant quantitative and qualitative effects of FDI; findings published Merková, Rajnoha & Novák (2012) or Merková, Drábek & Jelačic (2012). The results of the correlation and regression analysis was aimed at presenting the dependence in the period 1999-2008 and demonstrated significant dependence between FDI stocks and GDP growth of Slovakia.

The recent research analyzing the macroeconomic statistical data of whole economy was followed by the research at the microeconomic level and was aimed at businesses in various industries in Slovakia. We focused on both - traditional key indicators such as accounting profit, value added, wages and labor productivity as well as non-traditional way of performance measuring. Company managers utilize a number of concepts for the management of performance including Balanced Scorecard (BSC), Economic Value Added, benchmarking and many others (Knápková, Pavelková & Jirčíková, 2010). Petera, Wagner & Menšík (2012) deal with performance measurement and management systems with focus on BSC and they found statistically significant difference between BSC adopters and BSC non-adopters as for utilization of Activity Based Management. Lean manufacturing, team working, continuous process improvement, knowledge management and e-business are just a few of the practices that organizations are using in their search for effectiveness (Chromjaková & Rajnoha, 2012). Skokan, Pawliczek & Piszczur (2013) in their empirical study confirmed the importance of strategic management and strategic planning for gaining competitive advance and better economic results. Each enterprise should have qualified strategy and created its effective way of realization based on the latest management approach (Sujová, Rajnoha & Merková, 2014).

Managing of the company's performance and efficiency is very important. Constantly changing environment significantly affects the overall efficiency and so also the competitiveness of enterprises. One of the conditions to maintain the competitiveness and performance of the company is the ability to work properly and timely with information not only about past and present but also especially about the future (Rajnoha et al., 2014).

### **3 OBJECTIVE AND METHODOLOGY**

#### **3.1 Objective of the research**

The objective of research within solution of grant project interested in business performance measurement and management in Slovakia, financed by the Ministry of Education, Science, Research and Sport of the Slovak Republic was to analyze the extent of the use of traditional and modern indicators, methods and models of performance management on a sample of randomly selected companies in various industries of Slovakia, based on relevant mathematical and statistical methods to identify the cause and subsequent context and determine their influence in achieved business performance.

In this paper we present results of partial research and we focus on area of investment measurement and management. One of the partial objectives was to analyze investment behavior, types and objectives of investment, financing and cost of capital, factors and elements such as routing, form of investment, preparing and valuation of investment projects, we interested in the question of investment risk analysis and so on.

The aim was to demonstrate the relationship between foreign capital and investment management – application of concepts, know-how, tools and practices useful for local business due to foreign firms. Selected mathematical and statistical methods should show that the certain elements of knowledge base are typical only for firms with foreign capital and do not occur and are not used in local firms without foreign investment.

#### **3.2 Research questionnaire and sample**

There was created on-line questionnaire through internet application to build data collection of companies in Slovakia. We maintain complete anonymity of participating firms. The size of research sample was 164 counts. The relatively low frequency resulted mainly from the reluctance of companies, their negative mood and skepticism of economic development, lack of time or lack of interest. Nevertheless, the research sample of 164 firms we consider as relevant with sufficient expressive capability.

#### **3.3 Statistical methods used in the research**

Data from questionnaire were processed and evaluated by chosen statistical methods, we applied chi-squared test, which is commonly used for testing the independence between two categorical variables. The research consists from qualitative – nominal variables, their relationship cannot adequately describes the correlation coefficient. Association between variables we examined with contingency coefficients and contingency tables.

Results of chi-squared tests describe selected statistics: Pearson's ch-square and significance p-value „p“, Maximum-Likelihood chi-square and p-value, Pearson's contingency coefficient (CC), Adjusted contingency coefficient (Adj. CC) and degrees of freedom (df).

$$\text{Pearson's Chi-square: } \chi^2 = \sum_{i=1}^k \left[ (f_{oi} - f_{ei})^2 / f_{ei} \right]; \quad \text{while } \sum (f_o - f_e) = 0 \quad (1)$$

$$\text{Pearson's contingency coefficient CC: } CC = \sqrt{\chi^2 / (\chi^2 + N)} \quad (2)$$

Maximum contingency coefficient  $CC_{\max}$ :  $CC_{\max} = \sqrt{(q - 1)/q}$  (3)

Adjusted contingency coefficient:  $Adj. CC = CC/CC_{\max}$ ; while  $CC \leq CC_{\max}$  (4)

Where:

$f_{o_i}$  – observed frequency in an field of the table,

$f_{e_i}$  – expected (theoretical) frequency in an field of the table,

k – number of cells in the table

N – sample size

q – number of rows or columns (in square tables)

**The Pearson’s Chi-square** (Pearson, 1904) is the most common test for significance of the relationship between categorical variables. This measure is based on the fact that we can compute the expected frequencies in a two-way table (i.e., frequencies that we would expect if there was no relationship between the variables). The *Chi-square* test becomes increasingly significant when the observations deviate further from expected pattern. The value of the *Chi-square* and its significance level depends on the overall number of observations and the number of cells in the table.

**The Maximum-Likelihood Chi-square** (Bishop, Fienberg & Holland 1975) tests the same hypothesis as the Pearson *Chi-square* statistic; however, its computation is based on Maximum-Likelihood theory. In practice, the M-L *Chi-square* is usually very close in magnitude to the Pearson *Chi-square* statistic.

Contingency coefficient is meaningful only if there is a real dependence between variables (Lienert, 1962). This question is tested using the chi-square values. If the value of chi-square corresponds to the probability  $p > 0.05$ , the relationship between variables is not statistically significant and it is not meaningful to count contingency coefficient or analyze the residuals in contingency tables. In the case of  $p \leq 0.05$ , we can characterize the "strength" or "tightness" of relationship between two variables by the appropriate coefficient.

**Pearson's contingency coefficient** we have chosen, because this characteristic can be calculated also for tables of any size and shape (square or rectangular; if any variable is subdivided several members, the number of rows or columns  $q \geq 2$ ). In research, we analyzed the quadratic and rectangular tables; in this article we publish only the results of tables 2x2 and 6x2. In six categories was divided variable "performance" based on indicator Return on Equity (ROE) (six groups; group 0 - worst performance with a negative value of ROE, group 5 - the highest performance with ROE above 10%), all other variables have two categories. The coefficient ranges from 0 (no relationship) to 1 (perfect relationship).

Tab. 1 – Maximum values of contingency coefficient for square tables. Source: Clauss & Ebner (1988)

Number of rows or columns	2	3	4	5	6	7	8
$CC_{\max}$	0,707	0,816	0,866	0,894	0,913	0,926	0,935

Pearson's contingency coefficient may occur in **different maximum values** depending on the number of categories for the studied variables. Clauss & Ebner (1988) report the maximum values for square tables,  $CC_{\max}$  for rectangular tables can be roughly estimated by averaging the maximum values for square tables. From Table 1 we use  $CC_{\max}$  for 2x2 tables, which is

0,707, CCmax for combination of 6 columns and 2 rows we calculated (Formula 3) value CCmax 0,810.

For clear interpretation and relevant comparisons of the contingency coefficients of several analyzes we calculated **adjusted contingency coefficient** (Adj. CC), which takes into account the calculated CC and the corresponding CCmax (Formula 4). That ranges from 0 to 1, values close to 1 mean a stronger dependence of two variables.

The term **contingency table** first used Pearson (1904). It is a method of organizing and analyzing data by groups, categories or classes, which allows them to be compared. It combines the frequency distribution of two variables and represents an extension of simple frequency table. It contains the observed frequencies, expected frequencies and the difference between observed and expected frequencies (residuals).

The only assumption underlying the use of the Chi-square (other than random selection of the sample) is that the expected frequencies are not very small. The 2x2 tables would be the value of the expected frequency for each cell being in a table greater than 5. When the expected cell frequencies fall below 5, those probabilities cannot be estimated with sufficient precision. For larger tables, compliance of this condition is often problematic. The result is inaccurate approximation of the test characteristics of the chi-square probability distribution. However, according to Finkelstein & Levin (2001), for tables larger than 2x2 it is recommended to have at least 80% of the expected frequency of greater than 5 or not the expected frequency of less than 1 in more than 10 % of cases.

## **4 RESULTS**

In presenting results we focused on statistically significant dependence (p-value < 0.05, which is the alpha level associated with a 95% confidence level) between firms with foreign capital and the use of various tools, practices and manners from knowledge base of investment management. For each association we present the results of statistics and contingency tables. Just from the results of residuals we can demonstrate relevant, scientifically based findings and to state certain logical conclusions presented below.

### **4.1 Business performance**

From the descriptive statistics of variable performance (categorized according the ROE indicator into 6 groups), presented on Figure 1 shows mean 2.06, companies in average create positive, but relatively low Return on Equity in the range of 2-4 % in Slovakia. Median is at level 2. Modus, the maximum frequency is represented in the second group with a performance at the level of 0-2 % ROE, which includes 47 (29 %) of the total sample of enterprises.

Fig. 1 – Business Performance (ROE indicator). Source: own elaboration.

The starting point of the research was to find out the difference in performance of firms with purely domestic capital compared to companies with foreign participation (partial or full foreign ownership). Analysis presented in Tab. 2 means statistically strongly significant dependence ( $p$  value  $<0.001$ ) with Adj. CC 0.40. From the values of residues (Tab. 3) we show that firms with purely domestic capital typically merit in group 1 (very low ROE in the range of 0-2%), enterprises with foreign participation are sorted in better performance groups, most typically with ROE above 10%. These results demonstrate a statistically significant impact of foreign capital in better business performance.

#### 4.2 Investments to knowledge base

We asked in the questionnaire which kind of investment is dominant (crucial) in companies and were founding an association with home or foreign ownership. There is a statistically significant relationship in two kinds of crucial investment (Tab. 4 and 6):

- Intangible assets as know-how, innovations, brands, reputations, other knowledge capital, patents, licenses, rights, software, etc.,
- Investment in Research & Development (R&D).

Residual frequencies demonstrate in both cases (Tab. 5 and 7) that occurrence of these kinds of crucial investment is more typical for foreign firms. Companies with foreign investor focus on certain types of investments providing knowledge flows towards local firms.

### 4.3 Comprehensive approach to investment valuation methods

There are several approaches how to value economic effectiveness of investment and which methods or indicators are used in companies. The most frequently mentioned methods in theory are Net Present Value and Internal Rate of Return (e.g. Levy & Sarnat, 1986; Khan, 1993; Brealey & Myers, 2003, etc.) considering the discount rate. Discounted cash flow valuation is based on expected future cash flows and discount rates. While discounted cash flow valuation is only one of the three ways of approaching valuation, it is the foundation on which all other valuation approaches are built (Damodaran, 2012). Brealey & Myers (2003) also deal with often used indicators Return on Investment or Return on Equity, but these methods do not take into account the time factor. Cost criteria (discounted cost method) commonly used in manufacture industries (Popesko, 2010) compare different technical and production alternatives of investments, and their goal is not maximizing the benefits, but estimating the parameters, which the investment has to fulfill (Tuček, Tučková & Zámečník, 2009).

We asked about four types of methods in questionnaire section aimed in investment valuation indicators:

- Annual indicators without time value of money (profit, cash flow, cost, earnings, payback period and return on investment) were the first group. The research demonstrated the statistically significant relationship between foreign firms and use of the ROI indicator (Tab. 8 and 9).
- In the second group were long-term indicators considering time value and cost of capital, it means methods based on discounted values (net present value, internal rate of return, profitability index and discounted payback period). In analysis of individual methods does not exist any association, but generally, use of discounted cash flow methods is statistically significant and typical for foreign firms (Tab. 10 and 11).
- The third group covered methods used in investment controlling (modified internal rate of return and net final value) and the results are similar like in the second group, for individual method no one relationship (low counts), but use of controlling methods and foreign companies means significant contingency (Tab. 12 and 13).

- The last group contained additional indicators for support decision-making (break-even point and others). There was not found out any significance.

Finally, results of the research in part of valuations methods defined several statistically significant dependences and declare comprehensive approach to investment economic valuation.

#### 4.4 Investment project preparation

Theory fundamentals for an importance of investment project preparation, their content, structure, range or quality describes for example Bangs (1995) or Blackwell (1989). In evaluation of particular investment project we evaluate their suitability, efficiency and feasibility (Rajnoha, Jankovský, & Merková, 2014). Preparation of investment projects is the main assumption for successful realization and use of an investment, according Drábek & Polách (2008) we evaluate the impact of the investment project on total effectiveness, prosperity and financial stability of the company. Due to appropriate and precise investment

project can companies react quickly and adequately to changes in surrounding conditions, increase the hope to succeed in given entrepreneurial activities and gives presumptions for improving long-term economic results of the enterprise. If local firms do not make any investment projects, or they make them in non-adequate way, it can be the factor of failure.

Preparation of investment projects considering local or foreign firms is typical for the second mentioned group, against the local firms without extensive making of business or investment projects (Tab. 14 and 15). Although most domestic enterprises prepare investment projects, it is not sufficient in relation to foreign companies and the relationship between investment projects and foreign capital is statistically significant.

Tab. 14 – Contingency: Foreign ownership x Investment project preparation – Statistics.

Totals	0.00000	0.00000	0.00

#### 4.5 Emphasis on investment risk analysis

The last presented result demonstrates statistically significant dependence between use of risk analysis and foreign firms (Tab. 16). Although from observed frequencies is evident, that most enterprises (local and foreign) do not use any methods for risk analysis, share of use in foreign companies is in greater extent; or on the other side, only few local companies emphasis on investment risk analysis (Tab. 17).

The research in this part contained also individual risk analysis methods (statistical, simulation Monte Carlo, Hertz model, sensitivity analysis, cost of capital rate correction, decision tree, etc.), but there was not any significant relationship considering each one. So, firms use the risk analysis, but they do not know or want to specify any method.

## 5 DISCUSSION

Results of the research highlight several facts. At first, local firms don't use or use in low level some sophisticated practices, techniques, concepts or methods in investment management and they achieve worse performance. There are several reasons for absence of some modern and useful knowledge fundamentals in local firms. The most important is lack of capital to buy or form own know-how. But it is possible to mention the typical sign of local firms - indifference and aversion to use new and unfamiliar tools, they do not understand those. If company doesn't trust them, it doesn't expect possible future effects and performance improve.

Second, just foreign investors bring and implement tools using in investment decision-making, measurement and management, what cause better business performance. Local firms benefit from entry of MNEs and improve own knowledge base. Investments focused in intangibles and R&D are connected with sophisticated production, higher added value and economic growth. Foreign firms benefit from advantages, which the host country provides, uses inexpensive raw material resources and particularly the cheap labor force, which is the main comparative advantage of Slovakia. This reality is often criticized as exploitation of workers and natural resources without the positive impact in the economic growth of country. However, it is important to perceive proved positives, advanced technology in transition country of Slovakia is precisely because foreign-owned firms. Supported result refutes

skeptical views of the FDI opponents, who argue that foreign firms in Slovakia only use outdated tools and procedures without requirements to develop and improve their knowledge base.

## **6 CONCLUSION**

Based on the scientific conclusions and the results of previous research, in which we have shown the positive effects of the FDI at the level of macro environment, we then hypothesized certain influence of foreign firms in microeconomics and we tested if companies with foreign capital are performing better. Current research has statistically confirmed that better business performance is significantly dependent on financing from foreign capital. The best performing companies (the most typically reaching of ROE above 10%) are mainly or wholly financed from abroad, and vice versa, for purely domestic firms are characteristic lower performance with a value of ROE in the range of 0-2%.

Consequently, we analyzed benefits, development and knowledge improvement comparing local and foreign firms. The research of various parameters in the particular area found out, that for the companies with foreign participation are typical certain elements of investment management:

- Focus in certain type of investments (intangible assets, research and development) providing knowledge flows towards local firms,
- Comprehensive approach to investment effectiveness valuation covered the ROI indicator, long-term indicators based on discounted cash flows and methods used in investment controlling,
- Preparation of investment projects,
- Emphasis on investment risk analysis.

Of course, we reflect the foreign knowledge flows in field of investment measurement and management is only part of business development. We simultaneously realize the research aimed at other strategic parameters, modern tools, concepts and methods as an asset of FDI in local firms.

## **STATISTICAL COMPARISON OF OECD MEMBER COUNTRIES HEALTHCARE EFFICIENCY BASED ON CHOSEN MACROECONOMICS INDICATORS**

*Martin Mikeska, Petr Klímek, Pavla Staňková*

### **Abstract**

The paper presents a statistical comparison of OECD member countries healthcare efficiency based on chosen macroeconomics indicators. Such comparison is perceived as problematic due to numerous economic specifications of the countries under comparison. These countries historically consume a significant proportion of their GDP to ensure public health of their citizens. All present-day healthcare systems are based on the prerequisite of future prosperity, sustainable wages and demographic growth. These systems are efficient in the times of industrial development where long-term employment with high wages is reached. However, all OECD countries have recently found themselves in the economic stagnation, real wage slump and the demographic decline. Dropping income into healthcare systems along with the growing expenditures create high deficits of public and private finances. Such changes have raised a question of which of the present-day healthcare systems is economically the most efficient and sustainable in the long run. To compare chosen economic parameters statistical testing of the significance of differences among healthcare systems with one-way analysis of variance (one factor ANOVA) is used. When conditions for its use are not fulfilled (especially the homogeneity of variance), which is tested by Hartley test, an adequate non-parametric Kruskal-Wallis test is applied. The paper suggests a conclusion that no major statistical dependence of the chosen macroeconomic aspects of various healthcare systems in the OECD countries exists.

### **1 INTRODUCTION**

Present-day OECD countries feature four basic healthcare systems comparison of which is highly problematic. In the majority of cases the compared expenditures of public budgets and private expenditures covering the overall healthcare are compared from the view of macroeconomic factors. From the view of the economic principles of each healthcare system a pressure is obvious for the responsibility of an individual to sustain one's own health but also for the population health. Population health is placed higher than the health of an individual from the point of view of the economic importance of healthy workforce. A person's health is an indivisible part of population health, as is suggested by Arah (2009, p. 235). He claims that health of an individual must be seen in the context of "socioeconomic circumstances and other health determinants of where they were conceived, born, bred, and how they shaped and were shaped by their environment and communities, especially given the prevailing population health exposures over their lifetime."

The first healthcare system ensuring the collective health originated in the 19<sup>th</sup> century industrially developing Germany and it is known as Bismarck system until today (Němec, 2008; Jarošová, 2007). It was Chancellor Bismarck who linked health of citizens (thus employees) to the work productivity. He supposed the public system of health insurance

would realize economies of scale and the healthy workforce would offer higher work efficiency. Employees pay a part of their wages and employers pay healthcare system contributions from which healthcare is provided for everybody. Employees pay more from their higher wages thus creating favorable conditions for higher standards of healthcare.

Presently the OECD countries are considered to be industrial or postindustrial. They consume a significant proportion of their GDP to ensure public health of their citizens. Majority of the healthcare systems of the industrialized societies has been financed from the taxes and wages of the employed citizens. After the deindustrialization trend and the shift towards the economy of services started developing after 1970 in the OECD countries, the principle of employment and wages changed. Shift work changed to work on demand with many employers. Deep structural changes of OECD economies together with the growth of unemployment caused the shortfall of healthcare systems revenues. Based on the lower income into healthcare systems, a requirement for higher efficiency of healthcare systems and search for new sources of income has originated.

Some authors state that an important source of income into healthcare systems was found in direct patient fees (Tučková, Fialová, Popesko, 2011). In the Czech Republic, for example, these so called regulatory fees were supposed to bring shortening of waiting time for intervention, shortening of the hospitalization period, bring more money into treatment of serious diseases, increase the availability of healthcare and improve the patients' comfort by eliminating the possible overuse of medical services.

Based on such economic situation the specialized and lay public has been conducting debates about which of the basic healthcare systems is the most competitive. The aim of these debates is clear: to find the cheapest and the most effective healthcare system for the wide masses of citizens.

## **2 THEORETICAL BACKGROUND**

According to WHO (2013), the healthcare system can be defined as all the activities the aim of which is to support, renew or sustain health of a man. Four basic healthcare systems and several mixed systems (not classified in any of the basic categories) are identified in the 39 OECD countries. Chile and Ireland are considered to have mixed systems. Healthcare systems of the other OECD countries can be divided by the way of healthcare payment into:

- a) The Universal Health Insurance Model – healthcare systems based on universal health insurance, such as the Bismarck healthcare insurance system;
- b) The National Health Insurance Model – based on the principle of national healthcare service financed from the taxes, thus from the state budget – the Semashko and the Beveridge healthcare insurance systems. Contrary to the Semashko model the Beveridge model comprises a share of private healthcare service;
- c) The Out-of-Pocket Model – healthcare systems based on the market healthcare and individual responsibility of the citizens – Liberal and Mixed Models.

### **2.1 The Bismarck healthcare system**

The Bismarck model, based on the obligatory social insurance, was created and realized in industrial Prussia. Until the WWII it worked basically in all developed European countries. The basis of its functioning is to create within legally set limits the so called public funds, into which special purpose fees for social care and healthcare are paid. These funds are managed by healthcare insurance companies via elected management. The health care is paid for from the obligatory payments for health insurance, which consists of payments by the employees, employers and the state. The insurance sum is set with regard to the insured person's income. The provided healthcare is contracted through health insurance companies. The residents

register and become insured with one of the insurance companies. In some countries the insurance policy covers the family members who are currently unemployed. The insurance companies are non-government organizations managing the insurance funds. This system works (with slight differences) in Germany, France, Austria, Switzerland and Benelux (Lameire et al., 1999) and some other countries (see Tab. 2).

## **2.2 Semashko healthcare system**

According to Dragoi et al. (2008, p. 331) Semashko centralized healthcare system was typical for the former socialist countries of the Central and Eastern Europe. Gladkij et al. (2003, p. 36) claim that in such a system all healthcare units are owned by the state, there are no private healthcare organizations, healthcare is paid for from the state income directly via state budget, healthcare is considered to be a national economy sector, it is planned centrally and is provided “free of charge”. Healthcare workers are state employees and are remunerated with a wage. From the macroeconomic perspective healthcare in this system is considered to be a non-productive sector which results in low economic priority. Such healthcare type was terminated together with the transformations of centrally planned economies into market economies after 1990. Countries using the Semashko model typically transformed into using the Bismarck system. Cuba and North Korea are the only two countries currently using the Semashko model.

## **2.3 Beveridge healthcare system**

The Beveridge model is based on a single payer and is financed by national taxation. It is a model traditionally used in the United Kingdom, where a National Health Service provides publicly financed services. It also provides access to hospital specialists for which one must usually have a referral from a general practitioner (Bevan, Helderman and Wilsford, 2010, p. 252). The Beveridge Model of National healthcare service was elaborated on in Great Britain in 1948 according to the Beveridge Report from 1942, which reflected the changes of Swedish healthcare system in the 1930s. It departs from the principle of ensuring the healthcare for all citizens regardless their payment possibilities. As a part of their taxation citizens pay a proportion of their income into the state budget from which healthcare is paid for – with a significant influence of the state. In this system the majority of the specialized inpatient care facilities, laboratories and X-ray facilities are a part of hospitals which in turn are a part of national healthcare service. Private beds are rather rare. General practitioners’ offices, dentists’ offices, pharmacies, specialized surgeries, a large proportion of nursing homes and nursing care are in private ownership. This system is used in various modifications in Italy, Spain, Sweden, Denmark, Norway, Finland (Lameire et al., 1999) and some other countries (see Tab. 2).

## **2.4 Liberal: Market-driven healthcare system**

The Liberal Model of healthcare is based on the presumption that healthcare is an individual’s issue. Healthcare services are understood as a type of service running according to the market rules. Patient is taken as a client and doctor as an entrepreneur. Private healthcare insurance operates in this system. Employer partly contributes towards the health insurance of its employees. State here is a coordinating and regulatory body. Apart from this, non-profit charity facilities exist in the system as well as state hospitals offering the basic healthcare for poor citizens without healthcare insurance. According to Paterick, Z., Paterick, T. and Waterhouse (2009, p. 11), the Liberal Model is a comprehensive healthcare system that comprises some competitive elements regarding prices and the quality of services, but also makes available “accurate, transparent, data-supported information”. This system operates in the USA, some South American countries and other countries (see Tab. 2).

## 2.5 Comparisons of healthcare systems

The four major healthcare systems differ mainly due to their historical and economic background which in each case required different needs to ensure public healthcare. The following table (Tab. 1) shows the main advantages and disadvantages of the four systems as concluded by Gladkij (2003, p. 28).

Tab. 1 – Comparison of advantages and disadvantages of healthcare systems. Source: Gladkij (2003, p. 28)

	Advantages	Disadvantages
The Bismarck model	Wide availability of healthcare Satisfactory network of healthcare facilities Rich offer of healthcare services Continuity of healthcare services Support of primary care Adequate costs	Emphasis on basic care Administrative ponderousness Financial situation of some insurance institutions and the influence of their management on providing the offered healthcare Rising costs for healthcare through the activities of insurance institutions
The Semashko model	Wide availability of healthcare Rich offer of healthcare services Network of healthcare facilities Continuity of healthcare services Support of primary care Adequate costs for healthcare	Rising costs for healthcare through the activities of insurance institutions Emphasis on basic care Financial situation of some insurance institutions and the influence of their management on providing the offered healthcare Administrative inflexibility
The Beveridge model	General availability of services Sufficient offer of services Adequate importance of preventive care Interconnectedness of healthcare services Lower costs of healthcare services Good coordination of healthcare subjects' interests	Lack of financial resources for investments Problems with financing the care during recession Long waiting periods for non-urgent interventions Insufficient motivation of citizens for their own healthcare Limiting of competitive environment
The Liberal model	Wide range of high-quality services Support and development of medical technologies Support of competitiveness of healthcare facilities	Insufficient preventive care High administrative costs Low availability of high-quality care for low-income groups of citizens Nonexistent interconnections in healthcare services High healthcare costs

Present situation in OECD countries is represented by only three main healthcare systems: Bismarck, Beveridge and Liberal model. Since 1990s, the Semashko model is no longer in use in European countries.

The following table (Tab. 2) shows economic and noneconomic factors which can illustrate the differences of the three chosen healthcare systems. The factors are divided into two main areas. The first area comprises quantitative factors - healthcare resources; the second area comprises qualitative factors - health status. Both of them are measured in all OECD member states thus enabling comparison across all healthcare systems. Affordability of healthcare system can be discussed by comparing the numbers of physicians, nurses and hospital beds per 1000 citizens. Quality of healthcare and health services provided by state or private institutions can be compared by evaluating of life expectancy and infant mortality data.

### 3 METHODOLOGY

Primary economic indicators comprise indicators regarding health expenditures. Statistical links are searched for between these indicators to prove differences between individual healthcare systems. In order to compare the healthcare systems as such it is also important to compare non-economic factors such as healthcare resources and health status.

The stated research question asks if various models of health systems differ from each other. Following main indicators were selected from OECD data to answer this question:

- I. Total expenditure, % GDP
- II. Annual growth rate of total expenditure on health, in real terms
- III. Annual growth rate of public expenditure on health, in real terms
- IV. Public expenditure on health, % total expenditure on health (TEH)

- V. Health expenditure by financing agent/scheme, Out-of-pocket payments (households), % total expenditure on health (TEH)

The following main statistical hypotheses (null and alternative) were set:

H<sub>0</sub>: There is no difference among healthcare systems in the selected indicator.

H<sub>1</sub>: There is a difference among healthcare systems in the selected indicator.

Upon having chosen the five indicators the null hypothesis is tested five times on XLStatistics software. One-way analysis of variance (one factor ANOVA) is used to test the significance of differences among healthcare systems. Condition for its use (in particular the homogeneity of variances) is tested by the Hartley's test. If this condition is not fulfilled, the Kruskal-Wallis test is applied to test the null hypothesis. The post-hoc multiple comparison test is applied in the case of rejection of the null hypothesis, thus demonstrating the difference between the models of healthcare systems (Scheffé test for one-way analysis of variance or Néményi test for Kruskal-Wallis test).

### 3.1 One factor ANOVA

Suppose experiment where only one factor is treated. This factor can be either numerical or categorical. It is used at  $I \geq 2$  levels  $A_1, A_2, \dots, A_I$ . The total number of observations in the whole experiment is  $n$ . The analysis of variance (ANOVA) is a technique designed to divide the total variation in a set of data into its component parts, each of which can be ascribed to a particular source. We test the null hypothesis  $H_0$  that the effects on all levels of A-factor are the same. The test statistic for ANOVA is  $F = \frac{S_A / (I - 1)}{S_e / (n - I)}$ . If  $F \geq F_{1-\alpha}(I - 1, n - I)$ , the null

hypothesis is rejected; otherwise it is not rejected. It means that factor A is significant (effects are different, for  $\alpha$ -level). The use of ANOVA assumes equal variances. This equality can be tested by Hartley's test. The null hypothesis is set as variances are equal. The test is based on the ratio of the largest group and of the smallest group variance. The calculated ratio is then compared to a critical value from a special table. If the calculated ratio is less than the critical value, the groups are treated as they have similar or equal variances. In case of the variances in groups are not equal the nonparametric Kruskal-Wallis test should be used instead of one factor ANOVA (Klímek, 2010).

### 3.2 Kruskal-Wallis Test (KW ANOVA)

The total number of observations is  $n = n_1 + n_2 + \dots + n_k$  in the  $k$  independent samples. The null hypothesis that all samples are the same (or there is no significant difference among them) is tested. All elements (units) are sorted into the growing row with rank. Then  $T_i$  is sum of rank of units from the  $i^{\text{th}}$  selection/group ( $i = 1, 2, \dots, k$ ). Finally, the test statistic

$Q = \frac{12}{n(n+1)} \sum_{i=1}^k \frac{T_i^2}{n_i} - 3(n+1)$  is calculated. If  $Q \geq \chi_{1-\alpha}^2(k-1)$ , we reject the null hypothesis;

otherwise we do not reject it (Klímek, 2008).

### 3.3 Post-hoc comparison

Post-hoc comparison is used after rejecting the null hypothesis. The equality of means  $\mu_i = \mu_j$  for all pairs  $i, j = 1, 2, \dots, I; i \neq j$  is tested. The methods of multiple comparisons (e.g. Scheffé method, LSD test, Neuman-Keul test, etc.) can be used. The null hypothesis that  $\mu_i = \mu_j$  for all

pairs (i, j) is rejected if  $|\bar{x}_i - \bar{x}_j| \geq \sqrt{(I-1) s^2 F_{1-\alpha}(I-1, n-I) \left(\frac{1}{n_i} + \frac{1}{n_j}\right)}$ ;  $i \neq j$ ; otherwise we do not reject it (Klímek and Kovářik, 2011).

## 4 STATISTICAL COMPARISON OF MACROECONOMIC EFFICIENCY ASPECTS

The chosen data have been confronted with null hypotheses. In case the null hypothesis is confirmed, the individual healthcare systems do not differ. In case the null hypothesis is rejected, statistically significant difference exists among the healthcare systems.

### 4.1 Trends in Total Expenditure, % GDP

To compare the models of healthcare systems the following null hypothesis is proposed:

$H_0$ : Individual models do not differ with regard to the Total expenditure, % GDP.

Tab. 3 – Analysis of Variance, Hartley’s Test, Kruskal-Wallis Test of Total expenditure, % GDP; healthcare systems by OECD countries. Source: Own processing.

p-value =	0.265714624
<hr/>	

Since the variance in the individual categories is not the same, the non-parametric Kruskal-Wallis test must be used. Because the p-value is again higher than 0.05 the null hypothesis is not rejected. The individual systems do not differ from one another.

#### 4.4 Trends in Public expenditure on health, % total expenditure on health (TEH)

To compare the models of healthcare systems the following null hypothesis is proposed:

H<sub>0</sub>: Individual models do not differ with regard to the Public expenditure on health, % total expenditure on health (TEH).

Tab. 6 – Analysis of Variance, Hartley’s Test, Kruskal-Wallis Test of Public expenditure on health, % total expenditure on health (TEH); healthcare system by OECD countries. Source: Own processing.

p-value =	0.035254062				
POST-HOC TEST					
PUBLIC EXPENDITURE ON HEALTH IN TOTAL EXPENDITURE ON HEALTH					
CELL	MODEL	{1}	{2}	{3}	{4}
1	Liberal	61.329	75.744	75.666	58.854
2	Bismarck	0.032048	0.32048	0.033274	0.990638
3	Beveridge	0.033274	0.999997	0.999997	0.144319
4	Mixed	0.990638	0.144319	0.147193	

Because the p-value is lower than 0.05 the null hypothesis is rejected. The individual systems differ significantly. The follow-up is the post-hoc test which identifies pairs of models that differ significantly. A significant difference is proven between the Bismarck and the Liberal system and again between the Beveridge and the Liberal system.

#### 4.5 Trends in Public expenditure Health expenditure by financing agent/scheme, Out-of-pocket payments (households), % total expenditure on health (TEH)

To compare the models of healthcare systems the following null hypothesis is proposed:

H<sub>0</sub>: Individual models do not differ with regard to the Health expenditure by financing agent/scheme, Out-of-pocket payments (households), % total expenditure on health (TEH).

Tab. 7 – Analysis of Variance, Hartley's Test, Kruskal-Wallis Test of Public expenditure Health expenditure by financing agent/scheme, Out-of-pocket payments (households), % total expenditure on health (TEH); healthcare systems by OECD countries. Source: Own processing.

H<sub>0</sub>: Population variances of all categories equal

H<sub>1</sub>: Population variances of all categories not equal

F <sub>max</sub>	4.271027432
DF <sub>1</sub>	4
DF <sub>2</sub>	8
p-value =	0.038530878

Kruskal-Wallis Test

H<sub>0</sub>: All population medians equal

H<sub>1</sub>: Not all populations medians equal

H	2.83487395
p-value =	0.417791173

Because the p-value is higher than 0.05 the null hypothesis is not rejected. The adequacy of using the analysis of variance is tested by Hartley test. Since the variance in the individual categories is not the same, the non-parametric Kruskal-Wallis test must be used. Because the p-value is again higher than 0.05 the null hypothesis is not rejected. The individual systems do not differ from one another.

## 5 CONCLUSIONS

The statistically significant difference (significance level of 0.05 or lower) among healthcare systems (BIS, BEV, LIB, and MIXED) was proved (H<sub>0</sub> was rejected) only for the indicator of **Public expenditure on health, % total expenditure on health (TEH)**. Differences between healthcare systems in other indicators were not proved.

Tab. 8 – Table of results. Source: Own processing.

Indicator	ANOVA	Hartley's test	Kruskal-Wallis	Post-hoc Test	H <sub>0</sub>
Total expenditure, % GDP	0,66779	0,000185	0,6059	–	Not rejected
Annual growth rate of total expenditure on health, in real terms	0,07064	0,0589	–	–	Not rejected

Public expenditure on health, % total expenditure on health (TEH)	0,00417	0,02307	0,03525	Significant differences: (LIB, BIS) and (LIB, BEV)	<b>Rejected</b>
Health expenditure by financing agent/scheme, Out-of-pocket payments (households), % total expenditure on health (TEH)	0,18244	0,03853	0,41779	–	Not rejected

The proven difference between the Liberal and Bismarck system and the Liberal and Beveridge system is in the essence of financing the healthcare systems under investigation. While the Bismarck and Beveridge systems are financed from the public sources, the Liberal system is financed mainly from the private sources. The Liberal systems focus on individual's responsibility for their own health and majority of the healthcare costs are required from the individuals. The Bismarck and Beveridge systems focus on public health and supply the majority of needed funds from the public sources. That is the major reason for the disclosed statistical difference. This difference, however, cannot answer the question of which healthcare system is the most efficient from the point of view of the macroeconomic aspects.

According to Tučková, Fialová and Strouhal (2011), the evaluation of the quantitative factors of the healthcare systems are more complex than is usually considered. From their point of view, for people to get what they want from the system, exchanges between patients and providers must be made (Tučková, Fialová and Strouhal, 2011). The overall comparison of the average parameters of the OECD counties healthcare systems (see Tab. 9) shows that Liberal systems are the most expensive from the point of view of Total expenditure on health, as a percentage of gross domestic product. The cheapest ones are the Mixed systems but these have the fastest Annual growth rate of total expenditure on health, in real terms, which suggests that the expenditures equalize in the medium run. Similar growth is recorded with

the Liberal and Mixed systems in the Annual growth rate of public expenditure on health, in real terms. On the other hand, the Bismarck and Beveridge systems show stable (even if lower) share of the Annual growth rate of total and public expenditure on health, in real terms.

The highest Health expenditure by financing agent/scheme, Out-of-pocket payments (households), as a percentage of total expenditure on health (TEH) are seen with the Liberal healthcare systems. They also feature a lower number of physicians and a comparable number of nurses at a high number of the offered hospital beds. Together with the Mixed systems the liberal systems have the highest infant mortality at a relatively comparable life expectancy. The Bismarck system is the second cheapest from the point of view of GDP expenditures with the lowest participation of private funds. It offers the highest number of hospital beds with a high number of physicians and nurses. Nevertheless, the life expectancy of citizens is almost two years lower than the average of the other healthcare systems. The infant mortality is the second best. The Beveridge system is comparable with the Liberal system in terms of overall expenditures. It sets up a different ratio between public and private funds where the majority of payments for healthcare is covered by the government sector. The Beveridge system offers the highest number of physicians and nurses at a low number of hospital beds. The infant mortality is the lowest and the life expectancy is the highest from all the compared systems. Mixed systems appear to be specific in their evaluation. They do not reach lower costs for healthcare but they have fewer physicians, nurses and hospital beds. They also have the highest infant mortality and only a standard life expectancy. This system thus seems to be the least advantageous. From the point of view of economic efficiency the most efficient systems are the Bismarck and the Beveridge healthcare systems, which in the long term concentrate on building public health. However, there were no statistically significant differences disclosed in the comparison of OECD member countries healthcare efficiency based on chosen macroeconomics indicators.

For the future extension of the research it would be appropriate to compare healthcare systems of specific countries by detailed econometric analyses of macroeconomic indicators. These macroeconomic variables could be expanded, for example, onto purchasing power parity. Such explained variables would be one of the proxies for the efficiency of healthcare in the given country or of chosen healthcare system itself across OECD member countries.

## **ETHNIC NETWORKS EFFECT ON INTERNATIONAL TRADE BETWEEN VIETNAM AND CZECH REPUBLIC**

*Minh Ly Pham, Hong Nga Do, Minh Tuan Phung*

### **Abstract**

Ethnic networks have been found to have a heterogeneous effect on economic outcomes. Vietnam is a developing, non-English speaking country and has a diversity of ethnic networks. In addition, Vietnamese ranked the third largest ethnic minority in Czech Republic at all since both countries established relationship. However, there is a shortage of research studying whether culture structure has an effect on international trade among two countries mentioned above or not. Using data from 1993 to 2013 on export and import value between these nations, we found that the number of Vietnamese living and working in Czech and GDP of Vietnam do have a positive impact on export activities among two countries.

*Keywords: ethnic networks, international trade*

### **1 INTRODUCTION**

In recent years, sociologists and anthropologists have begun to apply their analytical frameworks and empirical tools to role of culture and social networks on economic outcomes. In their influential research, Guiso, Sapienza and Zingales (2006) have found that culture as defined by religion and ethnicity does have a positive impact on economic behavior such as international trade, direct investment, national savings rates and government's redistributive policies as well. In addition, a number of scholars have accumulated a wealth of field evidence on the effect of ethnic networks in promoting macroeconomic outcomes, namely international trade and investment (Hiller, 2011; Chung & Tung, 2013; Freeman & Lindsay, 2012; Sanderson, 2013). Some recent papers include Rauch and Trindade (2002), Huang and Qian (2008) study how ethnic ties facilitate cross-country trade and investment flows. This study has been extended by Duanmu and Guney (2013) to cover multiple ethnic networks. Here, social and culture factors such as family ties and ethnic network can affect trade between Thailand and their countries of origin.

Vietnam is a developing, non-English speaking country and has a diversity of ethnic networks. Therefore, using Vietnam as a sample can provide an interesting case because it is not major immigration nations such as the United States, Canada and the United Kingdom (Girma and Yu, 2002; Mundra, 2005; Wagner, Head and Ries, 2002). On the other hand, the Czech Republic is, due to its advantageous geographic location at the heart of Europe, a very essential nation for migrants either as a final destination or transit point (Strielkowski and Weyskrabova, 2014). According to the 2001 census, there were 17,462 ethnic Vietnamese in the Czech Republic. The Vietnamese population has grown very rapidly since then, with the Czech Statistics Office estimating that there were 61,012 Vietnamese residing in the Czech Republic in October 2009. Vietnamese people in the Czech Republic, including residents and citizens, form the largest immigrant community in the country (and 3rd largest ethnic minority at all, after Slovaks and Romanies), numbering more than 83,000 people according to 2011 census.

However, there is a shortage of research studying whether culture structure has an effect on international trade among two countries mentioned above or not. To address this gap, the aim of this study is to explore the impact of ethnic networks on cross-border trade between Vietnam and Czech Republic.

This paper has the following structure. Section 2 reviews the existing literature and develops our hypotheses. Section 3 presents a general background of ethnic minorities in Vietnam. Our models and empirical data are shown in Section 4. Then these results and conclusions are reported and discussed in Section 5.

## **2 LITERATURE REVIEW**

The theoretical claim that ethnic networks encourage trade has found broad empirical support in the literature on migration business networks and international trade (Hiller, 2011). People have a tendency to cooperate with others who have some same aspects such as ethnicity, religion and race (Duanmu & Guney, 2013). Networks have properties that allow them to persist in spite of the dramatic development of market economy (Bowles & Gintis, 2004; Guiso, Sapienza & Zingales, 2009). Sociologists hold a believe that within-group cultural affinity supports association by means of positive sentiments, namely ethnic purity and personal loyalty among group members (Loury, 2001), while economists claim that consistent network effect is explained at least in part by their problem-solving capacities such as altering the information structure among members and powerful contractual enforcement (Bowles & Gintis, 2004).

Prior research on ethnic networks as an essential intermediary has shown that ethnic networks can reduce unofficial barriers in foreign markets by supporting information about laws, languages, and business culture (Bandyopadhyay et al., 2008). For instance, Rauch and Trindade (2002) developed a test for this information function of co-ethnic networks. They have found that an ethnic-Chinese network has a significant strong effect on trade in differentiated product space. Because homogeneous products do not have a ready reference price point, information requirements are particularly important in this product segment. And the fact that the ethnic effects are large in this product space is evidence of the informational advantage of ethnic ties. In addition, Fisman and Love (2003) have found that common ethnic ties also facilitates trade credit extensions in developing countries, as well as the more productive forms of financial transactions such as the use of longer-term contracts over the short-term ones – checks rather than cash (Guiso, Sapienza & Zingales, 2004). However, one of the gaps of prior research is that it has either concentrated on a single network or supposed that all ethnic networks have an equal effect on trade (Duanmu & Guney, 2013).

This lacuna has been elaborately described by Bandyopadhyay et al. (2008) in his empirical research. They figured out that positive heterogeneous effect of ethnic networks on cross-broad trade between US and five countries namely Brazil, Columbia, Spain, Thailand and Turkey. Nevertheless, there is no explanation for why the impact only exists for five nations out of twenty-nine countries in their investigation. On the other hand, one of the attempts to clarify the complicated effect of ethnic network is presented by Dunlevy (2006). In his paper, he gathered the export data of fifty states of US with eighty-seven other countries during the period 1990-1992. Dunlevy (2006) found that the higher corruption level of the origin country's political system leads to the stronger effect of diverse ethnicities, and less significant when Spanish or English is the language of the country of origin.

We carry on this line of investigation by concentrating on several notable points of the original country that may make up the complex impact of ethnic networks. There is an increasing number of paper studying on the remarkable effect of social and cultural aspects on economic outcomes in various avenues. For instance, Giuliano (2007) indicated that the US family structure are affected by economic conditions and culture heritage. In addition, Fernandez and Fogli (2009) found that culture is likely to play an essential role in explaining the large variation across time and countries in women's work and fertility. Moreover, culture

is also the explanation for cross-country variation in other individual economic outcomes such as entrepreneurial activity, creativity, and physical and human capital accumulation. Therefore, culture is an important area for economists and sociologists to study. Therefore, we hypothesize that:

*H1: Ethnic networks have a positive effect on export (import) between Vietnam and Czech.*

*H2: GDP of Vietnam has a positive effect on export (import) between Vietnam and Czech.*

*H3: GDP of Czech has a positive effect on export (import) between Vietnam and Czech.*

*H4: Population of Vietnam has a positive effect on export (import) between Vietnam and Czech.*

*H5: Population of Czech has a positive effect on export (import) between Vietnam and Czech.*

Based on our hypotheses, we provide the country background of Vietnam in Section 3, then present our empirical study in Section 4.

### **3 RESEARCH BACKGROUND: VIETNAM**

Vietnam is a multi-ethnic and multi-cultural country in South east Asia, and become a member of ASEAN in 1995. The Vietnamese people are the majority ethnic group of Vietnam, comprising 86% of the population. The Kinh population is concentrated mainly in the alluvial deltas and coastal plains of the country. However, Vietnam is also home to 54 ethnic minority groups, including the Hmong, Dao, Tay, Thai, and Nùng. Many ethnic minorities – such as the Muong, who are closely related to the Kinh – dwell in the highlands, which cover two-thirds of Vietnam's territory. The Hoa - ethnic Chinese and Khmer Krom people are mainly lowlanders.

The official national language of Vietnam is Vietnamese, which is spoken by the majority of the population. Vietnam's minority groups speak a variety of languages, including Tày, Mường, Cham, Khmer, Chinese, Nùng, and H'Mông. The Montagnard peoples of the Central Highlands also speak a number of distinct languages.

The French language, a legacy of colonial rule, is spoken by many educated Vietnamese as a second language, especially among the older generation and those educated in the former South Vietnam. Russian – and to a much lesser extent German, Czech and Polish – are known among some Vietnamese whose families had ties with the Soviet bloc during the Cold War. In recent years, as Vietnam's contacts with Western nations have increased, English has become more popular as a second language. Japanese, Chinese and Korean have also grown in popularity as Vietnam's links with other East Asian nations have strengthened.

Vietnam has become a major tourist destination since the 1990s. In 2012, Vietnam has 6.84 million tourists visiting. This was a 13% increase from 2011 figure of 6 million international visitors, which was itself a rise of 2 million visitors relative to 2010 arrivals. Vietnam has become increasingly popular as an expat destination in recent years and it is now recognized as a safe place for foreigners to live and work. Expats are attracted by the nice weather, low cost of living, lively culture and the steady improvements in Vietnam's infrastructure. According to the Ministry of Labour, Invalids and Social Affairs, by May 2012, the total number of foreign workers in Viet Nam has now reached over 71,000 people. Of which, over 41,500 (more than 63 per cent) were granted work permits, nearly 24,000 people (nearly 37 per cent) were not granted work permits and 5,500 are not required to hold such a permit. The

Ministry also announced a breakdown of the figures on foreign workers, from over 60 countries, of which roughly 58 per cent are from Asia (mostly China, Japan, South Korea, Malaysia and Taiwan) and 28.5 per cent from Europe. Men make up nearly 90 per cent of all foreign workers and 86 per cent of workers are over 30 years old. In conclusion, Vietnam is not a major immigration country. This country is small, developing, South East Asian country with diverse cultural and religious attributes from Western nations. Findings from this research will help us extend theoretical and empirical previous studies.

## **4 EMPIRICAL MODEL AND DATA**

### **4.1 Gravity model specification**

We examine the effects of ethnic networks using a standard gravity model of bilateral. We analyze it in two ways. Firstly, we use ethnic networks as a dummy variable to estimate the overall effect of ethnic networks. This is to examine whether the presence of ethnic networks generates positive effects on international trade between Vietnam and Czech Republic. Secondly, we measure it as the natural logarithm of number of citizens of a foreign origin plus 1, so that it is a continuous variable which will allow us to examine the complicated impacts of ethnic networks on cross-border trade by incorporating into the model their two salient social features, namely family ties and ethnic diversity. This will enable us to test our hypotheses and establish whether or not these social features magnify or deflate the effect of ethnic networks on trade (Duanmu & Guney, 2013). The common gravity model that we are going to use is specified as follows:

$$\text{Ln Exports}_t \text{ or Ln Imports}_t = \beta + \delta_1 \text{Ethnic networks}_t + \delta_2 \text{GDP\_VN}_t + \delta_3 \text{GDP\_CZ}_t + \delta_4 \text{Population\_VN}_t + \delta_5 \text{Population\_CZ}_t + \varepsilon_t$$

Where  $j$  denotes a country and  $t$  denotes time.  $\beta$  is the constant term common to all countries;  $\varepsilon_t$  is the general disturbance term for the model. The dependent variable is either Ln Exports or Ln Imports.  $\text{Ln Exports}_t$  denotes the dollar value of exports from Vietnam to Czech Republic in year  $t$ . Similarly,  $\text{Ln Imports}_t$  defines the total value of goods imported from Czech to Vietnam in year  $t$ .  $\text{Ethnic networks}_t$  denotes the number of Vietnamese people in Czech in year  $t$ .  $\text{GDP\_VN}_t$  denotes GDP of Vietnam in year  $t$ .  $\text{GDP\_CZ}_t$  denotes GDP of Czech Republic in year  $t$ .  $\text{Population\_VN}_t$  denotes the population of Vietnam in year  $t$ .  $\text{Population\_CZ}_t$  denotes population of Czech Republic in year  $t$ .

### **4.2 Data and measurement**

Our empirical research has collected data from various sources. First, we gather data on exports and imports between Vietnam and Czech Republic through the UN Comtrade database. We use exports as our primary dependent variable; and imports are used as an alternative to check the robustness of our findings. Exports and imports data are collected during the period of 21 years (from 1993 to 2013). Second, data on ethnic networks, we collect the number of Vietnamese people in Czech Republic from 1993 to 2013, which is gathered from Czech Statistical Office. According to this figure, when two countries had established diplomatic relationship in 1954 until now, the number of Vietnamese people in Czech Republic has increased steadily. Data on GDP, population of Vietnam and Czech Republic from 1993 to 2013 are drawn from the World Bank.

## 5 RESULTS AND CONCLUSIONS

Firstly, Table 1 has showed the definition and descriptive statistics of all variables. As can be seen, we use the natural logarithm for both independent and dependent variables.

Tab. 1 - Descriptive statistics for the main variables and their definition

<b>Variable</b>	<b>Definition</b>	<b>Mean</b>	<b>SD</b>	<b>Min</b>	<b>Max</b>
Ln Exports	The natural logarithm of the dollar value of exports	17.6776	1.01817	15.43	19.03
Ln Imports	The natural logarithm of the dollar value of imports	16.6577	.82156	15.58	18.07
Ethnic networks	The natural logarithm of the number of Vietnamese people in Czech	12.6486	.65983	11.55	13.63
GDP_VN	The natural logarithm of GDP of Vietnam	24.6109	.76089	23.30	25.87
GDP_CZ	The natural logarithm of GDP of Czech	25.3422	.58726	24.39	26.14
Population_VN	The natural logarithm of Vietnam's population	18.1971	.07726	18.06	18.31
Population_CZ	The natural logarithm of Czech's population	16.1500	.01043	16.14	16.17

Before discussing the multiple regression analysis, table 2 provides the correlation matrix among the dependent and explanatory variables.

Tab. 2 - Correlation matrix for the main variables

		EX	IM	Ethnic networks	VN_GDP	CZ_GDP	VN_PO	CZ_PO
EX	Pearson Correlation							

IM	Pearson Correlation	.791**						
Ethnic networks	Pearson Correlation	.958**	.760**					
VN_GDP	Pearson Correlation	.960**	.798**	.990**				
CZ_GDP	Pearson Correlation	.922**	.792**	.958**	.967**			
VN_PO	Pearson Correlation	.960**	.748**	.999**	.986**	.953**		
CZ_PO	Pearson Correlation	.508**	.681**	.511**	.602**	.539**	.477*	

\*\* . Correlation is significant at the 0.01 level (2-tailed).

\* . Correlation is significant at the 0.05 level (2-tailed).

We report our regression results as follow. Table 3 and 4 report our main results where Vietnam's export is the dependent variable. As can be seen from these tables, there is no independent variable having a positive effect on international trade between Vietnam and Czech when we run all the explanatory variables together in one model as mentioned in Section 4.

Tab. 3 - Regression model with all independent variables and export value

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1 (Constant)	-2167.918	1662.215		-1.304	.212
ln_ethnicnetwork	-9.302	6.273	-6.028	-1.483	.159
ln_vngdp	-.646	2.122	-.483	-.304	.765
ln_czgdg	.404	.681	.233	.593	.562
ln_vnpp	92.888	64.135	7.049	1.448	.168
ln_czpp	38.306	38.764	.392	.988	.339

a. Dependent Variable: ln\_export

Tab. 4 - Regression model with all independent variables and import value

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-4312.368	2721.009		-1.585	.134
	ln_ethnicnetwork	-14.404	10.268	-11.568	-1.403	.181
	ln_vngdp	-4.168	3.474	-3.860	-1.200	.249
	ln_czgdg	1.960	1.115	1.401	1.757	.099
	ln_vnpop	149.761	104.988	14.084	1.426	.174
	ln_czpop	113.864	63.455	1.446	1.794	.093

a. Dependent Variable: ln\_import

Therefore, we have adjusted our model and finally find out that only ethnic networks and GDP of Vietnam have positive impact on export value between Vietnam and Czech as shown in Table 5 & 6. Adjusted R<sup>2</sup> is 91.4% and 55.6% respectively, indicating a satisfactory model fit.

Tab. 5 - Regression model with export value and ethnic networks variables

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-1.030	1.278		-.806	.430
	ln_ethnicnetwork	1.479	.101	.958	14.652	.000

a. Dependent Variable: ln\_export

### Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.958 <sup>a</sup>	.919	.914	.29787

a. Predictors: (Constant), ln\_ethnicnetwork

Tab. 6 - Regression model with import value and ethnic networks variables

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	4.683	2.350		1.993	.061
	ln_ethnicnetwork	.947	.186	.760	5.103	.000

a. Dependent Variable: ln\_import

### Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.760 <sup>a</sup>	.578	.556	.54747

a. Predictors: (Constant), ln\_ethnicnetwork

From these tables above, we have some conclusions about our hypotheses. Based on the results from the regression, we reject the H2, H3, H4 and H5; whereas only H1 can not be rejected. In conclusion, export and import value between Vietnam and Czech Republic are affected by the number of Vietnamese living and working in Czech, whereas GDP and population of both countries do not have an impact on international trade between these nations. This results point out the importance of ethnic networks representing by Vietnamese people in Czech on the total amount of goods exported and imported between both countries. Government can base on these results to make some policies to encourage people to move between Vietnam and Czech to have the positive effect on international trade. The Government of Czech and Vietnam should create more opportunities for citizens to live, work, study abroad and do business in Czech Republic and vice versa, which can produce a positive impact on trade.

Our research also has some limitations in methodology and data. Firstly, we just carry two models by one method which is linear regression. Therefore, there are several areas for further research, which can apply multiple models to have a comparison between these models for the best one. Secondly, our model contains only five variables, so next study can add some variables relating ethnic networks or culture such as ethnic diversity, religion, family ties and so on to get more results and practical implications. We can also investigate ethnic networks effect on international financial flows such as FDI. Finally, our data just covers about two decades, in the future research, we may expand data for the longer time span.

## **EFFECTS OF EXCHANGE RATE SHOCKS ON SHORT-TERM INTEREST RATES IN NEW EU MEMBER COUNTRIES**

*Rajmund Mirdala*

### **Abstract**

New EU member countries are still suffering from negative implications of economic crisis. Low interest rate environment and associated liquidity trap risk motivated economists to investigate sources of interest rates volatility. We suggest that interest rates responsiveness to the exchange rate shocks can reveal substantial implications of relative exchange rate diversity and its importance during the crisis period. As such, sources of interest rates volatility may help to reveal side effects of the exchange rate regime choice affecting monetary policy decision making. In the paper we examine responsiveness of short-term nominal interest rates to the exchange rate shocks in ten new EU member countries by employing SVAR methodology. We observed unique patterns of the short-term interest rates responsiveness in countries with different exchange rate arrangements that contributes to the fixed versus flexible exchange rate dilemma.

### **1 INTRODUCTION**

Crisis period with a large complex of key and side effects affected not only the overall performance of the new EU member countries but also maneuverability of authorities in fighting the economic crisis. Increased uncertainty on the financial markets resulted in higher volatility of market prices/rates reduces predictability of market trends, even in the short period. As a result, increased instability of exchange rates seems to be inevitable but painful implication (Stavarek, 2012).

Low interest rate environment clearly reduced effects of monetary policy on the business cycle. At the same time, spurious effects of quantitative easing induced economists to examine sources of interest rates volatility. Responsiveness of short-term interest rates to the structural shocks provides unique platform to investigate sources of their unexpected volatility and associated effects on monetary policy decision making. Moreover, sources of interest rates volatility may help to reveal side effects of the exchange rate regime choice.

In the paper we analyze effects of exchange rate shocks on interest rates in ten new EU member countries. From estimated SVAR model we compute impulse-response functions to analyze responses of short-term nominal interest rates to the unexpected positive one s.d. exchange rate shock. Results of estimated model are discussed from the perspective of fixed versus flexible exchange rate dilemma (Calvo and Reinhart, 2002). To provide more rigorous insight into the problem of the exchange rate regime suitability we estimate the model for each particular country employing data for two subsequent periods 2000-2007 (pre-crisis period) and 2000-2013 (extended period). Comparison of the results for both models is crucial to investigate the origins and key implications of current economic crisis on the volatility of short-term interest rates.

## **2 OVERVIEW OF THE LITERATURE**

Gerlach-Kristen and Rudolf (2010) compared three monetary operating procedures by examining optimal policy reaction functions, impulse responses and simulated volatilities of inflation, the output gap and the yield curve to examine volatility of interest rates and other main macroeconomic variables. Their results suggest that volatilities in key variables under different monetary-policy framework (commitment vs. discretion) are strongly dependent on general preconditions (normal times vs. financial distress). Eiffinger, Schaling and Vehagen (2000) analyzed the relevancy of the term structure of interest rates for the transmission process of the monetary policy. Authors identified and empirically tested the long-term interest rates as a crucial indicator for monetary policy discretionary changes. Emiris (2006) decomposed long-term interest rates into term premium and inflation premium to investigate the sources of average premium on ten years bonds variability. Author also examined responses of the term premia to the different shocks. Fendel (2009) intended to support the empirical findings on the information content of the term structure of interest rates for monetary policy. Kulish (2007) analyzed two roles (first, as a key determinant in the reaction function of the monetary authority; second, as instruments of policies) that long-term nominal interest rates can play in the conduct of the monetary policy. McGough, Rudebusch and Williams (2005) investigated the problem of short-term versus long-term interest rates suitability to operate as a monetary policy instrument. Authors highlight and discuss a crucial role of inflation expectations and real interest rate for selecting the most appropriate interest rate as a key pillar of a monetary policy framework. Michaud and Upper (2008) identified the origins of interbank interest rates volatility by examining the possible determinants of the risk premium contained in the money market interest rates. Rudebusch, Sack and Swanson (2007) examined the origins and implications of changes in bond term premiums for economic activity to analyze the stability of long-term interest rates. Authors also analyzed empirical relationship between short-term and long-term interest rates.

## **3 OVERVIEW OF EXCHANGE RATE REGIME EVOLUTION IN THE NEW EU MEMBER COUNTRIES**

Macroeconomic stability, fast recovery from deep and sudden transition shock and real output growth stimulation represents one of the most challenging objectives for the European transition economies in the early 1990s. Consistent choice as well as flexible adjustments of monetary policy framework and exchange rate regime accompanied key crucial economic policy decisions in this process. Associated changes in monetary-policy strategy reflected wide range of macroeconomic aspects underlying sustainability of appropriate exchange rate regime choice.

Among key determinants of the exchange rate regime choice in the European transition economies at the beginning of the 1990s we may consider an effort to regain macroeconomic stability, foreign exchange reserves requirements and availability, overall external economic (trade and financial) openness, etc. At the later stages of transition process we emphasize the role of massive foreign capital inflows, sustainability of real economic growth, institutional adjustments according to perspectives of ERM2 entry.

Initial transition shock followed by the sharp real output decline associated with intensive inflation pressures (caused by rapid exchange rate devaluations, price liberalization and deregulation, tax reforms, fiscal imbalances, etc.) emphasized a crucial importance of strong nominal anchor for monetary authorities in restoring a macroeconomic stability and confidence as well as positive expectations of economic agents. However immediate exchange rate based stabilization became an appropriate strategy only for countries with

adequate foreign exchange reserves while being able to significantly reduce inflation pressures in adequate (short) time period to prevent undesired rapid overvaluation. As a result it seems to be convenient to divide the new EU member countries in two groups (so called “peggers” and “floaters”) considering initial exchange rate regime framework.

Relative diversity in exchange rate regimes in the new EU member countries revealed uncertain and spurious conclusions about the exchange rate regime choice during last two decades. Moreover, Eurozone membership perspective (de jure pegging to euro) realizes uncertain consequences of exchange rate regime switching especially in the group of large “floaters”.

	Exchange rate regime																							
<b>Bulgaria</b>		managed floating								currency board														
<b>Czech Republic</b>	peg with horizontal bands								managed floating															
<b>Estonia</b>		currency board												ERM2				eurozone						
<b>Hungary</b>	adjustable peg				crawling peg				peg with horizontal bands						managed floating									
<b>Latvia</b>		floating		conventional fixed peg										ERM2										
<b>Lithuania</b>		floating		currency board										ERM2										
<b>Poland</b>		crawling peg								free floating														
<b>Romania</b>	free floating								managed floating															
<b>Slovak Republic</b>	peg with horizontal bands								managed floating						ERM2				eurozone					
<b>Slovenia</b>		managed floating										crawling band		ERM2			eurozone							
	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013

**Note:** Exchange rate regime evolution in the New EU member countries (Information in the table are based on the condition from the end of 2013. See following per country description for up-to-date information): *Bulgaria* - since 1991 floating (pegged exchange rate regime undesirable due to possible low credibility), currency board since 1997 (after 1996-1997 financial crisis (public debt, bad commercial banks loans)). *Czech Republic* - exchange rate pegged to currency basket with narrow but continuously widen horizontal bands, since May 1997 after currency attacks switch to managed floating with no predetermined path for the exchange rate with DEM (EUR) as reference currency. *Estonia* - currency board since 1992 till 2011 (euro adoption), plan to adopt in 2008 but delayed due high inflation, since 2011 eurozone membership. *Hungary* - managed floating till February 1995, since March 1995 till the end of 1999 crawling peg with continuously decreased rate of periodical devaluation and widen horizontal bands, since January 2000 exchange rate pegged to euro combined with wide horizontal bands (since May 2001), since May 2008 managed floating with EUR as reference currency. *Latvia* - since February 1994 exchange rate pegged to SDR (fixing the exchange rate to a basket of currencies (SDR) instead of a single currency serves

to promote long-term stability) (since January 2005 pegged to EUR), since 2014 eurozone membership. *Lithuania* - since April 1994 currency board (exchange rate pegged to USD, in February 2002 pegging switched to EUR), since 2015 eurozone membership. *Poland* - since the end of 1991 crawling peg with continuously decreased rate of periodical devaluation and widen horizontal bands, since April 2000 free floating. *Romania* - free floating, since 1998 exchange rate arrangement reclassified as managed floating. *Slovak Republic* - exchange rate pegged to currency basket with narrow but continuously widen horizontal bands, since October 1998 after currency attacks switch to managed floating with no predetermined path for the exchange rate with DEM (EUR) as reference currency, since 2009 eurozone membership. *Slovenia* - managed floating with no predetermined path for the exchange rate (since February 2002 crawling band - the monetary authority manages the float of the domestic currency within certain fluctuating margins around a depreciating path - a heavily-managed crawling band with pragmatic monetary, real, external and financial indicators).  
ERM2 - June 2004 - Estonia (left in January 2011 after euro adoption), Lithuania (left in January 2015 after euro adoption), Slovenia (left in January 2007 after euro adoption)  
- May 2005 - Latvia (left in January 2014 after euro adoption)  
- November 2005 - Slovak Republic (left in January 2009 after euro adoption)

Successful anti-inflationary policy associated with stabilization of inflation expectations in the European transition economies at the end of 1990s significantly increased the role of short-term interest rates in the monetary policy strategies. At the same time, so called qualitative approach to the monetary policy decision-making performed in the low inflation environment, gradually enhanced the role of real interest rates expectations in the process of nominal interest rates determination. However, economic crisis increased uncertainty on the markets and thus worsen expectations (inflation expectations including) of agents.

Eurozone member countries as well as global economy are currently exposed to the negative effects of the economic and debt crisis. To alleviate recession and support economic recovery, monetary authorities dramatically reduced key interest rates. Low interest rates together with quantitative easing, however, should not necessarily increase supply of loans due to prudential credit policy of commercial banks reflecting increased uncertainty on the markets. As a result, policy of low interest rates seems to be inefficient.

Exchange rate policy evolution represents one of the key parts of crucial economic policy decisions at the beginning of the transition process in countries from the region of Central and Eastern Europe in the early 1990s. Despite its complexity and particularity there seems to be some similar features at the starting point of transition process in all European transition economies such as recession followed by initial transition shock and common vision of European union and Economic and Monetary union membership.

Macroeconomic stability as one of the primary objectives in the initial phase of the transition process affected exchange rate regime choice in the later new EU member countries. However, low credibility of monetary institutions, lack of foreign exchange reserves and high inflation differentials represented real constraints and difficulties related to the sustainability of pegged exchange rate regimes. Brief overview of the exchange rate regimes evolution in new EU member countries provides table 1.

It seems to be clear that new EU member countries did not follow common practice in the process of the exchange rate regime choice at the beginning of the 1990s. Small Baltic countries adopted currency board regime (Estonia and Lithuania) eventually conventional fixed peg regime (Latvia). Hungary adopted crawling peg regime (after few years of adjustable peg in place) together with Poland. Czech Republic and Slovak Republic adopted

pegged regime with horizontal bands. Despite high inflation rates Bulgaria, Romania and Slovenia adopted floating exchange rate regime due to low level of reserves and lack of credibility though Bulgaria switched to currency board after 1996-97 financial crisis. It seems to be clear that most of new EU member countries enjoyed disinflationary and credibility benefits of so called hard or soft exchange rate regimes. Fixed exchange rates as the nominal anchor significantly contributed to the successful disinflationary process at the end of the 1990s.

Till the end of the decade many countries from the group switched to more flexible exchange rate regimes (Czech Republic in 1997, Slovak Republic in 1998 and Poland in 2000). Similarly Hungary switched to intermediate regime by widening horizontal bands. Although Hungary stacked to exchange rate pegged to euro, by employing wide horizontal bands de facto followed the same trend as previous group of countries.

Exchange rate regime choice also affected corresponding monetary policy strategy framework. Countries with exchange rate as nominal anchor (hard pegs or soft pegs with narrow horizontal bands) successfully implemented exchange rate targeting. Countries with soft pegs (pegs with wide horizontal bands or crawling pegs) and floating regimes employed monetary targets as intermediate criteria of monetary policy (monetary targeting).

Overall success of disinflationary process represents one of the key milestones on the road to stable macroeconomic environment with crucial role of low and stable inflation expectations. Low inflation combined with stable inflation expectations is considered to be a substantial condition for switching from quantitative (money supply) to qualitative (interest rates) approach in monetary policy decision-making. This adjustment in monetary policy strategies seems to be obvious in new EU member countries since the end of 1990s as a part of prevailing trend in weakening of relationship between money and inflation. Increased role of inflation expectations together with raising credibility of monetary authorities resulted in adoption of direct (explicit) inflation targeting strategy in many new EU member countries - Czech Republic (1998), Poland (1999), Hungary (2001), Slovenia (2002), Romania (2005) and Slovak Republic (2005).

New EU member countries challenged a decision of a euro adoption and Eurozone membership several years before the economic crisis arises. Disputable policy implications of sacrificing monetary sovereignty rose as a crucial assumption affecting main features as well as durability of preparation phase timetable in countries with flexible exchange rate regimes (Czech Republic, Poland, Romania, Slovak Republic and Slovenia). Among a variety of determinants and aspects we emphasize the role of decisions inevitably associated with "right" scheduling of the Eurozone entry. Some countries from the group of new EU member countries already joined the Eurozone (Slovenia (2007), Slovak Republic (2009), Estonia (2011), Latvia (2014), Lithuania (2015)) followed by participation of their currencies in ERM2 (Estonia (June 2004), Lithuania (June 2004), Slovenia (June 2004), Latvia (May 2005), Slovak Republic (November 2005)).

The loss from sacrificing exchange rates flexibility in the Eurozone candidate countries became directly confronted with benefits related to exchange rate stability associated with sacrificing monetary autonomy. Despite plausible advantages of pegging exchange rates of candidate countries to euro followed by the euro adoption it seems to be clear that risks associated with potential effects of breakdown in mutual interconnections between macroeconomic development and flexible exchange rates leading path seem to be of a minor interest in current empirical literature.

Economic theory provides clear suggestions in fixed versus flexible exchange rates dilemma in fighting high inflation pressures. At the same time exchange rate based enhancement of

external competitiveness may provide a convenient framework to foster economic growth even when domestic economy is cooling down. On the other hand, incentives to increase external demand during the crisis period may start unfavorable spiral of competitive devaluations. Central banks and governments may tend to devalue currencies (internal devaluation) especially in times when low interest rates policy associated with quantitative easing doesn't provide correct and sufficient incentives to foster domestic demand. Internal devaluation causing real exchange rate to depreciate became highly discussed nowadays, in the time of economic and debt crisis in Eurozone, when inability of low performing economies to increase foreign competitiveness of their production forces authorities to experiment with internal devaluation considering all adjustments are made by prices, wages (and associated costs of production) and assets values falling.

#### 4 ECONOMETRIC MODEL

We implement a VAR methodology to analyze effects of positive exchange rate shock on short-term nominal interest rates in new EU member countries. Identification scheme based on imposing long-run restrictions on the variance-covariance matrix of the reduced-form VAR residuals is employed to identify structural shocks hitting the model.

True model is represented by the following infinite moving average representation:

$$X_t = A_0\varepsilon_t + A_1\varepsilon_{t-1} + A_2\varepsilon_{t-2} + \dots = \sum_{i=0}^{\infty} A_i\varepsilon_{t-i} = \sum_{i=0}^{\infty} A_iL^i\varepsilon_t = A(L)\varepsilon_t \quad (1)$$

where  $X_t$  represents  $n \times 1$  a vector including endogenous variables of the model,  $A(L)$  is a  $n \times n$  polynomial consisting of the matrices of coefficients to be estimated in the lag operator  $L$  representing the relationship among variables on the lagged values,  $\varepsilon_t$  is  $n \times 1$  vector of identically normally distributed, serially uncorrelated and mutually orthogonal errors (white noise disturbances that represent the unexplained movements in the variables, reflecting the influence of exogenous shocks):

$$E(\varepsilon_t) = 0, \quad E(\varepsilon_t\varepsilon_t') = \Sigma_\varepsilon = I, \quad E(\varepsilon_t\varepsilon_s') = [0] \quad \forall t \neq s \quad (2)$$

Vector  $X_t$  consists of six endogenous variables - industrial production ( $y_{r,t}$ ), money supply ( $m_t$ ), core inflation ( $p_t$ ), short-term nominal interest rates ( $ir_{n,t}$ ) and real exchange rate ( $er_{r,t}$ ). In the five-variable VAR model ( $X_t = [ip_{r,t}, m_t, p_t, ir_{n,t}, er_{r,t}]$ ) we assume five exogenous shocks that contemporaneously affects endogenous variables - demand shock ( $\varepsilon_{ip_{r,t}}$ ), nominal shock ( $\varepsilon_{m,t}$ ), inflation shock ( $\varepsilon_{p,t}$ ), monetary policy shock ( $\varepsilon_{ir_{n,t}}$ ) and exchange rate shock ( $\varepsilon_{er_{r,t}}$ ).

Structural exogenous shocks from equation (1) are not directly observable due to the complexity of information included in true form VAR residuals. At the same time, the shocks in the reduced form are likely to be correlated so they cannot be considered as true structural shocks. As a result, structural shocks cannot be correctly identified. It is then necessary to transform true model into following reduced form

$$X_t = C(L)Y_{t-1} + e_t \quad (3)$$

where  $C(L)$  is the polynomial of matrices with coefficients representing the relationship among variables on the lagged values and  $e_t$  is a  $n \times 1$  vector of normally distributed errors (shocks in reduced form) that are serially uncorrelated but not necessarily orthogonal:

$$E(e_t) = 0, \quad \Sigma_u = E(e_t e_t') = A_0 E(\varepsilon_t \varepsilon_t') A_0' = A_0 A_0', \quad E(e_t e_s') = [0] \quad \forall t \neq s \quad (4)$$

Relationship between reduced-form VAR residuals ( $e_t$ ) and structural shocks ( $\varepsilon_t$ ) can be expressed as follows:

$$e_t = A_0 \varepsilon_t \quad (5)$$

As we have already noted at the beginning of this section structural VAR (SVAR) approach, is based on decomposing a series into its permanent and temporary components. It imposes long-run restrictions to the reduced-form VAR model. Identification scheme in the SVAR models reflects a long-run neutrality assumption so that we expect the cumulative effect of a certain shock on the certain endogenous variable development is zero.

The equation (6) we can now rewrite to the following form:

$$\begin{bmatrix} 1 & 0 & 0 & a_{14} & a_{15} \\ 0 & 1 & 0 & 0 & a_{25} \\ 0 & a_{32} & 1 & a_{34} & a_{35} \\ a_{41} & a_{42} & a_{43} & 1 & a_{45} \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} u_{y,t} \\ u_{m,t} \\ u_{p,t} \\ u_{in,t} \\ u_{er,t} \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \varepsilon_{y,t} \\ \varepsilon_{m,t} \\ \varepsilon_{p,t} \\ \varepsilon_{in,t} \\ \varepsilon_{er,t} \end{bmatrix} \quad (6)$$

In order to correctly identify the VAR model we have to impose fifteen restrictions. The number of long-run identifying restrictions is given by the simple equation  $n(n+1)/2$ , where  $n$  denotes the number of endogenous variables of the model. Five restrictions we obtain by normalizing the original matrix. Ten remaining long-run restrictions are identified as follows:

- demand shock does not have permanent effect on money supply (1), inflation (2), real exchange rate (3),
- liquidity shock does not have permanent effect on real output (4), real exchange rate (5),
- inflation shock does not have permanent effect on real output (6), money supply (7), real exchange rate (8),
- monetary policy shock does not have permanent effect on money supply (9), real exchange rate (10).

Estimated SVAR model is used to compute impulse response functions to analyze responses of short-term nominal interest rates to the one standard deviation exchange rate shock in new EU member countries.

## 5 DATA AND RESULTS

We employed monthly data for period 2000M1-2007M12 (model A) consisting of 96 observations and period 2000M1-2013M12 (model B) consisting of 168 observations for the following endogenous variables - industrial production (nominal volume of the industrial product deflated by averaged PPI), money supply (monetary aggregate M2), inflation (core inflation), short-term nominal interest rates (interbank offered rates with 3 months maturity) and real exchange rate (real effective exchange rate). Time series for monthly industrial

production were employed due to absence of data on the same basis for real output (GDP). Short-term interest rates in Estonia, Slovak Republic and Slovenia we replaced by EURIBOR after euro adoption in each particular country (2007, 2009 and 2011).

Estimation of two models is in line with the primary objective of the paper to estimate the responses of the short-term nominal interest rates to the exchange rate shocks considering possible implications of the crisis period on presented results. Time series for all endogenous variables were drawn from IMF database (International Financial Statistics, October 2014). Time series for industrial production, money supply and inflation were seasonally adjusted.

### Model A

### Model B

Fig. 1- Responses of Interest Rates to Exchange Rate Shock. Source: Author's calculation.

**Note:** Curves represent responses of interest rates (IR) to the positive one standard deviation exchange rate shock in each country from the group of new EU member countries.

Exchange rate shock was followed by an immediate interest rates decrease in all ten countries from both groups. However, we observed some differences in short-term and long-term response patterns according to the relative diversity in the adopted exchange rate regime in individual countries.

In countries with the nominal exchange rate anchoring we investigated that positive exchange rate shock (exchange rate appreciation) was followed by the interest rate drop with around one month lag. However, we observed some different patterns with regard to the intensity of the interest rate decrease even among countries from the same group ("peggers"). Regardless of this it seems that the short-term interest rates are likely to be responsive to the unexpected exchange rate shocks in countries with the nominal exchange rate targeting.

Initial dynamic decrease in interest rates followed by the exchange rate shock culminated during the second month since the shock. After reaching the peak, interest rates tend to converge to their pre-shock levels following the path of steady and continuous though slight increase. However, the speed of interest rates adjustment in the medium term differs. As a result, the overall effect of the positive exchange rate shock was neutralized between tenth (Estonia and Latvia), eighteenth (Lithuania) and twenty-fourth (Bulgaria) month since the shock in group of countries with pegged exchange rate regime.

Following our results we suggest that high short-term (or even immediate) responsiveness of interest rates to the unexpected exchange rate shocks in countries with exchange rate targeting is associated with an increased stabilization role of interest rates to maintain exchange rate stability affected by the exchange rate volatility (i.e. due to exchange rate shocks). Immediate higher responses of short-term interest rates in these countries should operate as a convenient vehicle to support the exchange rate on its way back to per-shock equilibrium levels.

Quite different response patterns of the short-term interest rates to the positive exchange rate shock were observed in the group of countries with flexible exchange rate arrangement. In comparison with the previous group of countries it seems that the immediate responsiveness of interest rates is lagged (by one to three months). Initial load of the exchange rate effect to the short-term interest rates is quite moderate. Interest rates reacted to the unexpected exchange rate shock by a moderate decrease. Effect of the shock intensified during next months. Despite relatively similar features in immediate responses of the short-term interest rates to the positive exchange rate shock in countries with flexible exchange rate arrangement we observed some differences in medium-term responsiveness patterns among individual countries.

Negative effect of the exchange rate shock to the short-term interest rates leading path completely died out within one year after the shock only in Poland. In remaining countries we observed longer response path on the way to the pre-shock equilibrium. As a result, interest rates returned back to their pre-shock levels till end of the second year since the shock hit the model in Hungary, Romania and Slovak Republic. However, negative effect of the exchange rate shock to the short-term interest rates seems to be permanent even in the long run in the Czech Republic and Slovenia.

We suggest that lower immediate responsiveness of interest rates to the unexpected exchange rate shock in countries with flexible exchange rate arrangement results from generally expected interest rates response patterns under interest rate parity conditions. As a result, interest rate differentials affect associated exchange rate adjustments in the medium-term horizons that is why the overall effects of exchange rate shock on interest rates are more durable under flexible exchange rates.

Crisis period affected substantial features in short-term interest rates responsiveness to the unexpected positive exchange rate shock in countries with nominal exchange rate anchoring. Differences in the immediate effects of the shock seem to be biased (in comparison with model A) according to the intensity of the response patterns within first three months. Immediate response path reflects slightly higher vulnerability of interest rates to the shock in some countries, though in some cases it does not change. However, we observed clear reduction in the overall durability of the immediate effect of the shock. As a result, interest rates converged to their pre-shock levels within reduced time period in all countries from the group but Bulgaria (though medium-term interest rate response trajectory reveals slightly reduced vulnerability). At the same time, we investigated increased volatility of interest rates on their medium-term converging path toward long-run equilibrium. Finally, effects of the

exchange rate shock died out in the long run and thus short-term interest rates are neutral to the distorting effect of the shock.

Different patterns in the short-term interest rates responsiveness to the exchange rate shock during the crisis period was also recognized in the group of countries with flexible exchange rate regime. Following our results we realize that in comparison with the pre-crisis period there is slightly reduced lag in the immediate response (within first three months) of interest rates during the initial loading phase. At the same time, short-term responsiveness of interest rate clearly increased in all countries from the group of “floaters” emphasizing increased role of the short-term interest rate differentials for exchange rate determination under expectation of higher uncertainty.

The overall durability of the exchange rate shock related interest rate effects slightly increased in all countries. However, similarly to our results for the model with a pre-crisis time series, we received mixed results about the overall durability of the exchange rate shock. The negative effect of the shock seems to be permanent in the Czech Republic, Poland, Slovenia and Slovak Republic while it is just a temporary in Hungary and Romania.

## **6 CONCLUSION**

Estimated results of the interest rates impulse-response functions revealed quite distorting effects of the unexpected exchange rate shock to the responsiveness and durability of short-term interest rates according to the employed exchange rate regime as well as baseline period. We suggest that a relative diversity in results according to the exchange rate arrangement provides important evidence about crucial patterns of adjustment processes under fixed and flexible exchange rates. Our results thus may be contributive to the discussion about side effects associated with the process of monetary integration of new EU member countries. On the other hand, comparison of results for pre-crisis and extended periods revealed unique crisis related effects. However, origins of examined crisis related effects in the area of the interest rates determination and distortions in particular contribution of exchange rate shocks to the interest rates leading path may be a subject of further investigation and academic discussion.

Crisis period affected responses of nominal interest rates to exchange rate shocks in both groups of countries. In general, we observed some different short-term interest rates responsiveness patterns in both groups of countries. It seems that responses of interest rates to structural shocks during the crisis period follow different path according to their initial change as well as following adjustment on the way to their long-run equilibrium. Observed changes in the interest rates responsiveness patterns differ not only according to the baseline period but also from the exchange rate arrangement perspective. Our investigation and estimated results thus highlight both crisis related implications in the area of the short-term interest rates determination as well as exchange rate arrangement bias (i.e. fixed versus flexible exchange rates dilemma) particularly in new EU member countries.

## **RECOGNITION OF DEFERRED TAX IN SMALL AND MEDIUM-SIZED ENTERPRISES: A CASE STUDY FOR THE CZECH REPUBLIC**

*Libuše Müllerová, Marie Paseková, Zuzana Crhová*

### **Abstract**

The article concerns deferred tax and its significance for the information capability of the financial statement. Temporary differences between accounting and tax rules are the cause of the formation of deferred tax. The accounting and recognition thereof stems from generally accepted accounting principles. The accrual principle, the principle of caution and that of the functioning of the accounting entity in the foreseeable future are at issue. The majority of small and medium-sized enterprises are not obliged to account for and recognize deferred tax, although they may do so, and it is desirable from the perspective of faithful representation of the financial situation of the accounting entity. The conducted investigation in the form of a questionnaire survey ascertained whether accounting entities recognize deferred tax. If not, for what reasons; and if so, from which temporary differences they ascertain it.

*Keywords: Accounting legislation, deferred tax, financial statement, small and medium-sized enterprises*

JEL Classification: M41

### **1 INTRODUCTION**

Accounting entities listed in the commercial register are obliged to release their financial statements, which are a fundamental source of information for the decision-making of all their users. For this reason, the financial statement should provide reliable and truthful data on the activity of the accounting entity so that users can, on the basis thereof, form a realistic concept of its financial situation and efficiency. At the same time, it is necessary to adhere to certain standard procedures in order to achieve reciprocal comparability of the accounting entity's financial statements with, for instance, those of competitors. The accounting act imposes many obligations for accounting entities, which they have to fulfil in order for their accounting and, subsequently, their financial statements to present a fair and true image on the state and flow of property and sources of its financing, but also on expenses, revenues, and the results of business activity. Accounting has to be internally consistent and should stem from the rules and generally accepted accounting principles imposed by the law and the connected accompanying regulations thereof.

Certain transactions recorded in accounting are influenced by other legal regulations, especially tax laws, with which Czech accounting is historically closely connected. Notwithstanding the fact that the accounting profit/loss is used as a departure point when ascertaining the base of current income tax, it is necessary to implement numerous modifications and eliminate from the tax base accounted expense or revenue items which, according to the income tax act, are not a part of the tax base, or, as the case may be, allocate others to it which are contrariwise not in the accounting. The tax base varies to a greater or lesser extent from the economic result ascertained from the accounting.

Deferred tax is the result of generally accepted accounting principles, which are historically the province of double-entry bookkeeping. The **accrual concept** imposes on an accounting entity the obligation to report expenses and revenues in the period with which they are connected objectively and in terms of time. The accounting entity's obligation to report also potential liabilities stems from the **principle of caution**; on the other hand, profits must not be over-estimated. **Preserving property**, or more precisely, the principle of the business's continuance in the future (the going concern concept) assumes that if a business divides the entire disposable profit during the period when a deferred tax liability (for which it did not account) arises, it does so at the expense of its property and it could thereby threaten its future existence. A **fair and true image** of the financial situation and the business activity of the accounting entity is fundamental, and it is the most important requirement of the accounting act. Accounting for deferred tax is thus among the accounting instruments that contribute to the achievement of this umbrella accounting principle. Last but not least, **objectification of financial analyses** is at issue; disposable profit is among the data used for the calculation of numerous financial indicators, especially for the calculation of viability indicators. By correct accounting for deferred tax, the accounting entity can acquire more realistic values of this financial indicator and avoid the distortion thereof caused by overestimation of disposable profit.

The presented contribution focuses on the problem of recognition of deferred tax in small and medium-sized enterprises and their influence on the information capability of the financial statement. It is precisely these businesses that are not obliged to account for deferred tax. The aim of the implemented survey was thus to ascertain whether small and medium-sized enterprises reflect deferred tax and to verify the hypothesis that if businesses are not obliged to account for deferred tax and recognize it, they do not do so, or only in very limited numbers and range. Furthermore, the aim is then to ascertain the reasons why this so.

The questionnaire survey method was used for data collection. The acquired data were further analysed. The text that follows is divided into five chapters. Firstly, attention is devoted to a conducted literary search, which is focused on the formation of deferred tax, the calculation method, usage of deferred tax for earnings management and also the obligation of small and medium-sized enterprises to account for deferred tax. This is followed by a chapter devoted to methodology. The chapter concerned with the acquired results is followed by a summary of the fundamental insights and the close.

## **2 LITERATURE REVIEW**

Hanlon and Heitzman (2010) state that there are numerous differences between the calculation of the accounting profit/loss (prior to taxation) and the taxable income. These could be classified as permanent or temporary. Typical examples of temporary difference is depreciation or adjusting items of receivables. If a tax write-off occurs prior to an accounting expense, recognition of a deferred tax liability and, at the same time, a deferred tax expense occurs.

The pilot version of IAS 12 enabled accounting entities to choose whether they would use, whilst calculating deferred tax, the deferral method or the liability method with the revenue procedure. Time differences between the accounting profit/loss and the tax base thus formed the departure point. At the time, emphasis was placed especially on information presented in the profit and loss statement, and standards therefore preferred the deferral method to the liability method. According to Janoušková (2007), the deferral method ensured better adherence to the principle of assigning expenses to revenues with which they are connected

objectively and in time, and thereby led to a more precise enumeration of the economic result than was the case with the liability method.

In certain cases, transactions connected with the formation of deferred taxes are accounted against equity capital. According to Müllerová (2006) deferred tax is in this case also accounted for in this manner, for the rule applies that deferred tax is accounted for in the same way as the transaction which elicited it.

Poterba et al. (2011) further states that the majority of companies recognize a deferred tax liability rather than a deferred tax asset. Depreciation, then, is indeed the greatest source of temporary differences. According to Dhaliwal (2012), it is possible on the basis of the release of deferred tax assets to assess whether a given business will make adequate profits in the future.

Financial Accounting Standard Board (FASB) indicates that supplementary information on a deferred tax asset or liability should be stated in an appendix to the financial statement (Philips et al., 2003). Graham et al. (2012) add that it is precisely notes on deferred tax in the appendix and the harmonization of the tax and accounting profit/loss that can provide users of the financial statement with information on the viability of a given company.

Lev and Nissim (2004) further document the positive relationship between the future growth of the economic result and the proportion of the taxable economic result and the accounting profit/loss.

A change from accelerated to linear depreciation increases deferred tax and increases the economic result (Lev and Nissim., 2002). According to Lev and Nissim (2002), similar accounting choices which have an impact on deferred tax are thoroughly standard and reduce the ability of deferred tax to provide information on the quality of business activity.

Philips et al. (2003) state that a deferred tax expense provides information on earnings management prior to taxation.

Profit is an important foundation for various indicators of financial analysis. According to Müllerová (2005), by correct accounting for deferred tax, the accounting entity can acquire more realistic values of these financial indicators and avoid the distortion thereof caused by overestimation of disposable profit. In addition, improved comparability with sectorial indicator values or values acquired from the data of competing businesses is achieved.

### ***Deferred tax in small and medium-sized enterprises***

The small and medium-sized enterprise sector plays an irreplaceable role in the Czech national economy. According to data from the Ministry of Industry and Trade CR, small and medium-sized enterprises represent more than 1 million economic subjects; they account for 61.52 % of employment and 54.57 % of accounting added value. The proportion of these businesses in the total number of active entrepreneurial subjects is 99.83 %. Support of small and medium-sized entrepreneurship is currently connected with the requirement of reducing the administrative burden for these businesses, which has an impact also on the area of accounting and financial reporting. One of these reliefs is the possibility to compile a simplified financial statement, which entails a condensed financial statement and a simpler appendix. In contrast to this, there is no doubt that there is the unified European Union market, which requires uniform legal norms and standardization also in the area of financial reporting for small and medium-sized enterprises. (Ministry of Industry and Trade)

Decree No. 500/2002 Coll. states in Section 59 which accounting entities are obliged to account for deferred tax. Those which form a consolidated whole due to unified accounting rules for compilation of a consolidated financial statement are at issue. Then there are

accounting entities which compile a full financial statement: These include all joint-stock companies; then from the remainder of trade corporations, those which are obliged by law to have their financial statements verified by an auditor (see Section 20 Act No. 563/1991 Coll. on accounting). Other accounting entities can (but do not have to) account for deferred tax and recognize it voluntarily. The extent to which they do so was the subject of the presented survey to follow.

### **3 METHODOLOGY DESIGN**

The data for the survey was acquired by a questionnaire survey. Students who visited small and medium-sized enterprises in the Czech Republic participated in the collection of data for the study. Students were selected based on pseudo-random selection. A total of 418 questionnaires were acquired. In each completed survey, the students stated the name of the business and the contact person. The origin of data was randomly verified in roughly thirty businesses by a question posed to the contact person via telephone.

The questionnaire contained six questions. The first question ascertained whether deferred tax was recognized in the business. If the reply was negative, the respondents stated the reason for non-recognition. Other questions were aimed only at those respondents who answered positively to the first question. Replies to the questions provided information as to whether they recognize deferred tax as a deferred tax asset or a deferred tax liability. In the case of recognition of a deferred tax asset, the respondents stated why they chose this method of recognizing deferred tax. Other questions then ascertained the reasons for recognizing deferred tax, what titles enter into the calculation of deferred tax and whether they elaborate the information on deferred tax in an appendix.

The first two questions divided the respondents into three groups. The first group included respondents which do not recognize deferred tax; in the other group there are respondents which recognize deferred tax as a deferred tax liability (DTL); and finally, the third group comprises of respondents which recognize deferred tax as a deferred tax asset (DTA).

### **4 RESULTS**

Figure 1 shows that deferred tax is not recognized in approximately half of businesses; and among the other half of businesses which recognize deferred tax, approximately two thirds are those which recognize it as a deferred tax liability.

Fig. 1 - The relative number of respondents according to recognition of deferred tax. Source: own survey

Accounting entities which did not recognize deferred tax were asked questions which were intended to justify this fact, which is shown by the following figure:

Fig. 2 - Relative representation of reasons for not recognizing deferred tax. Source: own survey

Most respondents give objective reasons to justify non-recognition of deferred tax. Most frequently, it is the non-existence of temporary and accounting differences (in small businesses, accounting and tax depreciation are equal; as a rule, neither adjusting items nor reserves are accounted). Another reason is the non-comprehension of the significance of deferred tax and the conviction stemming therefrom that its recognition makes no sense. Ignorance of the problem is a markedly less frequent substantiation, and a relatively small part of the respondents refer to the fact that they are not obliged to recognize deferred tax.

Furthermore, reasons for possible recognition of deferred tax in the event of deferred tax assets were surveyed.

Fig. 3 - Relative representation of reasons for recognizing deferred tax as deferred tax assets. Source: own survey

For a dominant number of respondents, the reason for recognition of deferred taxes as deferred tax assets is the guarantee of the generation of future taxable profit. Only less than a quarter of monitored respondents substantiate this accounting method as a guarantee of a better future accounting profit/loss, or as the case may be, they consider this accounting procedure as the natural consequence of the reporting system. Less than a twentieth of monitored respondents did not justify the given choice.

The relative representation of titles entering into calculation of deferred tax is illustrated in Figure 4. The difference between accounting and tax depreciation enter the calculation of deferred tax in more than 80% of businesses. Similarly to the formation of accounting reserves, the formation of accounting adjusting items is utilized by approximately 40 % of businesses. Approximately one fifth of businesses state the title of transferred tax losses. Overestimation, fines and penalties, unsettled social and health insurance and retrospective tax assessment of liabilities is stated by less than 3% of businesses.

Fig. 4 - The relative representation of titles entering into the calculation of deferred tax. Source: own survey

It stemmed from the questionnaire that approximately half of the businesses which recognize deferred tax provide information on this tax and, as the case may be, on its structure in an appendix, and half do not.

## **5 DISCUSSION**

The actual recording and reporting of deferred tax assets or liabilities is preceded by several steps. The first is the ascertainment as to whether the accounting entity is obliged to account for deferred tax. If the law does not directly impose this obligation on the accounting entity, it has to decide whether this will improve the information capability of its financial statements, compile them fully with the connected recognition of deferred tax or not. The results of the questionnaire survey clearly show the unwillingness of accounting entities to recognize deferred tax voluntarily.

The second step is the identification of temporary differences, from which title deferred tax arises. According to effective accounting regulations, deferred tax is calculated from all temporary differences. Besides the difference between the accounting and tax net book value of depreciated property caused by varying accounting and tax depreciation, other temporary differences also have to be taken into consideration. Adjusting items, reserves, contractual interests from delays and other titles are examples. In view of the fact that deferred tax is not a novelty in Czech accounting, accounting entities have, as a rule, been adequately acquainted with the main titles leading to the formation of deferred tax. However, the majority of them generate a deferred tax asset, so they prefer not to include it into the calculation due to caution. Different accounting and tax depreciation of property are thus the dominant cause of the formation of deferred tax.

It is clear from the results of the questionnaire survey that the number of accounting entities that recognized a deferred tax liability dominates. This is given both by caution in the case of deferred tax assets and the fact that a deferred tax liability usually arises from the title of dissimilar tax and accounting depreciation, which is the most frequent and most significant title, and its influence often dominates over titles leading to the formation of deferred tax liabilities.

Accounting units are obliged to provide details on deferred tax (both as a liability and as an asset) in an appendix to the financial statement. In the event of non-recognition of deferred tax assets due to caution, the accounting entity must not forget to substantiate this fact. It should, among others, state the amount of non-recognized deferred tax assets and a breakdown of the titles which caused the formation of partial deferred tax assets and liabilities. It stemmed from the questionnaire survey that half of the interviewed accounting entities do not state any information on deferred tax in an appendix.

The aim of the survey was to verify the hypothesis that if businesses are not obliged to account for deferred tax and recognize it, they do not do so, or only in very limited numbers and range. The results of the survey confirmed this hypothesis, and also pointed towards the reasons why this is so.

## **6 CONCLUSION**

The accounting act obliges accounting entities to keep accounts so that the financial statement compiled on the basis thereof may provide a fair and true image of the subject of the accounting of the accounting entity's financial situation (see Section 7 Para. 1 Act No. 563/1991 Coll.). Accounting for deferred tax is among the tools which enable the fulfilment of this required accounting principle. The fact that Decree No. 500/2002 Coll., as an accompanying regulation to this act, enables the majority of small and medium-sized enterprises not to account for deferred tax and not to recognize it is indeed a certain reduction of administrative burden for these businesses, although it is a contravention of the above-mentioned principles laid down by the law.

Increasing harmonization in an increasingly connected world cannot be halted. Discussion as to whether small and medium-sized businesses require thorough harmonization has been underway since the beginning of the new millennium. Objections from the sides of opponents of harmonization of financial reporting for these businesses (with the reason they are not businesses of international scale) are gradually weakening in the connected and globalizing world. Foreign investors, for whom the ability to orient themselves in business financial statements is fundamental, operate also in small and medium-sized businesses.

In 2009, the International Accounting Standards Board (IASB) published the Standard for Small and Medium-sized Enterprises, which stems from full IFRS, although it was modified for the needs of smaller entrepreneurial subjects. Many principles from full IFRS for recognition and valuation of assets, liabilities, revenues and expenses have been simplified; certain themes which did not concern small and medium-sized businesses were omitted, and the number of requirements for publication was fundamentally simplified. Although the Czech Republic has not yet implemented it (which cannot be ruled out in the future), it is an important fact that the standard does not take into consideration that small and medium-sized enterprises would not have to account for deferred tax.

### **Acknowledgments**

The authors are thankful to the Operational Programme Education for Competitiveness co-funded by the European Social Fund (ESF) and national budget of the Czech Republic for the grant No. CZ.1.07/2.3.00/20.0147 - "Human Resources Development in the field of Measurement and Management of Companies, Clusters and Regions Performance", which provided financial support for this research.

## **DETERMINANTS OF NEW ENTERPRISE FORMATION: THE CZECH REPUBLIC (2011-2012)**

*Jana Nekolová, Jiří Novosák, Oldřich Hájek*

### **Abstract**

This paper deals with determinants of new enterprise formation in the Czech Republic in the time period 2011-2012. The determinants are analyzed for 227 functional areas delimited according to labor commuting flows. Regression models are computed to reveal the relationship between new enterprise formation and explanatory variables. Final results point out positive impact of spatial concentration of entrepreneurs, high share of foreign firms, the quality of human capital and industrial diversity on new enterprise formation. On the contrary, the presence of large firms is negatively associated with new enterprise formation. The relationship between new enterprise formation on one hand and population density and unemployment on the other is ambivalent.

*Keywords: entrepreneurship, determinants of new enterprise formation, the Czech Republic, regression models*

## **1 INTRODUCTION**

Thinking about the relationship between the size of enterprises and economic growth went through important changes after the Second World War. First, large firms were regarded as the main engine of economic growth. This assertion was explained by the higher efficiency of large firms compared with their small and medium counterparts due to economies of scale and innovativeness (see, e.g., Verheul et al., 2001). However, this view was reformulated in the 1970s, emphasizing the crucial contribution of small and medium-sized enterprises (SMEs) to economic growth. Concerning reasons for this change, the scholar literature traditionally mentions the increasing importance of knowledge, economies of scope, and flexibility in the decision-making process - the main sources of SME competitiveness in increasingly uncertain global markets (e.g., Audretsch, 2001; Raposo, 2009).

New enterprise formation and entrepreneurial activity are perceived to be the conditions of long-term economic development and growth (see, e.g., Andersson and Koster, 2011; Fritsch and Mueller, 2007; Lee, Florida and Acs, 2004). Scholars have attempted to empirically verify the relationship between enterprise activities and economic growth. The positive impact of enterprise density on economic growth is mentioned by, e.g., Carree et al. (2007), Sternberg (2012), Romero (2012), and Huggins and Williams (2011). Similarly, Fotopoulos (2013), Andersson and Koster (2011), and Fritsch and Mueller (2007) note the importance of new enterprise formation for economic growth. Consequently, the support to SME development is positioned high on the political agenda of developed countries. Generally, two closely interlinked strands of such policies may be distinguished (e.g., Raposo, 2009). The first strand is focused on the competitiveness of existing SMEs while the second strand is on the creation of new enterprises (entrepreneurship). The formation of new enterprises is the main research theme of this paper, embedding it into the spatial dimension of entrepreneurship.

Despite the widely accepted positive relationship between entrepreneurship and economic growth, a consensus on the importance of particular determinants of new enterprise formation is missing. Thus, for example, some studies point out the positive impact of high unemployment on entrepreneurship while other studies speak about the inverse relationship (compare, e.g., with Fotopoulos, 2013). Moreover, research on the determinants of new enterprise formation in post-communist countries is rather scarce. This paper contributes in filling this research gap. Using tools of regression analysis, it reveals determinants that influenced the formation of new enterprises in the Czech Republic in the time period 2011-2012. The paper is structured as follows: the following part introduces the theoretical framework of the research; the third part describes the methodology used in this paper; the fourth part summarizes the findings from the analysis. The final part draws conclusions.

## **2 THEORETICAL BACKGROUND**

The importance of new enterprise formation for employment, productivity growth, innovation and wealth (see, e.g., Fotopoulos, 2013) substantiates the political interest in determinants of new enterprise formation (see also Fritsch and Mueller, 2007; Schutjens and Wever, 2000). The relevance of particular determinants influences decisions about the form of public interventions. These decisions are of increasing importance in global competition of locations (see, e.g., Brühlhart et al., 2012; Devereux et al., 2007). Moreover, uneven distribution of entrepreneurial activities plays its part (see, e.g., Audretsch and Fritsch, 1994; Wang, 2006). In this regard, Fotopoulos (2013) and Andersson and Koster (2011) pointed out persistence of this distribution in time. They state that the determinants of new enterprise formation are changed slowly. Consequently, focus of public interventions on the most influential determinants of new enterprise formation may be crucial to break the path dependency.

Despite its importance, the knowledge about the relevance of particular determinants of new enterprise formation is not straightforward (see, e.g., Sutaria and Hicks, 2004). Theoretical background offers various views on the issue. The theory of entrepreneurial choice emphasizes the entrepreneur's personality and experience (see, e.g., Evans and Jovanovic, 1989). Armington and Acs (2002) describe three life strategies of potential entrepreneurs in this regard. Self-employment is the strategy preferred mostly in rural areas and territories with limited employment opportunities. The wage-work strategy is typical for a territory whose economy is characterized by the presence of large firms (see also Fritsch and Mueller, 2007). The career strategy is followed by ambitious, well-educated people in knowledge intensive sectors (see also Armington and Acs, 2002; Acs, Armington and Zhang, 2007; Bishop, 2012; Lee, Florida and Acs, 2004 for the positive relationship between quality of human capital and new enterprise formation). Consequently, new enterprise formation may be positively associated with unemployment, absence of large firms, quality of human capital, and knowledge concentration. Note that unemployment may have also negative impact on new enterprise formation due to structural problems of economy (see, e.g., Bishop, 2012; Cieřlik, 2005). However, the scope of determinants that influence entrepreneur's decision is much wider. Wang (2006) and Bishop (2012) note conditions on labor market, state of national economy and risk of firm failure. Belás et al. (2015) mention several motivational factors, including access to financing or administrative burden (compare also with Jurcik, 2013). Lee, Florida and Acs (2004) and Bilan (2014) point out higher propensity of foreigners to become employer compared to natives.

Besides entrepreneur's personality, another research approach is concerned with determinants of new enterprise formation. Spatial perspective is the cornerstone of this approach. Its essence rests on the variance in new enterprise formation rates amongst territories.

Subsequently, various characteristics of these territories - determinants - are used to explain the variance. What are the determinants of new enterprise formation from the spatial perspective?

Several spatial development theories emphasize the importance of agglomeration economies. These theories point out positive relationship between agglomeration economies and new enterprise formation. Thus, concentration of people and entrepreneurial activity stimulates new enterprise formation (see, e.g., Audretsch and Fritsch, 1994; Acs, Armington and Zhang, 2007; Brühlhart et al., 2012; Devereux et al., 2007). Specialized business services, pooled labour market, innovation and knowledge spillovers and entrepreneurial infrastructure are the sources of agglomeration economies. However, agglomeration diseconomies from competition may counteract the positive effects (see, e.g., Sutaria and Hicks, 2004). Two types of agglomeration economies are distinguished in literature. Marshall-Arrow-Romer (MAR) externalities are connected with economies from specialization. It is claimed that innovation and knowledge spillovers can be easily realized in related industries (see, e.g., Beaudry and Schiffauerova, 2009; Acs, Armington and Zhang, 2007). On the contrary, Jacobian externalities emphasize the advantages from diversity and diversified skills in identifying market opportunities. Thus, diversity allows utilization of processes and methods from one sector in the others – innovations (see, e.g., Beaudry and Schiffauerova, 2009; Bishop, 2012; Delfmann et al., 2014). There is not a consensus which type of externalities is more important for new enterprise formation.

### **3 METHODOLOGY**

The methodology of this study is based on the broadly used spatial approach to new enterprise formation research (see, e.g., Audretsch and Fritsch, 1994; Armington and Acs, 2002; Bishop, 2012), using the Czech Republic in the time period 2011-2012 as the case study. The further analysis is related to the so called functional areas (FUAs) as defined by the Czech Statistical Office on the basis of the 2011 Census data for municipalities (see CSO, 2013). The FUAs delimitation is based on labour commuting flows between core municipality and its hinterland (see, e.g., Armington and Acs, 2002 for such an approach). In this regard, we slightly adapted the CSO methodology through inclusion of all Czech municipalities to a FUA. Thus, we dissolved the set of uncategorized municipalities. Overall, 227 FUAs were delimited.

Linear regression was used to examine determinants that influence new enterprise formation in the Czech Republic in the time period 2011-2012. Variables were chosen with respect to the theoretical background. The number of new enterprises in each FUA was taken from the Business Register of the Czech Republic. An enterprise was counted as a new enterprise if it was registered in the Business Register of the Czech Republic in 2011 or 2012. Note that both legal entities and natural persons with the status of an entrepreneur were included into the analysis. However, the absolute number of new enterprises is influenced by different size of FUAs. There are two broadly accepted approaches to cope with this problem (see, e.g., Bishop, 2012; Armington and Acs, 2002; Fritsch and Mueller, 2007). The ecological approach divides the number of new enterprises by the total number of entrepreneurial entities in the territory. The labor force approach uses total labor force as the denominator. The second approach was used in this study. Thus, the number of new enterprises was divided by the number of economically active people (NEW). Logarithmic transformation (LNNEW) was applied to reduce the influence of outliers. The data for economically active people were taken from the 2011 Census.

Explanatory variables for this study were defined as follows. Population density (DENSITY) was included into the analysis to explore the impact of agglomeration economies on new

enterprise formation. Positive impact of spatial concentration of people is expected in this regard (see, e.g., Audretsch and Fritsch, 1994; Acs, Armington and Zhang, 2007; Brühlhart et al., 2012; Devereux et al., 2007). Moreover, agglomeration economies are connected with the distinction between MAR and Jacobian externalities (see, e.g., Beaudry and Schiffauerova, 2009). Therefore, the entropy measure of diversity (ENTROPY) was added into the analysis to explore the impact of industrial diversity on new enterprise formation. This measure was defined as

$$ENTROPY = \sum_{i=1}^n I_i * \ln \frac{1}{I_i}$$

where  $I_i$  is the share of the  $i$ th 2-digit NACE code in SO ORP's employment and  $n$  is the number of 2-digit NACE codes (see, e.g., Shannon and Weaver, 1949 for theoretical aspects of the measure). Scholars did not find a consensus which type of externalities is more important for new enterprise formation (see, e.g., Fotopoulos, 2014; Delfmann et al., 2012). The data for the both variables were taken from the 2011 Census.

Two explanatory variables were included into the analysis to explore the impact of the quality of entrepreneurial climate on new enterprise formation. The first variable is the ratio between the number of entrepreneurs and economically active people (ENTREP). Positive impact of spatial concentration of entrepreneurs is expected because of, e.g., information and knowledge spillovers, and positive attitudes to entrepreneurship (see, e.g., Audretsch, 2001; Verheul et al., 2001). The data for this variable were taken from the 2011 Census. The second variable is the share of foreign enterprises in the total population of enterprises (FOREIGN). Foreigners may substantially contribute to new enterprise formation. Their lower risk aversion plays positive role in this regard (see, e.g., Bilan, 2014; Lee, Florida and Acs, 2004). The data for the variable were taken from the Business Register of the Czech Republic (2010).

Two alternative variables were included into the analysis to explore the impact of human capital on new enterprise formation. The first variable is the share of university-graduates in the population older than 15 years of age (UNIGRAD). The second variable is defined as the ratio between the number of workers in knowledge-intensive business industries and the number of economically active people (KIABI). The Eurostat's definition of knowledge intensive business industries as the 2-digit NACE codes was used. Positive relationship between the quality of human capital and new enterprise formation is expected. The ability to grasp entrepreneurial opportunities and ambitions of well-educated people are mentioned in literature (see, e.g., Armington and Acs, 2002; Acs, Armington and Zhang, 2007; Bishop, 2012; Lee, Florida and Acs, 2004). The data for the both variables were taken from the 2011 Census.

Unemployment rate (UNEMPLOY) was included into the analysis to explore the relationship between labor market conditions and new enterprise formation. Scholars did not find a consensus on the impact of unemployment on new enterprise formation. Unemployed people may be an important source of entrepreneurs. However, unemployment may discourage new enterprise formation because of economic problems of the territory (see, e.g., Audretsch and Fritsch, 1994; Armington and Acs, 2002; Lee, Florida and Acs, 2004). The data for the variable were taken from the Business Register of the Czech Republic (2010). Finally, the share of large firms understood as legal entities with more than 249 employees in the population of all firms (LARGE) was included into the analysis to explore the impact of the presence of large firms on new enterprise formation. Several scholars pointed out negative relationship between the presence of large firms and new enterprise formation. In this regard, large firms are perceived as a source of stable employment with high income (see, e.g., Lee,

Florida and Acs, 2004; Armington and Acs, 2002). The data for the variable were taken from the Business Register of the Czech Republic (2010).

Five multiple ordinary least square (OLS) regression models were computed to reveal the determinants of new enterprise formation with LNNEW as the dependent variable, and DENSITY, ENTREP, ENTROPY, FOREIGN, KIABI, LARGE F, UNIGRAD and UNEMPLOY as explanatory variables. Tab. 1 shows expected signs of particular explanatory variables in accord with the theoretical background. Tab. 2 summarizes descriptive statistics. Standard tests were applied to check for the OLS multi-collinearity, non-normality, and heteroscedasticity assumptions in all models.

Tab. 1 – Explanatory variables: expected signs

Variable	Expected signs
DENSITY	Positive
ENTREP	Positive
ENTROPY	Positive/negative
FOREIGN	Positive
KIABI	Positive
LARGE F	Negative
UNEMPLOY	Positive/negative
UNIGRAD	Positive

Tab. 2: Summary statistics

Variable	Mean	St. Deviation	Minimum	Maximum
LNNEW (per 1000 people)	3.48	0.15	2.99	4.28
DENSITY (inh./km <sup>2</sup> )	111.41	81.10	20.90	580.00
ENTREP (per 1000 people)	144.28	20.51	63.50	211.50
ENTROPY	0.89	0.02	0.77	0.92
FOREIGN (%)	4.67	3.57	0.40	27.00
KIABI (%)	6.79	2.45	3.00	22.50
LARGE F (%)	7.74	6.37	0.00	45.45
UNEMPLOY (%)	11.47	3.71	4.40	26.50
UNIGRAD (%)	8.54	2.43	4.00	21.00

## 4 EMPIRICAL RESULTS AND DISCUSSION

Tab. 3 contains results of the five multiple OLS regressions computed for this study. Note that variance inflation factors, Kolmogorov-Smirnov and Shapiro-Wilk tests, and Breusch-Pagan test do not indicate problems of multi-collinearity, non-normality, and heteroscedasticity, respectively. However, regression results may be influenced by the Kadaň FUA outlier. Therefore, we computed OLS regressions for both situations – for all 227 FUAs and for 226 FUAs without the Kadaň FUA. Because regression results are stable in the both situations we decided to retain the Kadaň FUA in the model.

All the five OLS regression models explain almost half of the variance in the data. The first model contains results of stepwise regression that retains only statistically significant variables. Four variables are included in the model. First, ENTREP is statistically significant at the 1% level with expected sign. Therefore, the share of entrepreneurs in economically active population is positively associated with new enterprise formation. Second, FOREIGN is statistically significant at the 1% level with expected sign. Therefore, the share of foreign enterprises in the total population of enterprises is positively associated with new enterprise formation. Third, LARGE F is statistically significant at the 1% level with expected sign. Therefore, the share of large firms in the total population of firms is negatively associated with new enterprise formation. Finally, UNIGRAD is statistically significant at the 1% level with expected sign. Therefore, the share of university-graduates in the population older than 15 years of age is positively associated with new enterprise formation.

UNIGRAD is replaced by the alternative variable of human capital – KIABI – in the second model. KIABI is statistically significant at the 1% level with expected sign. Therefore, the share of people employed in knowledge intensive business industries in economically active population is positively associated with new enterprise formation. ENTREP, FOREIGN and LARGE F remain statistically significant with expected signs. However, LARGE F is statistically significant only at the 5% level. Thus, KIABI reduces somewhat the impact of LARGE F on the variance of new enterprise formation.

Model 3, Model 4 and Model 5 are extensions of the first model by DENSITY, UNEMPLOY and ENTROPY respectively. First, population density is not statistically significant when explaining the variance of new enterprise formation (see Model 3). Therefore, population density alone is not sufficient source of agglomeration economies propulsive for new enterprise formation. This is the case of the Ostrava FUA. The quality of entrepreneurial environment of the Ostrava FUA characterized by relatively low shares of entrepreneurs and foreign firms does not enable to use the full potential of agglomeration economies created by spatial concentration of people. Second, also unemployment is not statistically significant when explaining the variance of new enterprise formation (see Model 4). This is in accord with a number of studies pointing out ambivalent relationship between unemployment and new enterprise formation. Unemployment may be an important source of entrepreneurs but also a symbol of declining economy. Third, ENTROPY is positively associated with new enterprise formation. Therefore, industrial diversity contributes to new enterprise formation. However, this relationship is not statistically significant either at the 1% level or at the 5% level.

Altogether, the findings contribute to the theory of new enterprise formation as follows. The statistical significance of ENTREP and FOREIGN indicates positive impact of various spillovers (e.g. information, knowledge, motivations) in the FUAs characterized by entrepreneurial climate of high quality. Moreover, the statistical significance of ENTREP and FOREIGN supports the path dependency nature of new enterprise formation. Thus, the existing enterprise stock as the result of previous development positively influences new enterprise formation. Consequently, it is long-term process to change new enterprise formation tendencies (see, e.g., Fotopoulos, 2014; Anderson and Koster, 2011; Fritsch and Mueller, 2007). The statistical significance of FOREIGN supports also the idea that foreigners are more likely to establish their business compared to natives (see, e.g. Lee, Florida and Acs, 2004).

The statistical significance of UNIGRAD and KIABI highlights the importance of human capital for new enterprise formation. This is in accord with the theoretical strand that emphasizes the changing nature of current economy towards increasing importance of

knowledge (see, e.g., Bishop, 2012). Consequently, the quality of human capital and knowledge stock is decisive to benefit from unused market opportunities. Industrial restructuring creates theoretical background also for the statistical significance of LARGE F. Increasing importance of knowledge, services and flexibility upholds the role of small and medium enterprises (see, e.g., Armington and Acs, 2002). The presence of large firms is not desirable in this framework. Finally, the positive sign of ENTROPY favors the Jacobian externalities. This finding contrasts several other studies that prefer MAR externalities (see, e.g., Fotopoulos, 2014; Delfmann et al., 2014).

Tab. 3: Regression results – standardized coefficients

Variable	Model 1	Model 2	Model 3	Model 4	Model 5
ENTREP	0.412** (0.000)	0.426** (0.000)	0.420** (0.000)	0.423** (0.000)	0.387** (0.000)

## 5 CONCLUSION

Entrepreneurship is regarded as an important source of economic growth and development. This relationship substantiates the research on determinants of new enterprise formation. This paper dealt with this issue. Its goal was to reveal determinants that influenced the formation of new enterprises in the Czech Republic in the time period 2011-2012. Multiple OLS regression was used from the methodological point of view. In this regard, regression models were built on the spatial basis for 227 FUAs.

The study points out several statistically significant associations between explanatory variables and new enterprise formation. Spatial concentration of entrepreneurs, high share of foreign firms, human capital of high quality and industrial diversity contribute to higher new enterprise formation. On the contrary, the presence of large firms is negatively associated with new enterprise formation. The impact of population density and unemployment on new enterprise formation is ambivalent.

## **OPTIONAL CCCTB IMPLEMENTATION AND ITS IMPACT ON THE CORPORATE TAX REVENUES IN THE CZECH REPUBLIC**

*Danuše Nerudová, Veronika Solilová*

### **Abstract**

The aim of the paper is to research the impact of the optional CCCTB implementation (i.e. implementation in all the EU Member States except the Czech Republic) on the tax bases in the Czech Republic, and to identify whether the outflow/inflow or inflow will occur. The empirical analysis is based on the data available from the Amadeus databases and covered 2403 parent companies with 3562 Czech subsidiaries. The research performed in the paper revealed that the implementation of CCCTB system in EU27 would negatively change the tax base generated in the Czech Republic, as the country would lose more than 8% of the current tax base. Based on the results of the research, we can conclude, that the implementation of CCCTB in EU27 without the participation of the Czech Republic might have very strong negative impact on the overall tax base generated by the Czech subsidiaries in the Czech Republic and therefore also on the tax revenue.

*Keywords: CCCTB, group, tax base, tax revenue, Czech Republic*

### **1 INTRODUCTION**

There have been many attempts to coordinate corporate taxation systems of EU Member States. Firstly, in 1962, European Commission suggested to split the corporate tax rates and to apply different tax rate for retained and distributed profits. Further, eight years later, Temple report suggested implementation of classical system of corporate taxation in the EU Member States. Consequently, the European Commission tried to approximate the corporate tax rates – it elaborated the proposal on common level of corporate taxation between 45% and 55%, lately on minimum corporate tax rate of 30%. As those harmonization efforts were not successful, European Commission decided to try to harmonize only the provisions affecting smooth functioning of the Internal Market. Moreover, as add Nerudová and David (2008), the long-term aim of the European Commission is to reduce the individual differences in the tax systems of the Member States, whether through tax harmonization or through tax coordination, in order to not cause the obstacles to the smooth functioning of internal market and not to cause inefficient allocation of production factors or production caused by the obstacles of tax character.

The background of the CCCTB draft directive goes back into 2001, when the European Commission suggested four alternative proposals on corporate income tax harmonization – Home State Taxation System, European Union Company Tax, Compulsory Harmonized Corporate Tax Base and Common Consolidated Corporate Tax Base. After the discussion of all four models, the European Commission decided to set the implementation of Common Consolidated Corporate Tax Base as its long-term. It represents one of the most ambitious projects in the history of the harmonization efforts. After more than ten years of the work Commission has published the text of CCCTB Directive proposal on 16th March, 2011.

With respect to the current situation, it is quite obvious that based on the experience with financial transaction tax, CCCTB will probably be introduced through enhanced cooperation as well. This solution is connected with one disadvantage. The existence of two systems

(CCCTB and national system) leaves the space for speculations, tax arbitrations, tax evasion and fraud. Moreover, if introduced under enhanced cooperation or as optional, countries not implementing the system can face the outflow of tax bases into the jurisdictions applying CCCTB system.

The implementation of CCCTB is connected also with the problem of tax sharing mechanism. Based on several discussions, finally, the directive proposal suggests the allocation formula. In that system the consolidated tax base will be shared among the members of the group based on micro factors. This new allocation ruled will have the impact on EU Member States budgets.

The aim of the paper is to research the impact of the optional CCCTB implementation (i.e. implementation in all the EU Member States except the Czech Republic) on the tax bases in the Czech Republic, and to identify whether the outflow/inflow or inflow will occur. The empirical analysis is based on the data available from the Amadeus database. The paper presents the results of the research within the project GA CR No. 13-21683S “The quantification of the impact of the introduction of Common Consolidated Corporate Tax Base on the budget revenues in the Czech Republic”.

## **2 THEORETICAL BACKGROUND**

At present, MNEs are facing two systems of income determination (i.e. also the determination of tax base) in the European Union – formulary apportionment and separate entity accounting. Under separate accounting approach the parent company has to calculate its financial account as each of its enterprise would be independent entity – i.e. all the transactions between the members of the group have to be at arm’s length. Oestreicher (2000) adds that conceptual core of separate accounting is to provide a level tax playing field among integrated and stand-alone firms by treating each subsidiary and branch of an MNE as a lawfully distinct party that deals at arm’s length with its parent and other members of the same overall entity. Bakker (2009) mentions that under arm’s length principle, affiliated businesses should set transfer prices at levels that would have prevailed that the transaction occurred between unrelated parties. On the contrary Gresik (2001) or Desai, Foley and Hines (2003) mention that current international practice using separate accounting is heavily criticised for there is direct and indirect evidence that MNEs are relocating their taxable incomes from high-tax jurisdictions to low-tax jurisdictions. Celestin (2000) mentions that separate accounting system failed to pass the test of simplicity, equity, efficiency and administrative ease. Hamaekers (2001) for example mentions that nowadays intra-group transactions occur in components and intangibles and in that situation separate accounting outlasted its usefulness.

There can be found only four empirical studies researching the impact of CCCTB introduction on the budget revenues of the EU Member States. Unfortunately, none of them is specifically aimed specifically at the impacts on the Czech Republic or solely on the scenario that CCCTB will be implemented by enhanced cooperation (i.e. by not all EU Member States).

The first paper by Fuest, Hemmelgarn and Ramb (2007) builds on the scenario of mandatory CCCTB. To predict the possible impact on budget revenues of EU Member states, they are using the data on German company-level foreign direct investment and data from balance sheets. The sample is limited on 2000 German parent companies and 6000 foreign subsidiaries in other EU Member States between the years 1996-2000. The authors estimate that national tax bases would decline by 20% on average.

The second paper by Van der Horst, Bettendorf and Rojas-Romagosa (2007) builds also on the scenario of mandatory CCCTB, this time in 17 EU Member states. It is not aimed directly on the changes in budget revenues, but on the welfare effects connected with the introduction

of the system. Not only the study comprise mandatory scenario, it also assumes that all companies have to opt for CCCTB. The research is based on the equilibrium model, which expects, that each from 17 EU Member states has MNE parent company having subsidiaries in each of the remaining Member States.

Third paper written by Deveraux and Loretz (2008) is more complex. The study researches two scenarios – voluntary and mandatory CCCTB. It analyzes the sample of 50,000 companies during the period of the years 2000-2004. The authors estimate, that under voluntary system, the tax revenues could decrease by 2.5%, while under mandatory system, the revenues could increase by 2 %. Also as in case of the previous mentioned studies, the results shows unequal effects in individual Member States on budget revenues. The impact varies from -18% to +60%.

Cline, Neubig, Philips, Sanger and Walsh (2010) have researched three possible scenarios – mandatory CCCTB in all EU Member States, voluntary CCCTB in all EU Member States and mandatory CCCTB in 9 EU Member States. The study is built on the model of 200,000 companies in the year 2005. The scenario of mandatory CCCTB system in 27 Member States has revealed that there would be winners and losers. The corporate tax collection varied from -8.3% in Denmark to +6.0% in France. In that model, the Czech Republic would lose 3.0% of corporate tax collection. In case, that the system would be voluntary in 27 Member States, the range of changes would be narrower – from -7.7% in Germany to +2.6% in United Kingdom. The Czech Republic would lose roughly the same – i.e. -3.1% of corporate tax collection. The scenario of mandatory CCCTB in nine Member States has revealed that the change in corporate tax collection would vary from -8.5% in Netherlands to +5.7% in France.

### **3 DATA AND METHODOLOGY**

With respect to the methodology, the paper follows the approach of Devereux and Loretz (2008), Fuest, Hemmelgarn and Ramb (2006) or Clien, Neubig, Phillips, Sanger and Walsh (2010). The research in the paper is based on the data from the Amadeus database (update 227). The database offer standardized financial information on public companies, private companies, financial institutions and insurance undertakings in 43 European countries.

As the paper is aimed on the identification of inflows and outflows of the tax bases in the Czech Republic, it was necessary to create the group of the Czech companies and other EU companies, which would qualify under CCCTB system for consolidation regime and group treatment. As is stated in the CCCTB directive proposal, two-tier test was performed. This test is based on two layers – control and ownership. First layer (i.e. control), is fulfilled when the controlling company holds at least 50.01% in the controlled company. The condition of ownership is fulfilled when the ownership rights amount to more than 75% of the company's capital.

Based on the two-tier test it was identified 1587 Czech parent companies with 2427 subsidiaries in the Czech Republic and other EU member states and 816 other EU parent companies with 1135 subsidiaries in the Czech Republic. The overall amount of companies represents final group with all necessary data. Missing data in financial statements of companies was supplemented based on method of imputation as the most suitable method for missing data as was proved in previous research by Nerudová (2012) and Nerudová and Solilová (2014).

In the next step, the assumptions of potential outflow/inflow of tax bases from/in to the Czech Republic were set up as a consequence of the implementation of the CCCTB system in EU27 (i.e. all the EU Member States except the Czech Republic). According to the report of the Committee of Independent experts on Company Taxation (1992) was proved that both -

differences in business taxation, the burden of business taxes and differences in the level of effective tax rates among EU Member States - have the impact on the decision of corporations on the location of their economic activity and investment in other EU Member States. Taking into account this permission, based on the analysis of the level of the effective tax rate among the EU Member States we have identified the potential outflow/inflow of tax bases from/in to the Czech Republic.

The table 1 below shows the effective average tax rate in EU member states in 2014. Its calculation is based on the methodology developed by Devereux and Griffith (1998). As can be seen from the table, lower effective tax rate than the effective tax rate in the Czech Republic were identified in Bulgaria, Croatia, Cyprus, Estonia, Ireland, Latvia, Lithuania, Romania and Slovenia.

Tab. 1- Effective average tax rate by EU member states in 2014. Source: Spengel, Endres, Finke and Heckemeyer (2014).

IE	12.5	14.4	UK	21.0	22.4

Our model is based on the assumption that CCCTB would be introduced in neighboring countries and not in the Czech Republic. Therefore companies would tend to relocate their taxable presence into the EU Member States with lower effective tax rate than in the Czech Republic. Such an assumption can be done due to the fact, that under CCCTB system (i.e. under the system with unified rules for tax base construction), the nominal tax rate is equal to the effective one, as was already explained above.

Moreover, in the model we can have defined two scenarios. Firstly, we are researching the group of EU parent company (in the jurisdictions with lower effective tax rate than in the Czech Republic) having subsidiaries in the Czech Republic. As a result of CCCTB introduction in those states we expect the relocation (outflow) of Czech subsidiaries into the above mentioned states. Secondly, we are researching the group of the Czech parent companies having subsidiaries in the Czech Republic and other EU member states. We expect outflow to occur in situation when the group includes at least one subsidiary situated in other EU member states (i.e. we do not expect group with only Czech subsidiaries to move its tax bases from the Czech Republic). The second scenario expects not only the outflow of tax bases of the Czech subsidiaries into the member states where other subsidiary is situated but

also the outflow of the tax base of the parent company. Only after that, the group can benefit from CCCTB system which will be implemented in EU27 except of the Czech Republic.

#### 4 RESULTS

The research of the selected group of companies (2,403 parent companies with 3,562 subsidiaries) enabled to identify the overall tax base. Based on the above mentioned two scenarios, we identified the outflow of tax bases of 108 Czech subsidiaries, its 81 Czech parent companies, and 35 Czech subsidiaries of other EU parent companies (for details see table 2 below). The research has not identified any inflow of the tax bases. As can be seen from the below stated table 2, the largest outflow represents the scenario of the Czech parent companies and its subsidiaries.

Tab. 2 - Summary of parent companies and its subsidiaries, tax bases and potential outflow.

Source: Amadeus database, own research.

Database	Czech parent companies				Other EU parent companies				Total companies	Total subsidiaries
	No. of companies		No. of its subsidiaries in EU		No. of companies		No. of its subsidiaries in CZ			
	total	out-flow	total	out-flow	total	out-flow	total	out-flow		
Amadeus	1,587	81	2,427	108	816	0	1,135	35	2,403	3,562

Furthermore, data set from Amadeus database including 2,403 parent companies with 3,562 subsidiaries was categorized based on NACE classification. As can be seen from the table 3 below stated table, the researched group of companies generates the tax base (i.e. without CCCTB implementation in EU 27) in the amount of EUR 5,226,378 th. in the Czech Republic. NACE sector M (Professional, scientific and technical activities) represents the sector with the largest portion of the tax base (37.88%). It is followed by NACE sector C (Manufacturing) in the amount of 25.59%. As can be seen from the table, the rest of NACE sectors generate only marginal portion of the tax base in the Czech Republic.

Tab. 3 - Czech tax base according to current conditions. Source: Amadeus database, own research.

<b>Q</b> (human health and social work activities)	0.03	<b>2,376</b>
<b>R</b> (arts, entertainment and recreation)	0.04	<b>10,347</b>
<b>S</b> (other services activities)	0.00	<b>25</b>
<b>Sum</b>	<b>100</b>	<b>5,226,378</b>
		<b>100%</b>

Therefore, based on the above presented analysis, we have researched that currently (i.e. without the implementation of CCCTB), Czech Republic receives the tax base in the amount of EUR 5,226,378 th. As was already indicated above, the model is based on the research of the two scenarios. The following table 4 summarizes the results of the research of the first scenario – i.e. the potential outflow of tax bases in the group of Czech subsidiaries of parent companies from other EU member states, where we assume that the outflow of tax bases would occur when the parent company of Czech subsidiary would be situated in Bulgaria, Croatia, Cyprus, Estonia, Ireland, Latvia, Lithuania, Romania or Slovenia (i.e. in countries with lower effective tax rate than in the Czech Republic) .

<b>M</b>	47.31	1,886,336	72.33	35,503
<b>N</b>	0.20	8,183	2.09	1,024
<b>O</b>	0.02	706	-	-
<b>P</b>	-	-	-	-
<b>Q</b>	-	-	-	-
<b>R</b>	-	-	-	-
<b>S</b>	-	-	-	-
<b>Sum</b>	<b>100</b>	<b>3,987,079</b>	<b>100</b>	<b>49,084</b>
		<b>100%</b>		<b>1.23%</b>

As can be seen in the table, the research indicated only 1.23% (EUR 49,084 th.) outflow of tax bases in case of the group of Czech subsidiaries of parent companies in other EU member states. NACE sector M (Professional, scientific and technical activities) represents the sector in which the largest portion of outflow (72.33%) was identified, followed by NACE sector C (Manufacturing) with 15.76% and by NACE sector A (Agriculture, forestry and fishing) with 7.41%. In NACE sectors B, D, F, H, I, L and O to S any outflow of tax base was identified.

Following table 5 summarizes the potential outflow of the tax bases in the group of Czech subsidiaries of Czech parent companies, when CCCTB would be implemented in EU27 and not in the Czech Republic (i.e. second scenario). As was already mentioned above, we assume that the outflow of the tax base would occur when the group would include at least one subsidiary situated in other EU member states.

Tab. 5 - Overall Czech tax base after implementation of CCCTB in other EU member states- part II. Source: Amadeus database, own research.

<b>J</b>	3.59	44,540	0.40	1,555	206
<b>K</b>	16.55	205,203	41.38	162,136	657
<b>L</b>	4.35	53,897	0.06	247	3,273
<b>M</b>	7.56	93,671	0.31	1,213	179,845
<b>N</b>	0.32	3,996	0.00	-	10
<b>O</b>	5.95	73,767	0.00	-	-
<b>P</b>	0.04	557	0.00	-	-
<b>Q</b>	0.19	2,376	0.00	-	-
<b>R</b>	0.83	10,347	0.00	-	-
<b>S</b>	0.00	25	0.00	-	-
<b>Sum</b>	<b>100</b>	<b>1,239,299</b>	<b>100</b>	<b>391,739</b>	<b>970,019</b>
		<b>100%</b>		<b>31.61%</b>	<b>-</b>

1 - see explanation in table 3 above

As can be seen from the above stated table, the research indicated the outflow of 31.61% of the tax bases of the defined group of companies (i.e. EUR 391,739 th.). NACE sector G (Wholesale and retail trade; repair of motor vehicles and motorcycles) represent the sector with the largest portion of outflow (52.39%), followed by NACE sector K (financial institutions and insurance undertaking) with 41.38%. It is necessary to highlight that those two sectors represent nearly 94% of total outflow from the Czech Republic. Moreover, taking into account the possibility of relocation of also parent companies into the other EU member states, in order to access the advantages of CCCTB system, the Czech Republic would lose at least EUR 970,019 th. It is necessary to point out, that the research did not identify any inflow (for details see table 5 above).

Based on the performed research, we can conclude, that in case that the CCCTB would be implemented and the Czech Republic would not be joining the club, there could arise very large differences between the outflows of tax bases in the group of Czech subsidiaries of Czech parent companies (31.61 %) and in the group of Czech subsidiaries of other EU parent companies (1.23%). Only 1% outflow of tax bases may be caused by the fact that parent companies in other EU member states will consider whether entering into the CCCTB system will bring them more advantages than staying in the Czech tax jurisdiction. However, the total outflow of the tax bases in the amount of EUR 440,823 th. out of the total tax base in the amount of EUR 5,226,378 th. (currently present in the Czech Republic) presents 8.43%, which is nearly 3times more than calculated by Cline, Neubig, Philips, Sanger and Walsh (2010) in their last comparative study (for details see table 6 below).

Tab. 6 - Summary of results. Source: own research.

Amadeus data set	First and second scenario				Total tax base in th. EUR	Expected outflow in th. EUR

%					100	8.43	-

## 5 CONCLUSION

The aim of the paper was to research the impact of the optional CCCTB implementation (i.e. implementation in all the EU Member States except the Czech Republic) on the tax bases in the Czech Republic, and to identify whether the outflow/inflow or inflow will occur. The empirical analysis was based on the data available from the Amadeus database and covered 2,403 parent companies with 3,562 Czech subsidiaries.

The defined model and the research of the two scenarios performed in the paper revealed that the implementation of CCCTB system in EU27 would negatively change the tax base generated in the Czech Republic, as the country would lose more than 8% (i.e. EUR 440,823 th.) of the current tax base. Specifically, the outflow of the tax base from the group of the Czech subsidiaries of the Czech parent companies was assumed in the amount of 31.61% (i.e. EUR 391,739 th.). The largest portion of outflow (52.39%) was identified from NACE sector G (Wholesale and retail trade; repair of motor vehicles and motorcycles) and from NACE sector K (financial institutions and insurance undertaking) with 41.38%, i.e. almost 94% for both of them. The employment of second scenario enabled us to identify the other outflow of the tax bases in the group of the Czech subsidiaries of other EU parent companies in the amount of 1.23% (49,084 th. EUR). The largest portion of outflow (72.33%) was identified from NACE sector M (Professional, scientific and technical activities), followed by NACE sector C (Manufacturing) with 15.76% and by NACE sector A (Agriculture, forestry and fishing) with 7.41%. Any inflow was identified.

Consequently, the research of the two scenarios revealed that implementation of CCCTB in EU27 without Czech Republic joining the club may result into the relocation of tax base from the Czech Republic in case of the Czech parent companies with at least one subsidiary situated in other EU member states. In this case it would be the amount of EUR 970,019 th.

Finally, based on the research of the two scenarios (i.e. researching the group of EU parent companies having subsidiaries in the Czech Republic and the group of the Czech parent companies having subsidiaries in the Czech Republic and other EU Member States) and taking into account the above mentioned assumptions, we can conclude, that the implementation of CCCTB in EU27 with the Czech Republic not joining the club might have very strong negative impact on the overall tax base generated by the Czech subsidiaries in the Czech Republic and therefore also on the tax revenue.

## **THE ROLE OF BUSINESS ECONOMICS IN MEASURING AND MANAGING BUSINESS PERFORMANCE**

*Inka Neumaierová, Ivan Neumaier*

### **Abstract**

In order to understand the behaviour of businesses it is necessary to link the views of specialist scientific disciplines (management, marketing, finance, ...) into a holistic view of a business. The intersections of the individual specialised sciences are examined by business economics. The aim of this article is to consider the importance (role) of business economics in the development of measuring and managing business performance. The new conception is outlined, which meets requirements of the present time.

*Keywords: business economics, business performance, holistic view.*

JEL Classification: M200

### **1 INTRODUCTION**

The article was written for reason of deviation from business economics not at our university only, but abroad too. The reason is the generation exchange of lecturers, when the leaving generation simultaneously went away the business economics. We can consider that the rejection of business economics is mistake, because the business economics is probably the only scientific discipline on firm, which is able to absorb the comprehensive view on the business.

The redefinition of business economics, as a comprehensive business discipline with the compact view, is the contribution of authors to the discussion on business economics. The redefinition is based on the rich experience of authors in using of systematic dynamic simulators in tuition and practical applications.

The aim of this article is to consider the mission and role of business economics. To emphasise its importance for measuring and managing corporate performance and for the development of individual specialised disciplines.

### **2 HOLISTIC VIEW**

The standard of measuring and managing business performance is influenced by the development of business economics. In this article we want to draw attention to the fact that business economics (in German: *Betriebswirtschaft*) cannot be understood as a simple set of individual specialised economic disciplines (management, marketing, finance, etc.). It does not have the role of the plate on which a pile of peanuts lies. Business economics should be understood as a system and the individual specialist disciplines as subsystems of this system. The focal point of investigations by business economics are links between the individual specialist disciplines, their interfaces.

A comparison with medical science is instructive. Modern medicine has a large quantity of specialised scientific disciplines, which enables the perfection of knowledge about how the human body works. Holistic medicine, which deals with the context of images from individual specialists and the creation of a holistic view of the causes of problems in a

person's health, is starting to play a more and more irreplaceable role. The holistic view is not focused only on one physical medical problem, but looks for causes also in a sick soul.

Business economics principally plays a similar role when viewing a business to that played by holistic medicine when viewing a person. The thing compared to the soul in business economics is a business's vision and strategy. They are the basis of the business model.

At the centre of interest of business economics is the business, the same as the centre of medical science is the human body and the centre of infomatics is the computer.

A business can be viewed from various angles: as a coalition of stakeholders, as a portfolio of resources, from the viewpoint of its economic structure, organisational structure, procedural structure, ownership and capital structure. Business economics is a discipline of business science that links these views.

Understanding and managing the behaviour of a business requires a holistic approach from business economics. Holism (Petráčková & Kraus, 1995) emphasises the holistic nature and sees the whole as something more than the sum of its parts. This means that all the properties of a system cannot be explained only by examining its parts and the meaning of each part can be recognised by relating it to the other parts and to the whole.

The synergy effect is related to holism. When merging businesses, it is expected, for example, that the value of the business after the merger will be higher than the sum of the values of the individual businesses merged. Otherwise the merger would make no sense.

The meaning of business economics consists of the realisation of a synergy effect by linking knowledge from the individual specialised economic disciplines (management, marketing, finance, etc.). The problem, in our opinion (Neumaier & Neumaierová, 2006) is that this meaning is not fully appreciated. Many of the specialised disciplines aspire to a conducting role, although, given their specific focus, none of them can satisfactorily perform it. Instead of synergy there is a platform for conflict between them (Neumaierová, 2010).

The above, however, is also proof of the need for the existence of a holistic view of a business. A holistic view is emphasised, for example, by Porter or Kotler.

Porter (1994) emphasises that a competitive advantage cannot be understood unless we link disciplines that play a role in its establishment (marketing, production, management and control, finance...) in a holistic view of a business. It formulates methodological frameworks that are a set of basic logical relations showing competitive behaviour.

Kotler (2007) comes up with a definition of a holistic marketing concept: *"The concept of holistic marketing is based on the development, design and implementation of marketing programs, processes and activities that recognise their breadth and interdependencies. Holistic marketing recognises that 'everything matters' with marketing—and that a broad, integrated perspective is often needed."* (p.28).

Wehrich and Koontz (1993), in their book *Management*, talks about examining the relationship between basic managerial functions and their links to the corporate environment through a systemic approach.

Professor Koontz (1993) says that *"... you could say that the development of management science and theory has been a jungle until now."* (p. 52). It is not only a semantic jungle caused by the terminology used, which is not always clear. It is the concept of management and the approaches to it. The procedural (operational) concept tries to integrate the various "schools". It is based on an arrangement of management knowledge in accordance with managerial functions (planning, organising, personnel work, management and control). He

emphasises that this approach enables the “*differentiation of managerial knowledge from special knowledge and specialist abilities in non-managerial areas such as marketing and manufacturing.*” (p. 59).

Financial reporting is a significant example of integration efforts. There is an awareness of the need to create new corporate reporting (Beattie, 2000) that unifies the current approaches and better identifies a business as such and its outlook for the future. The aim is to create integrated reporting that would enable companies to create for stakeholders a single report with a faithful view of the business and its risks. The new principle-based standard is focused on facts that are related to the business’s ability to create value over time. It can capture the business strategy and the ability of a business to create value in the long term.

New corporate reporting is in accordance with the holistic approach to business economics and enables the search for a global optimum for a business.

### **3 GLOBAL OPTIMUM**

A business’s mission is the manufacture and distribution of goods and services. The vision is a milestone on the path to implementing the mission. The strategy realises the vision. It sets out long-term goals for the business, the focus of activities and the allocation of resources to achieve the goals foreseen by the vision.

The business model is important for a business’s life and the direction of its behaviour in accordance with the strategy. It is an expression of the business’s strategy. It has to ensure a business’s ability to generate profits. It represents a method of transforming input into output, including taking into account the feedback of output to input. The feedback of output to input usually occurs with a certain delay. There is a causal loop, which represents the structure generating a business’s behaviour.

The management system serves to implement the strategy. Each management system has its reporting model, which is its tool. Examples of a concept for a strategic management system are the Balanced Scorecard (Kaplan & Norton, 2010), Tableau de bord (Epstein & Manzoni, 1997) and Business Model Canvas (Osterwalder & Pigneur, 2012). It enables a business’s strategy to be expressed in a manageable way and to be operationalised. The strategy must express the route to the global optimum, i.e. to increase a business’s value. Increasing value can be achieved through a business’s competitive advantage.

The task of strategy is to attain a competitive advantage for a business. A competitive advantage can be both on the part of inputs, the method of their transformation, and on the part of outputs, the profiling of their usefulness and also in the management system.

A strategy should have two properties:

1. It should remain anchored by two anchors—economic and ethical (Neumaier & Neumaierová, 2006). The economic anchor is the basic criterion for assessing corporate performance, where a strategy leading to growth in the value of a business is regarded as acceptable (the net current value is positive). The ethical anchor of strategy provides an ethical dimension to doing business, compliance with which is the key to a business’s trustworthiness.
2. It should reflect the fact that the environment for business is changing, as is the method of achieving a competitive advantage. In the conditions of globalisation the world is more and more connected and is still more predisposed to unbalanced states. It is necessary to examine them and look for barriers to achieving balance.

The strategy profiles the ability of a business to interact with its environment. It is the guide for the operation of a business in the sense of usefulness and effectiveness.

For the correct formulation of a strategy leading to the achieving of the global optimum (growth in a business's value) it is necessary to understand the dynamic complexity of the environment.

#### **4 DYNAMIC COMPLEXITY**

Being oriented on detailed complexity is not enough. For example, accounts deal with detailed, but not dynamic complexity. Despite this, accounts also serve for an investigation of dynamic complexity, as the information that they provide enables an examination of the context in a business, in a maximally aggregated quantitative form. A financial manager must re-shape the detailed complexity of accounting data to the dynamic complexity of a view of the creation of a business's value (Brealey & Myers & Allen, 2014).

Financial accounting also shows the effect of intangible and intellectual assets that are regarded as decisive assets for a business's success. The effect of a great brand, know-how and specialists will certainly be reflected in a business's revenues. The building of a brand and the retention of experts obviously costs a business something.

Accounting is the showing of corporate reality that is already the past in a form that is an ideal starting point for a related statement about the business's future. Strategic plans have, in their most concentrated quantitative form, the form of expected financial statements.

The shift in thinking or the optics of viewing information produced by financial accounting consists of the non-monitoring of the current state and a linear chain of cause and effect, but attention will be paid to change processes and interrelations. It is focused on the image of deeper structures hidden behind events and details. This view enables an understanding of behaviour and forces able to cause a change.

It assumes systemic thinking (Senge, 2007), where the axiom that each influence is also a cause and an effect applies, and abandons the assumption of one-way influences. It significantly affects deeply-rooted ideas about causality.

Systemic thinking is beneficial for its ability to unify knowledge crossing the boundaries of individual specialised areas and disciplines. It is not possible to respond to the problem of complexity and change when a person sees only a detailed view—a wide view is necessary.

It is necessary to realise that in some cases it is possible to ignore dynamic complexity. There are situations where the linear approach is completely sufficient and it is not necessary to look for feedback, because it has minimal effects. It is important to be able to distinguish in accordance with what decision should be made, whether to use a linear or system dynamic approach. The answer lies in realising the essence of the problem.

A system dynamic approach should be used to solve problems for which there is not one best solution and where the cause and effect are remote from each other in terms of time and space. Most managerial problems are of this nature. An example is searching for the best satisfaction of individual stakeholders (Neumaierová et al., 2005).

The paradigm of business economics changes not in the sense of what is to be examined, but with what approaches, what methods, in accordance with what rules and conventions.

## 5 CONCLUSION

Business economics has, as every science does, its main current and its derivatives, as well as innovative directions that entail the development of the scientific discipline and a change to its quality.

What business economics deals with (the subject of its interest) remains valid, but it changes the method in which a business is viewed. As a consequence of the innovation in thought (application of system dynamics) it is possible to find strategies with a large leverage effect where a small change to the structure can have a huge influence on the system's behaviour.

The trends in business economics have consequences for the concept of measuring and managing the performance of businesses and for the development of individual specialised disciplines.

A suitable tool for realising a holistic view of business economics are simulators, in which it is possible to examine the interaction of explicitly expressed views of individual specialised economic sciences. The great benefit is also the fact that it enables an expression of the dynamism of strategy. The inability to turn back time is respected. It enables the verification of whether the business model that arises upon the expression of the business strategy is correctly set.

No specialised scientific discipline can substitute for the role of business economics. Business economics is not only a set of individual specialist disciplines standing next to each other. It has to deal with the relations between them. Its conducting role and non-substitutability consists of it being a system in the framework of which individual specialised disciplines have their irreplaceable positions (where if any discipline is excluded the system cannot function as a whole). So that it is better able to play this demanding role than it has been until now, it needs to be restored through an innovation in thinking, i.e. the thorough application of a holistic view of a business. Examining the connections and interfaces of the individual specialised economic scientific disciplines contributes to business economics and their development.

# **IMPACT OF SOCIAL CAPITAL, HUMAN CAPITAL AND PSYCHOLOGICAL CAPITAL ON INDIVIDUAL JOB PERFORMANCE-A STUDY ON 100% FOREIGN CAPITAL COMPANY IN VIETNAM**

*Nguyen Duc Trung, Nguyen Thuy Vy, Trinh Phuong Dung*

## **Abstract**

This study examined empirical information to investigate the influence of non-physical sources which are social capital, human capital, and psychological capital on individual job performance. The results of this study aim to assist firms with entirely foreign capital identified major factors contributing to enhanced individual job performance. Thus, facilitating these organizations upper management determines resolutions for improving their overall performance. In addition, the results also provide support for domestic enterprises in training and developing their employees. The proposed model is tested and proven adequately with the collected data. Despite the fact that it consists of limitations, the article contributes to the study on individual job performance in Vietnam.

*Keywords: Social Capital, Human Capital, Psychological Capital, Individual Job Performance*

JEL Classification:

## **1 INTRODUCTION**

Individual job performance, which is also known as individual performance, is a very significant factor. It is essential not only for the individual working in organizations but also for the development of these organizations (Erhard et al, 2010). To some extent, organizations need their individual working with high job performance in the provision of product and service. This is in order to lean forward competitive advantage, and eventually to achieve the ultimate goal of the organization.

On the other hand, in the traditional economy, economic capital includes financial assets and tangible assets such as machinery, equipment, and infrastructure which are key resources in the developing requirements of any organizations. In the new knowledge economy, these resources are no longer the sole most important factor creating competitive advantages of modern enterprises (Luthans et al., 2004). Thus, Luthans et al. (2004) associated concepts of new capital of organization including knowledge of human capital, social capital, and psychological capital. Human capital includes experience, skills, knowledge and competency of employee working in organization. Social capital refers to resources of trust, relationships, and contact network. Positive psychological capital discusses four factors: self-improvement (trust in self-improvement result), hope, optimism, and resilience.

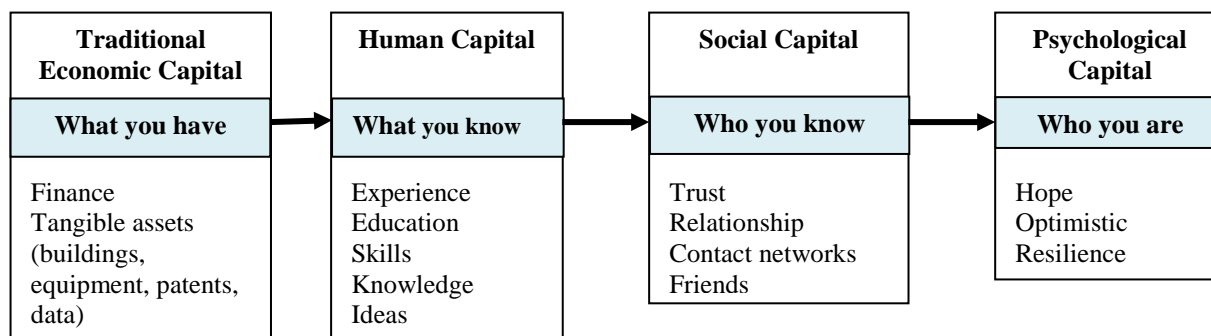

Figure 1 - Concepts of Capital. Source: (Luthans et al., 2004)

In this study, individual job performance of organizations at Vietnam is observed. It is known that individual performance at Vietnam is currently assessed at almost the lowest level in Southeast Asia. The labor is lack of experience and practical knowledge; have been undertrained and equipped with inconsistent skills with the labor market. That is the reason causes individual performance of Vietnamese is at the lowest level of Asia. It takes only 1/5 of Malaysian labor and 1/15 of Singaporean labor (laodong.com.vn).

Enterprises with 100% foreign investment in Vietnam are established in the form of Limited Liability Company with legal responsibility under the law of Vietnam. Although foreign investment is conducted in almost all provinces and cities of Vietnam, the largest proportion of investment is conducted at the key economic regions in the South include: Ho Chi Minh city, Dong Nai, Binh Duong, Ba Ria-Vung Tau; in the North include: Hanoi, Hai Duong, Hai Phong and Quang Ninh. However, the investment remain mostly in Hanoi and Ho Chi Minh city since these two have the most developed infrastructure, higher purchasing power and skilled labor force (www.hanoitie.com.vn).

Figure 2 - Proportion of GDP by economic sectors. Source: Report yield Vietnam 2010

In recent years, the number of projects with 100% foreign capital begins to increase. Foreign investment in Vietnam has been a boom. It gradually asserts its position as a dynamic part of the economy and contributes significantly to support the capacity and competitiveness of the economy strength. Along with the trend of increasing investment, foreign investment sector accounts for a quarter of the total capital of the country, 43.6% of industrial output (2004), 57.2% of total exports (2005) and 15, 9% of Vietnam's GDP.

From the evidences that mentioned, the gaps of the research are: (i) the lack of understanding in which examine all three forms of capital in the diagram of Luthans et (2004) at the same time ( not including the traditional economic capital) in relate to individual performance; (ii) the lack of research survey the interaction between the three forms of modern capital; (iii) in the case of Vietnam, research on the impact of non-traditional sources of capital to individual performance has significant practical implications.

The objectives of this study are as following:

- Identify and define the interaction between the three elements of social capital, human capital and psychological capital in relate to individual job performance;
- Measure impact of social capital, human capital and psychological on individual performance.

This study aims to propose a number of recommendations to improve individual job performance for different organizations in Vietnam.

## **2 LITERATURE REVIEW**

### **2.1 Individual Job Performance**

According to Sonnentag & Frese (2001), there are three different views of job performance: individual differences perspective, situational perspective, and process perspective.

Individual differences perspective expresses the difference between the performances of individuals which are due to differences in ability, personality and motivation. Therefore, to ensure high individual performance, organizations need to select individuals based on their ability, experience and personality. This study fundamentally approaches to follow individuals as briefly above.

Individual job performance includes a separate set of activities to contribute to the organization in different ways (Campbell, 1990). It is divided into two aspects:

In-role behavior is defined as activities that are directly related to the completion of the core tasks of the job or the direct operational support to complete the task participate in the "technical core" of an organization (Borman & Motowidlo, 1993). These behaviors include performing assigned tasks and focus on certain jobs; there is consensus on the job and they are relatively fixed over time (Ilgen & Hollenbeck, 1991). According to the popular model on performance of Borman & Motowidlo (1997), it is conducted formally known as task performance. To avoid confusion with job performance, this study will use the term in-role behavior.

Extra-role behavior indicates job performance includes not only the official performed duties but also the unofficially emerging task. It contributes to the organization in a less direct way (Borman & Motowidlo, 1997). The behavior of this type includes helping, honesty, devotion, and good morals (Organ, 1988) which does not contribute directly to the core values of an organization, but instead, they contribute to the organization by promoting a social environment and psychological advantages for the completion of the work related to the core values of the organization (Borman & Motowidlo, 1997). Regarding terminology, performing informal work is contextual performance of Borman & Motowidlo (1997) or organizational citizenship behavior of William & Anderson (1991).

### **2.2 Social Capital**

The concept of social capital first mentioned in studies of Hanifan (1916). Hanifan (1916) particularly interested in cultivating goodwill, friendship, empathy and good social relationship. Subsequently, the newer concept of social capital is formed later then. According to Nahapiet & Ghoshal (1998), social capital consists of three aspects of structural, relational and cognitive social capital. Although every aspect of social capital represents a distinct characteristic, but all the three aspects are interrelated. The structural aspect affects the

cognitive aspect and related aspects (Nahapiet & Ghoshal 1998), or the cognitive aspect affect the relationship aspect (Tsai & Ghoshal 1998).

Primarily, in the study of Ariani (2012) on the relationship between social capital and job performance, the structural concept of social capital is inherited from the work of Nahapiet and Ghoshal (1998). However, the correlation between the three aspects components which are mentioned as: structural, relational and cognitive of social capital are ignored.

In the meantime, a recent study of Sun, Y. (2012) correspondingly confirmed the positive impact of social capital on service quality and customer satisfaction. Nonetheless, the structural aspect of social capital is completely chemical intermediated by cognitive aspect and relationship aspect of social capital.

To compare the two models studied by Ariani (2012) and Sun Y. et al (2012), the authors find that mutual relationships between the three dimensions of social capital components should be considered in order to closely reflect the inclusion of social capital in the classic theory of Adler & Kwon (2002). Accordingly, this study contributes the three theories of social capital in H1A and H1B denoted, H8a of the proposed research model (see figure 3).

Consequential, the result demonstrates social capital is an appropriate prefix to describe job performance (Ariani 2012), the authors decide on the hypothesis about the relationship between social capital and the two aspects: official duties and informal task performed. The performance of the work consists of these hypotheses: H2A, H2b, H3a and H3b (see figure 3).

### **2.3 Human Capital**

The theory of human capital indicates that the enterprise does not own knowledge, skills and capabilities that employee possess (Wright & CTG 2001). Accordingly, the relationship between human resources (knowledge, skills and capabilities) with specific behaviors of employees in enterprises and human resource management practices show significant meaning. About the concepts, human capital is defined as the repository (stock) skills and business knowledge of employee (Hunt 2000), or the knowledge and skills of professionals in the company can be used to create professional services firm (Backer 1964), or represented by two indices that are the professional qualifications and experience (Arrow 1973). Also note that most of the studies established that human capital vary according to the specific industry.

Many studies emphasize that social capital is an important resource to access, exploitation and use of personal knowledge, share and thus provide strategic value to the organization (Nahapiet & Ghoshal , 1998). In other words, social capital affect the creation of individual intellectual capital (Reiche, 2009). It is understood that the whole range of knowledge can be shared through the exchange of social capital. The impact of social capital on human capital and knowledge support the authors to the hypothesis H4a and H5a in figure 3.

On the other hand, human capital is the platform of education, experience and skills. This is the most fundamental factor contributing to improve the performance of individual. According to Goldsmith et al (1997), it also shows that human capital is one of the factors that impact on job performance. Thus, the authors come up with the hypothesis H6a and H6b in figure 3.

Additionally, in a study of Luthans et al (2004) "Positive psychological capital: human capital side and the social capital" also shows the content and the relationship between the non-physical capitals. Therefore, the hypothesis H8b is formed in figure 3.

## 2.4 Psychological Capital

Luthans (2002) stated positive psychology in the workplace is a positive organizational behavior. Accordingly, positive organizational behavior is an approach based primarily on positive psychological state. It is defined as: "the study and application of psychological capacity and strength of human resources in a positive way to measure, develop and manage an effective way to improve productivity"(Luthans, 2002).

At the individual level, psychological resources could enhance growth and efficiency. At the organizational level, similar to human capital and social capital, which can create psychological levers, it brings a return on investment, and competitive advantage through improved work performance (Luthans & CTG, 2005). According to Luthans et al (2007), the structure consists of positive psychology: hope, resilience, optimism and self-improvement.

Yip et al (2006) declared that social capital has a positive impact on general health and mental health (psychological capital) in particular, and as the satisfaction of human happiness. Subsequently, two hypotheses are designed as H4b and H5b in the model (figure 3).

Resulting, the study on 422 samples of Chinese workers, Luthans et al (2005) shown positive psychological state of employees strongly correlated with their job performance and best results consistent with the assessment from their supervisors. Luthans et al (2007) point out that not only the employee's psychological capital is positively correlated with performance and satisfaction of their work, but also a strong positive correlation with the integration of the four aspects of the capital which is interest with reasonable performance and job satisfaction rather than individually at each aspect of psychological capital.

Sun T. et al (2012) also concluded that psychological capital is positively correlated with job performance. Consequently, the hypotheses H7b and H7a are formed.

## 2.5 The conceptual Model

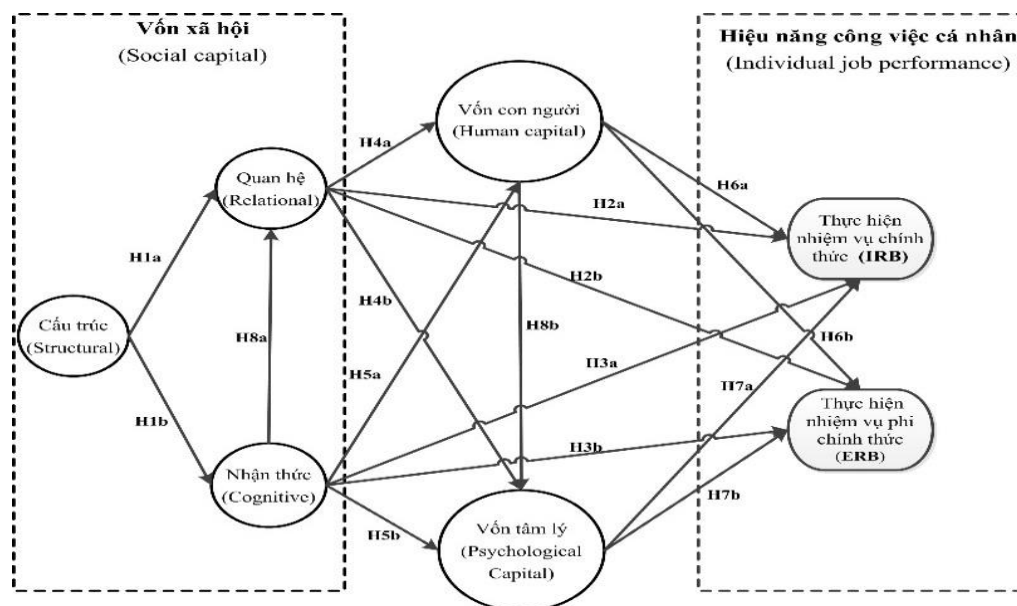

Figure 3: The suggested model. Source: Nguyen et al, 2015

The conceptual model used in this study is shown in Figure 3. To examine the relationship of human capital, social capital, psychological capital and individual job performance, eight hypotheses were developed:

*H1a: Structural (dimension of social capital) has a positive relationship with relational (dimension of social capital).*

*H1b: Structural (dimension of social capital) has a positive relationship with cognitive (dimension of social capital).*

*H2a: Relational (dimension of social capital) has a positive impact to in-role behavior.*

*H2b: Relational (dimension of social capital) has a positive impact to extra-role behavior.*

*H3a: Cognitive (dimension of social capital) has a positive impact to in-role behavior.*

*H3b: Cognitive (dimension of social capital) has a positive impact to extra-role behavior.*

*H4a: Relational (dimension of social capital) has a positive impact on human capital.*

*H4b: Relational (dimension of social capital) has a positive impact to psychological capital.*

*H5a: Cognitive (dimension of social capital) has a positive impact to human capital.*

*H5b: Cognitive (dimension of social capital) has a positive impact to psychological capital.*

*H6a: Human capital has a positive impact to in-role behavior.*

*H6b: Human capital has a positive impact to extra-role behavior.*

*H7a: Psychological capital has a positive impact to in-role behavior.*

*H7b: Psychological capital has a positive impact to extra-role behavior.*

*H8a: Cognitive (dimension of social capital) has a positive relationship with relational (dimension of social capital).*

*H8b: Human capital has a positive impact to psychological capital.*

### **3 METHODOLOGY**

The study was conducted in two main steps: a preliminary and main research. Preliminary studies are carried out through two methods: (i) qualitative research explored, adjusted and supplemented the observed variables using to measure the concept of study; (ii) qualitative research was conducted through discussions and interviews. Persons who participated in interviews and discussion are managers and employees in 100% foreign direct investment enterprises in Vietnam. Preliminary quantitative research primarily evaluated the reliability of the scale designed and adjusted to suit the context in Vietnam. Preliminary study of this study was done with a convenient sampling method with 119 observations which is suitable for EFA minimum sample size of 50 preliminary observations.

Main research was conducted with quantitative research methods. Through the review and analysis, the conceptual model consists of seven concepts with forty three observed variables. Based on this model, sixteen hypotheses will be tested through the primary collected data. The study based on original scale and adjusted to get the formal scales (Table 1). Data collection for this study was through a survey using questionnaires as the tool. A total of 439 respondents participated in this study. The persons who were survey in this study are employees and managers in 100% foreign direct investment companies at HCM City and Binh Duong Province in Vietnam. As for data analysis, confirmed factor analysis (CFA) and structure equation model (SEM) were used to test the model and hypotheses.

Table 1 - Details of items measuring variable. Source: Nguyen et al, 2015

Scale	Variable	Editor	Draft scales	Formal scales
Social capital – SC	Structural capital	Sun Y. et al (2012)	4 questions	10 questions
	Relational capital		4 questions	
	Cognitive capital		3 questions	
Psychological Capital – PC	Self-efficacy	Luthans et al (2007)	6 questions	17 questions
	Hope		6 questions	
	Resilience		6 questions	
	Optimism		6 questions	
Human capital – HC		Griffith and Lusch, 2007		4 questions
Human Performance	In role Behavior	Williams & Anderson, 1991	7 questions	12 questions
	Ex-tra Behavior	Lee và Allen, 2002	16 questions	

## 4 RESULTS

Descriptive statistics are presented in table below:

Table 2 - Demographic profiles. Source: Nguyen et al, 2015

Characteristic	Frequency	Percentage (%)
<b>Company</b>		
ScanCom	87	19.8
Unilever	72	16.4
Fujikura	69	15.7

<b>Marital status</b>		
Single	269	61.3
Married	57	13.0
Married and had children	113	25.7

After testing by explore factor analysis (EFA), Cronbach's alpha was reviewed to test reliability of the scale after eliminating variable in earlier. The scales' reliability coefficients and Corrected Item-Total Correlation are satisfied, so these variables were used to confirm factor analysis (CFA). 39 observed variables were measured the 10 dimensions of model studies. Some variables which are strongly correlated with other variables were removed to enhance the compatibility of the scale with market data. 13 variables such as ST01, REL05, SE11, SE13, SE15, SE16, HO17, RE20, RE22, OP27, HU30, EX37, EX38, EX43 were eliminated because of strong correlation.

The result shows Chi-square/df = 1.801 (<2), GFI= 0.919 (>0.9), TLI=0.926, CFI = 0.936 (>0.9); RMSEA = 0.043 (<0.08) (Figure 4). ) The model was sufficiently compatible with market data. Similar testing scales, Maximum LikeHood method (ML) was estimated the parameters and modeling studies. Results showed that three hypotheses are not supported (P> 5%) (Table 3)

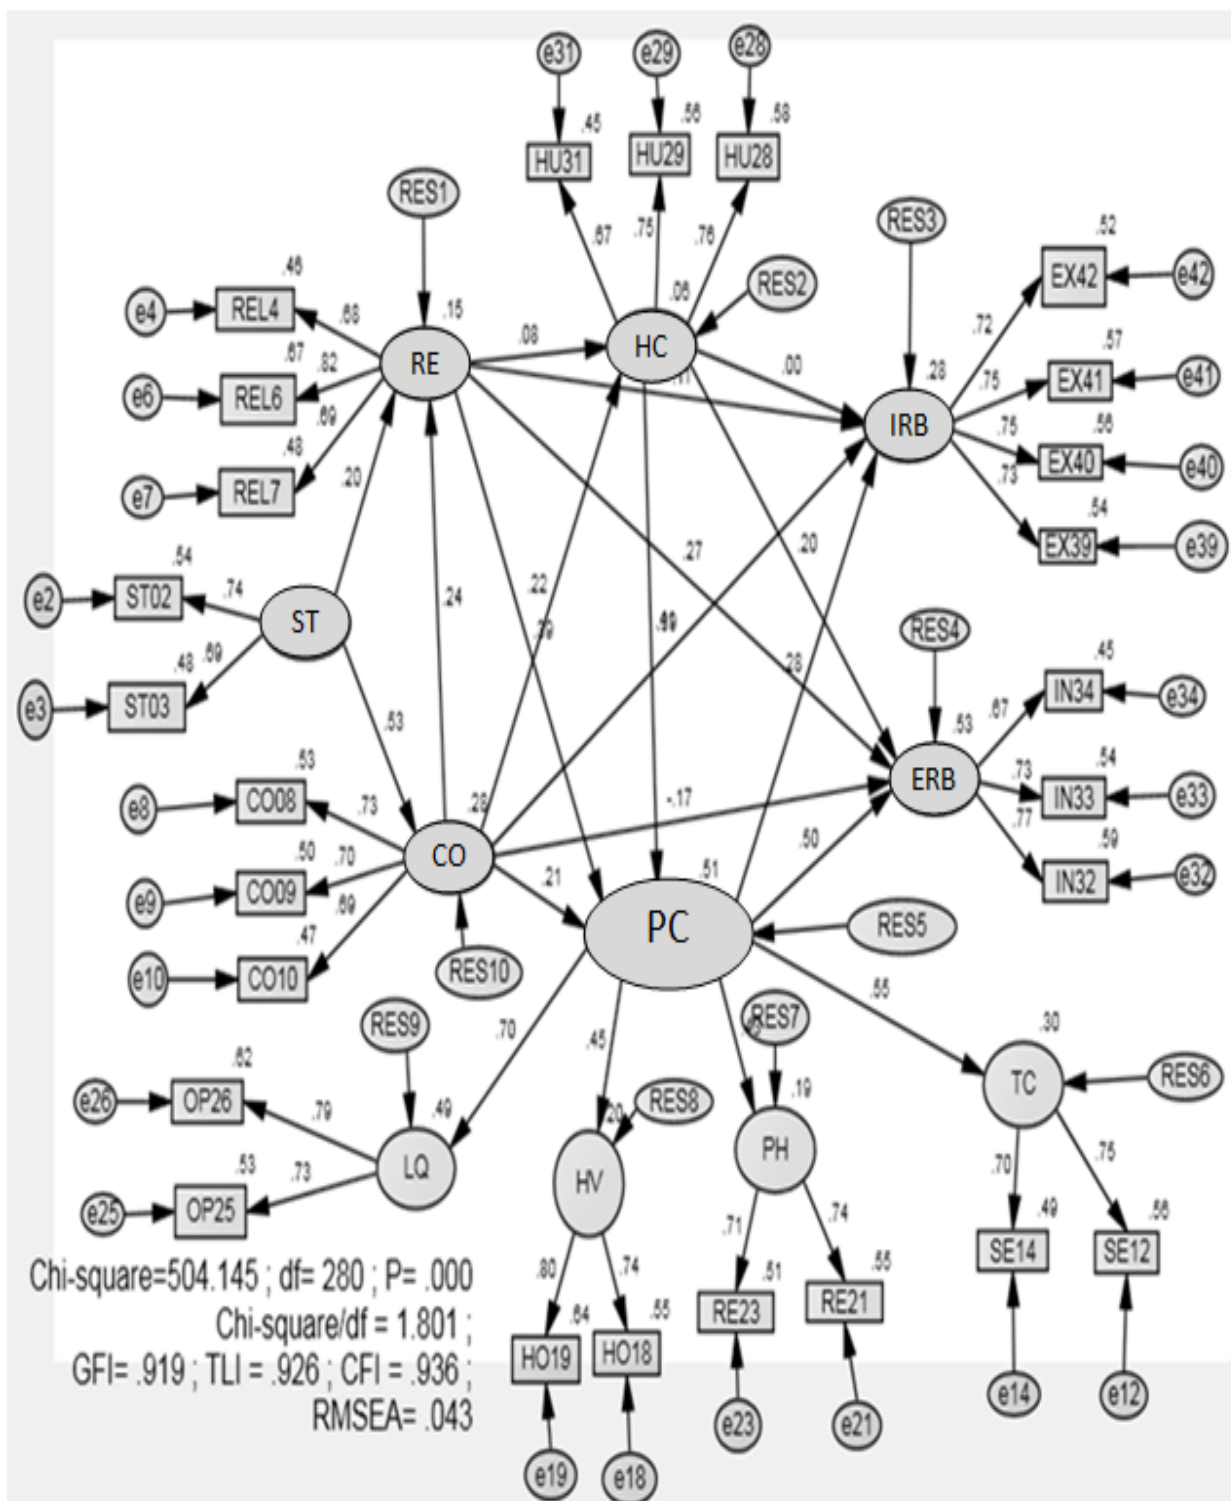

Figure 4 - Results of testing conceptual model. Source: Nguyen et al, 2015

## 5 DISCUSSION

The results showed that factors such as structural, cognitive, human capital and psychological capital have a positive impact to in-role behavior, and psychological capital is the most impact with  $\beta=0.497$ . However, relational and human capital does not affect extra-role behavior. The result can be explained that in-role behavior is attitude of each employee for their work, specific and obvious task. High social capital, human capital and psychological capital help employees to handle and complete their tasks quickly, easily with high performance. In the other hand, extra-role behavior refers the tasks not listed in the job description, which are made by the individual consciousness of each employee. Therefore, relational and human capital has no effect on extra-role behavior.

### **The relationship of social capital dimensions:**

As expected, the result shows that three hypotheses of social capital (H1a, H1b and H8a) are supported. Thus, the three dimensions formed by Ghoshal et al (1998) impact positively on each other. Structural dimension affects positively on relational and cognitive, and impact on

relational strongest. This confirms previous findings in the literature such as the studies of Nahapiet & Ghoshal (1998) and Tsai & Ghoshal (1998). In addition, the study of Sun Y. et al (2012) contributed to affirm that the relationship between social capital and structural is full mediated effected by cognitive and relational.

There was a significant positive correlation between relational and psychological capital. In the literature, human capital refers skills, experience, knowledge which employees accumulate to learn. Psychological capital refers the key concepts of consciousness, psychological which are difficult to quantify; including the ability to self-improvement, confidence, hope, optimism and self-recovery of each employee. Thus, psychological capital is influenced by stronger relationships, regular contact and shared terminology, general media understandable among employees together. This is consistent with finding of Yip et al (2006) that social capital (as a prefix) has a positive impact on general health, psychological health (or psychological capital) and satisfaction.

According to Coleman (1988) in "Social capital in the creation of human capital", social capital has an important influence in the creation of human capital in the next generation. Both social capitals in family level and in community level play main role in creating the human capital source of new generations. Many studies emphasize that social capital source is a key resource to access, exploitative and use personal and collective knowledge. Thus, it provides strategic value to the organization (Nahapiet & Ghoshal, 1998). In other words, social capital will affect the creation of individual human capital source (Reiche, 2009). This study confirmed cognitive positively impacts human capital.

H8b shows human capital strongly positive influent psychological capital with a high correlation coefficient (0.406,  $p < 0.001$ ). If workers have human capital and knowledge and expertise, they will get confidence in their job, career and life; they will think and act positively, overcome obstacles and recover from difficulties.

### **The effect of social capital, human capital and psychological capital on individual job performance:**

The results of correlation coefficient and regression analysis indicated that relational, human capital, psychological capital has a positive impact to in-role behavior. In particular, psychological capital is the most powerful influence to in-role behavior (regression coefficient = 0.497) and in-role behavior is positively influenced by two concepts: cognitive and psychological capital. Sun T. et al (2012) focus on the impact of psychological capital on job performance (IJP) and claimed that social capital and psychological capital impact positively on performance of the individual. However, the study refers general work performance and did not identify the distinction between in-role behavior and extra-role behavior.

Our result provided further evidence of difference in the interaction with in-role behavior and extra-role behavior. This will help researchers understand better which works of individuals need to be enhanced further. Even if factors (such as relational and human capital) are improved, the individual job performance through extra-role behavior will not increase.

## **6 CONCLUSION**

The research provided a relatively comprehensive view of the non-physical capital, which is concerned by many scholars of management (Luthans et al, 2004). Research has integrated the theories related to the social capital, human capital and psychological capital source and extended the hypothesis of the relationship between these source and then conduct the experiment.

Research also shows that the influence of social capital, human capital and psychological capital on the individual job performance through in-role behavior. In the other hand, extra-role behavior requires a higher level of voluntarily awareness and consciousness of each employee (Borman & Motowidlo, 1997), only affected positively by a few factors. This can be explained that the most of Vietnam employees' voluntary conscious level, community-driven awareness is not high.

In terms of management practices, this study contributes to provide more scientific basis to help companies: (i) to identify aspects of in-role behavior and extra-role behavior as well as dimensions of social capital, human capital and psychological capital in the context of their organization; (ii) to estimate the interaction of the three capital factors; and (iii) to evaluate the impact of them on the individual job performance of employees in the organization. This is expected to help enterprises improve their competitiveness through increase performance of human resources (Bontis & Dragonetti, 1999).

A number of works have studied the effect of human capital and social capital on business performance. A recent study in Vietnam by Tran Thu Hien et al (2012) claimed the positive impact of human capital, which concludes education and professional experience of the staff, on the success of the business establishment. Moreover, because human capital have a strong effect on psychological capital and in-role behavior, it is important to improve human capital. The interposers could provide the skill-improvement and specialized knowledge courses, training for new employees.

This study focused on the interactions of social capital on the other non-physical capital and its impact on individual job performance. The result showed that, in general, social capital has a positive impact on the human capital, psychological and influence on the individual job performance. This finding confirms that the respect, help and trust among employees always uphold in Vietnamese foreign enterprises. Besides, communication and the use of common, understandable common terminology were most focused by staff, and they always try to spend enough time to communicate and maintain relationships well with colleagues. This suggests that, all three dimensions of social capital help to improve workers' mood and can put all their effort into the job, in order to improve job performance.

It is important to note that psychological capital effects individual job performance and managers should improve their workers' psychological health and satisfaction in job. Enhancing psychological capital for every member of the organization is essential and can be fully implemented: organizing courses on life skills, positive and optimism thinking by researchers and activists.

Further studies are needed to estimate the relationship between the non-physical capitals with the performance of the organization (Rauch et al, 2009) instead of individual work performance as the current topic. More broadly, research is also needed to determine the differences between the various sectors, such as manufacturing and services among and between financial services and information technology services, etc. Finally, this study focus on the staff and manager of the enterprise with 100% foreign investment in the South, mainly consisting of Binh Duong and Ho Chi Minh city, it should be validated by a larger sample size with all the other regions in Vietnam (as in Central and North).

## **CREDIT CHANNEL IN MONETARY POLICY TRANSMISSION IN VIETNAM**

*Nguyen Duy Suu, Phung Quang Hung*

### **Abstract**

This paper examines the impact of credit channel in monetary policy transmission in Vietnam which resulted in the fact that discount interest rate has caused a great effect on the lending one. Private sector claims experienced changes caused by the growth of industrial output, lending interest rate and money supply M2. An increase in retailing goods and services has affected by the growth of industrial output and lending interest rate. The increase in claims on private sector, lending interest rate, inflation and money supply influenced international equity index. We have analyzed economic shocks, growth of private credit and huge variables. We analyze the impact of private credit lending on industrial output growth, lending interest rate and money supply. We found that private credit lending had effect. Analysis of variance has revealed that interest rate has put a great influence on private sector claims, mostly in 4<sup>th</sup> month. Money supply and industrial output grow on private credit in the 16<sup>th</sup> and the 24<sup>th</sup> respectively. On the other hand, claims on private sector on economic growth hit rock bottom but remained highest in the 24<sup>th</sup> month.

*Keywords: credit channel, monetary policy, equity index, money supply, lending interest rate*

JEL Classification: E42, E51

### **1 INTRODUCTION**

Credit channel is known as one of the most essential channels of conveying monetary policy. There are many points of views existing, which relate to concerning the ability of conveying of credit channel in monetary policy. According to Christina D. Romer and David H. Romer (1993), the monetary policy actions worked through credit channels can be classified into two categories. The first one was that monetary tightening policy by interest rate instruments will eventually lead to the rise of all interest rates. Whenever the current rate of interest slumps, for which it will result in narrowing choices of borrowing while lending takes over. Thus, it lowers demand of investment and expenditure. The second one was that the act of monetary policy might cause a direct effect to the finance supplying ability of the lenders. In addition, it was also influenced by the supplement from banks via tools of monetary policy applied by the State Bank such as reserve ratio, open market operations. In case there is a change in reserve ratio, it may give away the opportunity cost of money; and in order to make it up, commercial banks have to raise interest charges. For which, it is undeniable that monetary policy features a key role in organizations and households relying on borrowings and interest payments. However, according to Mishkin (1995), Bernanke and Gertler (1995), they believed that it worked in 2 different categories which are the lending channel and the borrowers' asset balance sheet channel. To be more specific, the lending channel was affected by tools of monetary policy, namely interest rate, reserve ratio, or capital adequacy ratio required to each commercial bank. Through this channel, the higher discounted interest rate raises, the higher lending one becomes, which reduces the borrowing came from organizations and households. Concerning the borrowers' asset balance sheet channel, it is undoubtedly put a direct effect on the borrowing ability of borrowers. Apparently, the variety of monetary policy actions through credit channel is quite a striking feature. In conclusion, those viewpoints above share

a common use of contributing to the effect of finance supplement relying on growth target and inflation stability.

Since the credit channel has brought up so useful and important feature, researchers have spent time carrying out studies about it. Observation by Bernanke and Gertler (1989) suggested that struggle happened during the crisis could cause the downward of property value of the borrowers, thus leading to the rise of borrowing costs and eventually it will cease the demand of investment and obviously, the economy crisis. In Bernanke's view, the borrowing depends on net asset. More specifically, if the net asset value rises, cost of borrowing will experience a fall and vice versa. That is the cost used for debt management and observation offered by lenders when it comes to finance supply to customers. Friedman and Kuttner (1992) both took the view that the difference between interest rate and government bond yield could see as equity risk premium. This seems true when it comes to dealing with equity risk premium, which will take into amount. Latest studies have figured out the influence of credit channel throughout the huge variables, which, particularly, is the impact claim private sector put on inflation of money supply, equity index and economic growth. Frankel and Romer (1999) took the variables relating to the growth of commercial activities through credit actions as to verify economic growth. Davis (2004) took equity index, revenue securities, number of companies and finance institutions as to verify credit in securities market. Crowley (2008) took the variables of claims on private sector in relation with growth of economy and other variables as to verify the conveying mission of credit channel to the variable factors. Tang (2003) concluded that there was a link between the growth and the development of the financial market, by which it means that the rise in financial market will cause the economy to grow in either long or short term.

The purpose of this paper is to examine the effect of credit channel in the way of operating interest rate policy of State Bank. Among these effects, one remained as the most crucial is the growth of claims on private sector followed by macroscopic factors, namely equity index, good and service retailing growth, inflation and lastly, economic growth.

## **2 LITERATURE REVIEW**

The act of monetary policy relating to credit channel was divided into 2 sides: Lending channel and balance sheet channel. With the help of lending channel, here is how the monetary policy works: Money supply rises → Deposit raises → lending from banks rises → Investment rises → Output rise. The other side is interest rate: Money supply declines → interest payments raises → lending from banks declines → Investment declines → Output decline (Mishkin, 1995).

Otherwise, the act of monetary policy via credit channel rests on the relationship between market and its problems, such as imbalanced information and other financial instruments given out by the government, companies and non-banking financial companies, namely government bond, corporate bond and fund certificate. Once the monetary policy is extended, money supply will increase in number, which apparently creates a necessary condition for credit bureaus and commercial banks to call off for deposit. Therefore, not only from which companies are fully provided with credit, but also contribute to gain investment and expenditure as well. This simply explains for a rise in output. Finally, with the increase in incomes comes either the rise in saving or expenditure. Regarding saving, its high rating will help providing credit for a part of the saving amount will be mobilized by commercial banks which cause the lending to go up. In a perpetual way, all of the activities above keep coming up and with this circulation, the economy is surely on its way towards the growth and stability.

Borrowers usually relied upon banks - when monetary tightening policy is on the way, they cannot get access to other credit channels - although they are aware of the significant rate of interest. In 1981, Stiglitz and Weiss decided to examine carefully the imbalanced information lowering credit granted by the commercial banks. To be more specific, lenders and borrowers received information from different sources building up doubts, thus leads to the reduce in credit granted, this is simply explained by the fact that the higher credit risk reaches, the higher interest rate becomes so as to make up for commercial banks. In contradict; borrowers are usually aware that they can always find supply with a reasonable interest rate, higher than what they expected - which seems unaffordable - will cease them from borrowing. Among requests of borrowing, interest rate higher based on the imbalanced information. According to Bernanke and Blinder (1992), financial intermediaries play an important role in supplying lending money. Many banks are expecting for some actions such as categorizing, selecting and controlling the consumers. A monetary tightening policy aims to lower deposits and bank securities.

Financial innovations and an act of loosening rules are causes making the credit channel become less and less essential. However, asset channel plays a key factor in expansionary monetary policy. Balance sheet channel has expressed its concern about the change in monetary policy based on consumers' financial statements and balance sheet.

Money supply decreases → value of assets decreases → financial assets decrease → financial crisis advances → expense constant and household expense drop → output decreases.

Money supply decreases → value of assets decreases → adverse selection and moral hazard raise → lending budget falls → investment decreases → output decreases.

Balance sheet channel is also known as either net assets value channel, or credit expansion channel. Based on the assumption that financial insurance needs to be solved within limits of the financial situation of debtors (Bernanke and Gertler, 1995), balance sheet channel bears just one similarity to the lending channel in which it explains that the impact of monetary policy placed on real output could reach a higher level by credit limit of debtors. In fact, those channels are actually two worlds apart: firstly stressing the importance of banks in the economy, and then followed by aiming at level balance asset. Precisely, monetary tightening policy will cause the value of assets to decrease and thus lowers the pledged assets value. A decline in value of net assets – total value of pledged assets and net cash flow – of the company will stand a good chance of advancing adverse selection and moral hazard, which fortunately is an encouragement for companies to invest in higher risk containing projects. These things create higher possibility of errors in increased spending and borrowing (Mishkin, 1995).

In summary, the credit channel has tremendous potential to explain the reaction of real economy or financial shocks remain strong base on the acts of financial institutions. It is also stressed that the credit channel is considered as a rule to add point of view in the transmission policy monetary. It was the shock in monetary tightening policy to cause both asset value and overhead one to shrink, which resulted in a rise of external finance followed by a significant decline in outputs and cash conversion cycle. A decrease in cash conversion cycle will have the asset value to increase (Hall, 2001). Furthermore, differences in monetary point view and credit channel explain the impact of the policy on lenders and borrowers. Different situation of the bank departments and balance asset of large companies contributes to various effects of monetary policy in the real economy.

### 3 RESEARCH METHODS

#### 3.1 Research model

Research model, which is promoted by Bernanke and Gertler (1995), Bayoumi and Melander (2008), improved in a way that fits the economy of Vietnam:

$$\mathbf{IRD}_t = \alpha + \beta(\mathbf{CPI}_t - \mathbf{CPI}_{t-1}) + \rho(\mathbf{IPG}_t - \mathbf{IPG}_{t-1}) + \varepsilon_t \quad (1)$$

Including:  $\mathbf{IRD}_t$  refers to discount rate, which State Bank is applying in commercial banks.  $\mathbf{CPI}_t$  refers to inflation happening at a specific time  $t$ .  $\mathbf{CPI}_{t-1}$  refers to inflation happening at the time of  $t-1$ .  $\mathbf{IPG}_t$  refers to the ratio of the industrial output growth, which represents the economic growth at a specific time.  $\mathbf{IPG}_{t-1}$  was the same as  $\mathbf{IPG}_t$  but applied at the time of  $t-1$ . From the equation (1), the change in discount rate is a result of difference in inflation between time  $t$  and  $t-1$ . To many countries, when it comes to fixing discount rate, they usually depend on expected inflation rate or that of the previous period. Another target of monetary policy is the economic growth, so that, from the equation above, discount rate should have an adjustment when the industrial output growth changes through the time.

$$\mathbf{IRB}_t = \alpha + \beta \mathbf{IRD}_t + \rho \mathbf{CPI}_{t-1} + \delta \mathbf{IRU}_t - \gamma \mathbf{M2}_t + \varepsilon_t \quad (2)$$

Including:  $\mathbf{IRB}_t$  refers to the base interest rate provided by the State Bank.  $\mathbf{CPI}_{t-1}$  refers to inflation of the previous stage.  $\mathbf{IRU}_t$  refers to the United State interest rate.  $\mathbf{M2}_t$  refers to real money supply.  $\varepsilon_t$  refers to errors.

The following equation is to find out how the base interest rate (IRB) was formed. Another question is that whether discount interest rate has an influence, which causes a change in IRB. IRB is the kind of rate announced by the State Bank so that commercial banks could decide their lending interest rate and that of deposit. It depends on each period and the operation of monetary policy that the IRB effects market interest rate in different ways. However, IRB is also considered as a monetary policy instrument. Inflation adjustment and interest rate operation are up to the inflation- fluctuation. The IRB is a form-based of the global rates and for a country, there is one-called national rates, which contains currency and trade relationship to an economy ( $\mathbf{IRU}_t$ ).  $\mathbf{IRU}_t$  refers to the IRB of the Federal Reserve System (FED). Moreover, money supply is the result as well as the reason why the State Bank operate the credit and interest rate policy.

$$\mathbf{IRL}_t = \alpha + \beta \mathbf{IRD}_t + \varepsilon_t \quad (3)$$

Including:  $\mathbf{IRL}_t$  refers to average lending interest rate of commercial banks. It is directly affected by discount rate, which can be explained by when there is a change happened in discount rate, lending one would experience the same thing. Would it be exact from what the theory states as each country has its own different financial market? There are many other factors, on which it depend, namely the huge difference between deposit and lending interest rates, credit supply and demand. However, the State Bank, with the help of equation (3), could consider carefully when it comes to reconciling money supply through credit channel and especially, places an indirect impact on lending interest rate.

$$\mathbf{CPS}_t = \alpha + \beta \mathbf{IPG}_t - \rho(\mathbf{IRL}_t - \mathbf{CPI}_t) + \lambda \mathbf{M2}_t + \varepsilon_t \quad (4)$$

Including:  $\mathbf{CPS}_t$  refers to claims on private sector,  $\mathbf{IPG}_t$  refers to the value of industrial outputs growth,  $\mathbf{IRL}_t$  refers to lending interest rate,  $\mathbf{CPI}_t$  refers to inflation and lastly,  $\mathbf{M2}_t$  refers to money supply. The equation clearly states that change in private credit depends on real outputs. There is an inverse relationship between private credit and real lending interest rate. By which, it means that when the interest rate of lending goes up, borrowing cost will follow the same pattern which will cause a cease in borrowing for investment and as a result, private

credit have a tendency to go down. Another thing is that money supply  $M2_t$  has a direct impact on claims on private sector meaning that when money supply raises, capital supply on market raises leading to gain possibility in credit and in addition to that, private sectors feel easier in asking for capital borrowing.

$$RSG_t = \alpha + \beta IPG_t + \delta M2_t + \gamma CPS_t - \lambda(IRD_t - CPI_t) + \varepsilon_t \quad (5)$$

Including:  $RSG_t$  refers to the growth of retail goods and services;  $IPG_t$  refers to industrial outputs representing real income.  $M2_t$  refers to money supply. Expense is in direct proportion to income, money supply, private credit sector and in inverse proportion to real interest rate. It is obvious that when people get higher income, they spend more money and cause the money demand to escalate. Money demand meets all the needs of spending, thus makes a gain in expense.

$$VNI_t = \alpha + \beta CPS_t + \lambda IRL_t + \gamma CPI_t + \theta IPG_t + \delta M2_t + \nu EXU_t + \varepsilon_t \quad (6)$$

Including:  $VNI_t$  refers to equity index, which represents market value of listed companies.  $(IRL_t - CPI_t)$  refers to real lending interest rate,  $EXU_t$  refers to exchange rate. This model is based on the one that Montiel (2003) had used. Since credit has a strong control over investment, it undoubtedly plays a key role in contributing to the growth of output and more importantly, the growth of economy.

What will happen to investment when interest rate experiences a change? Borrowing cost, according to Keynes, is resulted from an increase in interest charge, as it is the price of loan capital. Therefore, with other factors remaining unchanged and interest rate advancing, the value of investment will decline and vice versa.

In order to evaluate the shocking effect brought by credit on the macro variables, author has used the VAR model to examine the shocking reaction and variance decomposition. This model is highly recommended for references by other researchers in the world such as Gertler and Gilchrist (1994), Tang (2003), Bernanke and Blinder (2007). Here is the VAR model:

$$X_t = (IPG_t, CPS_t, IRL_t - CPT_t, M2_t) \quad (7)$$

Variables included in this equation are endogenous, which means that the entire variables do has influence to one another.

### **3.2 Variables and research data**

This table below including details which were from the monographs of the pioneers and adopt selectively to fit the economy of Vietnam.

Tab. 1 – Summary of variables

No.	Variables	Name	Source
1	IRD	Discount rate	State Bank of Vietnam, IMF
2	IRB	Base interest rate	State Bank of Vietnam
3	IRL	Average of lending interest rate	IMF
4	CPI	Consumer price index	IMF, ADB
5	CPS	Claims on private sector	IMF, ADB
6	M2	Money supply growth M2	IMF
7	IPG	Growth value of industrial	IMF, ADB
8	RSG	Growth rate for retail goods and services	ADB
9	VNI	Stock index	HCM Stock Exchange
10	EXU	Exchange rate	ADB
11	IRU	Federal funds rate	IMF

## 4 RESULTS OF STUDY

### 4.1 Test of stationary

Tab. 2 – Test of stationary

Variables	Name	T-Statistic	Prob	Result
$IP_t$	Industrial production index	12.689	0.000	Stationary D(1)*
$CPI_t$	Consumer price index	4.122	0.0014	Stationary D(0)*
$IRD_t$	Discount rate	3.377	0.013	Stationary D(1)*
$IRB_t$	Base interest rate	5.388	0.000	Stationary D(1)*
$IRL_t$	Average of lending interest rate	4.266	0.0008	Stationary D(1)*
$RSG_t$	Growth rate for retail goods and services	5.878	0.000	Stationary D(1)*
$M2_t$	Money supply M2	4.75	0.0001	Stationary D(1)*
$CPS_t$	Private credit	6.485	0.000	Stationary D(1)*
$LNVNI_t$	Stock index	7.58	0.000	Stationary D(1)*
$EXU_t$	Exchange rate (US Dollar)	9.304	0.000	Stationary D(1)*
$IRU_t$	Federal funds rate	6.77	0.0002	Stationary D(1)*

Notes: \* Significant at the 1% level

Table 2 shows that only consumer price index ( $CPI_t$ ) is station at corner data series. The others, under the significant level of 1%, they are station at first difference.

## 4.2 Determining the optimal lag

Tab. 3 – Determining the optimal lag

Formula	Variable	LR	FPE	AIC	HQ	Optimal lag
1	CPI	3	3	3	2	3
	IPG	2	3	2	2	2
2	IRD	5	6	2	2	2
	CPI	4	4	4	3	4
	IRU	8	8	8	5	8
	M2	3	5	5	2	5
3	IRD	6	6	6	3	6

## 4.3 Results of study

### Results and analyzing research models

Tab. 4 – The result of IRD

IRD			
Variable	Coefficient	T-statistic	P
$\Delta$ CPI(-3)	0.228	3.852	0.0002
$\Delta$ IPG(-2)	-0.0055	0.528	0.598
C	0.000197	0.2476	0.8049
R <sup>2</sup>	0.126		
DW	1.737		

The result from table 4 points out relation resting on discount rate, which is operated by the State Bank and inflation along with economic growth. There is a direct correlation between change in either inflation or discount rate while it is an inverse one between economic growth and change in discount rate. When inflation increases by 1%, discount rate experiences the same pattern at the rate of 0.228% at 1% level. By which, it clearly states that the operation of

discount rate was always to depend on previous inflation rate and stick to the goal of lowering it. That is to say, it appears effectively the goal works while economic growth sees a downward trend. In other words, it seems impossible to achieve the two targets. Monetary tightening policy is as control inflation. Another point of the result is higher rate of inflation comes with the same of discount rate. Therefore, an action is needed to affect positively the economic growth with inflation controlled by tight monetary policy. The credit channel in transmission through interest payment, according to Bernanke, Gertler and Gilchrist (1995), works with efficiency for when: interest rate rises in condition that the financial situation of companies remains fine, which is when interest rate is considered as an advantage to stimulate economic growth. However, if it advances in an opposite situation, which turns out to be a negative thing. An increase in interest rate seems to be a burden as it causes the weight cost of capital at present or in the future to go up too. Lowering the borrowing rate leads to a decline in investment. The result come a decrease in manufacture, rise in unemployment; fall in expense and slowing the economy.

Throughout the period, the economy, in fact, has shown us how the credit tightening policy works by raising interest charges. To be more specific, from 2010 to 2011, the State Bank has been running the monetary tightening policy through the interest rate instrument. Discount rate started to go up by 9% from September, 2010, continued to rise and finally reached and end at 15% in October, 2011 and kept following the same pattern until February, 2012. It resulted in the fact that growing economy remained at the rate of only 5.89% in 2011.

Tab. 5 – The result of IRB

<b>IRB</b>			
<b>Variable</b>	<b>Coefficient</b>	<b>T-statistic</b>	<b>p</b>
IRD(-2)	0.308915	4.778393	0.0000
CPI(-4)	0.000210	0.007844	0.9938
IRU(-8)	0.069331	1.046113	0.2980
M2(-5)	0.054138	3.377244	0.0010
C	0.043357	6.585737	0.0000
R <sup>2</sup>	0,374		
DW	0,967		

Based on table 5, the two variables, IRD and M2, are significant at 1% level, while the others such as CPI and IRU remain nothing. Therefore, we can only examine IRD and M2. Besides, R<sup>2</sup> =0.373 refers to an act of explaining 36.3% the base interest rate (IRB) when putting the IRD and M2 into model.

It is believed that IRD and IRB both vary in the same way which proves that the State Bank operate the base interest rate through discount rate and vice versa. In case the discount rate increases by 1%, the base interest rate has to follow by 0.31%. The advancing rate has not come to expectation yet although the base interest rate was only for commercial banks to reference. Still, M2 has not come to expectation of efficient working either. The expectation mentioned here is that when money supply M2 gains, the base interest rate has to follow in order to cease the growth of it. While as the result given, direct correlation that they are in. Money supply gains by 1%, base interest rate follows by 0.054%. Though this effect seems weak, it is against the goal of policy, which is preventing inflation by slowing the growth of money supply resulted from tightening the currency. All of the events above together make a phenomenon called “Puzzle” whose definition is against the goal of policy. Yet that problem

does not seem to cause any damage to the variables for two reasons. Firstly, it is for reference that the base interest rate means. Secondly, apart from interest rate, many more factors can make influences to the money supply. Operating monetary policy involves discount rate, refinancing rate and other tools such as reserve ratio and fiscal policy.

Tab. 6 – The result of IRL

<b>IRL</b>			
<b>Variable</b>	<b>Coefficient</b>	<b>T-statistic</b>	<b>p</b>
IRD	0.797533	18.33988	0.0000
C	0.059691	15.10506	0.0000
R <sup>2</sup>	0.752		
DW	1.212		

The estimation states that  $R^2 = 0.752$  refers to an act of discounting rate explaining 75.2% the variation of an average lending interest rate from commercial banks. Apart from discount rate, there are many other factors which are not put into this model have an influence on interest rate, namely money supply, economic growth... as the model above is only considered to examine the relationship between discount and average lending rate from commercial banks. The result figures that convulsion in lending interest rate is dependent on discount one. It conclusively proves the efficiency of the interest rate policy in which discount rate remains a helpful tool.

When discount rate gains by 1%, lending one advances by 0.797% with the significant level of 1%. The figure illustrates that discount rate and average lending interest rate vary in the same direction, which explains that the State Bank has been operating monetary policy through interest rate and credit channel efficiently and right in time and with that, inflation might be ceased for a while.

Fig. 1 – IRL and IRD. Source: IMF

Tab. 7 – The result of CPS

<b>CPS</b>			
<b>Variable</b>	<b>Coefficient</b>	<b>T-statistic</b>	<b>p</b>
IPG(-3)	0.252970	2.768265	0.0067
IRLT(-3)	-0.804409	-5.199073	0.0000
M2(-3)	1.331905	15.76638	0.0000
C	-0.107079	-4.391518	0.0000
R <sup>2</sup>	0.736		
DW	1.082		

It is shown from table 7 that  $R^2 = 0.736$  refers to an act of independent variable in the model explaining 73.6% in change of CPS with the significant level of 1%. From which, it is believed that CPS replies on variables put into the model. When industrial production growth gains by 1%, CPS experience the same gain by 0.253%. Growth of credit must interact and stimulate that of the economy. Credit channel, according to Bernanke (1995), could represent a group of factors, which either affect or spread to growth and inflation. Therefore, it is undeniable about the important role in monetary policy that credit channel plays. In interest rate channel, take a special look at the real lending one, when it rises, it will also have the difference between lending interest rate and inflation gained. Thus causes financial cost of companies to rise resulting in restricting borrowings. That is explained by a decrease or even falling under the real lending interest rate. As the result above shows, CPS suffers a decline of 0.8% from a gain by 1% of the real lending interest rate. This effect is considered extreme of an effect to the interest rate compared to credit related activities. In the research of Bernanke and Gertler (1995), from the previous theories they claim that it was the shock in monetary tightening policy that lowers such many things as investment, household expense and permanent consumption. From which, in can be drawn that monetary tightening policy in Vietnam does have an influence which cause a fall in investment through credit. More specifically, interest rate advances  $\rightarrow$  credit drops  $\rightarrow$  investment drops. This is about that same as the point view of Gertler and Gilchrist (1994). In which, it urged that monetary tightening policy effected merchandise inventory of manufacture companies due to a short term decrease in credit.

Tab. 8 – The result of RSG

<b>RSG</b>			
<b>Variable</b>	<b>Coefficient</b>	<b>T-statistic</b>	<b>p</b>
IPG(-2)	0.167021	2.115731	0.0371
M2(-3)	0.097565	0.761775	0.4481
CPS(-3)	0.108177	1.330234	0.1867
IRLT(-3)	-0.476292	-3.763465	0.0003
C	0.185647	9.020540	0.0000
R <sup>2</sup>	0.268		
DW	2.195		

From the table above,  $R^2 = 0.268$  refers to an act of the variables put into model explaining 26.8% of change in RSG. Furthermore, there are 2 of the 4 variables which has the significant level of 1%, are IPG and IRLT. From the result, we can see that value of goods and services growth varies the same way as industrial productions but the other way around of the real

lending interest rate. This totally lifts up to an expectation of monetary policy that is when industrial production gained by 1%, retail goods and services value rise by 0.16% as well with the significant level of 5%. Meanwhile, if real lending interest rate advances by 1%, retail goods and services value drops by 0.476% with the significant level of 1%. The monetary policy causes lending interest rate to go up and inflation to go down. The larger the gap between them gets, the higher expense both private enterprise and government pay. This will follow causes restriction in good exchange and a decrease in retail goods and services value.

Tab. 9 – The result of LNVNI

<b>LNVNI</b>			
<b>Variable</b>	<b>Coefficient</b>	<b>T-statistic</b>	<b>p</b>
CPS(-2)	-1.530513	-3.943959	0.0002
IRL(-3)	-4.494183	-2.396962	0.0185
CPI(-3)	2.118297	2.271359	0.0254
IPG(-2)	-0.092982	-0.214812	0.8304
M2(-2)	1.540107	3.270377	0.0015
EXU(-2)	-2.99E-05	-1.308309	0.1939
C	7.127290	11.77197	0.0000
R <sup>2</sup>	0.469		
DW	1.624		

Equation 9 is used to estimate how the monetary policy, through credit channel, affects the value of listed companies as well as that of portfolio on the stock market based on the variation of stock exchange index. This model includes a dependent variable (VNI), independent one (CPS), lending interest rate (IRL), inflation (CPI), industrial production growth (IPG), money supply M2 and exchange rate (EXU). Most independent variables are analyzed in percentage terms so the author keeps original chain. Except for VNI, this is a value chain, in logarithm. Variables are taken in optimal lag from table 2.

In table 9,  $R^2 = 0.469$  refers to an act of variables explaining 46.9% in change of VNI. With the aim of testing how the policy through credit channel affects the VNI, it finally results in the fact that private credit growth, lending interest rate, money supply do have an impact on VNI with significant level of under 5%. However, it is an opposite effect that private credit places on VNI, which compared to what was expected, failed to gain credit in order to stimulate stock index. This can be recognized as “Puzzle” to credit growth compared to stock index. As stock market of Vietnam appears to be quite new, stock index might experience a variation from many factors. Stock prices vastly outweighs its real one for so many times so it is in a viable that CPS growth and stock index are contrary. It is because stock market of Vietnam has been manipulated by information and herd behavior the whole past period.

Meanwhile, lending interest rate actually lifts up to the model’s expectation in which it oppositely affects the stock index. With that outcome, when interest rate rises by 1% leading to a decrease of 4.49 points in stock index. It is easily aware that interest rate has a direct impact on either stock supply or demand. When it comes to enterprises mobilizing funds to expand a large-scale plan, a gain in interest rate will have weight cost of capital to escalate and profit to shrink. Following that will be a decline in value of stock. To investors, when interest rate gains, it will lower the need of borrowing which is used to invest. Thus, have the investment demand fell. There are factors other than interest rate that affects the stock price, take money channel as an example. It affects exactly the same way as stock index, which is of

the expectation. To be precise, with 1% gain of the money channel comes only 1.5 points up of stock index.

Not only is the stock index affected by variances from monetary policy but also by inflation factor. As inflations grow, return rate has to follow. As a result, stock value varies the same way as inflation. Precisely, with 1% increase in inflation comes only 2.11 points up in stock index. This can also happen when the two objects switch position. By which, it means that increase in stock value will follow that of inflation. Between inflation and stock index lays a causality relationship, it especially happens to the rising market of Vietnam.

### Analyzing shock

Fig. 2 – Response of CPS to IPG, IRLT, M2. Source: Eview

Fig. 3 – Response of IPG, IRLT, M2 to CPS. Source: Eview

The figure illustrates that industrial production growth; real lending interest and money supply are affected by shocks in private credit. Regarding the first sector, the shock started working in the 3<sup>rd</sup> month, remaining strongest in the 15<sup>th</sup> month and gradually slowing down then. From which, we can see the potential role that private credit plays in the industrial growth and to further, economic growth. The impact credit shock burdened on real lending interest rate started in the 1<sup>st</sup> month, then lasting for 10 more months and finally saturating in the 12<sup>th</sup> month. Regarding money supply, it is heavily affected by the credit shock. An increase in credit is followed by that of money supply, which started in the 1<sup>st</sup> month, up and reaching its peak in the 12<sup>th</sup> month but gradually falling in 24<sup>th</sup> month and eventually remaining saturated. That is to say, such great influence credit growth has on money supply in scale of either time or level.

So how do other variables affect private credit? CPS has suffered from the shock of industrial production, which started to gain in the 1<sup>st</sup> month to the 7<sup>th</sup> then falling till the 15<sup>th</sup> and saturated in the end. In addition, it suffered from shock of real interest rate. To be more specific, real interest rate rises, which will put a decrease in private credit growth and that fall will last until the 10<sup>th</sup> month after returning to advance till the 20<sup>th</sup>. It is undoubted that the effect on private credit caused by interest rate shock is huge, on both level and time scales. Other than that, CPS has the same problem with money supply M2 as well. The result only lasts for 3 month since the 1<sup>st</sup> to the 3<sup>rd</sup>.

**Analyzing variance decomposition.**

Tab. 10 – The result of decomposing variance

Variance Decomposition

A synthesis of variance decomposition of private credit on macro-economic factors and vice versa. The impact of other factors on CPS do have optimal lag, usually lasting for months. Having been affected firstly by itself, coming second are factors such as industrial production, real lending interest rate and money supply. Industrial production growth, which represents economic growth, with its effect on CPS, remains weak from the first few months. (The 1<sup>st</sup> to the 8<sup>th</sup>), getting gradually stronger since and reaching its peak in the 24<sup>th</sup> month. The given result shows that the growth of CPS does not seem to follow the economic growth advances. That was the same of Crowley’s opinion being that private credit has experienced a slow change compared to economic growth in North Africa and Mid –Asia. Vietnam’s is still an emerging one; for which, the effects that macro-economic factors causing on each other seem week and slow, especially indirect ones.

Real lending interest rate happens to be the variable causing direct effect on private credit. Result states out that effect seems fast and strong in the first few months (from the 2<sup>nd</sup> to the 4<sup>th</sup>), reaching its strongest in the 4<sup>th</sup> followed by a gradual slowing. This looks true based on previous research claiming that real interest rate very much affects borrowing needs of individuals and enterprises. Interest rate falls, which immediately influences borrowing need. Loose monetary policy ranging from basic interest rate to discount rate affects the lending one. On contrary, tight monetary policy rises along with inflation slowly changes causing interest rate to advance, thus limits borrowing need. After a period, it is when interest rate gets to be saturated that private credit suffers less from the real one but from money supply, rate of return and other macro-economic factors, instead. Of which, money supply is considered as the most powerful factor. Estimated result from table 6 shows that it places huge impact on private credit with the p-value of 1%. In order to know how it works and lasts, we have to examine with the help of variance decomposition table. In the table states, that money supply affects in a strong and fast way. Money supply, in the 8<sup>th</sup> month, affected due to the change of 9% of CPS, the 9<sup>th</sup> month with 64% and the 24<sup>th</sup> with 63% then gradually slowing down. An immediate change in money supply will cause an influence to credit and the other way around. Credit does contribute to accelerate the pace of cash flows

## **5 CONCLUSION**

The credit channel of monetary policy transmission to macroeconomics factors of Vietnam's economic is unstable. From interest rate policy to market interest rate have some improper problems, operating the base interest rate among them although the operating state of the interest rate ceiling through the base rate. However, the discount rate has caused a great effect on the lending one. CPS is strongly affected by macro variables such as the growth of the industrial output, effective interest rate and money supply M2. An increase in retailing of goods and service only affected by the industrial output, effective interest rate. International equity index was affected by the increase in CPS, effective interest rate, inflation and money supply.

According to analysis of shock, the growth of CPS and the huge variable showed that CPS had put an deep influence on macro variable the same as increasing industrial production, real interest rate and money supply M2 was prolong but unstable. Analysis of variance had pointed out that the impact of real interest rate on private credit, mostly in 4<sup>th</sup> month. Money supply M2 and economic growth made a tremendous impact on CPS highest in the 16<sup>th</sup> and 24<sup>th</sup> month while CPS was just weak influencing on economic growth, highest in the 24<sup>th</sup> month. Economic growth relatively was also impacted by money supply in the 24<sup>th</sup> month and real lending rate in the 8<sup>th</sup> month.

Credit channel in Vietnamese currency policy is in accordance with the result of this detailed multi-stage analysis. Although there has been a strong connection between lending, and discount rate, connection between credit to economic growth and inflation were still slow and weak. Private credit was impacted by the economic growth, real interest rate and money supply. However, in opposite way private credit has still put a weak influence on economic growth. Private credit might not be the representative of all credit economy. Therefore, the detail analysis did not appreciate exact result although private credit was important to economic growth. It is also the limit of this detailed analysis.

## **THE INTEREST RATE CHANNEL IN THE TRANSMISSION OF MONETARY POLICY IN IN VIETNAM**

*Nguyen Duy Suu, Bui Thi Phuong Thao*

### **Abstract**

Interest rate is one of the effective instruments of implementing monetary policy, which central banks use to regulate the currency flow, consequently stabilizing inflation and stimulating economic growth. Hence, this study aims to examine the levels of transmission of interest rate to the price factors in Vietnam's economy during the period from 2005 to 2013 by SVAR models. The results indicate an existence of long-term relationship between interest rates using co-integration test. Between interest rate and economic variables, only one-way causality from consumer price index to interest rate is found. Results from shock response and variance decomposition test show that the shocks of interest rate affect most of economic factors. However, only money supply and stock price index are strongly affected in all four periods

*Keywords: interest rate, interest rate policy, interest rate channel, SVAR model*

JEL Classification: E42, E51

### **1 INTRODUCTION**

Monetary policy in most countries always pays attention to two important objectives that are stabilizing inflation and stimulating economic growth. The implement of monetary policy instruments bases on the actual situation of each economic development stage, in which interest rate policy is used with other policies to regulate the circulation of monetary. A reduction in interest rate may not only contribute to increase domestic production, but also causes pressure on inflation. According to the economic model of the famous economist John Keynes, the transmission of interest rate channel to economic growth is expressed by following process: Reducing money supply => Interest rate will increase => Investment will decrease => Yield will decrease. However, interest rates not only affect investment through the creation of fund, but also effect to money supply. It is also acknowledged by Mishkin (1995), he suggested that interest rates could affect the spending decisions in investing.

Agreeing with this point of view, many famous economists, in which Taylor (1995) also indicated that interest rate channel is the key channel in monetary policy. In his model, a contractionary Monetary Policy will make nominal interest rate increase in short-term. This thing makes wage and price be not as expected. However, in long-term the real interest rate will increase. High interest rates cause many companies fix those investments in which private sector investment as well as regular consumption will decrease and even the investment in inventory will decrease too, therefore the total output decreases.

Since the 1990s, Central banks in many countries around the world have seen that interest rate is the intermediate target of monetary policy. When the economic is in overheat growth and high inflation period, central bank will raise short – term interest rate and vice versa, if economic is in slowdown and deflation period the central bank will cut short – term interest rate to regulate money supply to achieve the targets of monetary policy. In addition, most central banks of industrialized countries also take short-term interest rate as activity target (BIS, 1998).

For example, State bank of Germany (Germany Bundesbank) is using interest rate (the call money rate), Federal Reserve is using federal interest rate (federal funds rate).

In the period of 2001 – 2003, Central banks of countries in the world applied easy monetary policy and finance policy to stimulate investment and increase in demand to prevent the economic downturn which caused by monetary and financial crisis in previous years. In this time, most countries in the world had low growth, the export, and import between countries significantly reduced. The foreign direct investment fell by more than 40% from 2001 -2003.

In recent years, there are many studies about the level of interest rate transmission to price factor in many countries' economy. According to Mohanty and Turner [2008], the monetary policy framework was launched on Emes (Emerging Markets Economies) in recent years has strengthened the transmission of interest rate channel in monetary policy.

Mukherjee and Bhattachaya [2011] discovered that the interest rate channel affects private spending and private investment in EMEs. Acosta - Ormaechea and Coble [2011] compared the transmissions of monetary policy between dollarized countries and not dollarized countries and found that in controlling inflation, the traditional interest rate channel was more important in Chile and New Zealand while the exchange rate channel was more important in Peru and Uruguay.

The objective of this paper is solving three questions: (1) Is there a major transmission from interest rate channel to price factor and other macro-economic factors? (2) Is there or not the causal relationship between interest rate and macro economic factors? (3) How do the shocks in interest rate impact on macro-economic factors?

This study includes the following contents: (1) introduction, (2) the literature review about the impact of interest rate to macro economic factors, (3) research model, (4) result of research, (5) Concludes.

## **2 LITERATURE REVIEW**

The interest rate parity theory and international Fisher effect explain the impact of interest rate on foreign exchange. The interest rate parity theory pays attention to explain why spot rate differs from forward rate and the gap of them. This theory involves a certain time (forward rate), this confirms interest rates affect exchange rate.

According to the interest rate parity theory, currency of a country, which has a lower interest rate, will have the term premium for forward contract with currency of another country, which has a higher interest rate.

In other words, the term premium of forward price is approximated with the gap of two currency's interest rates. In contrast, international Fisher effect focused on explaining why spot rate of a currency changes over time and confirming that spot rate will change according to the gap of two countries' interest rates.

Svensson (2000) explained that in an open economy, exchange rates depend on the operations of economic. The open economy allows transmission channels in monetary policy operate much more. He also said that a change in short term interest rate would affect to nominal exchange rate and real exchange rate. This observation is similar to Taylor (2001) when it suggested that Central bank should react to the changing in short term interest rate. On the other hand, the other said that if the change in interest rate is large enough to change exchange rate, this will lead to reduce property value and increase inflation (Berbanke and Gertler, 2000 and Taylor, 2001)

Meltzer (1995) re-emphasised transmission through multiple asset prices, extending beyond interest rates, exchange rate and equity prices. Some studies, on the other hand, have argued that monetary policy transmission is weak in the EMEs and low income countries. Reviewing monetary policy transmission in low income countries, Mishra *et al.* (2010) found that weak institutional mechanism impaired the efficacy of traditional monetary transmission channels viz., interest rate, bank lending, and asset price. Similarly, for a group of EMEs, Bhattacharya *et al.* (2011) argued that the weakness in domestic financial system and the presence of a large and segmented informal sector led to ineffective monetary policy transmission.

The transmission mechanism relates to stock price, which impacts to: (i) investment; (ii) the balance of asset of company and (iii) the wealth of household.

The impact to investment: the q-Tobin model (1969) set up the relationship between stock price and investment spending. Q of Tobin is defined as market price of company divided by the replacement of cost (tool or asset procurement cost...)

If q was high, the market price of company's stock would be higher than the replacement cost of capital. At that time, companies issue securities and receive a higher price than price of other capital asset, which they bought. Therefore, the spending for investment capital will increase because companies can buy much more capital assets by a small amount of issued securities.

Expansionary Monetary Policy ( $M \uparrow$ ) decrease market interest rate, while bonds will be less attractive than stocks. The result is the demand and price of stock rising highly. The higher stock prices are ( $P_s \uparrow$ ), the much more capital is raised in each issued stock ( $q \uparrow$ ), and this will lead to the replacement cost decrease ( $c \downarrow$ ), stimulate investment and increase total demand ( $Y \uparrow$ ).

The impact of interest rate to the balance sheet of company: credit and stock price impact to the balance sheet of company. The expansionary monetary policy ( $M \uparrow$ ) leads to increase stock price ( $P_s \uparrow$ ), resulting net worth of company will increase ( $NW \uparrow$ ). The increasing in net worth will enhance the ability of mortgage credit so loan will increase ( $L \uparrow$ ). The more the debt is, the more the investment spending is, so  $Y \uparrow$ .

The impact of interest rate to the wealth of household: the life circle model of Modigliani (1963) set up the theory below: consumption is determined by the lifetime resources of consumers. An important component of lifetime resources of consumers is financial assets, in which stock is a principal component. Expansionary monetary policy will make increase the stock price, increase the wealthy of household ( $W \uparrow$ ), this leads to increase lifetime resources of consumers, and the result is the total of consumption increases.

The transmission of interest rate to stock price index through supply and demand. Interest rate is the price of using capital, changing in interest rate will impact to the supply and demand of capital and impact directly to supply and demand of securities. When having the decreasing in interest rate, the demand of stock investment will be higher; this makes the demand of stock increase in short-term so the stock price index will increase. The decreasing in interest rate makes decrease the attractiveness of deposit in commercial bank, people tends to transfer money from saving to investing securities. The decreasing in interest rate also makes the attractiveness in speculating securities. Who recognize that this is a profitable investment opportunities so they will borrow to invest. From the above reasons the demand of securities increases, while the supply of securities does not change timely, resulting stock price index will increase.

Wong et al (2005) found the relationship between money supply and interest rate to stock price index in Singapore in the period 1982 to 2002. Angaro et al (2002) found that no long-

term relationship between interest rate and stock price index in Bogota in the period 1994 to 2000. However Uddin and Alam (2007), Leon (2008) stated when interest rates rise, the stock price will decrease in short-term.

In addition, there are many evidences, which prove if there are changes in interest rate, stock price index will change in different directions. Ehrmann and Fratzscher (2004) discovered that every stock in S&P500 index responds differently with monetary policy, the responds depend on the financial constraints and coefficient  $q$ . Besides, Bjornland and Leitemo (2009) discovered that stock market price fell 7-9% if Fed raised interest rate higher than the expectation of market 1%.

The second channel is the impact of monetary policy to the properties of people. In MPS model of Modigliani (1971) about consumption, the increasing in interest rate will make stock, bond price decrease, and adversely affect to the properties of people, this leads to decrease in consumption and finally impact negatively on the business operations. The experimental studies offer the compelling evidences about the inverse relationship between basic interest rate and stock market.

Rigobon and Sack (2004) discovered that American stock market decreased if Fed raised interest rate higher than the market expectations. Bernanke and Kuttner (2005) discovered that if Fed cut the interest rate higher than the market expectation 0.25%, the stock price index increased 1%. Besides, if Fed raised interest rate higher than the expectation, The American stock market would change much more. Similarly, Bomfim (2003) discovered that the market would be more stable in close days before the meeting of FOMC; however, in the decision day of FOMC, market would change strongly. In addition, the decision, which is higher than the market expectations, will affect stronger than the lower.

Real estate prices impact on total demand through channels: (i) the house expends, (ii) the wealth of household, (iii) the balance sheet.

The impact on housing expenditure: the housing expenditure model is a modified form of  $q$ -Tobin theory. Expansionary monetary policy ( $M \uparrow$ ) makes decrease interest rate, reduce the cost of housing funding and therefore increase the price of housing ( $P_h \uparrow$ ). The increasing in house price increases the building company's profit and thus increase housing expenditure ( $H \uparrow$ ), leading to the total demand of society increase.

The impact on the wealth of households: housing price is an important component of the wealth of households, it affects to consumption. Thus, expansionary monetary policy ( $M \uparrow$ ) makes increase housing price ( $P_h \uparrow$ ), increase the wealth of households ( $W \uparrow$ ), leading to the increasing in consumption ( $C \uparrow$ ) and total demand of society ( $Y \uparrow$ ).

The impact on the balance sheet asset of bank: this model is based on theory below, when borrowing the investor must mortgage real estate in bank. Expansionary monetary policy ( $M \uparrow$ ) makes increase real estate price ( $P_h \uparrow$ ), increase the price of mortgage asset and capital of bank ( $W_b \uparrow$ ), leading to investment, and output increase.

A number of studies have also examined the efficacy of various channel in Emerging and Developing Economies. Using VAR framework, Disyatat and Vongsinsirikul (2003), in Thailand, found that in addition to the traditional interest rate channel, banks play an important role in monetary policy transmission mechanism, while exchange rate and asset price channels were relatively less significant. A number of studies have also examined the importance of different channels of monetary policy transmission in India. Singh and Kalirajan (2007) showed the significance of interest rate as the major policy variable for conducting monetary policy in the post-liberalised Indian economy. Pandit and Vashisht

(2011) found that policy rate channel of transmission mechanism, a hybrid of the traditional interest rate channel and credit channel, works in India, as in other six EMEs considered by them. In Sri Lanka, Amarasekara (2008) found interest rate channel to be important for monetary policy transmission.

### **3 RESEARCH METHODS**

#### **3.1 Research model**

In the framework of analyzing the transmission of monetary policy to price indexes of economy, there are many methods of measuring the level of transmission. The first, using the linear regression model. The second, using the VAR and SVAR model, and the third approaching the Co-integration Test and ECM model.

In the 1990s, economic researchers around the world used vector autoregressive model (VAR is abbreviation) for analyzing the transmission mechanism of monetary policy and the monetary policy framework of economies. The advantage of VAR model is the using time series data, in which previous observation values were used to determine the forecast, which was accurate as possible. Sim (1980) suggested that if exist the relationship between variables, variables must be considered with the same role, i.e. all variables are considered to be the endogenous variables. The following years, the variant form of the VAR model such as SVAR model or Vector error correction model (VECM), they have been used popularly to analyze the relationship between macroeconomic variables and policy instruments.

The paper have used the SVAR model to model the monetary policy framework of a market economy which has level of large opening like Vietnam in the period after the crisis financial sector in 1997. SVAR model was applied by Bernanke and Blinder (1992) in researches related with monetary policy. SVAR method is known that is very flexible because it can contain multiple relationships between macroeconomic variables based on economic theory and in turn allows us to identify the orthogonal currency shock.

In this model, the authors establish the necessary condition to find out monetary shock and exchange rate shock of Vietnam, after that evaluate the effectiveness of the impact of monetary policy and other transmission channels to commodity price and business operations of domestic economy.

Simultaneously, the analysis of transmission mechanism of monetary policy and the responds of monetary policy after the effect of shocks outside the economy will be done through Choleski decomposition mechanism.

Theoretically, the relationship between macroeconomic variables and policy instruments is shown by SVAR model below:

$$A_0 Y_t = A_1 Y_{t-1} + A_2 Y_{t-2} + \dots + A_p Y_{t-p} + \varepsilon_t$$

In which,  $Y_t$  is vector (Nx1) of endogenous variables at time t

$A_i$  is matrix of parameters (NxN) with  $i = 0, 1, 2, \dots, p$

$\varepsilon_t$  is (n+1) white noise vectors ( White noise: the time series are uncorrelated)

It also turns out as the variable which change the structure or shock structure

The assumption of the error components (error terms):

- Expectations of the residual is 0:  $E[\varepsilon_{i,t}] = 0$

- The residual is not correlated:  $E[\varepsilon_{i,t}, \varepsilon_{j,\tau}] = 0$  với  $t \neq \tau$

Var structural model has been used to test the interest rate channel in Vietnam

To study transmission of interest rate to price variables in economy, authors have used SVAR regression model. The SVAR model is applied for the relationship between interest rate and other variables as below:

$$Y_t = f(IP_t, CPI_t, IRD_t, M2_t, CPS_t, VNI_t, EXU_t)$$

Performing the above equations in matrix form:

$$B_i = A_0^{-1} A_i \text{ in which } i=1, 2, \dots, p \text{ and shock } e_t = A_0^{-1} \varepsilon_t$$

$$\text{And } B(L) y_t = e_t$$

$$\text{With } B(L) = B_0 - B_1L - B_2L^2 - \dots - B_pL^p$$

To perform the systems of equations in matrix form

$A_0$  matrix in Svar model is determined as form below:

$$\begin{pmatrix} e_t^{IP} \\ e_t^{CPI} \\ e_t^{IRD} \\ e_t^{M2} \\ e_t^{CPS} \\ e_t^{VNI} \\ e_t^{EXU} \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ a_{21} & 1 & 0 & 0 & 0 & 0 & 0 \\ a_{31} & a_{32} & 1 & 0 & 0 & 0 & 0 \\ a_{41} & a_{42} & a_{43} & 1 & 0 & 0 & 0 \\ a_{51} & a_{52} & a_{53} & a_{54} & 1 & 0 & 0 \\ a_{61} & a_{62} & a_{63} & a_{64} & a_{65} & 1 & 0 \\ a_{71} & a_{72} & a_{73} & a_{74} & a_{75} & a_{76} & 1 \end{pmatrix} \begin{pmatrix} \varepsilon_t^{IP} \\ \varepsilon_t^{CPI} \\ \varepsilon_t^{IRD} \\ \varepsilon_t^{M2} \\ \varepsilon_t^{CPS} \\ \varepsilon_t^{VNI} \\ \varepsilon_t^{EXU} \end{pmatrix}$$

$B(L)$  matrix in Svar model is determined as below:

$$\begin{pmatrix} b_{11} & b_{12} & b_{13} & b_{14} & b_{15} & b_{16} & b_{17} \\ b_{21} & b_{22} & b_{23} & b_{24} & b_{25} & b_{26} & b_{27} \\ b_{31} & b_{32} & b_{33} & b_{34} & b_{35} & b_{36} & b_{37} \\ b_{41} & b_{42} & b_{43} & b_{44} & b_{45} & b_{46} & b_{47} \\ b_{51} & b_{52} & b_{53} & b_{54} & b_{55} & b_{56} & b_{57} \\ b_{61} & b_{62} & b_{63} & b_{64} & b_{65} & b_{66} & b_{67} \\ b_{71} & b_{72} & b_{73} & b_{74} & b_{75} & b_{76} & b_{77} \end{pmatrix} \begin{pmatrix} IP_t \\ CPI_t \\ IRD_t \\ M2_t \\ CPS_t \\ VNI_t \\ EXU_t \end{pmatrix} = \begin{pmatrix} e_t^{IP} \\ e_t^{CPI} \\ e_t^{IRD} \\ e_t^{M2} \\ e_t^{CPS} \\ e_t^{VNI} \\ e_t^{EXU} \end{pmatrix}$$

### 3.2 Variables and research data

Research data of paper is secondary. Data was obtained from reputable statistic website. Specifically, in interest rate variables, re-discount interest rate (IRD) was obtained from website of state bank of Vietnam, consumer price index (CPI), which represents for inflation was obtained from IMF, industrial production index (IP), which represents for economic growth was obtained from general statistics office Vietnam, growth in money supply (M2) was obtained from IMF, stock price index of Vietnam was obtained from website of HCM Stock exchange, exchange rate of USD (EXU) was obtained from website of state bank of Vietnam. Growth of private sector credit (CPS) was taken from statistic website of ADB. Data was collected monthly, starting from January 2005 to December 2013

### 3.3 The Order in study

Basing on the model and variables, the authors used methods of quantitative analysis by examining the appropriateness of the research model. The method of Unit root test was used to evaluate the stationary of time series data. To test the causal relationship between interest rates and other macro-economic variables, the authors used Granger causality test. Besides, the authors used Co-integration Test to consider the long-term relationship between interest rate and other macroeconomic variables. To evaluate the impact of the shock of interest rate to other macro-economic variables in economy, the authors used shock respond test associated with the variance decomposition analysis to evaluate the level of impact of interest rate on macroeconomic variables over time and evaluate the strong or weak impact on variables.

## 4 RESULTS OF STUDY

### 4.1 Test of stationary

Testing the angle data string the results is not all variables are stationary so the authors perform variables in first differences. The test result below:

Tab. 1 - The result of Unit root test. Source:own analysis.

Variable	Name of variable	T statistic	P value	Result
IP <sub>t</sub>	Industrial production index	13.636	0.000	Stationary at D(1)*
CPI <sub>t</sub>	Consumer price index	4.133	0.0013	Stationary at D(0)*
IRD <sub>t</sub>	Re-discount interest rate	6.8	0.000	Stationary at D(1)*
M2 <sub>t</sub>	Money supply (M2)	4.75	0.0001	Stationary at D(1)*
CPS <sub>t</sub>	Claims private sector credit	5.385	0.000	Stationary at D(1)*
VNI <sub>t</sub>	Stock price VN index	7.58	0.000	Stationary at D(1)*
EXU <sub>t</sub>	Exchange rate of USD	9.304	0.000	Stationary at D(1)*

Notes: D: differences, D(0) angle string, D(1) first differences

\*(\*\*), (\*\*\*) significance level 1%, 5% and 10%

The result of unit root test showed that data series of CPI stopped at corner, the rest stopped at first differences with significance level 1%. From these results, the variables in model fit with SVAR model

## 4.2 Determining the optimal lag

Tab. 2 - Determining the appropriate lag. Source: own analysis.

Lag	Log L	LR	FPE	AIC	SC	HQ
0	-2068.105	NA	3.46e+08	39.52581	39.70274	39.59751
1	-1098.883	1790.753	8.454578	21.99778	23.41322*	22.57134*
2	-1030.370	<b>117.4519*</b>	<b>5.898649*</b>	<b>21.62609*</b>	24.28005	22.70153
3	-990.5783	62.90821	7.245959	21.80149	25.69397	23.37880
4	-969.4404	30.59958	13.06763	22.33220	27.46319	24.41138
5	-935.2600	44.92285	19.14249	22.61448	28.98398	25.19553
6	-888.0876	55.70833	23.13532	22.64929	30.25731	25.73221
7	-828.3976	62.53246	23.72442	22.44567	31.29220	26.03046
8	-769.0567	54.25454	27.06729	22.24870	32.33375	26.33536

From the test result above, we can find out the appropriate lag for this model is 2 months according to the same standards which having the same results such as LR, FPE and AIC. As this result, the lags of the macro-economic variables, which estimated together, were 2 months

## 4.3 Johansen Co-integration Test

To examine the long-term relationship between variables in model, the authors using Johansen Co-integration Test, especially the relationship between interest rate and other macroeconomic variables. Gujarati (1999) suggested that although the time series cannot stop but may exist equilibrium relationship between them if the long-term time series have co-integration – that means the residuals of regression in model of non-stationary time series is a stationary string.

Tab. 3 - Johansen Co-integration Test. Source: own analysis.

Hypothesized		Statistic	0.05	
No. of CE(s)	Coefficient	Trace	Significance level	P value
None *	0.374644	173.3906	125.6154	0.0000
At most 1 *	0.339481	123.6305	95.75366	0.0002
At most 2 *	0.246513	79.66914	69.81889	0.0067
At most 3 *	0.209314	49.66654	47.85613	0.0334
At most 4	0.126659	24.77191	29.79707	0.1697
At most 5	0.093083	10.41638	15.49471	0.2501
At most 6	0.000563	0.059685	3.841466	0.8070

Trace test indicates 4 co-integrating eqn (s) at the 0.05 level  
 \* denotes rejection of the hypothesis at the 0.05 level  
 \*\*MacKinnon-Haug-Michelis (1999) p-values

The result of Johansen Co-integration Test above showed us: survive the long-term relationship between variables in model. This indicates that changes in monetary policy are shifted from interest rate to other factors in both short-term and long term.

To find out if the macro-economic variables in the model have a causal relationship or not, the authors used Granger causality test model. According to Granger, macro-economic variables can have the causal relationship, that means variables affect other variables and vice versa. However, this relationship will depend on identifying appropriate lag. In this test, the authors used 4 months lag for all variables

#### 4.4 Granger causality test

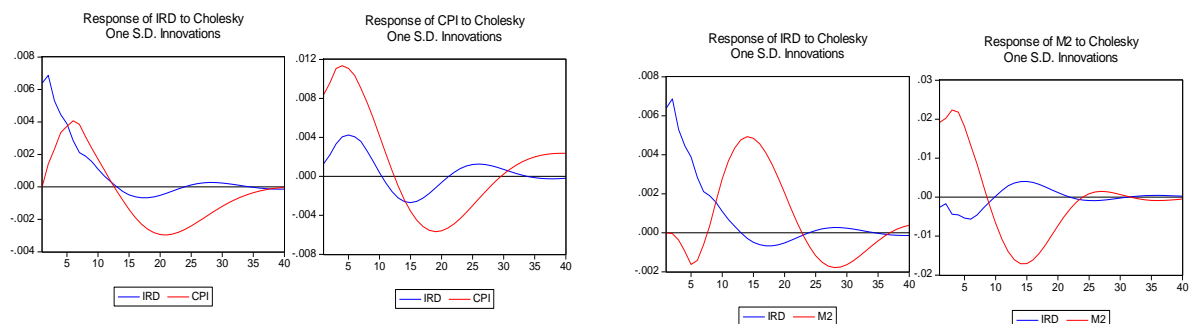

Tab. 4 - Result of Granger test. Source: own analysis.

Result	observat ions	F statistic	Significance level
<b>CPI does not Granger Cause IRD</b>	<b>109</b>	<b>4.87816</b>	<b>0.0012</b>
<b>IRD does not Granger Cause CPI</b>		<b>0.38202</b>	<b>0.8210</b>
VNI does not Granger Cause IRD	109	2.09609	0.0869
IRD does not Granger Cause VNI		2.62557	0.0390

The table result of Granger causality test showed that: survive the two ways causal relationship between discount rate and VN-Index. Among other variables, survive one-way causal relationship such as IP and CPS, CPS and CPI, M2 and CPS, M2 and CPI, VN-Index and M2. This result showed that the changes in interest rate would impact on CPI and vice versa. With an efficient market, this will not happen. This result proved that Vietnam finance market is still not efficient. Therefore, any fluctuations related to macroeconomic factors are not still reflected in the price level of economy.

It is very difficult for policy makers because of the Asymmetric Information Problem. The market manipulation through Asymmetric Information is still in financial market, especially in stock market in recent years. This problem affects greatly to the stability and liquidity of market

#### 4.5 Shock response analysis

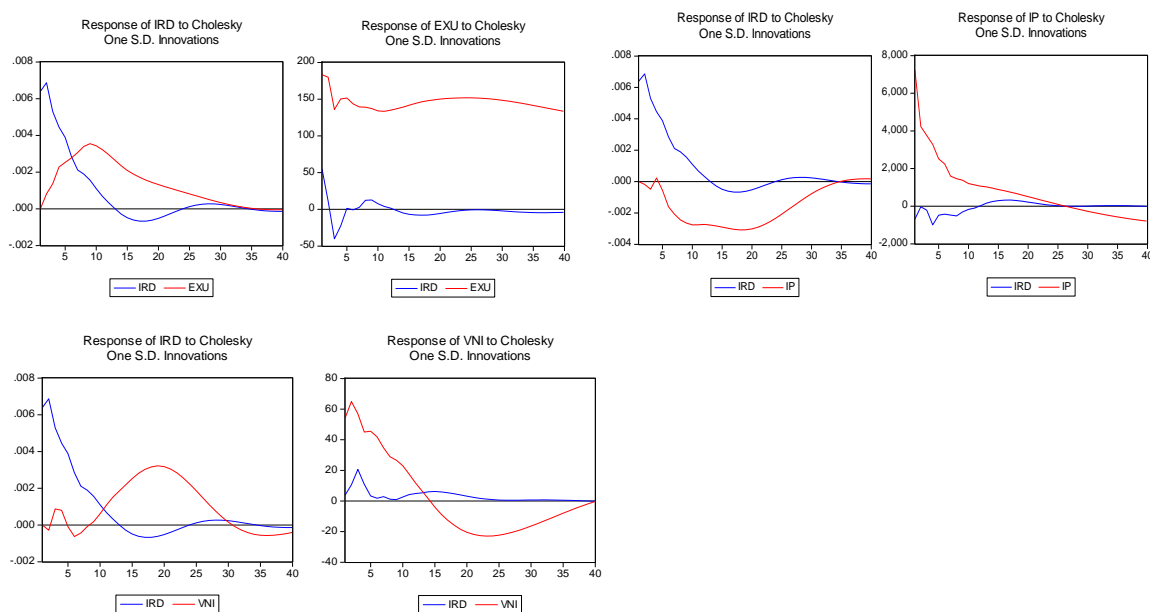

Fig. 2 - The shock response between interest rate and macroeconomic factors. Source: own.

Looking at the graph expressed shock response we found that the early stage of changing interest rates, inflation tends to change in the opposite direction. Specifically, before the time the interest rate shocks occur, inflation tends to rise, which is considering the late effect of policy. Basing on the graphs above, we found that the late effect of interest rate to inflation was 5 periods or 5 months.

The interest rate and inflation have the same trend during the period. However, under the impact of prolonged lag, inflation still decreases while interest rates rise again. The increasing in interest rate makes input cost increase, these combines with previous lag and impact of new shock will make inflation rise again. Now inflation tends to increase with interest rate.

Interest rate and money supply changed in opposite direction. However, the shock of interest rate affected to money supply slowly: interest rate decreased continuously in 9 periods while money supply only increased 3 periods after affected by the shock of interest rate. We see that the impact of interest rate to money supply still lagged, and the lag was approximate 6 periods. In the later period, the order followed the rule when interest rates increase, money supply will decrease and vice versa.

We see that, the implementing of money supply policies through discount rate tool of Vietnam in recent year still works but slower than expectation. The adverse effect from money supply to interest rates showed the relationship between interest rates and the money is adverse.

This is a clear finding, which showed that besides other instruments that are being used in Vietnam, interest rate plays an important role in implementing monetary policy. Interest rates remain a key instrument in implementing monetary policy and stabilizing the macroeconomic and inflation.

The impact of the shock of interest rate on IP was instantaneous. However, this impact lasted in 2 periods. After that, the phenomenon “puzzle” occurred when industrial output tended to fluctuate in the same direction with interest rate. This shows that interest rates were not impact directly to industrial output but through the credit channel. Although interest rates

changed, the lag impact of credit channel lead to the impact of interest rate was not great on industrial output.

In addition, because IP is a variable, which represents growth so when interest rates increase, IP also increases, and this is right with Vietnam economy in period 2007 – 2010. This period, interest rates increase continuously and growth also increases. However, growth in this period will not sustainable and this shows that Vietnam economy is not stable.

About interest rate and exchange rate: 2 variables have relationship through interest rate parity between countries. Interest rate and exchange rate have relationship in long term. When having the difference in interest rates, exchange rate must be adjusted. If not the arbitrage phenomenon will occur. The increasing in domestic interest rate will attract the foreign investment flow in, thereby causes the excess foreign currency supply, so leads to decrease exchange rate.

The monetary policy always aims at make the capital flow efficiently and timely, in which stock market is one of the channels of raising and creating capital for economic. The operation of Stock market relates to financial market. Therefore, the factors such as interest rate, inflation, and credit always impact greatly on this market. According to many economist in the world, most interest rate policies impact on the stock price index both in short term and long term. Testing the relationship between interest rate and VNI shows that interest rates impacted on stock market

With credit: the shock of interest rate impacted on private sector credit in 4 periods. This result shows that appeared positive signs in implementing interest rate policy. This is a good evidence for interest rate policy makers reviewing and implementing the interest rate policy successfully, especially when economic is in crisis period with phenomenon as excess and lack of capital in firms and banks (Banks limited to lend while corporations have a big capital demand but offered high interest rate or refused to lend). This leads to the business operations could not cover interest cost

#### 4.6 The variance decomposition analysis

Tab. 5 - The result of decomposing variance. Source: own analysis

Period	Variance decomposition analysis						
	IP	CPI	IRD	M2	CPS	VNI	EXU
<b>IP</b>

Looking at the the summary result table of variance decomposition, we find that IP was influenced more primarily by the shock of interest rate than other variables and the highest impact is during 24 months. By the way, we found that IP was influenced indirectly by interest rate, especially by M2.

The impact of the shock of M2 increased continuously by the length of the periods, 18% for 4 periods, and 22% for 12 periods. Therefore, in early stage IP was impacted strongly by the shock of money supply. CPI was impacted most strongly by the shock of interest rate in 12 periods however weaker by M2, IP, and EXU.

This is also right with the theory when money supply impacted strongly on CPI because money supply impacted directly on the circulation of goods. Interest rate impacted strongly on M2 in 4 periods and this impact was weaker than the impact of the shock of IP on M2 in the same periods.

It is easy to understand because M2 and interest rate have direct relationship, so when implementing the monetary policy to regulate money supply, interest rate is the most priority tool. However, the result of this paper shows that M2 was impact most strongly by the shock of IP (13% compared with 15%). Credit private section growth was impacted most strongly by the shock of interest rate in 12 periods. However, this impact was weaker than money supply, VNI and EXU. Therefore, CPS could impact indirectly through interest rate. This is a concern in managing the monetary policy when the changes in interest rate impacted weakly on CPS. VNI was impacted most strongly by the shock of interest rate in 4 periods and this is the biggest impact in rest of variables. This is one of significant findings for the stock market.

The changes in interest rate impacted strongly on stock market. The result of this paper is suitable with the theory and practice of Vietnam stock market. Foreign exchange was impacted by the shock of interest rate in 12 periods and impacted weakly by other variables. This issue is suitable when exchange rate and interest rate have the closed relationship in

practice, when having the changes in interest rate the exchange rate was adjusted by the interest rate parity theorys

## 5 CONCLUSION

This paper tested the transmission of interest rate to monetary policy by the Var model. The result of shock response analysis and variance decomposition analysis show that the interest rate plays an important role in managing economic. A shock of interest rate in monetary policy impacts most of variables of macroeconomic in model. However, besides money supply variable and VNI, other impacts were weak and late. The result also shows that duration of interest rate policy impacted other price factors such as CPI, VNI. This result suggests that appropriate interest rate policy through macroeconomic factor can foster its aims: economic growth and inflation stabilization.

This study does not consider other macroeconomic variables such as the real estate price, the product price index, the growth of credit yet. Furthermore, interest rates, which the authors used to study, is discount interest rate, this is the limitation of paper. In the next study, the authors will include variables mentioned above to the model and will try to find effect of the transmission through average interbank interest rate and refinancing interest rate.

## **THE FACTORS AFFECTING THE SUCCESS OF A PROJECT OF CONSTRUCTION COMPANY IN VIETNAM**

*Huong Thi Mai Nguyen, Thuy Thi Phuong Nguyen, Trieu Thi Nguyen*

### **Abstract**

The construction sector of any country in the world always plays an important role in the economy and keeps the task of forming, building and developing infrastructure. A poor infrastructure cannot create a modern society. With the specific characteristics of the construction industry, during construction progress, the projects will face with any risks and difficulties. The project teams in Vietnam are facing unprecedented changes in technology, products, investment resources...and ect. Therefore, the measurement of the factors affecting to the success of the project in Vietnam is aimed to improving the efficiency of the project.

Based on relevant previous studies and comments from the experts in the construction industry, a rough questionnaire was formed and sent to six individuals who have extensive experience in the field of construction management for testing interview. After analysing, evaluating, eliminating superfluous elements, adding elements to the draft questionnaire, finally the research team had completed the questionnaire and established the four criteria for evaluating the success of the project, which are included of cost, time, technical completion and customer satisfaction. These criteria will be measured through four groups of factors that affect the success of the project, namely the external environment, the ability of the construction project manager, the capacity of project members and the way to organize the projects. This questionnaire requires each individual participating in the survey to give their opinions about the impact of these factors on the success of a project, based on a seven-level Likert scale (from less stable the high stability), corresponding to the score of 1-7.

*Keywords: Manage the investment Project of Vietnamese Enterprise, Vietnam's construction enterprise, the success of construction projects, factors affecting the success of the project.*

## **1 INTRODUCE**

After nearly 30 years of innovation, the construction industry in general and the construction enterprise in Vietnam in particular have made significant strides towards modernization, not only in the field of site construction, building materials, architect and construction planning, but also in other sectors such as urban and housing development, ability to plan the site schedule, ect... meeting the need of itself industrial development and innovation. Besides, Vietnam's construction industry still has a lot of restrictions, such as:

- Restrictions on financial capability, most of the construction companies have to pay in advance to proceed their works and get back the payment after inspection from the owner as contract. The contractors have to pay a monthly rate for banks while there is no interest for the debt of the owner, and cannot force the owner either. Fund planning is essential for the contractors, in which we need to evaluate the potential risks (e.g. price fluctuations, changes of state policy...). The financial matter of contractors in the construction process is the major issues in the developing countries like Vietnam;

- The degree of synchronization for construction machinery and equipment reached 26.5% - 39.4%. The obsolescence of technology and techniques will affect to the cost, quality and price of products;
- The experience and qualifications of the management organization is limited, such as the way to organize marketing activities to find markets, materials resource, qualifications of staff responsible of the tender contract, construction schedule management, the possibility of joint ventures;
- Shortage of technical and high quality labor force .

Vietnam has a dynamic economy, and together with other Southeast Asian countries, in recent years, the prospect for Vietnam economy in general continues to improve. The construction sector of Vietnam is a kind of special material production that combines many factors from ideas for construction planning, design, manufacture and supply of materials, technical materials, management of site construction until to be completed. And finally it forms the fixed assets in use, then those products were warranted, maintained and transferred to the final possessed owner, all the achievements of the natural sciences, social sciences and humanities can be applied and focused on the building. That makes construction products contain high levels of intelligence and material values.

The construction industry is constantly changing with the development of business methods and new technologies. The success is the ultimate goal of each company because it is considered an indicator for the existence in competitive business environment. Therefore, the construction companies have to use and develop appropriate strategies to be successful in their business.

Meeting deadline, cost and quality is considered as the success criteria of project. In addition, the success of the construction projects is to meet the strategic objectives of the owners and the organization; to satisfy the needs of users and of all parties, including related products. However, the issue that the research team wants to raise is to identify the factors that mostly influence the remaining elements after reviewing and measuring, the construction companies prepare the priority solution to make timely adjustments, and ensure maximum effectiveness of the project.

## **2 OVERVIEW FOR PREVIOUS RESEARCH**

Construction industry is considered one of the most important industries in the economy. It interacts with almost all fields of human endeavor. Unfortunately, the intrinsic complexity, uncertainty and dynamics of most construction projects makes difficulties for even the best project manager. The decision timelines are used to predict outcomes,. Risk management is done to prevent disasters, Repeated sequence is used to ensure that the planned facility is available. However, the project still ends with delay progress, budget overruns and technical details intrusion (Meyer et al., 2002). For that reason, the challenge is how to handle a successful construction project has attracted considerable researchs in the past few decades.

Previous studies (de Wit, A. 1988; Munns & Bjeirmi, 1996; Cooke-Davies, 2002) states that the success of the project is evaluated with the overall objectives of the project when project management success is measured against the cost, time and quality. This research indicated that the distinction between a successful project which cannot be measured until the project is completed and the project implementation which could be measured in the life of the project is an important matter.

However, Baccarini (1999) asserted that project success is measured in terms of successful products (including equipment) and successful project management. Despite this controversy, under the broad definition of successful project this study is aimed to disseminate the common elements to the managers in Vietnam and the projects in developing countries where the knowledge about project management is not high.

Beside, success factors of the project are defined as the knowledge, skills, traits, motives, attitudes, values or individuals characteristics that are necessary to perform the job (PEPDS, 2004). Then Ashley et al. (1987 cited in Sanvido et al., 1992) referred to the project to be called a success if it has much better results than expected such as cost, schedule, quality, safety, and satisfaction of the participants.

Or De Wit (1988) noted that a project is considered to be successful if it meets the specification of technical performance or task is done, and if there is a high degree of satisfaction of the project's results among key figures of the management and the users or customers.

Albert P. C. Chan<sup>1</sup>; David Scott<sup>2</sup>; and Ada P. L. Chan<sup>3</sup> (2004), this paper focuses on the csfs and not on the measurement of project success, the key performance indicators (KPIs). Further study should be directed to identify the KPIs, so that the causal relationships between CSFs and KPIs can be identified. The causal relationships, once identified, will be a useful piece of information to implement a project successfully. It can help in selecting project team members, identifying the development needs of the project team members, and most important for forecasting the performance level of a construction project before it commences.

Abdelnaser Omran, Mohammed Alnor Abdulbagel, Abdelwahab O.Gebril (2012), the paper identifies ten critical success factors that are important and will impact positively on construction projects if they are focused on by all the stakeholders, that examines different situations and environments and it will improve the construction industry development in Libya.

Clearly, determining the success or failure of a project is complex and ambiguous because of factors affecting both contain elements of quantitative and qualitative aspects. We noticed there are many factors that affect the success of the project - the reason for this difference may be due to the approach and different research objectives of each above authors. After the overall achievement of the impact factors connected with the scope and control capabilities, combined with hierarchical micro-environment and micro factors affecting to identify the causes which takes subjective or objective effect, the research team has collected, processed data as well as conducting inspection and measurement of each element in each group of factors that affect the success of the project of construction enterprises in Vietnam.

### **3 RESEARCH MODEL AND HYPOTHESES**

#### **3.1. Research model**

Based on the above theory, the article proposed the research model shown in below Figure 1:

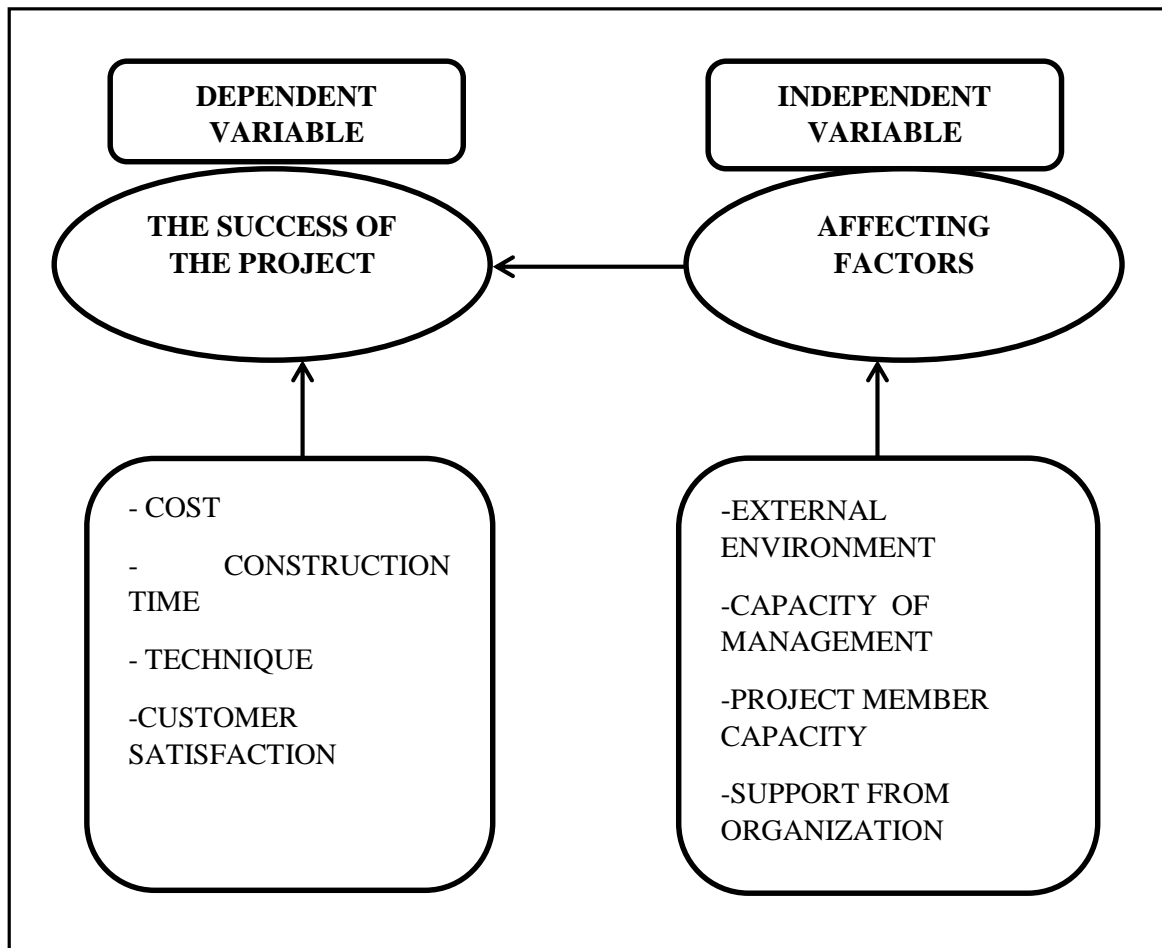

Fig. 1 - Research model. Source: Cited by the authors.

### 3.2. Research assumption

#### Firstly, external environment

The factors of the external environment that have an impact on the success of construction projects including: the political environment, economic environment, social environment, law, technology, natural environment (air climate, weather...), competitors, subcontractors and feedback from customers.

H1: The more stable the external environment is, the more impact it has on the success of construction projects

#### Secondly, capability of management

Project management board is operating and coordinating center in the work of the project. In big projects in Vietnam, the problem is coordinating a capable team to implement the project successfully. A project management is a collection of individuals performing work on the specialty, so that we need a capable project leader to lead them following a common orientation. The characteristics to evaluate a good project leader is to build a team with good communication skills, enforce the confidence and focus on results. Two factors influence throughout the lifecycle of the project. The capacity of the project managers is demonstrated by the following criteria: ability of decentralization, discussing skill, coordination, decision-making ability, the ability to perceive the role and administrative tasks, ability to withstand the pressure of work.

H2: The higher capacity the project manager has, the higher the success of construction projects impact.

### **Thirdly, the project member capacity**

In the construction projects, virtually all activities are dependent on human resources. There are many parties involved in a construction project like the chain linked together. When any link is broken, the project will be disrupted. For that reason the cooperation as well as the determination of the parties is critical factors to the project. This is the concern of the consulting company, usually independent party, with cultural projects, they want the active cooperation between the parties (especially between investors and contractors) to complete a good project. The criteria for measuring their abilities are: professional knowledge, communication skills, ability to solve risky problems, the ability to commit the goals, ability to face problem, teamwork ability, withstand work pressure.

H3: The higher capacity the project member has, the more it impacts on the success of the construction project.

### **Fourthly, the support from organization**

The relevant parties, either directly or indirectly involved in the project, have different views about success, play a very important roles in every project. The satisfaction of the stakeholders, both internal and external (including clients, contractors, managers, etc.), with the final product as a project success criteria are given special importance.

H4. The more support from organization, the more impact on the success of the construction project.

## **4 RESEARCH METHOD**

### **4.1. Research method**

The research process is done through two steps: preliminary research and formal research.

- Preliminary research was conducted through qualitative research methods, such as communication, expert interviews, collect reference information from the relevant article and the comments... etc. Then, we discuss general factors affecting the success of the project to establish a questionnaire survey using in formal study.
- In formal research, the team employed quantitative methods, and the questionnaire survey. In particular, the random sample of non-probabilistic method for conducting data collection. The data is encrypted and processed by SPSS 22.0 software. To consolidate multiple choice and composition of the scale, we use the method Cronbach's Alpha testing, EFA factor analysis in order to determine the hidden factor behind the observed variables. Binomial logistic regression (binary logistic) analysis is used to determine the coefficient of the factors in the regression and analyze the impact of these factors to the success of the project.

### **4.2. Research sample**

With 180 samples issued, a number of collected samples met the requirements of 150 (counts for 83.3%). The questionnaire was distributed to the director, deputy director of the project, head of supervisor, head of construction at various construction companies. After being collected, the questionnaires were reviewed and eliminated the wrong ones. We continued coding variables, inserting date and cleaning data by SPSS version 22.0 software to perform statistical analysis of the data.

### **4.3. Design data collection**

There are Discussions with experts to prepare interview questions, for testing interview, adjusting and distributing survey questionnaire. In formal questionnaire has 26 items asked for the level of factor affecting the success of the project. Each item is scored according to unidirectional Likert scale from 1 to 7 with the convention from lowest (1) to highest (7). The questionnaire consists of 26 statements, in which nine questions are about the "external environment", 6 questions about "The capacity of the project management", 7 questions about "The capacity of the project members "and 4 questions about" the support of the project organization ".

## **5 RESULTS**

### **5.1. The model analyzes the factors affecting the success of the project**

Based on the elements inside that affect the success of the project is pointed out, regression models were established:

In which:

$\beta_1, \beta_2, \beta_3, \beta_4$ : Regression coefficients

BPT: the success of the project

MT: External environment

NQT: Capacity of project management

TV: Capacity of project member

HT: The support from project organization

### **5.2. Building scale**

The success of the project is measured by 04 observed variables code TC1 to TC4

The external environment is measured in 09 observed variations code MT1 to MT9

The capacity of project managers is measured by 06 observed variables code NQT1 to NQT6

Capacity project members was measured by 07 observed variables code TV1 to TV7

The support of the project organization is measured by 04 observed variables code HT1 to HT4

### **5.3. Measurement model inspection**

Cronbach's alpha coefficient helps us to access whether using the observed variables which belongs to a researching variable (latent variables, factors) is appropriate or not. According to the rules of experience, if the coefficient reaches alpha of 0.7 or higher, the scale will be reliable and effective explanation (Nunnally & Bernstein, 1994, p.264-265). Or as Peterson (1994), the alpha coefficient of 0.7 or higher, even 0.77 or higher, the scale is considered to be reliable and efficient.

At the same time, to have a high reliable scale , we need the observed variables strongly correlated each other. This is reflected in the correlation index between variables - total (Corrected item - total correlation). Accordingly, correlated variables - the total is greater than 0.3 is considered good and usable.

Also, in the opposite case, if the coefficient alpha is too high (greater than 0.95), it is capable of superfluous observed variables appear in scale. The superfluous observed variables are

variables measuring a concept almost identical to other measuring variables when the superfluous variables should be eliminated.

After testing the Cronbach's Alpha many times, the research team excluded six observed variables, that is, "Social Environment" (MT3), "Natural Environment" (MT6), "Clients Comments" (MT7) "Competitor" (MT8), "The ability to perceive the role and administrative tasks" (NQT5) and "Ability to endure the pressure of work" (TV7) because the coefficient of Cronbach's Alpha is larger the coefficient Alpha of each factors group. The remaining variables have Cronbach's alpha coefficient in accordance with standards of measurement, the inspection results measurement model shown in Table 1.

#### **5.4. Exploring Factor Analysis EFA**

Exploring Factor Analysis EFA considers the convergence of the observed variables for each component and distinguished value between the factors.

According to Hair and ctg. (1998, 111), Factor loading (load factor or weighting factor) is an indicator to ensure the practical meaning of EFA:

Factor loading > 0.3 is considered to reach a minimum

Factor loading > 0.4 is considered important

Factor loading > 0.5 are considered to have practical significance

Hair and ctg. (1998, 111) also suggest that: if choosing the factor loading standard > 0.3 then your sample size is at least 350. If your sample size around 100, you should choose the factor loading > 0.55. If the sample size is around 50, the factor loading should be > 0.75. For that reason, the condition for analyzing the exploring factor has to meet these requirements: Factor loading > 0.5.

- $0.5 \leq KMO \leq 1$ : the coefficient of KMO (Kaiser – Meyer – Olkin) is an index used to examine the appropriateness of factor analysis. Larger KMO values means the factor analysis is appropriate.
- Bartlett Inspection has statistical meaning (Sig. <0.05): This is a statistical quantity to consider the hypothesis of the variables is not uncorrelated with overall. If this testing has statistical meaning (Sig. <0.05), the observed variables correlated with each other in overall.
- Percentage of variance > 50%: Shows the percentage of variation of the observed variables. Means that if we considered the variation as 100%, the value shows how many percentage the explanation factor is.

Exploring Factor Analysis EFA the independent variables:

The results of total variance table (Table 3) shows that the four extracted factors may explain for the variability of 83.05% observed variables. Moreover, KMO coefficient is  $0.81 > 0.50$  with a significance level of  $< 5\%$  (Table 2) which is consistent with accreditation standards.

Results from the rotation matrix factors (Table 4) shows the initial 20 observed variables has practical significance (greater than 0.50) and are aggregated into four factors in the table.

Extraction Method: Principal Component Analysis.

### 5.5. Regression analysis

Using Binary Logistic Regression models for binary dependent variable, we performed three testing as following:

- Inspection of partial correlation regression coefficient: The objective of the inspection is to examine whether the independent variables are correlated with the dependent variables or not (for each independent variables). Using the Wald test, the level of significance of the partial regression coefficient is least ( $\text{sig.} \leq 0.05$ ). We concluded that the correlation between the independent variables and the dependent variable has statistical significance. The results at Table 1 shows the "External Environment" variables, "Capacity of project management" and "The support of the project organization" has partially correlated with variables "The success of the project" ( $\text{sig.} < 0.05$ ), only the " Capacity of project members " variable has no statistical significance with the significance level of  $0.887 > 0.05$ .

Tab. 7 - Variables in the Equation. Source: authors' calculations.

	B	S.E.	Wald	df	Sig.	Exp(B)	95% C.I. for EXP(B)	
							Lower	Upper
Step 1 <sup>a</sup> FACT1	0.961	0.286	11.326	1	0.001	2.615	1.494	4.578
FACT2	1.944	0.555	12.258	1	0.000	6.989	2.353	20.756
FACT3	0.068	0.480	0.020	1	0.887	1.070	0.418	2.743
FACT4	0.814	0.338	5.792	1	0.016	2.258	1.163	4.383
Constant	-16.780	3.194	27.599	1	0.000	0.000		

a. Variable(s) entered on step 1: FACT1, FACT2, FACT3, FACT4.

*- The suitability of model*

Referring to the accuracy of forecast: in Table 8, with 26 failed projects, the model correctly predicted 23 projects, counting for 71.9%. At the same time, in 124 successful projects, the model correctly predicted 115 projects, counts for 97.5%. The percentage of correct prediction of the whole model is 92%.

Tab. 8 - Classification Table<sup>a</sup>. Source: authors' calculations.

Observed		Predicted			
		The success of the project		Percentage Correct	
		0	1		
Step 1	The success of the project	0	23	9	71.9
		1	3	115	97.5
Overall Percentage					92.0

a. The cut value is 0.500

Regarding the suitability of the model: , The Omnibus testing shows  $\text{sig.} < 0.0001$  (the significance is 99%). Thus, the independent variables generally have a linear relationship with the dependent variable in the overall. In other words, the model is a suitable.

Tab. 9 - Omnibus Tests of Model Coefficients. Source: authors' calculations.

		Chi-square	df	Sig.
Step 1	Step	79.367	4	0.000
	Block	79.367	4	0.000
	Model	79.367	4	0.000

- *The level of explanation of the model:*

Table 10 shows the index R<sup>2</sup> - Nagelkerke = 0.637, means that 63.7% of changing in the dependent variable are explained by the independent variables.

In addition, the regression coefficient (B) in Table 2, shows that the factors affecting the success of the project in order of importance is are the "Capacity of project management" (B = 1944 ), "External environment" (B = 0961), "The support of the project organization" (B = 0814) while the "Capacity of project members" (B = 0068).

Thus, by the result of the logistic regression model, we concluded the factors, such as "Capacity of project management," "External environment" and "The support of the project organization", affect "The success of the project. The factor of "Capacity of project members", however, has not enough statistical evidence to confirm the influence to "The success of the project".

Tab. 10 - Model Summary. Source: authors' calculations.

Step	-2 Log likelihood	Cox & Snell R Square	Nagelkerke R Square
1	76.135 <sup>a</sup>	0.411	0.637

a. Estimation terminated at iteration number 6 because parameter estimates changed by less than 0.001.

## 6 DISCUSSION MATTER

Identifying critical success factors will support for reliance on the cognitive objectives of the organization. With the conclusion from the analysis of the logistic regression model, the factors of "Capacity of project management," "External environment" and "The support of the project organization" may affect "The success of the project ". However, with the constituents on the survey for each group as well as the collected information after processing of the data, the research team proposed that to make a success of construction project in Vietnam, the role of "The capacity of the project management" plays a very important role.

A good project management requires a combination of many factors such as multi-dimensional capabilities (including communication skills, technical and administrative), determine their level of participation, the power and control they have. Besides, the project manager must have good technical knowledge and experience, because most of the projects are high technique. At the same time, they need to have the ability to convince the other members on their opinion, to resolve conflicts between the parties, to encourage and convince the project team to perform duties together and to adapt to the adjustment.

The convergence of all these factors in the project manager proves that he has ability to catch up, to solve the problem, and ability to coordinate... All these things will help savings time and cost to create a successful project. For that reason, the problem is how to have a good manager before implementing a construction project, in other words , how the construction industry of Vietnam can find out and train expert and skillful project managers for professional working. That is the solution to sustainable and effective development in Vietnam construction market.

Besides, we need to improve the capacity and the cooperation of the relevant parties: the characteristic of multiple parties involved in the various stages in construction leads to the affecting among contractors. All parties need to improve their capacity. The good cooperation among the parties is critical to the success of the project. All parties should be aware that in addition to their good work, they should make good working conditions for the others. This is a modern cooperative "win - win" situation. To Promote the role of State management in the

construction sector, the State should give favorable conditions to investors, simultaneously also have strict management of the planning, urban architecture and reject inappropriate projects. Successful project management is successfully to manage the works, the major factors which affecting the success of the project.

Meanwhile, to solve the problem of financial management of construction enterprises in Vietnam, these enterprises may need to organize management accounting for stages of estimation, valuation, analysis and measurement of information in short-term and long-term in order to build the effective internal control system. By these actions, the management accounting activities will contribute to give the information on time in order to meet the "dynamic feature" of the construction enterprises in Vietnam in the current competitive conditions.

## **7 CONCLUSION**

On the whole, the entire content of the article is done for the purpose of identifying and measuring the factors that affect the success of a project. We hope that the findings in this study will expectedly contribute to prevention of "delay" factors as well as the ability to improve success in construction projects in Vietnam. Based on data analysis, we have proven that there is completely a link and influence of four groups of factors to the success of the project, and possibility of measuring the impact of each factor group on predicting value of their impact when implementing the project.

In addition, we want to affirm the role of "harmonization" of the project managers system in the organization system. They must be those who is assertive and professional to assume this position in the project. And the talents of the project managers will narrow the "gaps" of the external environment, the members of the project and the support of the organization. The support of relevant parties and management accounting, completedly internal control system has the same meaning as improving the efficiency of time and cost for a project to give the most customers satisfaction on the quality of the building.

Some limitations of this study are that the scope of research subjects of 150 is not much, not classified in the type of project, not deeply assessing the interaction of each element in each factors group affecting the success of the project. From here, we propose the following research is to increase the number of research subjects in order to improve reliability, measure the customer satisfaction and assess the environmental friendliness of the project.

## **PRICE LIMITS AND STOCK MARKET VOLATILITY: EMPIRICAL EVIDENCE FROM THE HO CHI MINH STOCK EXCHANGE**

*Nguyen Thi Tuyet Nhung*

### **Abstract**

The paper aims to examine the effect of stock price limits on the volatility of its return in the Ho Chi Minh Stock Exchange. By employing GARCH (1,1) model, the estimated results indicate that the price limits has an impact on the stock return during the first testing period. However, during later period, the paper detects no effect of price limits.

*Keywords: price limits, stock return volatility, Ho Chi Minh Stock Exchange*

JEL Classification: G15

### **1 INTRODUCTION**

After the U.S. market crash in October 1987, price limits was implemented and widely considered as a necessary protection mechanism to many stock exchanges. As defined by Kim (2001), price limits are simply a maximum upward and downward boundaries of daily price movements and set to provide a cooling-off period for investors under extreme market conditions. However, the effectiveness of price limits on stock market remains controversial to market participants, regulators and academics. One main argument is that price limits would succeed in reducing stock market volatility. Conversely, many researchers strongly suggest that price limits will have no impact on the stock market volatility. This inconsistency of opinion has accordingly attracted considerable empirical analysis, and is also the motivation of this research.

This paper particularly examines the effect of price limits on the volatility of the Ho Chi Minh stock exchange (HOSE), the biggest stock exchange in Vietnam. Since established in July 2000, HOSE has implemented daily price limits to restrict extreme price movement in the market during a trading date. However, it is worth noting that, during 14 years, HOSE has changed its daily price limits 10 times. This raises an interesting question that whether changing the price limits actually has an impact on the Ho Chi Minh stock market volatility. To answer this question, we employ an asymmetric GARCH model to test the impact of price limits on the stock market volatility during its price limits changes. To our best knowledge, there is no research on price limit has been conducted in the Ho Chi Minh stock exchange. Hence, the inferences of this study expectedly offer practical implications to investors and policymakers in the stock market.

The remaining of the study is constructed as follows. Section two briefly provides a literature review of the effect of price limits on stock price volatility. Section three describes data and methodology utilized while empirical findings are focused in section four. Section five provides a conclusion.

## **2 LITERATURE REVIEW**

Theoretical debates on the effect of price limits on stock volatility have provided conflicting conclusions which are mostly motivated from two major hypotheses. First, the information hypothesis, also known as the delayed price discovery hypothesis, basically argues that, price limits exhibit the delaying effect under efficient market condition (Fama, 1989). Phylaktis et al. (1999) further explain that the presence of price limits only lengthen the number of trading days it will take for the market to absorb the new information into the equilibrium stock price and hence the volatility of stock returns should be indifferent between pre- and post-limit period.

Second, the impact of price limits is discussed under the overreaction hypothesis, which considers the activation of price limits under an inefficient market condition. Phylaktis et al. (1999) explain that when new information occurs in the market, investors are likely to overreact to the information, causing an increase in the volatility of stock returns in this short-run period. In such circumstance, the presence of price limits provides an additional time for the investors to reassessment the market, resulting in a less volatility of the market. Therefore, this hypothesis concludes that volatility of returns in the post-limit period should be less than in the pre-limit period.

The theoretical debate over the impact of price limits on stock price volatility results in an increasing number of empirical studies, which have been conducted in different stock markets and methodologies. For example, Phylaktis et al. (1999) studied the role of price limits on stock market volatility on Athens stock exchange. By testing the serial correlations of ten stocks, which exhibit highest number of price hitting during testing period, they found that the price limits have a delaying effect as predicted by the information hypothesis. Additionally, they report that the price limits have no power in reducing the stock market volatility. A similar study by Kim (2001) on the stock exchange of Thailand also documents that when price limits are made more (less) restrictive stock market volatility is usually not lower (higher). Huang et al. (2001), alternatively, shows that the impact of price limits observed in the Taiwanese stock exchange is consistent with the overreaction hypothesis, indicating that the volatility of stock returns is stabilized after the activation of price limits. Other previous researches also investigate the effect of price limits in destabilizing stock returns volatility such as DeBondt and Thaler (1985, 1987) on the U.S stock market, Chen (1993), and Lee and Kim (1995), Berkman and Lee (2002), etc. However, inconsistent conclusions have been reported.

## **3 METHODOLOGY AND DATA**

### **3.1 Methodology**

Testing the impact of daily price limits changes on stock market volatility is basically to compare stock volatility between pre and post changing periods. Although several empirical techniques have been used in measuring the stock volatility, the generalized ARCH (GARCH) (Engle, 1982; Bollerslev, 1986) appears to be the most commonly used process due to two reasons. Firstly, GARCH process can capture the tendency of volatility clustering in financial data. Secondly, Fama (1965) and Bollerslev et al. (1992) consistently conclude that heteroscedasticity usually occurs in stock return series. Hence, GARCH can overcome the heteroscedasticity problem by modeling the conditional variance of the error term as a linear function of the lagged squared residuals and the lagged residual conditional variance. In our study, the simplest GARCH model, GARCH (1,1), is employed.

To effectively capture the volatility of stock market follows by the change of price limits, a dummy variable is incorporated in the conditional variance equation. Besides, a proxy variable is also employed in the conditional mean equation to filter off the market-wide effects. The usage of the proxy variable is basically to ensure that any volatility observed is only caused by the modification of price limits. Therefore, the conditional mean and variance equations of GARCH (1,1) model have the following form:

$$(1) \quad R_t = a_0 + a_1RX_t + u_t \quad u_t \mid \Psi_{t-1} \sim N(0, h_t)$$

$$(2) \quad h_t = \alpha_0 + \alpha_1u_{t-1}^2 + \beta_1h_{t-1} + \gamma DP$$

where  $R_t$  and  $RX_t$  are respectively continuous returns of spot prices and proxy variable prices at time  $t$ ,  $u_t$  is an error term representing unexplained price changes and  $\Psi_t$  is the information set available at time  $t$ ,  $DP$  is the price limits dummy which takes value of 0 before the price limits changes and value of 1 after the price limits changes.

### 3.2 Data

During its 14 years operation, the HOSE has changed its price limits 10 times, which is disclosed in Tab. 1. It is interesting to note that there are 2 times where the price limits were significantly changed, 13/06/2001 and 27/03/2008. However, at 13/06/2001, there are only 5 stocks listed on the market. The small number of listed stocks during this period may cause bias in conclusion of this paper. Moreover, after 4 years, the price limits was changed again on 15/01/2013. Hence, to investigate the impact of price limits changes on the volatility of the Ho Chi Minh stock market, we will only focus on two times where the price limits noticeably changed, 27/03/2008 and 15/01/2013.

Tab. 1 - Price Limits Changes in the Ho Chi Minh Stock Exchange. Source: Own processing

No.	Date of change	Increased/decreased	Price limits
	<b>Expected</b>		<b>+/-5%</b>
1	28/07/2000	Decreased	+/-2%
2	13/06/2001	Increased	+/-7%
3	15/10/2001	Decreased	+/-2%
4	01/08/2002	Increased	+/-3%
5	23/12/2002	Increased	+/-5%
6	27/03/2008	Decreased	+/-1%
7	07/04/2008	Increased	+/-2%
8	16/06/2008	Increased	+/-3%
9	18/08/2008	Increased	+/-5%
10	15/01/2013	Increased	+/-7%

Following a study of Phylaktis et al. (1999), we comprises daily closing price of ten stocks which have the highest number of price limit hit for each examined time. Without directly detecting price hitting, we identify the occurrences of hitting prices by examining the daily open, low, high, and closing price of all stocks listed in one year after and before the price limit changes. The final samples for each period also cover a variety of sectors as given in Tab. 2.

Tab. 2 - Information on Individual Stocks. Source: Own processing

PERIOD 1			PERIOD 2		
Stock code	Abbreviation	Sector	Stock code	Abbreviation	Sector
LBM	A1	Construction and Material	DRH	B1	Real Estates
VIS	A2	Essential Resources	CYC	B2	Construction and Material

HTV	A4	Essential Resources	CIG	B4	Construction and Material
FPC	A5	Construction and Material	CLG	B5	Real Estates
TNA	A6	Foods-beverage	CCL	B6	Real Estates
HAX	A7	Car and accessory	CMG	B7	Information technology
MCP	A8	Goods-industrial services	ALP	B8	Goods-industrial services
SCD	A9	Foods-beverage	CNT	B9	Construction and Material
VPK	A10	Goods-industrial services	DHC	B10	Essential Resources

As discussed in the earlier section, it is required to eliminate market-wide effects on stock price fluctuation by introducing a proxy variable in the conditional mean equation. Since we will perform the test for each individual stock, the priority choice for proxy variable should be an industrial stock index. By doing so, the proxy variable could be able to efficiently reflect worldwide, domestic and industrial impacts on the stock market. However, there is no industrial stock index provided in Vietnamese stock market. Hence, we will conduct the Arithmetic Stock Price Average (ASPA), which was used in a study by Ryoo and Smith (2004), for all listed stocks for each sector. The ASPA of each sector will be used as a proxy variable in our model. Daily continuously compounded returns for the each stock and the ASPA are also calculated as  $R_t = 100 * \ln(P_t / P_{t-1})$  where  $P_t$  and  $R_t$  are respectively daily stock prices and returns. Additionally, to successfully capture the fluctuation of stock markets followed by the change in the price market, we apply testing window for 1 year before and after the price limits changing time.

## 4 EMPIRICAL RESULTS AND DISCUSSION

### 4.1 Statistical Descriptions

Tab. 3 and Tab. 4 respectively show descriptive statistics for 20 sample stocks returns in the two testing periods. It is interesting to note that the mean values of stock returns in both periods are negative. Mean values of period 1 exhibit higher negative values compared to those of period 2, indicating that a bigger loss of stocks during period 1. The conclusion is consistent with maximum and minimum values during the periods. Period 1 discloses higher negative minimum than those of period 2. However, the standard deviations of all stocks are indifferent during the periods. This surprisingly implies that the impact of the global financial crisis on the stock markets during period 1 is unable to confirm.

Besides, the Augmented Dickey-Fuller (ADF) unit root tests are used to examine the stationary property of all the series, 20 stocks and industrial variables as required by GARCH (1,1) model. The results from Tab. 3 and 4 specify that the null hypothesis of unit root is rejected at 1% level for all the series, meaning the data is stationary and hence appropriate for GARCH (1,1) model.

## 4.2 Empirical Results

Tab. 5 presents GARCH (1,1) estimated results for the period 1. During the period, all of the proxy variable coefficients are statistically significant at 1% level, meaning that the industrial variables are highly correlated to the stock returns. This also strongly indicates that using ASPA value of each industry as the proxy variables are appropriate for our purpose of filtering the other effects in the market. By considering the coefficients of the conditional variance equation, except for the constant, most coefficient of  $\alpha_1$  and  $\beta_1$  are statistically significant at 1% level, confirming the presence of significant GARCH effects.

Besides, it is noticeable that seven testing stocks exhibit statistically significant coefficient of price limits dummy ( $\gamma$ ), implying the changing in stock volatility before and after the price limits change. Hence, it is reasonable to conclude that the price limits change at 27/03/2008 has material effect on the stock price volatility. Another point to note is that most of the coefficients ( $\gamma$ ) have negative values. The negative values of ( $\gamma$ ) may present that the stock volatility was decreased after the price limits was decreased to +/- 1%. In other words, price limit change is likely to stabilize the stock volatility. This finding is consistent to argument of the overreaction hypothesis of price limits.

It is moreover interesting to observe that, among 7 stocks which exhibit the effect of price limits change, three stocks are classified in Essential resource sector. The other 4 stocks belong to Construction and material, Car and accessory, Food and beverage sector. Unfortunately, the paper findings are not sufficient to conclude whether the price limits changes has different affect on the stocks of different sectors. Further investigations are required to deal with this concern.

Note:\*\*\*, \*\*, \* indicate statistical significance at the 1% , 5%, and 10% levels, respectively. Numbers in the parentheses are standard errors

Tab. 6 represents the estimated results for period 2. In parallel with the results of period 1, coefficients of proxy variables exhibit the appropriateness in the model. The parameters  $\alpha_1$  and  $\beta_1$  also have statistically significant coefficients at 1% and 5% level, except for B1, B3, and B4 stock. This indicates the presence of GARCH effect during this period. Nevertheless, if the period 1 results strongly confirm the impact of price limits change on the stock volatility, the impact of price limits change is not observed in the period 2. All coefficient of price limits dummy ( $\gamma$ ) are noted with insignificant values during this period.

The inconsistency in the effect of price limits change found in the two periods is explainable. During the first period, the stock market was believed to be strongly affected by the global financial crisis during the year of 2008. Under this extreme market scenario, the HOSE has significantly decreased the price limits from +/-5% to +/-1%. This change was helpful to cool-off the market, causing a decrease in the stock volatility during the later period. Alternatively, after over 4 years since the last change of price limit on 18/08/2008, the price limit was changed again from +/-5% to +/-7% on 13/01/2013. However, the investors were not as sensitive to the change as previous time, reflected by the insignificant coefficient ( $\gamma$ ) of all testing stocks.

## 5 CONCLUSIONS

The study has examined the impact of price limits on the stock returns volatility in the Ho Chi Minh stock exchange. The estimated results of GARCH (1,1) model suggests that the stock return volatility seems to be lower after the price limits is decreased in the first period. The conclusion is derived from the significance of price limits dummy in 7 out of 10 sample stocks. However, during the second period, an increase in price limits has no significant effect on the stock return volatility. The findings strongly indicate that the implementation of new price limit only affect the stock return volatility during the extreme market scenario. The conclusion strongly supports the overreaction hypothesis of price limits. During this period, a decrease of price limit effectively helped to calm the investors and cooled off the market. As the result, the volatility was significantly decreased and the market was recovered. Conversely, the price limit change under normal market condition seems to have no impact on the stock market and the stock volatility was driven by other market factors.

Nevertheless, the study is sustained with several limitations. Firstly, the study drawn the conclusion regarding the impact of price limits on the stock returns volatility by only investigating the 10 stocks which usually experience limit-hits as suggested by Phylaktis et al. (1999). Therefore, it is questionable if the conclusion would change with an increase of the sample. Besides, the findings are unable to clarify if stocks in different industries may react differently to the change in price limits. Due to these limitations, further investigations are required in order to deal with those concerns by which could provide more information about the effect of price limits on stock volatility.

## **COMPARISON OF MANAGERIAL IMPLICATIONS FOR UTILIZATION OF VARIABLE COSTING AND THROUGHPUT ACCOUNTING METHODS**

*Novák Petr, Popesko Boris, Papadaki Šárka*

### **Abstract**

Variable costing (VC) and throughput accounting (TA) are methods frequently used for decisions affecting product mix. Both methods feature some similarities in data processing, but they are applied in different situations. The VC method is preferred in situations when product mix decisions are based on maximizing a product's contribution margin, while TA depends on maximum utilization of resource constraints. Both take a different approach to variable costs, which are assigned to individual products. While TA conceives of total variable cost in the meaning of absolute variable cost, VA accepts the maximum level of variable cost.

The objective of the study presented herein is to analyze the differing approaches of the VA and TA methods to cost variability and any consequent managerial implications. Adhering to a different approach to variable costs could result in a variety of product mix decisions. Such distinctions between the methods are given, through the analysis of several examples, and the authors' final conclusions on making effective product mix decisions are deduced.

*Keywords: variable costing, throughput accounting, TOC, cost behavior, cost variability*

JEL Classification: M10, M49

## **1 INTRODUCTION**

Businesses today have to face increasing challenges from competitors relating to time and quality. A company simply could not survive unless it capitalized on competitive advantages gained through providing high quality products and services in a shorter throughput time and with quicker inventory turnover. (Rahman, 1998)

The relevance of cost information to managerial decision-making has been a central issue in cost accounting for the past 100 years. Decision-making is the most important objective of a cost accounting system. (Boyd and Cox, 2002)

The aim of this paper is to compare two approaches - throughput accounting and variable costing - and their impact on decisions affecting the structure of production. These methods are very similar in many ways, but instigating them highlights the major impact they make on decisions concerning production structures. This study applies these methods to the same product structure, mainly focusing on the influence of accuracy and details of cost allocation (according to their variability) when judging the prioritization of individual products.

## **2 LITERATURE REVIEW**

Throughput accounting (TA) is based on the concepts of TOC and is implemented in management accounting (Waldron and Galloway, 1988). Throughput accounting has been designed to inform decisions that boost the profitability of an organization and to accommodate assigning responsibility for those decisions. This is because throughput

accounting ensures transparency and visibility of the underlying data and principles on which decision-making rests (Ruhl, 2000).

Variable costing is an inventory costing method that only applies variable production costs to a product; under this method, a fixed factory overhead is not assigned to the product. Typically variable production costs are direct material costs, direct labor costs and variable overhead costs. (Horngren and Sorter, 1961) From a variable costing perspective, fixed costs are generally considered to relate to a period of time, i.e. they are period costs (Green, 1960). Many fixed costs can be viewed as typically representing resources that provide productive capacity for a period of time (McFarland, 1966). If, during an accounting period, the given capacity is not fully utilized, then some of the fixed costs represent costs of such idle capacity (Fess and Ferrara, 1961).

Noreen according to Goldratt stated that traditional accounting proved reasonably accurate when direct labor was variable and there was little overhead. However, labor is now termed a fixed cost and has become a large part of total cost. (Noreen, 1995) A number of authors claim that TOC is useful only in the short-term, while other accounting methods are more suitable for informing long-term decisions. (Kee and Schmidt, 2000, Graves and Gurd, 1998; Dugdale and Jones, 1997; Holmen, 1995) Applying TOC can be useful in other management areas such as purchasing, quality management or information management. (Rahman, 1998)

Balderstone and Keef (1999) reported that many authors highlight that throughput is defective to the degree that it ignores other variable costs, and the debate on its use is misguided in addition to being based on incorrect specifications. They claim that there may be situations where direct materials are not true variable costs, thus adversely affecting the throughput measure. Some feel there is little or no difference in throughput and contribution margin (Balderstone and Keef, 1999; Tollington, 1998).

Table 1 describes the basic characteristics of direct costing and the theory of constraints.

Tab. 1 – Basic characteristics – direct costing, the theory of constraints. Source: Boyd and Cox, 2002, Dugdale and Jones, 1998

<b>Cost system</b>	<b>Basic characteristics</b>
<b>Direct costing</b>	<ul style="list-style-type: none"> <li>• Fixed overhead is not allocated to products</li> <li>• Product costs consist of direct labor, direct material, and the portion of overhead that varies with the units produced</li> <li>• An inventory is understood as an asset</li> <li>• Contribution per unit: selling price less direct labor, direct material and variable overhead</li> </ul>
<b>Theory of constraints</b>	<ul style="list-style-type: none"> <li>• No concept of product cost</li> <li>• Throughput is defined as the price of a unit less the raw material and other costs that vary for each unit of production</li> <li>• All costs other than raw material costs and any other costs that vary for a unit of production are considered an operating expense</li> <li>• An inventory is understood as a liability that binds money</li> <li>• Throughput per unit of the constraint: selling price less raw material cost, divided by units of the constraint used in making the product</li> </ul>

It is necessary to realize that costs need to be discerned as either variable (linked to load capacity) or fixed (independent of load capacity). How the Wagner (2012) states, in the vast

majority of the literature is the issue of variability of costs examined only from the perspective of a relationship quantities for which the volume is considered performance (outputs). Volumes of output as the fundamental cost driver, however, individual professional sources usually further specify. Indeed, part of such a fixed cost can have a proportional character by maintaining continuity (e.g. costs associated with a charge for production). As Zamecnik (2014) states, when implementing the method of allocating indirect costs, it is necessary to keep in mind a very important rule, i.e., that it is necessary to distinguish between total indirect costs actually related to the given activity and part of indirect costs – can be specified as eligible indirect costs. For example, it is possible to distinguish costs united with the dose and its level that change in accordance with the quantity of doses, but that remain fixed in connection with individually produced units or products. As Weil states, costs can be controllable or uncontrollable. The success of a responsible accounting system depends on the ability of the company to correctly identify which costs each level of management can control. (Weil and Maher, 2005) The next possibility is to distinguish costs related to a group of products or services. Discussion could continue on such enumeration of variability, for example, through costs, their formation being induced by specific customers and the individual attitude to the same (e.g. in marketing, support from customers, and so on). It is also possible to evaluate the variability of costs in terms of the influence of time.

Knowledge of cost behavior is very important, especially for decision-making. Balakrishnan (2014), however, emphasizes that virtually every firm has some resources whose adjustment costs are sufficiently large to preclude capacity adjustments in the short-run (e.g., a year, which is the usual time period chosen). Weiss (2010) proposed the following: results indicate that firms with stickier cost behavior obtain less accurate earnings forecasts by analysts than firms with less sticky cost behavior. Activity or volume may be measured in terms of units of production or sales, hours worked, distance traveled or any other appropriate measure of the activity of an organization. For each decision taken, the management of a company requires estimates of costs and revenues at different levels of activity for alternative courses of action (Drury, 2004). Meanwhile the behavior of the costs and any subsequent decision depends on the cost driver. This also highlights Rajnoha (2011), adding that for detailed cost management could be further also use methods such as Activity Based Costing, Target Costing, Kaizen Costing and many others, which are based on the detailed calculations according to cost activities and processes.

### **3 METHODS**

The behavior of cost, from the perspective of its variability, is crucial for informing **managerial decisions**. Naturally, it is also necessary to apply appropriate costing methods and procedures.

Traditionally, two different product costing systems are defined – process costing (e.g. via traditional absorption costing) and alternative variable costing. These two major costing approaches differ from one another in the degree of costs assigned to the cost object. A widely utilized method is the traditional absorption full-costing procedure (job-order costing). Currently, this simple model denotes overhead rates as costs allocated (most commonly), although this would appear insufficient, as significant inaccuracies arise in the assignment of overheads costs. These inaccuracies can be eliminated by using costing methods based on partial cost absorption.

The authors of this study have performed a number of follow-up surveys in the past, which focused on cost management and the utilization of different calculation methods adopted by manufacturing firms in the Czech Republic. One of the objectives of this research was to find

out how the companies worked with costs (especially overheads) and how they performed their allocation of various cost objects. The last survey was conducted in 2014 as a lead-in to a quantitative research project – “Variability of cost groups and its projection in the costing system in manufacturing enterprises”.

Such research led to conclusions that the authors reported in an article comparing two methods which did not allocate all costs. These methods are frequently applied so as to aid decisions on product mix - variable costing (VC) and throughput accounting (TA).

In order to present the differences between the individual methods that assist decision-making on product mix, it is possible to demonstrate these through providing a model portfolio of four products. The authors registered, for each product, lead time as limiting the input factor, the price, absolute variable cost (TVC), and other variable costs (OVC). These costs were also recalculated, by the relative percentages, in relation to the selling price of products. As can be seen in Table 2, these parameters for individual products differ from each other and it is possible to examine and compare the impact of calculation methods specified for managerial decision-making. Furthermore, the process of optimizing the production portfolio was conducted due to the limited overall production time, using the variable costing and throughput accounting methods. It was based on indicators of contribution margin, throughput and their share of the limited factor of lead time. These indicators determined classification of the benefits of products. Finally, the overall effects were determined (total contribution) resulting from the proposed product mix.

## **4 RESULTS**

Surveying the current level of knowledge in this field clearly reveals that constant change and development occur in the business and economic environment; hence companies require new approaches to constantly assess costs and their variability. Obviously, the more accurate the determination of the variability costs, the more possible it is, and it supports their recognition by appropriate calculation methods. Companies very often lack sophisticated tools for proper identification and allocation of costs, which explains why they are not properly factored into the price of products. Supporters of Activity-Based Costing espouse that all costs are variable over the long-term. The Activity-Based model captures this variability by assigning costs to products in proportion to the expected long-term demand of each product for costly resources. Nevertheless, there are proponents of the Theory of Constraints, who take a very short-term perspective and assume that the costs of most resources are fixed and inescapable. This means that the TOC model usually only assigns variable material costs to products while seeking to optimize throughput (i.e. the contribution margin) on the fixed resource capacities that constrain the overall system. (Novák and Popesko, 2014)

From the research carried out, it was found out that companies use calculations pertaining to partial allocation of costs in approximately 25% of cases. This was also confirmed by recent research, through utilizing the afore-mentioned calculation methods, as occurring in 34% of cases. Consequently, comparison is required of variable costing (VC) and throughput accounting (TA). The following table shows the basic data model example, thereby demonstrating the major differences in decision-making on various cost allocations. For this example, the authors wish to simply by selecting just four types of products - A to D, which vary in their method of manufacture. It can be assumed that the manufacturing process differs in length of production time, thus labor content. Additionally, it is presumed that production time is a limiting factor, with 210,000 minutes given over to production for the period in total.

Tab. 2 – Basic data – lead time, price and cost of products. Source: own

	<b>A</b>	<b>B</b>	<b>C</b>	<b>D</b>
<b>Lead time (LT) (min per unit)</b>	12	20	80	10
<b>Price (P)of unit (CZK)</b>	250	400	1200	150
<b>Direct material (TVC)</b>	110	300	600	30
<b>Other variable costs (OVC)</b>	50	40	200	100
<b>TVC portion (of price)</b>	44%	75%	50%	20%
<b>OVC portion (of price)</b>	20%	10%	17%	67%

\*TVC = absolute variable cost

The basis for evaluating the effectiveness of products A to D by using variable costing is determining the contribution margin (c) as the difference between price and variable costs (note: variable cost = TVC+OVC).

$$c = P - VC$$

A crucial factor for throughput accounting is the difference between price and absolute variable costs (TVC).

$$tp = P - TVC$$

Tab. 3 – Comparison of contribution margin (c) and throughput (tp) of products Source: own

	<b>A</b>	<b>B</b>	<b>C</b>	<b>D</b>
<b>c (CZK per unit)</b>	90	60	400	20
<b>tp (CZK per unit)</b>	140	100	600	120
<b>rank by c</b>	2 <sup>nd</sup>	3 <sup>rd</sup>	1 <sup>st</sup>	4 <sup>th</sup>
<b>rank by tp</b>	2 <sup>nd</sup>	4 <sup>th</sup>	1 <sup>st</sup>	3 <sup>rd</sup>

The first option for management decisions is to determine the order of profitability of the product, either according to contribution margin or according to throughput. The table shows that the most profitable product is product C, which shows the highest absolute contribution margin and throughput value. The second is product A, which is somewhat similar to C. The greatest difference pertains to products B and D. Due to the substantially varying other variable costs, the ranking of the products in the methods is reversed. As can be seen, the OVC portion of product D is about 67% of the price, while it is only 10% for product B. In this situation the manager would have to consider, according to which criteria will be for example put products into production process, whether to adhere to the figure of the contribution margin or throughput.

Continuing on, it is necessary to consider which criteria should inform decision-making. Since the products are not equivalent from the viewpoint of labor, it is desirable to evaluate them based on relative values linked to a limiting factor, therefore comparing:

$$c/LT \text{ and } tp/LT$$

From Table 4, it is evident totally different results are obtained in the relative expression of c and tp, which also dramatically alters the order of the products informing such a decision-making process. When deciding on product order based on c/LT, it seems the best product would be A, and product D the least advantageous. Conversely, according to tp/LT, the

evaluation is for D as the best product, exactly the opposite compared to assessment following c/LT. The least advantageous would then seem to be product B.

Tab. 4 – Comparison of relative contribution margin and throughput. Source: own

	<b>A</b>	<b>B</b>	<b>C</b>	<b>D</b>
<b>LT (min per unit)</b>	12	20	80	10
<b>c</b>	90	60	400	20
<b>tp</b>	140	100	600	120
<b>c/PT</b>	7.5	3.0	5.0	2.0
<b>tp/PT</b>	11.7	5.0	7.5	12.0
<b>rank by c</b>	2 <sup>nd</sup>	3 <sup>rd</sup>	1 <sup>st</sup>	4 <sup>th</sup>
<b>rank by tp</b>	2 <sup>nd</sup>	4 <sup>th</sup>	1 <sup>st</sup>	3 <sup>rd</sup>
<b>rank by c/LT</b>	1 <sup>st</sup>	3 <sup>rd</sup>	2 <sup>nd</sup>	4 <sup>th</sup>
<b>rank by tp/LT</b>	2 <sup>nd</sup>	4 <sup>th</sup>	3 <sup>rd</sup>	1 <sup>st</sup>

Now this begs a question: what do these approaches mean with a view to the overall effect on the company? For consideration, there might also be the possibility of production due to market demand (see Table 5, row 2). It is evident that to supply a quantity thus demanded, total installed capacity would be exceeded (see total LT, row 3; 260,000 minutes of manufacture would be needed, but the limit is only 210,000 minutes). This would represent the need to make a managerial decision on setting the product mix. The question is, however, which calculation method should be used to make a good decision? The following table illustrates the overall contribution of product mix adjusted according to individual methods and criteria.

Tab. 5 – Design of product mix according to variable costing or throughput accounting  
Source: own

<b>1</b>		<b>A</b>	<b>B</b>	<b>C</b>	<b>D</b>	<b>Total PT (min)</b>	<b>TCM (CZK)</b>
<b>2</b>	<b>total demand (pcs)</b>	5,000	4,000	500	8,000		
<b>3</b>	<b>LT (min)</b>	60,000	80,000	40,000	80,000	260,000	
<b>4</b>	<b>production based on c (pcs)</b>	5,000	4,000	500	3,000	210,000	<b>26,800,000</b>
<b>5</b>	<b>production based on tp (pcs)</b>	5,000	1,500	500	8,000	210,000	24,800,000
<b>6</b>	<b>production based on c/LT (pcs)</b>	5,000	4,000	500	3,000	210,000	<b>26,800,000</b>
<b>7</b>	<b>production based on tp/LT (pcs)</b>	5,000	1,500	500	8,000	210,000	24,800,000

\* TCM = total contribution margin

In this case, managers would have to decide which products and the amounts of these they should produce to achieve the greatest effect. Rows 4 - 7 show a model of setting a product mix based on the order of products from Table 4. In all cases it would be necessary to eliminate part of the production of one product by the maximum possible capacity. In the case of setting production by variable costing (rows 4 and 6), products A – C are fully included in production, but capability would be limited to producing only 3,000 pieces of product D (although demand outstrips this at 8,000 pieces). Should managers set the product mix based on the order specified by throughput accounting, the decision would be to fully produce

products C, A and D, although product B would be restricted to 1,500 pieces (compared to a potential 4,000 pieces). The total effect is expressed in the column labeled TCM. Here it is evident that settling on a product mix based on the order derived from variable costing would bring a greater overall effect in the form of a higher total contribution margin – 26.8 million CZK, compared to 24.8 million CZK resulting from throughput accounting.

## **5 DISCUSSION AND CONCLUSION**

The example given above is not intended to determine which calculation method is more suitable for a company. The aim is to point out the importance of properly allocating costs and forming opinions based on relevant information. The above example clearly shows the need for more detailed cost allocation. In the case of throughput accounting, only the allocation of direct costs would seem insufficient for effective decision-making. Comparing this with the variable costing method, this appears more appropriate as it also allocates other variable costs. Despite these disadvantages, however, frequently manufacturing companies only allocate absolute direct costs - direct material, even when using standard variable costing.

Needless to say, the advantage of this approach is the simplicity to assign merely the cost of direct materials, which are usually accurately recorded in relation to defined products. Companies thus avoid possible problems arising from improper allocation of costs of other groups – e.g. the allocation of salaries in manufacturing. Hence they work with the throughput indicator (i.e. the price minus absolute direct costs) and determine its relative amount in relation to the quoted price of the product, which should be sufficient to cover other costs (other variable costs and overheads). However, as illustrated by the model above, decisions on the basis of throughput could lead to incorrect setting of the product mix. Consequently, the company might well experience reduced profit.

Therefore, important factors relating to this would be detailed allocation of costs and determining other variable costs that significantly affect the efficiency of individual products (see other variable costs of product B and D in Table 1).

### **Other variable cost**

A certain degree of uncertainty in direct and clear allocation of these costs plays a large role in the frequent absence of allotting other variable costs. In other words, it is a challenge even considering which costs should be included. For example, labor cost cannot be clearly identified as direct. Would it be worthwhile looking for a link which could describe labor cost as absolutely direct? In fact, only one single case exists where workers were strictly rewarded by piecework pay for labor, which would preclude the possibility of a worker being rewarded at all (even if earning reduced wages), but is also relevant if performance was limited (e.g. due to lack of orders and reduced production at the company). Another could lie, for example, in the character of production, where automation and robots work would become a more indirect factor due to actual physical work by employees being replaced by servicing activities – by machine operators. In such cases it is hard to look for a strictly direct relationship to production. Under circumstances like these, such costs can be considered variable, because they correspond to the volume of production, although they cannot be considered as strictly direct. Even more striking is the case of production executives, who do not participate directly in the actual production of individual units – effectively being the masters overseeing production.

The same may also be true with other costs which can be categorized as other variable cost, such as excipients in production, e.g. lubricants, auxiliary tools, etc. Not least there is also the

figure for costs which can be described as "variable production overheads", relating to things such as electricity (for operating factory premises), heating costs, cleaning services, and so on. All of these costs need to be accordingly assigned to their individual performances, which can sometimes be difficult or inaccurate.

Furthermore, as product costing research in Europe shows, a significant proportion of units using a direct labor-based overhead rate (either direct labor cost or direct labor hour rates) or other volume-based overhead rates (e.g. machine hour, material cost, units produced and production time-based rates) have been applied extensively (Brierley et al., 2001) Many firms are likely to incur overheads driven by direct labor hours, and hence it is not surprising that researchers have found direct labor being used as a basis for assigning overheads to products. However, given the relatively low proportion of product costs that are made up of direct labor costs, it is perhaps surprising to see that it is the most commonly used overhead rate. Simply using a labor-based overhead rate for allocating production overheads can lead to problems relating to inaccurate direct allocation to a unit in the case of automated production.

The problem described above demonstrates that using calculations which only allocate absolute direct costs (direct material) for informing the decision-making process is insufficient, revealing the importance of understanding cost behavior and its proper projection in calculation systems. The more detail determined in the variability of costs (as a consequence of various factors and not merely volume of production), the more reliable information one obtains to aid subsequent decisions – on the product mix, pricing of products, production capacity utilization, and so on. Hence, it is apparent that the variability of costs is of utmost importance and indicates the need for further research in this area.

## **HOW BRAND-ORIENTED CULTURE AND ENTREPRENEURIAL ORIENTATION INFLUENCE FINANCIAL SERVICES SMEs FINANCIAL PERFORMANCE? AN EMPIRICAL STUDY**

*Christian Nedu Osakwe, Benson U. Ogbonna*

### **Abstract**

This paper is aimed at examining the interplay between brand-oriented culture, entrepreneurial orientation, workforce motivation and the financial performance of SMEs in a selected services sector, that of the financial services industry and in the context of a Sub-Saharan African economy. The contributions of this article to the fledgling SMEs marketing literature are threefold. First, we show that a brand-oriented culture is positively associated with a service-oriented enterprise financial performance. Second, we provide empirical support that workforce motivation is a direct antecedent of both entrepreneurial orientation and financial performance of this set of service-oriented SMEs. Third, we show that the complementarity of brand-oriented culture and entrepreneurial orientation is a key predictor of SMEs financial performance. Our study equally shows that in terms of relative strength, the complementary effect of brand-oriented culture and entrepreneurial orientation exceeds the individual effects of both on SMEs financial performance. Arguably, ours is the first quantitative study to report this particular finding in the SMEs marketing literature. More importantly, we have offered some strategic insights that could help deepen practitioners' understandings on how they could go about unlocking more marketing opportunities in the marketplace and ultimately become more financially successful in a rapidly changing business environment that is fuelled in part by ongoing technological advances, changing consumers' preferences, and hypercompetition.

*Keywords: brand-oriented culture, entrepreneurial orientation, financial performance, financial services SMEs, Nigeria, workforce motivation*

### **1 RESEARCH BACKGROUND AND SIGNIFICANCE OF STUDY**

Globally, financial services firms are facing more intense competition both within and outside their industry (Crittenden, Crittenden, & Crittenden, 2014). At the same time, relevant stakeholders are increasingly becoming more demanding about the financial transparency and performance of these firms in the aftermath of the recent global economic meltdown. Be that as it may, the focus of this study is not on large financial service providers but rather on SMEs in this sector with a particular focus on whether or not brand-oriented oriented culture and entrepreneurial orientation have direct consequences on the financial performance of these enterprises in the context of an 'emerging' market that is situated in the African continent. This paper is further grounded in the resource-based theory (RBT) of the firm which largely posits that the competitiveness of a firm stems from having the right mix of intangible marketing resources such as market orientation, entrepreneurial orientation, management capability, learning orientation, and brand-oriented culture (Barney, 2001; Jaworski & Kohli, 1993; Urde, 1994).

More specifically, this research is premised on the need to provide a better understanding on how the interplay of brand-oriented culture, entrepreneurial orientation and possibly their

complementarity impact upon the financial performance of SMEs using the Nigerian financial services industry as our empirical evidence. Additionally, we explore the interplay between workforce motivation, entrepreneurial orientation and the financial performance of these enterprises. In a way, this research responds to the call in Laukkanen et al. (2013) for further empirical investigation on how brand-oriented culture can indeed impact on the performance of SMEs. More so, the authors apparently suggested that entrepreneurial orientation is an antecedent of brand-oriented culture. Thus, we sought to further investigate if entrepreneurial orientation is a driver of brand-oriented culture in the context of SMEs in a service sector that is highly competitive in the country of study, but less ‘sophisticated’ when compared with what is obtainable in most advanced economies.

By and large, this paper will enrich the inchoate SMEs marketing literature by providing deep insights on how the mix of some strategic orientations could be of benefit to SMEs financial performance in a marketplace that is constantly driven by changing consumers’ preferences, hypercompetition and technological innovations. To the best of our knowledge, this is arguably the first study of its kind in Anglophone West Africa and similar developing countries that seek to model these impacts on the financial performance of financial services enterprises using the Partial Least Squares (PLS) approach to causal modelling. Thus, we can state that this work contributes appropriately to the methodological applications of PLS-SEM in the SMEs marketing literature.

So to recapitulate, primarily the main objective of this paper is to cast some light on the role that a brand-oriented culture either implicitly or explicitly role plays in enhancing the financial performance of small and medium-sized financial enterprises in Africa’s largest commercial hub, Nigeria. A quick recap of the study’s sub-objectives have been itemized below:

- [1] To empirically investigate whether or not entrepreneurial orientation is an antecedent to a brand-oriented culture in financial services SMEs;
- [2] To empirically investigate and establish the relationship between brand-oriented culture and financial performance of financial services SMEs;
- [3] To demonstrate the complementary effect of entrepreneurial orientation and brand-oriented culture on financial performance of the SMEs; and
- [4] To an extent explore the dominant role that workers’ motivation play to the realization of a firm’s financial well-being and entrepreneurial orientation.

This paper is further structured as follows. In the next section, we provide a conceptual framework of the study with hypotheses while the subsequent section covers the research design, data collection and data analysis. In the last but not the least section, we painstakingly provide discussion of the research findings, implications, limitations and possible future research directions.

## **2 CONCEPTUAL FRAMEWORK AND HYPOTHESES FORMULATION**

The conceptual framework of this research paper as well as its associated hypotheses is depicted in Figure 1.

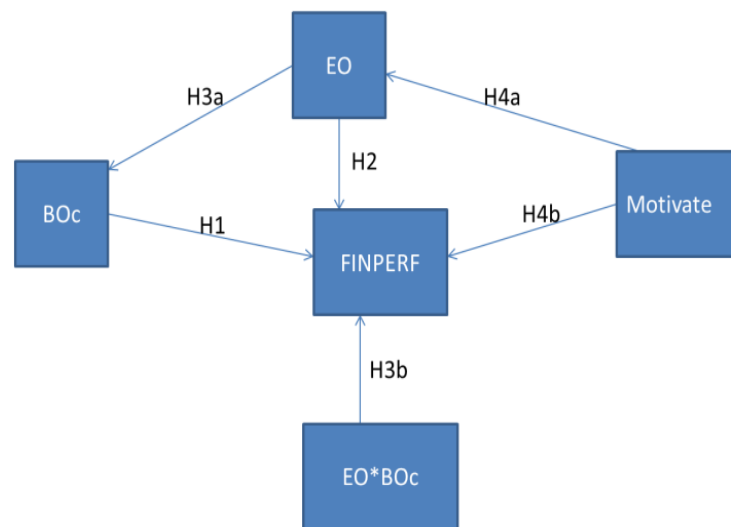

Fig. 1 – Theoretical Model. Source: Authors’

Extant literature has it that a firm’s brand-oriented culture, entrepreneurial orientation likewise workforce motivation underpin the market and financial success of the firm in the marketplace. These three main concepts are deeply rooted in the marketing field and some marketing scholars (Hudson, Smart & Bourne, 2001; Otubanjo, 2011; Urde, Baumgarth & Merrilees, 2011) assert that these are strategic resources that are capable of making a firm ‘easily’ stand out from the rest of the competition.

A firm’s brand-oriented culture is rooted in the understanding that the firm’s internal business processes, marketing activities, and its communication with relevant stakeholders uniformly conform to a unique identity in the marketplace (Urde et al., 2011). In fact, as Urde (1994) puts it, a firm’s brand-oriented culture should be seen as a strategy for survival since this will distinguish the firm from the rest of the pack. Thus, the concept of brand-oriented culture encompasses the full spectrum of enterprise business activities, marketing strategies, and relationship-building with stakeholders, particularly customers. Enterprises with a high brand-oriented culture are perceived to be enterprises that are focused on building a strong brand name and carving a niche for itself in their target market(s). Narrowing it down further to the SMEs context, the main question would be this-is a brand-oriented culture relevant for these enterprises to compete in the marketplace? Indeed, there is a dearth of scholarly literature dealing with SMEs branding. Nonetheless, a recent study appears to show that brand-oriented culture (BOc) is positively associated with SMEs brand performance and market performance (Laukkanen et al., 2013). Against this background, we propose that:

***H1: BOc positively influences SME financial performance.***

Moving forward, prior studies seem to suggest that entrepreneurial orientation (EO) or what some new studies have dubbed as ‘corporate entrepreneurship’ is key to enhancing enterprises’ market competitiveness and financial performance (Helm, Mauroner & Dowling, 2010; Nadia, Achtenhagen & Davidsson, 2014). EO obviously has to do with the disposition of the firm towards innovation, clarity in the identification of business/consumer needs, proactiveness as well as the propensity to venture into ‘high-risk’ business dealings (Lumpkin & Dess, 1996). Another important dimension of EO has to do with the firm’s business owner

stoic determination to succeed in the marketplace regardless of its present business challenges. Based on the evidence provided by the aforementioned studies, we propose that:

***H2: EO positively influences SME financial performance.***

It may well seem reasonable so to picture EO as a direct antecedent of SMEs brand-oriented culture (Laukkanen et al., 2013; Wong & Merrilees, 2005). More so, the configurations of EO and BOc, that is the complementary effect of EO and BOc could provide greater financial benefits for these enterprises. Some recent research (Ngo & O' Cass, 2012; Sok, O'Cass & Sok, 2013) appear to suggest that since most intangible strategic resources strongly complement one another, it is important to investigate how this configuration might have an effect on enterprise performance. Thus, in line with the above-mentioned studies, we propose that:

***H3a: The greater the intensity of EO, the greater will be the BOc of the SME.***

***H3b: In addition to their independent effects, the complementary effect of EO and BOc will have an increasing effect on an SME financial performance.***

More so, research has consistently shown that business owners desire to build a business model with a motivated workforce that could serve customers' needs in multifarious ways. Extant literature in human resource development clearly shows that employees who are well-motivated perform better, add value and will positively affect organizational performance (Kovach, 1995; Kruger & Rootman, 2010; Perry, Mesch & Paarlberg, 2006). Similarly, a related study that was conducted among German SMEs appears to indicate that workforce motivation is a direct antecedent of corporate entrepreneurship in SMEs (Schmelter et al., 2010). Thus, in line with these studies, we further propose that:

***H4a: Workforce motivation will rub off positively on the EO of an SME.***

***H4b: Workforce motivation will rub off positively on an SME financial performance.***

### **3 RESEARCH DESIGN, DATA COLLECTION AND DATA ANALYSIS**

The unit of analysis in this study is an enterprise employing between 10-249 employees, which is an SME. To guide against industry heterogeneity, we concentrated on a particular service sector - financial services sector. Three Nigerian cities and/or states were chosen as the survey locale for this study. These three Nigeria cities (Abuja, Lagos, and Port Harcourt/Rivers State) were chosen based on their strategic relevance to the Nigerian economy. Moreover, Lagos State alone accounts for a majority of the financial services firms as well as SMEs in the country while Abuja happens to be the administrative capital of the Nigerian state and Port Harcourt/Rivers State is the oil hub in Nigeria. A structured questionnaire was used as the instrument for this study. Due to the challenges of inefficient postal delivery system in Nigeria, a drop and pick procedure was adopted for this study. In all, we got 156 effective responses from our target population. The key informants for this study are SMEs' owners and/or managers.

The main constructs in our structured questionnaire were adapted from prior studies. For an example, the perceptual measure of financial performance was gotten from Baker & Sinkula (2009) while the construct measuring brand-oriented culture was adapted from Wong & Merrilees (2008). The items measuring entrepreneurial orientation were adopted from Laukkanen et al. (2013). All the items measuring the key constructs were anchored on a 5-point Likert scale. The measure for workforce motivation was anchored on 'Yes/No' option. Prior to the main survey, a pretested survey was carried out in order to enable us to get initial

feedback from our target population. Based on this initial survey, we were able to come up with a more terse research instrument.

Further to check for non-response bias, we checked whether the late respondents were somewhat different from our early respondents. Based on our findings from the data, we did not notice any significant difference across enterprise demographic variables. More so, all those who participated in this study all have university qualifications and a majority of these enterprises have between 10 to 49 employees while relatively few have 50-249 employees. Most of the SMEs in our study are micro finance banks (MFBs), finance houses, and insurance firms. Consistent with extant literature, we checked for common method bias (CMB) using the procedure suggested by Podsakoff et al. (2003), that is Harman's unrotated one-factor analysis solution. From our result (using PCA- Principal Component Analysis), a single factor solution did not emerge and no single factor accounted for the majority (50%) of the variance. Thus, it appears that CMB is not a major issue in this study.

Given that the centrality of this study is aimed at predicting the interrelationship between brand-oriented culture, entrepreneurial orientation and financial performance of SMEs; we further proceeded to evaluate the measurement model as the well as the structural model using the two-stage approach of model verification in Partial Least Squares-Structural Equation Modelling (PLS-SEM).

Specifically, we made use of SmartPLS (Ringle, Wende & Will, 2005) for the soft modelling of our theoretical model. All the constructs in our model are first-order reflective constructs. All the items' factor loadings are statistically significant ( $p < 0.01$ ), with the exception of one item in the BOc construct ( $p < 0.1$ ) using 5000 bootstrapped samples. Checking further for convergent validity, we based our criterion values of 0.7 and 0.5 for composite reliability (CR) and average variance extracted (AVE) respectively in accordance with these studies (e.g., see Fornell & Larcker, 1981; Hair et al., 2012). All the constructs, including the interaction term (complementarity) of BOc and EO fulfil the assumption of convergent validity (see Table 1). Next, we check for discriminant validity using the suggestions given by Fornell and Larcker (1981). Our results satisfy the assumptions of the outer model's discriminant validity (see Table 1).

Tab. 1 – Results of the Outer Model Evaluation (Source: Authors' Elaboration)

	AVE	CR	Cronbach's $\alpha$	SFL (range)
BOc	.648	.874	.858	.481 - .953
EO	.900	.978	.972	.921 - .965
EO*BOc	.554	.952	.958	-
FinPerf	.573	.800	.649	.721 - .817
Motivate	-	-	-	-

	BOc	EO	EO*BOc	FinPerf	Motivate
BO	<b>.805</b>				
EO	.085	<b>.948</b>			
EO *BOc	.357	.188	<b>.744</b>		
FinPerf	.409	.174	.482	<b>.757</b>	
Motivate	.044	.246	.145	.367	-

Consequently, the inner model was assessed by examining the coefficient of determination ( $R^2$ ), path coefficients, predictive relevance (Stone-Geisser's  $Q^2$ ) and the model's global Goodness-of-Fit (GoF) measure (Hair et al., 2012; Tenenhaus et al., 2005). The results of the overall quality of the research model, including the path coefficients are displayed in Table 2. In order to ascertain the statistical power and effect size of the sample ( $n=156$ ) used in this study, we went further by conducting a post-hoc power analysis test in G\*Power software, a tool provided by Faul et al. (2009). The result of the test exceeds the minimum required statistical power of 0.8 as suggested by Cohen (1988), albeit moderate effect size.

Table 2- Overall Research Model's Regression Weights and Quality Parameters (Source: Authors' Elaboration)

Direction of Paths	Beta Coefficient	T Statistics	P-Value
BOc -> FinPerf	0.274	2.511	$P < 0.05$
EO -> Boc	0.085	0.377	$P > 0.05$
EO -> FinPerf	0.013	0.171	$P > 0.05$
EO*BOc -> FinPerf	0.338	3.266	$P < 0.01$
Motivate ->EO	0.246	3.145	$P < 0.01$
Motivate -> FinPerf	0.303	3.308	$P < 0.01$
$R^2$ for FinPerf	0.388	Cross-validated redundancy ( $Q^2$ ) $Q^2$ for FinPerf is 0.189 $Q^2$ for BOc is -0.010 $Q^2$ for EO is 0.053	
$R^2$ for Boc	0.007		
$R^2$ for EO	0.06		
Model's GoF	0.318		

#### **4 DISCUSSION OF RESEARCH FINDINGS, IMPLICATIONS, LIMITATIONS AND FUTURE STUDIES**

Recall that this paper sought to model the form of relationship between the interplay of brand-oriented culture, entrepreneurial orientation, workforce motivation and financial performance of SMEs in the financial services industry. Based on our findings, we have empirical support for four out of the six hypothesized relationships. First, BOc has been found in this study to increase the financial performance (Finperf) of SMEs. This particular finding provides ample support for the sparse literature on the significance of brand-oriented culture to SMEs market and/or financial performance (e.g., see Berthon, Ewing & Napoli, 2008; Laukkanen et al., 2013; Wong & Merrilees, 2005). Similarly, the complementary effect of BOc and EO appears to have an increasing effect on SMEs financial performance. To our best of knowledge, this is arguably the first study to report of this particular finding in the research stream on SMEs marketing.

Furthermore, we have empirical evidence that workforce motivation rubs off positively on both EO and Finperf of SMEs. This finding is consistent with previous studies (Hudson et al., 2001; ILO, 2013; Muogbo, 2013). Although EO appears to have the expected signs on both BOc and Finperf of SMEs, we do not have further evidence that EO is indeed a significant predictor of BOc and Finperf. This particular result appears to be in contrast with a related study that was conducted in two EU countries (see Laukkanen et al., 2013), such a difference may be attributed to the peculiarity of the financial services industry when compared with other industries as well as differences in geographical settings.

Given the outcomes of the present study, it follows that SMEs' owners/managers in the service sector, particularly financial services, should endeavour to develop a brand-oriented culture that cuts across all their service contact points. Such a culture should be able to permeate all the marketing activities of any enterprise that is interested in a building a strong brand name in the marketplace.

Thus, it is imperative for an SME in the financial services sector to synchronize its marketing activities with an 'umbrella' brand name, that is, the corporate brand. These enterprises should equally endeavour to engage more with their target market(s) through cost-effective traditional marketing channels as well as the use of social media in evangelizing their corporate brand names and unique selling proposition (USP). Creating an enviable financial brand status in this present era of 'Internetization' as well as globalization would demand enterprises to be more sociable, innovation driven, prudential, transparent in their financial dealings with stakeholders, and importantly, a copper-bottomed organization.

More so, given the competitive nature of this sector of the Nigerian economy, SMEs could leverage on a multiple strategic orientation at the same time, particularly the simultaneity of entrepreneurial orientation and brand-oriented culture. Such a 'co-alignment' has been found in this study to enhance the financial success of an enterprise. An enterprise that is proactive, takes calculated business risks, innovative and equally perceives branding as a strategic value to its long-term business success will most likely financially outperform its rivals in the marketplace.

In addition, this study has equally demonstrated that workforce motivation is a direct antecedent of EO and Finperf. Therefore, enterprises should endeavour to continuously incentivize its workforce. In the Nigerian setting, workforce motivation could be in the form of a pay raise, prompt payment of staff salary and/or bonus. More importantly, is the need to create a learning and conducive workplace environment.

Notwithstanding the interesting findings in this study, our research model is only able to capture about 40% of the variance in the outcome variable (Finperf). This possibly indicates that there may be other more relevant predictors that were not covered in the current study that could impact upon the financial performance of these enterprises in Nigeria. This leaves room for future studies to explore other relevant intangible and tangible resources that could impact positively on the financial performance of SMEs in the financial services sector as well as in related industries. To further establish the veracity of these findings, researchers could replicate this study in another developing country context. Moreover, researchers could explore this research model further by comparing the outcomes with objective measures of financial performance. In all this research paper makes a significant contribution to the financial services and SMEs marketing literature.

## **INFLUENCE OF STATISTICAL METHODS ON EFFICIENCY OF FINANCIAL AUDIT IN PUBLIC ADMINISTRATION**

*Milana Otrusínová, Lubor Homolka, Eliška Pastuszková*

### **Abstract**

The paper aims to analyze the use of statistical methods and the efficiency of their use on financial performance in the public administration. The paper defines the performance audit and states it as currently one of the effective tools to support performance. This paper explores a new model for testing the probability of the occurrence of errors in the audit sampling for verifying the accuracy of operations when performing financial control in public administration. To be able to assess some sample statistically, it is necessary to apply the methods of probability sampling, which enable accurate quantification of the level of ascertained certainty.

*Keywords: performance audit, financial audit, statistical methods, audit sampling, probability*

JEL Classification: M41

### **1 INTRODUCTION**

Financial control as a part of a performance audit is not the domain of only commercial entities, but also of public administration as a whole. All mechanisms of performance measurement are adequate and useful if they are designed to achieve goals. The goal of this paper is to obtain answers to the following key question: Using statistical methods, is it possible to contribute to the efficiency of public administration in the performance of financial control?

In the first part of this paper, the authors discuss the main purpose of the theoretical background of performance management in public administration and the principles of "3E's" as a basic principle for the area of financial control in public administration. Then the chapter summarizes the main findings from the literature review of using statistical methods in the financial audit. The third part presents the methodology used in the paper. The fourth part presents a new model of testing the probability of the occurrence of errors in the auditor's sampling for verifying the accuracy of operations when performing financial control in public administration. The last part concludes by discussing the results.

### **2 THEORETICAL BACKGROUND AND PROBLEM FORMULATION**

Specialized literature has been dealing with the issue of performance of the public administration, see, e.g. Arnaboldi, M. (2010), Behn (2003), Lapsley (2008), Wholey & Newcomer (1997) and Modell (2009). It is true that all mechanisms of performance measurement and management are adequate and useful if they are designed to achieve goals. If we want to assess the success of public administration using performance measures, it is first necessary to define the term performance. The definition of performance or performance measurement is not very clearly defined anywhere in the literature. As Neely et al. (1995) states, "performance measurement is a topic often discussed but rarely defined". The same authors present their own definition of how to understand performance and its measurement:

"Performance measurement can be defined as the process of quantifying the efficiency and effectiveness of action".

The principles of economy, efficiency and effectiveness are collectively defined in the Czech environment as organizational performance, and the model concept of the "3E's" is considered the basis for performance monitoring in public administration, when based on the objectives, inputs are provided, i.e. resources that are in the form of personnel and material securing transformed into outputs. Outputs are developing effects in which public administration is interested. Even with a separate study of the economy or efficiency of the given activity, it is essential to assess the effectiveness at least in general, which has fundamental importance. And vice versa, in assessing the effectiveness, it is necessary to evaluate the economy and efficiency, because assessed activities, programs, operations, etc. could indeed have the desired result, but resources to achieve this result have not been used economically and efficiently. A generally known and customary explanation of how to understand various terms is represented in a quote by Drucker (1993): "Efficiency is doing things right, effectiveness is doing right things." In the Czech Republic, the principle of "3E's" is a basic principle for the area of financial control in public administration under the rule of statutory regulations (Act No. 320/2001 Coll., on Financial Control). Within the Financial Control Act (2001) and Pastuszkova et al. (2011), the meaning of words can be loosely interpreted as follows: Economy = the lowest possible expenditure of funds within the appropriate quality (performance in relation to price), the evaluation criterion for input based on the principle of doing things inexpensively. Efficiency = achieving the necessary outputs for little money, the relationship between inputs and outputs based on the principle of doing things the most suitable way. Effectiveness = expresses the degree of progress towards the set objectives (Do we have what we wanted?), the evaluation criterion for output based on the principle of doing only those things that really should be done.

Financial control as a part of a performance audit is not the domain of only commercial entities, but also of public administration as a whole. In terms of financial flows, public administration is ranked amongst large organizations, so thorough control of all activities is necessary. In general, financial control is considered one of the guarantees of upholding the legality and financial discipline in the area of financial relations. Financial control is one of the parts of monitoring public expenditures. Its essence is monitoring selected indicators that concern the problem of handling and using public expenditures. The essence of a financial audit of public expenditures can be both control of relevant expenditure processes, and monitoring of economic indicators concerning rational use of invested resources, i.e. assessment of results and performances for which the designation performance audit is used. Rosa (2014) and Kells (2011) take up the issue of the performance audit in public administration in their respective papers. Control of public expenditures primarily includes review of financial accounting expenditures of resources in terms of the appropriateness of use of resources, and simultaneously acts as oversight that the given expenditure processes correspond to legal standards and regulations. The performance audit is monitoring of followed indicators from the aspect of performance and result, their verification and comparison with target statuses, with consequent ascertaining of possible deviations from the target condition and defining of recommendations for changes. The essence of the performance audit is monitoring how effectively resources were spent. During the performance audit, we monitor the qualitative and the quantitative side. Focus on the quantitative side means that we monitor economy, (cost) efficiency and effectiveness. According to Reichborn- Kjennerund (2013), the performance audit is widely used in public administration, but there still exists little proof of its usefulness.

Mainly the accounting of the given organization provides the necessary data and information for assessing all financial controls, financial and performance audits. Accounting aids in responsible decision-making. An integral accounting system is a comprehensive and reliable source of data for all forms of differentiated (external and internal) control, and is the basic and most important diagnostic instrument (Kolářová, 2013). It enables assessment in causation, in input-output relations, and in relations to the past, present and future. Evidential documentation for verifying the accuracy of operations when performing financial control in public administration comprises a group of assembled certificates and documents by which the derived conclusions are substantiated with regard to a specific aim of control activity. Without sufficient volume of complex, timely and reliable information elaborated in terms of needs of variously differentiated control, it is not possible to ensure efficient control or an audit.

A summary of all data on verified facts forms a basic group. Testing is understood as the process of ascertaining the true status of verified items, groups of items, selected samples or entire basic files, an analysis of the factual status and its comparison with relevant criteria. The aim is to gain certainty based on the evidential documentation of the fact of whether the information systems of the public administration authority are reliable, i.e. whether the verified data on handling public funds faithfully and completely illustrates the sources, status and movement of public funds. The basic aim of the financial audit is increasing the trustworthiness of accounting information. Auditors or employees involved in control in practice generally do not test all items of the basic group due to the great volume of data and thus the rigorous time and financial performance involved. The sampling includes examination of less than 100 % of the items forming the audited set. The selected sample (sampling) forms items that were selected from the basic group for testing in order to draw conclusions that are valid for the entire basic group. It is founded upon the expectation that such a sample may be a sufficient representative of the audited set for proving valid and reliable conclusions without having to test the entire set. The sampling risk expresses the tendency that conclusions based on testing the sampling may differ from conclusions that would be achieved if testing were applied to all items of the basic group.

In the area of the audited sampling, its testing and evaluation of results, various statistical methods are used, which apply the principle of mathematical probability. Many authors such as Smith (1979), Ponemon (1995), Gob (2012) and others presents statistical sampling in auditing from the statistician's or auditor's viewpoint. Rotaru et al. (2009) presents a statistical model for measuring the auditing risk, which arises from not uncovering errors upon sampling for testing. Taillard et al. (2008) assesses *Few statistical tests for proportions comparison*. For the auditor to test whether transactions were registered correctly, he must select a suitable sample for comparing compliance with internal control procedures; tests of compliance and substance tests are applied (Knight (1979), Hitzig (1998)). The aim of the auditing sampling is to draw conclusions on one or more characteristics of the audited set without testing the entire set. Even amongst the most carefully proposed selection procedures there exists a certain degree of uncertainty of whether results of the sample represent the audited set (Anderson (1986), Batenburg (1994), Cabras et al. (2015) and Gillett (2000)).

## **2.1 Problem formulation**

The paper deals with statistical methods in the financial audit. The aim is to discuss the possibility of quantifying the level of probability of gained certainty upon statistical evaluation of the number of accounting errors in the audited sampling. The paper introduces a decision-making statistical model using the probability function of hypergeometric distribution.

Two basic questions were formulated in relation to control (testing) of less than 100 % of the items forming the audited set:

1. How many errors is it possible to expect with the highest probability in the basic group?
2. What is the probability that a specific number of erroneous data entries will be found in the basic group?

### **3 METHODOLOGY**

To obtain the information necessary for complex processing of the issue, some of the basic methods of scientific research were used. The methods usually complement each other and, in consequence, overlap. Especially the methods of induction and deduction, analysis and subsequent synthesis were used. Procedures of analysis were used: identification of the processes, analysis of running of processes and analysis of value-added of identified processes. Also, some specific statistical methods and procedures are commented on in the paper.

To meet our research goal, a literature review has been performed following a multiple-step process. First, we searched the literature and identified the relevant journals for our review. Second, we selected a list of empirical papers that focus on performance of public administration and statistical sampling in auditing. Third, we chose those papers/studies that met our specific selection criteria. Fourth, we read the papers selected and tried to organize the papers into logically structured topics of statistical tests for comparing proportions. Fifth, we synthesized the insights extracted from the literature review in order to answer our research question and we proposed a draft of the model. Our first step in the literature review process was to identify keywords that could help us find relevant papers or studies. After that, we searched the literature in two electronic databases, namely ISI Web of Knowledge and SCOPUS, using the keywords selected. We conducted our searches in two different databases to maximize our likelihood of finding relevant studies and to improve the reliability of our research.

To resolve the draft model, mathematical and statistical methods were used that are founded on the principle of determining the level of importance, selection testing of samples, methods of sampling, probability statistical methods of selection, quantitative assessment, testing strategy and analytical test of reliability. Hypergeometric distribution means distribution of a discrete random quantity. The described methods and instruments are mutually intertwined, they mutually influence each other and are only effective in practical combination. On the basis of results, the decision-making statistic model for the financial audit is prepared.

### **4 PROBLEM SOLUTION**

To verify the quantification of the level of probability of gained certainty during statistical assessment of the number of accounting errors in the audited sampling, an analogy was used with manufacturing processes, whereas hypergeometric distribution was used to determine the probability of the number of scrapped product units in series manufacture.

Discrete random variable of dependent Bernoulli trials can be described by hypergeometric distribution. This distribution estimates probability of realization of a phenomenon (number of elements (x) with a certain characteristic) in several selections (n) without returning. The entire group has a total of N elements, which contain a total of M elements with a certain characteristic. The probability that the result of a random attempt performed on

(phenomenon) a random quantity X, which is governed by hypergeometric distribution, will be the very x realization is determined according to:

$$P(X = x) = \frac{\binom{M}{x} \binom{N-M}{n-x}}{\binom{N}{n}} \quad (1)$$

The mean value of hypergeometric distribution is gained from the formula:

$$E(X) = n \frac{M}{N} \quad (2)$$

and variance according to:

$$D(X) = n \frac{M}{N} \left(1 - \frac{M}{N}\right) \left(\frac{N-n}{N-1}\right) \quad (3)$$

In the case where  $\frac{n}{N} < 0.05$  it is possible to approximate hypergeometric distribution by

binomial distribution with the parameters  $\left(n, \frac{M}{N}\right)$ .

Statistics in (1-3) describe both the uncertainty of the studied problem and our expectations. Based on the random sample and prior knowledge (M) analyst can draw a conclusion whether a number of cases with some characteristics in the sample is close to the expected number or not. In our case of incorrect documents if there are more than expected cases analyst should enlarge the set of documents to study.

Following illustrations present means of estimating probabilities and total counts of erroneous documents based on expectations and random sample.

Illustration 1:

There are 200 documents which have to be checked for errors ( $N=200$ ). To estimate whether quality of documents (in terms of absence/presence of error) is the same as required (by long-term standard) five documents ( $n=5$ ) were selected by random and were further analysed. For a long-term standard 5 % error rate is considered. Given the sample size and error rate we expect that there are 10 erroneous documents ( $M=10$ ).

What is the probability that in the control-sample of 5 documents there will be exactly 1 erroneous document ( $x=1$ )?

Solution: We estimate the probability by employing equation (1).

$$P(X = 1) = \frac{\binom{10}{1} \binom{200-10}{5-1}}{\binom{200}{5}} = 0.207$$

Interpretation: We assume 5 % document error rate. Probability of observing 1 erroneous document in control sample consisting of 5 documents is therefore 0.207. Auditor after observing one erroneous document has to decide whether this observation is unique enough to be incompatible with 5 % error rate. Note that estimated probability of observing 2 erroneous documents is 0.0199. Therefore, observation of two erroneous documents would be strong

evidence against low error rate. These results might be caused by the sampling error (“bad luck” in selecting documents) or by the fact that the error rate is not 5 % (both results suggest higher rate).

In the second illustration we extend the idea of probabilities of occurrence given the expected error rate. Let’s consider the situation where the number of all documents ( $N$ ), the number of erroneous documents in sample ( $x$ ) and the number of checked documents ( $n$ ) is known. Number of erroneous documents in the total sample ( $M$ ) to be estimated. We will summarise results graphically to highlight non-linear relation between estimated number of erroneous documents and corresponding probabilities. We have changed the settings to Illustration 2 as the purpose of illustration 2 is different.

#### Illustration 2:

There are 150 documents to be checked for errors ( $N=150$ ). Ten documents ( $n=10$ ) are randomly selected; 3 documents were found erroneous ( $x=3$ ). How many erroneous documents can be expected in the whole set of documents?

Solution: We create a probability graph for all permissible  $M$  and we find it with the highest probability.

Figure 1 – Hypergeometric probability function in Figure 1 presents estimates of probabilities of observing  $M$  cases (each point represents number of erroneous documents) out of total sample size  $N=150$ . Source: Own processing.

Hypergeometric probability function in Figure 1 presents estimates of probabilities of observing  $M$  cases (each point represents number of erroneous documents) out of total sample size  $N=150$ . From Figure 1 we can read that the most probable number of erroneous documents is 45 ( $M =45$  with probability  $P=0.276$ ). This 45 occurrences refer to  $45/200 = 22.5\%$  error rate.

Interpretation: If this estimated error rate exceeds threshold for unacceptable quality set by the auditor more attention should be paid for such a set of documents. These documents are likely to be more erroneous. Moreover, the asymmetrical shape of the distribution indicates that probability of observing some amount of erroneous documents is higher on the right off the most probable value rather on the left. It is therefore more likely to have +1 erroneous document than -1 erroneous document compared to the most probable value.

Presented results object to sampling error and therefore should be used only as a signal indicator of low quality.

The proposed statistical model can be applied similarly to any size of the basic group from which it is necessary to generalize errors from the tested sampling for the number of errors in the basic group with definite specific probability. The model is founded on the method where using probability, we determine the reliability of estimating the total number of erroneous pieces of data, and we can generalize errors in the sample for errors in the basic group. When using the proposed model, the probability of erroneous interpretations is determined based on the theory of probability of realization of the phenomenon in the selection, i.e. the tested group.

## **5 DISCUSSION**

To achieve the smallest amount possible of incorrect conclusions from the interpretation of results of the model display by the probability method, it is necessary always prior to testing the sampling to determine the size of the sample, i.e. how many items must be tested. This can either be resolved mathematically or using judgment based on experience. The sampling may be either statistical or non-statistical. For large groups, statistical sampling is mostly selected. When using judgment, the period necessary for determining the size of the sample is shorter, data necessary for mathematical selection need not be collected, and the actual selection and statistical evaluation need not be performed. A disadvantage however is that the size of the sample and interpretation of the probability of errors in the total group is neither mathematically nor statistically founded.

The risk of the selection procedure stems from the fact that a certain audited sample need not be a typical representative of the tested set. This means that the sample may contain unreasonably more or less control deviations or financial differences than there exists in the group of transactions or accounting balances as a whole. Conclusions of the auditor or controller may be different from the conclusions that he would make if the entire set were tested. The selection risk varies inversely to the sample size - the larger the size of the sample, the less the selection risk is. Upon formulating the overall conclusion of the auditor or controller, it is necessary to apply various analytical procedures. The final assessment should be in accordance with all information gained from performed analytical tests and selection of samples ascertaining risk in relation to the necessary level of certainty, and with the testing strategy. Performing tests and their efficiency depends on correct relation of the relation input - output. A basic rule applies that costs spent on gaining information may not exceed the benefits gained from this information. One must not underestimate the quality of information, as quantity is never a substitute for quality of the given information, and it is mostly possible to judge the whole even from a small quantity of information.

## **6 CONCLUSION**

A financial control or performance audit deals with researching the economy, effectiveness and efficiency, whereas an individual performance audit may be aimed at examining one or

more aspects. Performance in the performance audit is seen as minimizing the costs of resources or the use of public funds for the activity (inputs) regarding the relevant quality. The economy may in some cases mean maximizing the income from the activity. It is assessed as the relationship between outputs and inputs used to produce them. One element in the overall effectiveness assessment involves cost-effectiveness. The term cost-effectiveness concerns the effectiveness of spending on individual subjects, the activity, program or operation in achieving the results in relation to costs. Cost-effectiveness analysis studies the relationship between costs and results expressed by the cost per unit of output. Performance measurement refers to what extent objectives have been achieved and the relationship between intended and actual impact of activities. Usually it is more appropriate to try to determine the extent to which the tools have contributed to achieving the objectives. The performance audit in its true meaning requires evidence that the observed outputs are indeed outputs in relation to the defined objectives. The conclusions can be used to improve performance in such a way that it is possible to focus on those principles, which have shown as failing in practice. The further step is in the mobilization of the public administration in the adoption and implementation of statistical methods in the performance audit. These results suggest some avenues for future research.

## **AUDIT AND FINANCIAL CONTROL IN PUBLIC ADMINISTRATION THROUGH THE EYES OF STUDENTS OF ECONOMICS FIELDS**

*Milana Otrusínová, Eliška Pastuszková*

### **Abstract**

In general, the lay public does not quite understand the differences between the terms audit, internal audit, controlling and financial control, although these terms all mean something different. Based on questionnaire survey, this paper aims to assess the knowledge of terminology relating to the issue of financial control in public administration, audit and controlling amongst students of relating master's degree programs in the field of Finance and Financial Control at the Faculty of Management and Economics of Tomas Bata University in Zlín, Czech Republic. The aim is to ascertain whether with their existing knowledge in accounting, financial management and controlling, they can distinguish and state the essence of these terms. One may generally state that the modern concept of control leads to covering up the difference in meaning between the verb "to control" and the noun "control", and the respondents also comprehend them as one and the same.

*Keywords: internal audit, financial control, controlling, performance, public finance*

JEL Classification: M41

### **1 INTRODUCTION**

A necessary part of the knowledge of every financial manager must be correct knowledge of the principles "control" and "controlling". This is no different in public administration institutions and the public sector. Students of the master's degree program encounter the issue of financial control, audit, internal audit and controlling during their studies at the Faculty of Management of Tomas Bata University ("FaME UTB") in Zlín in multiple subjects. Based on questionnaire survey, this paper aims to assess the knowledge of terminology relating to the issue of financial control in public administration, audit and controlling amongst students of relating master's degree programs in the field of Finance and Financial Control at the Faculty of Management and Economics of Tomas Bata University in Zlín, Czech Republic. The first part of the paper concentrates on explanation of the context of public administration performance and the theoretical background of financial control, audit, internal audit and controlling. The next part presents the methodology used in the paper and then the results are discussed. Findings presented in the paper are derived mainly from research carried out that respondents comprehend the terms control, audit and controlling as a synonym, where control mainly has a repressive task.

### **2 THEORETICAL BACKGROUND**

Since the late 1980s a variety of approaches, termed New Public Management, have been considered international best practice (Wynne, 2012). New Public Management represents a strategy oriented on increasing efficiency and satisfaction of citizens who are understood as

customers (see e.g. Lapsley, 2008; Mörth, 2009). One part of the new Public Management concept should be the role of accounting and financial control. Moraru & Dumitru (2012) present the role of internal audit as a tool in changing the mentality of management and employees of entities. Sterck & Bouckaert (2006) state that the modernization of financial management in the public sector has led to an increased focus on auditing and control. The same authors present their study that compares the internal audit function in the governments of six OECD countries: Australia, Canada, the Netherlands, Sweden, Great Britain and the United States, the research shows that internal auditing is receiving increased attention in the public sector.

Amongst the important accounting functions such as registration, recognition, information, analytical and communication functions, the control function is no less vital. This especially relates to the implementation of new methods of how to measure performance of public sector institutions. All public administration reforms that have been undertaken are accompanied by questions regarding the efficiency of various functions of public administration. According to Bolivar et al. (2014), analysis of government sustainability is considered very important. Unlike the private sector, public administration institutions and other public sector organizations are disadvantaged concerning the evaluation of performance and efficiency, because they are managed primarily on non-profit basis and therefore cannot apply the profit criterion as a performance indicator. Information on prosperity, profitability or loss are among the important information necessary for financial management and performance measurement, including information on cost structure and its links to revenues. This applies even to public sector institutions, although they often do not provide paid services, however, they always have their performance and thus revenues as well (in the form of various subsidies and transfers, tax revenues, etc.).

Today in the Czech Republic, efficient ways are being sought out of how to manage public administration and allocation of public resources. For the given process, the principles of new public management are applied, which can also be implemented in the area of public expenditures, see e.g. Jurcik (2013). In interconnecting with system changes in budgeting, leaning on the demand approach to creating a budget, it is possible to perform transformation of the public sector in the area of allocating public resources. Managing public expenditures is connected to monitoring results, when the expenditure policy resolves the strategic problem: "what is necessary to implement, what needs, or public interest, to satisfy"? Budgeting is then a tool used to search for an answer to the question of "in what ways or by what form will the stated needs be budgeted and by what form will achieved performance be monitored"? Rosa (2014) and Kells (2011) deal with the issue of the performance audit in public administration in their papers. During a performance audit, we monitor the quantitative and qualitative side. Focus on quantitative side means that we monitor the efficiency, cost effectiveness and effectiveness. According to Reichborn- Kjennerund (2013), the performance audit is widely used in public administration, but little proof exists of its effectiveness.

The principles of economy, efficiency and effectiveness are in the Czech environment collectively defined as organizational performance and the model concept of the "3E's" is considered the basis for performance monitoring in public administration, when based on the objectives are provided inputs, i.e. resources that are in the form of personnel and material securing transformed into outputs. In the Czech Republic, the principle of "3E's" is a basic principle for the area of financial control in public administration under the rule of statutory regulations (Act No. 320/2001 Coll., on Financial Control).

The law respects the main principles of financial control and internationally recognized standards, which are a basis of control systems of countries of the European Community. The main aims of financial control are verification of upholding legal regulations and adopted measures when managing public funds for securing determined aims; providing protection of public funds against risks, discrepancies or other deficiencies caused mainly by violation of legal regulations, by inefficient, purposeless and ineffective handling of public funds or criminal activity; timely and reliable informing of managing public administration on handling public funds, on performed operations, on their demonstrable accounting elaboration for the purpose of effective channeling of activities of public administration authorities in accordance with established tasks; thus economical, efficient and effective performance of public administration.

Public administration authorities are responsible for the system of internal management and control, including public financial control. Internal control activities verify the efficiency of the internal system of management and control (thus also the financial control system). Complexity of organization, or tasks carried out in public administration, require the need to verify the status of their fulfillment also by means of other functional means. Such means include units for internal audit (internal control), subordinate directly to the supervisor of the relevant level of public administration in the interest of maximum application of the principles of independence and objectivity, as well as the principles of reasonableness and efficiency of control structures. Emmanuel et al. (2013) presents an assessment of internal control audit of public sector. Many authors such as Iskandar (2014), Alzeban & Geilliam (2014), Sterck (2006) and others present the factors affecting the internal audit effectiveness. Factors such as competency, independence and objectivity of Internal auditors affect the effectiveness of the IA function; however, the internal audit office constantly face the problem of low technical staff proficiency and high staff turnover, with limited capacity to provide effective service to management (Baharud –din et.al, 2014).

According to Balalia (2011) "public internal audit has developed over the years. The internal public audit applies to all central and local public institutions, auditors assuring and advising managers for management of revenue and public expenditure. Through the completed audits, auditors should help public institutions to meet their objectives through and gradual and methodical approach, by assessing and recommending more efficient public management".

The main aim of the internal audit is channeling the audit in public administration towards the International Standards for Internal Audit. One condition is constant enhancement of knowledge amongst employees by studying legal regulations and taking part in professional seminars and training sessions. Tasks of the internal audit must be performed professionally, so the auditor must possess knowledge, skills and other capabilities, which are necessary for performing the given obligations and responsibilities. (see e.g. Peytcheva, 2013, Hardiman, 2006).

*Why is high professional and accounting qualification one of the essential conditions for quality performance of the profession of the internal auditor?* High requirements should be placed on internal auditors, especially within public financing, not only in the area of upholding the code of ethics, ensuring independence, communication and other skills, but mainly for securing high professionalism, which includes gaining, maintaining and expanding technical knowledge, including accounting. Further education is a must for maintaining and updating technical knowledge, because requirements and relevant legislation are always changing. The opposite case could lead to weakening economic function of control, if not directly to annulling efforts or even to discredit all other functions and requirements of

upholding the principles of "3E". According to Emmanuel et al. (2013) "an effective internal control system free from interference is needed. There is also the need for upgrading the skills of auditing personnel and also strict adherence to statutory and professional standards". According to Baharud –din et.al, 2014 internal auditors working in Malaysian public sector have lack of qualification, skill and experience.

In relation to improving management systems, we very often encounter the term controlling. But what are we to understand by this term? Almost every auditor defines the term controlling differently, but content definitions always have something in common. There are plenty of ways to understand the term controlling and its definitions. Here one may quote the publications of prof. Eschenbach (2004): *"Each has his or her own impressions of what controlling means or what it should mean, only everybody is thinking something different."* The verbal base of the term controlling is the English verb "to control", which can be understood in the meaning of managing, controlling to have under control or in the meaning of controlling or verifying. The following definition is drawn from the Controlling Dictionary: *"We call controlling the entire process of determining aims, planning and control of finances and performances."*

### **3 RESEARCH METHODOLOGY AND PROBLEM FORMULATION**

This section describes research methodology - data collection, the process of designing and implementing and questionnaire survey, identifying individual variables. Furthermore, it specifies the scientific methods used to answer the research questions. The research was performed in the year 2014 by the students research work, there were collected sources of 47 questionnaires (i.e. 76% of the total number of respondents). Every valid questionnaire was statistically analyzed and followed by synthesis of obtained information.

The aim of the survey was to highlight the views of students at the Faculty of Management and Economics TBU, particularly the Master's programs Finance and Financial Control, on the issue of the area of performance of public sector institutions. The questionnaire survey served as a source for the following areas selected for the purpose of presenting the results in this paper:

- The management process in public administration and the public sector
- Control, audit and controlling
- Essence of the performance audit

Based on the research questions, a null hypothesis was determined:

H01: The majority of questioned students of the Master's degree program in the fields Finance and Financial control cannot definitely distinguish the terms control, audit and controlling.

In contrast, an alternative hypothesis that rejects the null hypothesis was determined as follows:

H1: The majority of questioned students of the Master's degree program in the fields Finance and Financial control comprehend the terms control, audit and controlling as being synonyms of one another.

## **4 PROBLEM SOLUTION**

### **4.1 The management process in public administration and the public sector**

Respondents were asked based on their opinion to rank the given terms in order of importance for the management process in public administration, the public sector and non-profit organizations. A grading scale was added from 0 to 5, where 0 expressed the situation that none of the listed terms are a part of management in public administration, and 5 represented the fact that all types of "control and audits" are equally as important and indispensable. The vast majority of those surveyed ranked terms such as external audit, internal audit, internal control system and external control amongst the most important for management. By presenting a 5, the respondents judge that all types of "control and audits" are equally important and indispensable.

### **4.2 Control, audit and controlling**

The figure listed below (Fig. 1) displays the replies of respondents who were asked if they comprehend the terms control, audit and controlling as synonyms of one another. Out of 47 surveyed, only four agree that the task of control, controlling and audit is to verify accordance of a fact with aims or legal regulations, monitoring a condition that has already past, where this basically concerns control of conformity. Twenty-two students comprehend these terms where control has a repressive task (informs on deficiencies), an audit gives information about controlled facts, and also includes a methodical task, controlling includes feedback and management of deviations. The remaining twenty-one students comprehended these terms only in part as synonyms. They believe that all these systems blend together, the audit involves control, audit and controlling are monitoring as well as an analysis of efficiency of achieving the established aim, and they include a system of risk management, on the whole concerning a performance audit in essence.

Hypothesis H0 was established: Most respondents are not capable of definitely distinguish the terms control, audit and controlling

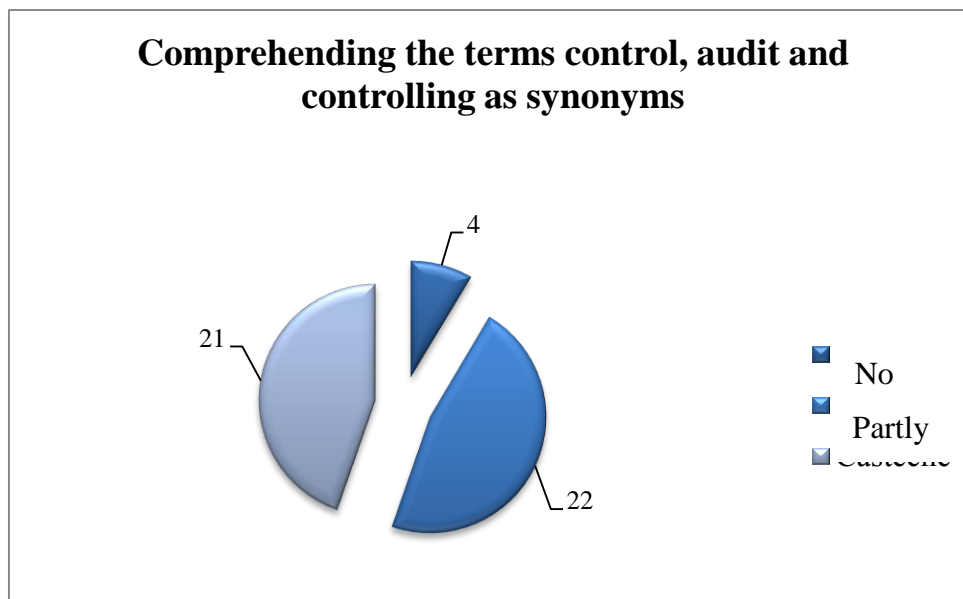

Fig. 1 - Comprehending the terms control, audit and controlling. Source: Author's illustration

Tab. 1 - Statistical test of appointed the hypotheses. Source: authors' calculations

H0:	$\pi_1 = 0.5$
H1:	$\pi_1 > 0.5$
1-sample proportions test with continuity correction	(x=25, n=47, alternative = "g" )
data:	25 out of 47, null probability 0.5
X-squared = 0.0851	0.0851
df	1
p-value	0.3852
alternative hypothesis:	true p is greater than 0.5
95 percent confidence interval:	0.4035657 1.0000000
sample estimates: p	0.5319149

On the importance level of 5%, we do not refute the null hypothesis, meaning that we cannot claim that the majority of respondents from the ranks of students of the Faculty of Management and Economics cannot definitely distinguish the terms control, audit and controlling. We do not have enough proof to overturn the null hypothesis.

### 4.3 Essence of the performance audit

Figure 2 shows that by their affirmative responses. 38 respondents confirmed that the essence of the performance audit in public administration is control of upholding the principles of economy, efficiency and effectiveness. The remaining nine addressed veered away from this statement or did not know at all.

## 5 CONCLUSION AND DISCUSSION

It is undeniably important to stress the importance of financial management in every organization, and it deals with a system of financial control in public administration with application of an internal control system, which is a must in every company. It is vital that the internal control system meets all up-to-date requirements of the Law governing financial control. Good internal system of financial control can improve financial management.

The modern concept of control leads to covering up the difference in meaning between the verb "to control" and the noun "control". These words have specific differing meanings in the business and government sector. The verb represents activity ensuring that what is to be performed is performed, and preventing that which is prohibited. The noun represents a means that helps those wanting to have something under supervision ("controller"). Internal auditors oriented towards management and aims needs to join the managerial function of management and control with means enabling performance of this function in all activities of the organization. Thus conceived, a joining occurs of the verb "to control" and the noun "controls". Control means applying all means created in a company for support, management, limiting, administration and controlling their various activities, which aim to ensure the achievement of company aims. Controls include the form of organization, principles, systems, procedures, instructions, standards, directives, chart of accounts, forecasts, budgets, plans, reports, records, control lists, methods and instruments.

From the aforementioned research, the following facts have been determined:

Most respondents from amongst students of fields of Finance and Financial control prefer emphasis on internal systems of control (internal audit and internal control system) to the external form of various controls, and believe that controls are more effective.

The majority of respondents agree with the opinion that the essence of the performance audit in public administration is control of upholding the principles of economy, efficiency and effectiveness.

On the question of whether respondents comprehend the terms control, audit and controlling as a synonym, 47%, replied no, because control has a repressive task, the audit gives information on controlled facts, and include a methodical task, controlling includes feedback and management of deficiencies. Then 45% respondents agree with the opinion that this partially concerns a synonym, whereas all these systems blend together, audit includes control, audit and controlling are monitoring as well as an analysis of efficiency of achieving the determined aim.

In conclusion, one may surmise that various definitions of management and control are however less important than the actual purpose of management and control. It applies that managing and controlling mechanisms are adequate and necessary if they are designed to achieve aims.

## **EFFICIENCY CHANGE IN BANKING SECTORS OF VISEGRAD COUNTRIES**

*Iveta Palečková*

### **Abstract**

The aim of the paper is to estimate efficiency change in banking sectors of the group of Visegrad countries during the period 2009-2013. We applied Malmquist index on the data of commercial banks. Average efficiency was slightly decreasing within the period 2009-2012 that was probably as a result of financial crisis. The most efficient was the group of small and medium-sized banks. We found the positive efficiency change during the period 2009-2013 that was especially due to the catch-up effect. Results of technological change indicates the negative average annual growth of 3%. Average efficiency change achieved the positive growth in most groups of banks. Technology had a negative effect on the total efficiency change. The highest technological change reached the group of small banks.

*Keywords: banking sector, Data Envelopment Analysis, Malmquist index, Visegrad countries*

JEL Classification: G21, C51

### **1 INTRODUCTION**

The aim of this paper is to estimate efficiency change in banking sectors of the group of Visegrad countries during the period 2009–2013. In accordance with the aim of the paper, we ask a research question: “What is the main reason for positive/negative efficiency change in Visegrad countries?” The group of Visegrad countries (V4) includes the Czech Republic, Hungary, Poland and Slovakia. For the estimation we applied Malmquist index (MI) on the data of commercial banks. The Malmquist index is determined in order to investigate the levels of and the changes in the efficiency of the Visegrad countries’ commercial banks over the analysed period. The Malmquist index is based on Data Envelopment Analysis (DEA) models. The DEA measures the relative efficiency of a homogeneous set of decision-making units (DMUs) in their use of multiple inputs to produce multiple outputs. We simultaneously use two alternative specifications of DEA approach, specifically CCR model and BCC model that differ in returns to scale assumption.

In empirical analysis there is a lack of studies in Visegrad countries’ banking sectors examining efficiency change, which creates an opportunity for this research. According to the author’s awareness, in empirical literature exists only a few studies which estimated efficiency change in banking sectors of V4. E.g. Řepková (2012) estimated efficiency change in the Czech banking sector using Malmquist index. Hančlová and Staníčková (2012) measured the efficiency change in Visegrad countries or Lyroudi and Angelidis (2006) estimated efficiency change of selected countries of the European Union.

The structure of the paper is follow. Following section describe empirical analysis about banking efficiency. Next section presents methodology and data, the Data Envelopment Analysis and the Malmquist index and selection of variables are described. Section 4 reveals and discusses the estimated results and Section 5 concludes the paper with summary of key findings and discussion.

## **2 LITERATURE REVIEW**

Several empirical analyses of efficiency of the Czech, Slovak, Polish and Hungarian banking sectors exist and we refer to some of them. Some empirical studies e.g. Grigorian and Manole (2006), Yildirim and Philippatos (2007), Bems and Sorsa (2008), Matoušek (2008), Mamatzakis et al. (2008) or Baruník and Soták (2010) examined the banking efficiency in several European countries and the Czech, Slovak, Polish and Hungarian banking sectors were included in panel data. Stavárek and Polouček (2004) estimated efficiency and profitability in selected banking sectors, including Visegrad countries. They found that Central European Countries were less efficient than their counterparts in European Union member countries. They also found that the Czech and Hungarian banking sectors were on average evaluated as the most efficient and the Czech banking sector showed itself as the most aligned banking industry among transition countries. Their conclusion was a refutation of the conventional wisdom that foreign-owned banks are more efficient than domestic-owned banks, and that size is one of the factors that determines efficiency. To achieve greater efficiency, a bank should be large, well-known, easily accessible and offer a wide range of products and services, or if small, must focus on specific market segments, offering special products. Any other structure leads to lower relative efficiency for the bank. Anayiotos et al. (2010) estimated relative efficiency of banks in emerging Europe before the recent boom, just before the crisis and right after the crisis using the Data Envelopment Analysis. Their results suggested that the banking efficiency decreased during the pre-crisis boom and also fell during the crisis.

Stavárek (2005) estimated commercial bank efficiency in the group of Visegrad countries before joining the EU. He concluded that the Czech banking sector is the most efficient, followed by the Hungarian with a marginal gap. Although there has been an improvement in levels of efficiency in all countries since 1999, its intensity was not sufficient to converge with Western European banking sectors. He also examined the increasing value of the efficiency of the Slovak banking sector during the period 1999–2003, but they also found that Slovak banking sector was lower efficient banking sector than other Visegrad countries. Also, Staničková and Skokan (2012) and Melecký and Staničková (2012) estimated banking efficiency of Visegrad countries and evaluated the banking sector of the Czech Republic as highly efficient.

Weill (2003) found a positive influence of foreign ownership on the cost efficiency of banks in the Czech Republic and Poland. The degree of openness of the banking sector to foreign capital has a positive impact on performance. It may also have a positive influence on the macroeconomic performance of these countries, because of the important role of the banking sector in the financing of these economies. Erina and Erins (2013) evaluate cost-benefit efficiency of the banks of seven CEE states (the Czech Republic, Hungary, Latvia, Lithuania, Poland, Slovakia and Slovenia) in the period 2006-2011 (ie. before and during the crisis, and in the period of economic recovery). They found that banking systems most effectively operate in Lithuania and Slovenia, while the Latvian banking system is most inefficient.

The results of Andries and Cocris (2010) showed that banks in the Czech Republic are inefficient from the perspective of costs. Staněk (2010) found that the efficiency of the Czech banking sector has improved in the last ten years and come closer to the efficiency of the Austrian banking sector. Stavárek and Řepková (2012) found that efficiency increased in the period 2000–2010 and they found that the largest banks perform significantly worse than medium-sized and small banks.

Rossi et al. (2005) examined that the banking systems of Slovakia showed significant levels of cost and profit inefficiency, indicating that on average banks operate far above (below)

from the cost (profit) efficient frontiers. Vincová (2006) found that the average efficiency slightly decreased and the number of efficient bank also decreased in Slovak banking sector. Iršová and Havránek (2011) estimated banking efficiency in five countries of Central and Eastern Europe including Slovakia. In Slovakia the results showed that the average cost efficiency was 51.8% and profit efficiency reached 43.2% in the years 1995–2006. Stavárek and Šulganová (2009) found that the average efficiency increased and their results point out a better ability of Slovak banks to use the inputs in the production process. Řepková (2013) estimated the cost and profit efficiency of the Slovak commercial banks and they found that the average cost and profit efficiency was decreasing in the Slovak banking sector during the period 2003-2012. And then they found that small and medium-sized banks were more efficient than the largest banks in the Slovak banking market. Zimková (2014) estimated the technical efficiency and the super-efficiency of the banking institutions in Slovakia in 2012 under transmission approach and found that that the level of efficiency differ from one bank to another. More than half of institutions under research were found technically efficient by applying conventional the input-oriented BBC-I and SBM-I models under variable return to scale. Also Bod'a and Zimková (2013a and 2013b) examined technical efficiency of the Slovak banking sector. Zemanová (2007) examined the Slovak banking sector's efficiency over the period 2002-2003.

Hasan and Marton (2003) examined the cost and profit inefficiency of Hungarian banking sector within the period 1993-1998 and found that average cost inefficiency was about 29% and average profit efficiency reached the value 34.5%. His conclusions were that banks with foreign involvement were found to be significantly less inefficient than their domestic counterparts. Among the foreign-involved institutions, a higher share of foreign ownership was associated with lower inefficiency.

Nikiel and Opiela (2002) estimated banking efficiency in Poland and found that that foreign banks are more cost-, profit-, and operationally efficient than state-owned or domestic private banks. Large banks are more efficient than small banks and foreign banks servicing foreign and business customers are more cost-efficient and less profit-efficient than other banks in Poland. Havrylchuk (2006) estimated efficiency of the Polish banking industry during the period 1997-2001. He found that bank efficiency has not improved during the analysed period. Wozniowska (2008) estimated efficiency of the Polish banking sector within the period 2000-2007.

The empirical literature review concluded that only few studies examined the Czech, Slovak, Polish and Hungarian banking sector individually. Most of the empirical studies research several banking sector which included the group of Visegrad countries and the second findings is that the most studies examined banking efficiency during 1990s. Thus, the literature review shows the motivation for this paper. This paper could fill the gap following time line in the empirical literature. Banking efficiency was estimated using the Stochastic Frontier Approach or Data Envelopment Analysis model. The contributions of this paper is the fact, that the DEA window analysis approach will be applied on the data of the Czech, Slovak, Polish and Hungarian commercial banks.

### **3 METHODOLOGY AND DATA**

#### **3.1 Data Envelopment Analysis**

The Data Envelopment Analysis is a mathematical programming technique that measures the efficiency of a decision-making unit relative to other similar DMUs with the simple restriction that all DMUs lie on or below the efficiency frontier Seiford and Thrall (1990).

DEA also identifies, for inefficient DMUs, the sources and level of inefficiency for each of the inputs and outputs Charnes et al. (1995).

The CCR (Charnes, Cooper and Rhodes, 1978) model presupposes that there is no significant relationship between the scale of operations and efficiency by assuming constant returns to scale (CRS) and it delivers the overall technical efficiency. The CRS assumption is only justifiable when all DMUs are operating at an optimal scale. However, firms or DMUs in practice might face either economies or diseconomies to scale. Thus, if one makes the CRS assumption when not all DMUs are operating at the optimal scale, the computed measures of technical efficiency will be contaminated with scale efficiencies. Banker et al. (1984) extended the CCR model by relaxing the CRS assumption. The resulting BCC (Banker, Charnes and Cooper) model was used to assess the efficiency of DMUs characterized by variable returns to scale (VRS). The VRS assumption provides the measurement of pure technical efficiency (PTE), which is the measurement of technical efficiency devoid of the scale efficiency (SE) effects. If there appears to be a difference between the technical efficiency (TE) and PTE scores of a particular DMU, then it indicates the existence to scale inefficiency (Sufian, 2007).

DEA begins with a fractional programming formulation. Assume that there are  $n$  DMUs to be evaluated. DMU <sub>$j$</sub>  consumes  $x_{ij}$  amounts of input to produce  $y_{rj}$  amounts of output. It is assumed that these inputs,  $x_{ij}$ , and outputs,  $y_{rj}$ , are non-negative, and each DMU has at least one positive input and output value. The productivity of a DMU can be written as:

$$h_j = \frac{\sum_{r=1}^s u_r y_{rj}}{\sum_{i=1}^m v_i x_{ij}}, \quad (1)$$

In this equation,  $u$  and  $v$  are the weights assigned to each input and output. By using mathematical programming techniques, DEA optimally assigns the weights subject to the following constraints. The weights for each DMU are assigned subject to the constraint that no other DMU has efficiency greater than 1 if it uses the same weights, implying that efficient DMUs will have a ratio value of 1. The objective function of DMU is the ratio of the total weighted output divided by the total weighted input:

$$\max h_0(u, v) = \frac{\sum_{r=1}^s u_r y_{r0}}{\sum_{i=1}^m v_i x_{i0}}, \quad (2)$$

subject to 
$$\frac{\sum_{r=1}^s u_r y_{rj}}{\sum_{i=1}^m v_i x_{ij}} \leq 1, j = 1, 2, \dots, j_0, \dots, n, \quad (3)$$

$$u_r \geq 0, \quad r = 1, 2, \dots, s, \quad (4)$$

$$v_i \geq 0, \quad i = 1, 2, \dots, m, \quad (5)$$

where  $h_0$  is the technical efficiency of DMU<sub>0</sub> to be estimated,  $u_r$  and  $v_i$  are weights to be optimized,  $y_{rj}$  is the observed amount of output of the  $r^{\text{th}}$  type for the  $j^{\text{th}}$  DMU,  $x_{ij}$  is the observed amount of input of the  $i^{\text{th}}$  type for the  $j^{\text{th}}$  DMU,  $r$  indicates the  $s$  different outputs,  $i$  denotes the  $m$  different inputs and  $j$  indicates the  $n$  different DMUs.

Conditions of CCR model:

$$\max h_0 = \sum_{r=1}^s u_r y_{r0}, \quad (6)$$

$$\sum_{i=1}^m v_i x_{i0} = 1, \quad (7)$$

$$\sum_{r=1}^s u_r y_{r0} - \sum_{i=1}^m v_i x_{i0} \leq 0, \quad (8)$$

$$v_i \geq 0, u_r \geq 0, j = 1, 2, \dots, n, i = 1, 2, \dots, m, r = 1, 2, \dots, s. \quad (9)$$

Conditions of BCC model:

$$\max h_0 = \sum_{r=1}^s u_r y_{r0} + u_0, \quad (10)$$

$$\sum_{i=1}^m v_i x_{i0} = 1, \quad (11)$$

$$\sum_{r=1}^s u_r y_{r0} - \sum_{i=1}^m v_i x_{i0} + u_0 \leq 0, \quad (12)$$

$$v_i \geq 0, u_r \geq 0, j = 1, 2, \dots, n, i = 1, 2, \dots, m, r = 1, 2, \dots, s, \quad (13)$$

where index  $o$  shows DMU, which efficiency is estimated,  $x_s$  denotes inputs,  $y_s$  denotes outputs,  $v_s$  is value of efficiency of the DMU,  $n$  shows number of DMU,  $m$  in number of inputs,  $s$  is number of outputs,  $u_0$  denotes return to scale.

### 3.2 Malmquist index

The Malmquist index (1953) evaluates efficiency change over time. The MI, based on DEA models, is one of the prominent indexes for measuring the relative productivity change of DMUs in multiple time periods. This index breaks down into various components. The index provides a useful way of distinguishing between changes in technical efficiency, pure technical efficiency, scale, total factor productivity (TFPC) and shifts in the efficiency frontier (technological change) over time. This index is the geometric mean of two TFPC indices, one evaluated with respect to the technology (efficiency frontier) in the current period  $t$  and the other with respect to the technology in the base period  $s$  (Coelli et al., 1998). One extension with DEA is to apply MI to panel data to estimate changes in technical efficiency, technological progress and total factor productivity.

The original idea of the Malmquist index was proposed by Malmquist (1953) who suggested comparing the input of a firm at two different points of time in terms of the maximum factor by which the input in one period could be decreased such that the firm could still produce the same output level of the other time period. Caves et al. (1982) extended the original Malmquist input index and introduced the first type of the Malmquist index, and then Fare et al. (1992) showed that the Malmquist index can be calculated using a nonparametric DEA-like approach, given that suitable panel data are available and they applied DEA for

measuring the Malmquist index. They assumed constant returns to scale and identified the technological change and the change of technical efficiency as two components of the productivity changes over time. Next, Fare et al. (1994) considered variable return to scale and offered an extended decomposition of the Malmquist index with another important factor capturing change in scale efficiency.

Following Fare et al. (1994) we use DEA to construct an input based MI between period  $t$  (the base period) and period  $s$ :

$$M_I(y^s, x^s, y^t, x^t) = \left[ \frac{D_I^t(y^s, x^s)}{D_I^t(y^t, x^t)} * \frac{D_I^s(y^s, x^s)}{D_I^s(y^t, x^t)} \right]^{\frac{1}{2}}, \quad (14)$$

where  $M_I(\cdot)$  is the input-oriented MI,  $D_I^t(y^s, x^s)$  is the distance function showing a maximal proportional reduction of the observed period  $s$  inputs under the period  $t$  technology. The distance function is defined as follows:

$$D_I^t(y^s, x^s) = \min_{\theta, \lambda} \theta, \quad (15)$$

subject to  $y_{is} \leq \lambda Y^t, \quad (16)$

$$\theta x_{is} \geq \lambda X^t, \quad (17)$$

$$\lambda_i \geq 0, i = 1, \dots, n, \quad (18)$$

where  $\theta$  is a scalar and  $\lambda$  is a vector of constants. The value of  $\theta$  obtained is the component score of the  $i$ -th firm.  $X$  and  $Y$  are input and output vectors, and the amounts of the  $i^{th}$  input consumed and output generated by the DMU<sub>0</sub>, are denoted by  $x$  and  $y$ .

The above measure actually is the geometric mean of two Caves et al. (1982) Malmquist productivity indexes. Fare et al. (1992) define that  $M_I > 1$  indicates productivity gain;  $M_I < 1$  indicates productivity loss; and  $M_I = 1$  means no change in productivity from time  $t$  to  $s$ . Relaxing Caves et al. (1982) assumption that  $D_I^t(y^t, x^t)$  and  $D_I^s(y^t, x^t)$  should equal to one, and allowing for technical inefficiency, Fare et al. (1992) decompose their Malmquist productivity index into two components:

$$M_I = \left[ \frac{D_I^t(y^s, x^s)}{D_I^t(y^t, x^t)} * \frac{D_I^s(y^s, x^s)}{D_I^s(y^t, x^t)} \right]^{\frac{1}{2}} = \frac{D_I^s(y^s, x^s)}{D_I^t(y^t, x^t)} \left[ \frac{D_I^t(y^s, x^s)}{D_I^s(y^s, x^s)} * \frac{D_I^t(y^t, x^t)}{D_I^s(y^t, x^t)} \right]^{\frac{1}{2}}. \quad (19)$$

The first component  $TEC = \frac{D_I^s(y^s, x^s)}{D_I^t(y^t, x^t)}$  measures the change in technical efficiency (technical efficiency change, TEC). The second component  $TCC = \left[ \frac{D_I^t(y^s, x^s)}{D_I^s(y^s, x^s)} * \frac{D_I^t(y^t, x^t)}{D_I^s(y^t, x^t)} \right]^{\frac{1}{2}}$  measures the technology frontier shift (technological change, TCC) between time period  $t$  and  $s$ . TCC can be seen as an average aggregated change in technology of a DMU from time period  $t$  to  $s$ .

Fare et al. (1992, 1994) point out that a value of  $TCC > 1$  indicates a positive shift or technical progress, a value of  $TCC < 1$  indicates a negative shift or technical regress, and value of  $TCC = 1$  indicates no shift in technology frontier. In this paper we use the decomposition of Malmquist index into two components, namely technological change and efficiency change ( $EC = \frac{D_{CRS}^s(y^s, x^s)}{D_{CRS}^t(y^t, x^t)}$ ), which is catch-up effect.

### 3.3 Data and selection of variables

The data set used in this study was obtained from the annual reports of commercial banks during the period 2009–2013 and all the data is reported on unconsolidated basis. We analysed only commercial banks that are operating as independent legal entities. As we have reliable data extracted directly from annual reports we eliminate the risk that incomplete or biased data may distort the estimation results.

In order to conduct the DEA estimation, inputs and outputs need to be defined. In the empirical literature four main approaches have been developed to define the input-output relationship in financial institution behaviour (intermediation, production, asset and profit approach). We adopt intermediation approach which assumes that the banks' main aim is to transform liabilities (deposits) into loans (assets). The bank collects deposits to transform them in loans. Consistently with this approach, we assume that banks use the three inputs (labour, fixed assets and deposits), and two outputs (loans and net interest income). We measure labour by the total personnel costs covering wages and all associated expenses and deposits by the sum of demand and time deposits from customers, interbank deposits and sources obtained by bonds issued. Loans are measured by the net value of loans to customers and other financial institutions and net interest income as the difference between interest incomes and interest expenses. Descriptive statistics of inputs and outputs is presented in Table 1.

## 4 EMPIRICAL ANALYSIS AND FINDINGS

DEA can be used to estimate efficiency under the assumptions of constant and variable returns to scale. For empirical analysis we use MaxDEA software. The DEA method is suitable in the banking sector because it can easily handle multiple inputs-outputs producers such as banks and it does not require the specification of an explicit functional form for the production frontier or an explicit statistical distribution for the inefficiency terms unlike the econometric methods (Sufian, 2007). The banking efficiency have been estimated using the DEA models, input-oriented model with constant returns to scale and input-oriented model with variable returns to scale. The reason for the using of both techniques is the fact that the assumption of constant returns of scale is accepted only in the event that all production units

are operating at optimum size. This assumption, however, in practice it is impossible to fill, so in order to solve this problem we calculate also with variable returns of scale. We used unbalanced panel data from 13 Czech commercial banks, 11 Slovak commercial banks, 23 Hungarian commercial banks and 38 Polish commercial banks (with regard to mergers and acquisitions of banks).

Tab. 2 – Efficiency score estimated in CCR and BCC model. Source: Author’s calculation

	CCR					BCC				
	2009	2010	2011	2012	2013	2009	2010	2011	2012	2013
Visegrad countries	0.50	0.49	0.45	0.31	0.56	0.63	0.63	0.62	0.42	0.73
Czech Republic	0.53	0.51	0.41	0.27	0.61	0.71	0.66	0.63	0.33	0.82
Hungary	0.56	0.50	0.45	0.31	0.47	0.79	0.74	0.73	0.54	0.77
Poland	0.48	0.49	0.46	0.34	0.58	0.53	0.58	0.58	0.38	0.69
Slovakia	0.43	0.44	0.43	0.27	0.57	0.55	0.55	0.52	0.37	0.66

Table 2 presents average efficiency in Visegrad countries, as well as in the Czech, Hungarian, Polish and Slovak banking sector estimated in CCR and BCC model. The average efficiency calculated in assumption of constant return to scale reach the value 21-61%. On the other hand, average efficiency with variable return to scale was between 33 to 82%. Efficiency in BCC model attained the higher value that efficiency in CCR model. The BCC model decomposes efficiency into two components: pure technical efficiency and efficiency to scale. The values of efficiency computed by the BCC model reach higher values than efficiency computed by the CCR model by eliminating the part of the inefficiency that is caused by a lack of size of production units. This situation may occur when a bank, which has been marked as ineffective in the CCR model due to its inaccurate size, will be marked as an efficient in the BCC model.

It was found that the Hungarian commercial banks were the most efficient in both models.

The results of the average efficiency scores based on constant returns to scale and variable returns to scale, which are divided into three groups of banks according total assets amount, are presented in Table 3. We adopt the breakdown of banks into the groups according Vodová (2012). We distinguish between small, medium-sized and large banks based on the amount of their total assets. Following Vodová (2012) we define large banks as banks with total assets greater than 6% of the total assets of the banking sector. Medium-sized banks have total assets of between 2% and 6% of total assets. Small banks are banks with total assets of less than 2% of the total assets of the banking sector.

Comparing the group of banks results show that according CCR model the group of small banks in Visegrad countries was the most efficient over the whole estimated period. In BCC model the highest efficient were medium-sized and large banks in Visegrad countries. In the Czech banking sector, the most efficient was the group of medium-sized banks in both models. In the Hungarian banking sector the most efficient were small banks in CCR model and the most efficient banks was the group of large banks in BCC model. It shows that large banks in the market are too large and have improperly chosen their size (range of operation). In the Polish banking sector the group of small banks was the most efficient in both model. And in the Slovak banking sector the most efficient were medium-sized banks in CCR model. In BCC model the group of small banks was the most efficient.

The large volume of information derived from DEA may be difficult to summarize and evaluate. Therefore, it is often helpful to break down the information using the Malmquist index. We calculate Malmquist index from the DEA scores between adjacent periods. The application of the Malmquist index is also conducted in MaxDEA software. The Malmquist change indices are computed using DEA. The indices measure TFPC for sampled banks in adjacent year during the period from 2009/2010 to 2012/2013. Its decomposition into technological change (TCC) and efficiency change (EC).

Table 4 presents the results of the average Malmquist indices in banking sectors of the group of Visegrad countries, as well as in the Czech, Hungarian, Polish and Slovak banking sectors during the analysed period.

The average Malmquist index reaches the annual average growth of 27% in CCR and 9% in BCC. This positive efficiency change can be dichotomized into its catch-up and frontier-shift components. The catch-up or recovery component (efficiency change) below 1.00 indicating regress or negative efficiency change. The mean value of EC (catch-up or recovery component) registered 1.00 or above 1.00 indicating progress or positive efficiency change. The catch-up effect is comprised of pure and scale efficiency changes. Pure efficiency change represents core efficiency due to improved operations and management while scale efficiency change is associated with returns to scale effects. In Visegrad region the average annual efficiency change (catch-up) was 10% in CCR and 12% in BCC model. On a year-by-year score, efficiency change only registered below the 1.0 mark for the 2011-2012 period.

Technological change or frontier-shift represents the innovation in the banking system that has been developed, adapted or absorbed by the players. Technological change reached average value of 0.97 in CCR model and 1.00 in BCC model. It indicated the negative average annual growth of 3%.

In the Czech, Hungarian, Poland and Slovakia banking sector, average Malmquist index ranges 1.00-1.09 in CCR and 1.02-1.10 in BCC model. It shows the positive efficiency change. Technological change registered the negative average annual growth of 2-4%. This is due to the negative growth in 2012-2013 which was probably caused as results of a financial crisis. Efficiency change (catch-up) was above 1 besides 2011-2012. It was probably caused due to reduce operations and managements and decreasing effect of return to scale.

Tab. 5 – Average Malmquist indices in the individual groups of commercial banks.

Small banks	1.07	0.96	1.02	0.97	1.03	0.98

Average Malmquist indices of individual group of banks are given in Table 5. The average efficiency change achieved the positive growth in most groups of banks (besides the group of medium-sized and large banks in Hungary) indicating that analysed banks registered positive efficiency growth in the group of banks in Visegrad countries.

We decomposed the efficiency change into the catch-up and frontier-shift effects and found that the catch-up effect was primarily accountable for the productivity growth rather than the frontier-shift effect, suggesting that the industry has lacked innovation or technological progress in the past 5 years. Technological efficiency change register below 1.00 in the most group of banks (besides small Czech commercial banks). It means that technology has a negative effect on the total efficiency change. The highest technological change attained the group of small banks.

The values of catch-up registered values above 1.00 in all group of banks, which indicate the progress or positive efficiency change. The highest efficiency change reach the group of medium-sized banks.

## 5 CONCLUSION AND DISCUSSION

The aim of this paper was to estimate efficiency change in the banking sectors of the group of Visegrad countries during the period 2009–2013. The group of Visegrad countries includes

the Czech Republic, Hungary, Poland and Slovakia. For the estimation we applied Malmquist index on the data of commercial banks. We estimated banking efficiency applying input-oriented model under the assumptions of constant and variable returns to scale. We used unbalanced panel data from 13 Czech commercial banks, 11 Slovak commercial banks, 23 Hungarian commercial banks and 38 Polish commercial banks.

The results show that average efficiency was slightly decreasing within the period 2009-2011. In 2012 average efficiency significantly decreased in banking sectors of Visegrad countries. This decrease was probably as a result of financial crisis. Average efficiency again increased in 2013. Our finding confirms the study of Anayiotos et al. (2010) who concluded that the banking efficiency decreased during the period of financial crisis. The Czech banking sector attained the highest efficiency under the assumptions of constant return to scale. On the other hand, the Hungarian banking sector was the most efficient under the assumptions of variable return to scale. The result shows that the Hungarian commercial banks, especially large banks in the market have improperly chosen their size. Our result is consistent with the conclusion of Stavárek and Polouček (2004), Stavárek (2005), Staníčková and Skokan (2012) and Melecký and Staníčková (2012) who evaluated the Czech banking industry as the highest efficient.

Next, we distinguish between the efficiency of the group of large banks, medium-sized banks and small banks in Visegrad countries as well as in the Czech Republic, Hungary, Polish and Slovakia. Results show that the group of small banks was the most efficient in CCR model and the group of medium-sized banks was the most efficient in BCC model. On the contrary, Nikiel and Opiela (2002) found that large banks were more efficient than small banks in Poland during 1990s. Our results show that small banks were the most efficient in the period 2009-2013. Difference in results can be due to different periods. In Slovakia we confirm the result of Řepková (2013) that large banks were the lowest efficient. Also this result is consistent with results of Stavárek and Řepková (2012) who found that largest banks performed significantly worse than medium-sized and small banks.

We asked this research question: "What is the main reason for positive/negative efficiency change in Visegrad countries?" The average Malmquist index reaches the annual average growth of 27% in CCR and 9% in BCC. We found the positive efficiency change during the period 2009-2013. We can answer that this positive efficiency change is especially due to the catch-up effect. Results of technological change indicates the negative average annual growth of 3%. The negative growth of technological change is due to the negative growth in 2012-2013 which was probably caused as results of a financial crisis. Efficiency change (catch-up) was above 1 besides 2011-2012. It was probably caused due to reduce operations and managements and decreasing effect of return to scale. Our findings are consistent with results of Hančlová and Staníčková (2012) who concluded that all Visegrad countries had the total efficiency increase through the period 1999-2007. They also found the most productivity growth was in the Czech Republic which illustrated the biggest performance change and thus efficiency trend.

Comparing the group of banks we found that average efficiency change achieved the positive growth in most groups of banks (besides the group of medium-sized and large banks in Hungary) indicating that analysed banks registered positive efficiency growth in the group of banks in Visegrad countries. We also found that that technology has a negative effect on the total efficiency change. The highest technological change attained the group of small banks.

## **DEBT RELIEF OF INDIVIDUALS AND THE RATE OF SATISFACTION OF THEIR CREDITORS IN THE CZECH REPUBLIC**

*Marie Paseková, Zuzana Fišerová, Luboš Smrčka, Dagmar Bařinová*

### **Abstract**

According to statistics, the indebtedness of Czech households has been on the rise since 2000, while a broadening supply from the financial sector, the growing standard of living (which is connected with debt financing of housing) and the tendency to favour a consumer lifestyle have contributed to the growing volume of credits.

The aim of our survey is to ascertain the extent to which creditors of debtors in debt relief are satisfied. A sample of insolvency proceedings permitted in 2008 was surveyed. Of these insolvency proceedings, we selected personal bankruptcies which underwent the five-year repayment period required by the insolvency act. A situation emerges in which we can for the first time evaluate the success of creditors satisfaction on the basis of concrete data which we gained from the insolvency register. On the basis of a survey, it was found that individual creditors are satisfied to 50 % of their ascertained receivables. The given initial finding is interesting especially in view of the fact that the law itself prescribes a 30 % minimal limit of satisfaction for debtors.

Further, the survey focused on the problem of securing receivables. The insolvency act has markedly changed the position of the creditor which secures its receivable by some form of collateral. A secured receivable can be monetized during the course of insolvency proceedings, and following the deduction of connected expenses the entire proceeds from the monetized property belong to the secured creditor. By contrast, in a case of personal bankruptcy a non-secured creditor is satisfied according to a percentage in a payment schedule. We surveyed especially the proportion of secured receivables and the form of collateral. From the data it stemmed that 19.62 % of receivables are secured with the debtor's property, most frequently a house, plot of land, flat or other form of collateral.

*Keywords: Debt relief, personal bankruptcy, insolvency, creditors' satisfaction, secured receivable*

JEL Classification: G33

## **1 INTRODUCTION**

The implementation of the institute of personal bankruptcy entailed a significant change for citizens of the Czech Republic when settling their debts. Given the fulfilment of given conditions, debtors get a chance to rid themselves of their debts definitely, whilst decision-making and supervision throughout the entire insolvency proceedings is the province of the pertinent regional courts. The Insolvency Act assigned to insolvency courts the role of supervision over insolvency proceedings and likewise significantly changed the position of secured creditors. Economic subjects have been forced to adapt to the new conditions. Debt relief deeply affects each debtor, especially in the social area.

Debt relief (also labelled as personal bankruptcy) is a manner of settling bankruptcy that was implemented by the Insolvency Act (Act No. 182/2006 Coll. on Insolvency and its Resolution) on 1 January 2008; it was primarily intended for individuals who are not

entrepreneurs. The amendment to the act, effective as of 1.1.2014, opened the possibility of debt relief also for individuals – entrepreneurs given fulfilment of conditions laid down by the law.

The point of debt relief is to help citizens who wish to settle their adverse situation in an active manner – they thus get a “second chance” and cover their debts at least partially.

There are two ways of clearing a non-entrepreneurial subject's debt. One of these is monetization of the debtor's property; the second possibility is debt relief by completing a payment schedule over a period of five years; the debtor, however, has to be able to repay non-secured debtors at least 30 % of their receivables. Unlike settlement of financial failure by bankruptcy, the amendment of debt clearance provides the debtor with a benefit in the form of cessation of obligation to repay the remainder of a debt after the debt relief process ends. A further specific feature is the fact that debt relief can only be proposed by the debtor (unlike bankruptcy).

Although the conditions are strict for the debtors, a growing number of filed requests for debt relief bears witness, nevertheless, to the fact that there is a great need in Czech society to solve this problem.

Throughout the payment period, the debtor should eliminate all unnecessary expenditures and should calculate its family budget, which should be compiled in such a way that the outgoing component should not exceed the income component. In the reasoned report, the legislators state that it is precisely the necessity of long-term economic activity with a limited budget that should have a positive effect on the debtor's behaviour after the close of the five-year period and personal bankruptcy, and it is thereby to fulfil also a certain instructional role. While the payment schedule is underway, the debtor is not to create further debts which it cannot repay and will therefore have to do without consumer loans which, as a rule, lead households and individuals into the debt spiral.

## **2 LITERATURE REVIEW**

Insolvency proceedings fulfil a significant purpose on a macro and microeconomic level. On a macroeconomic level, they provide a platform for the departure of economically unsuccessful subjects from the market. The task of insolvency law is to increase the efficiency of this process. Furthermore, it prevents all-societal losses, for it removes from separate creditors the individual legal means of enforcement and replaces them with the collective process. A further major goal is to ensure that regardless of the disparateness of the claims on the debtor's property, its assets are to be handled, if possible, in a manner as effective as would be the case if a homogenous proprietor – a single investor – handled them. An equally important function of insolvency law is the impact of its effect on solvent, i.e. non-bankrupting subjects and their investors. In this regard, we speak of ex ante effects (Richter, 2008).

The authors Carter and Van Auken (2006) focused on an analysis of the main reasons for the rise of insolvency among small firms. Their research, in which they compared demographic and potential problems in 57 bankrupting companies and 55 non-bankrupting companies in the American state of Iowa, pointed towards the three main causes of insolvency: lack of knowledge, the impossibility of debt financing and the economic climate. The necessity of economic knowledge as a safeguard against financial failure is documented, for instance also by the older research of Graham Hall (1992), who statistically processed data which British businesses in insolvency have to provide to the court by law. He saw the main cause of insolvency in the inability of a business to foresee the need for capital and, furthermore, in the inefficiency of money markets. Yet the authors Shepherd, Wiklund and Haynie (2007) point

out that besides the financial prospect of company bankruptcies, the emotional perspective (which, according to them, is the reason why entrepreneurs lengthen the agony period of a bankrupting company) also has to be taken into account. The connection of financial literacy and social standing was proved, for instance, by Jappeli (2010) in a comprehensive analysis of the financial literacy of inhabitants in 55 countries. According to him, financial literacy markedly varies in individual countries. One can, however, notice that it grows with education and the level of human capital, and also with the proportional representation of the town population; furthermore, the study proved lower financial literacy among inhabitants of countries with a generous social security system.

A hitherto relatively little-researched theme is the problem of the behavior of debtors and creditors after completion of personal bankruptcy. In the *Journal of Banking and Finance* (2013), the authors Cohen-Cole, Duygan-Bump and Montoriol-Garriga published a study in which they empirically surveyed the possibilities of credit accessibility for individuals immediately after the end of personal bankruptcy. On the basis of surveyed data, the authors arrived at the conclusion that, in American credit companies, the “debt-cleared” individual represents a better and less risky investment, and thus has a better chance of acquiring a potential credit. The authors likewise proved that credit-scoring models are unable to characterize adequately the debt risk of natural person bankruptcy, for there is here the risk of incorrect allocation or adjustment of a credit and, thereby, the non-repayment thereof.

### **3 AIM AND METODOLOGY**

The data for this survey was gained from the publically accessible insolvency register, whilst data were sought on debtors – individuals among whom debt relief was permitted in 2008, and it was thus possible to ascertain the final satisfaction of creditors after five years.

The aim of our survey is to ascertain the extent to which creditors of debtors in debt relief are satisfied. The survey included 664 insolvency proceedings of individuals commenced in 2008. This sample included both insolvency proceedings which took place in the form of bankruptcy, personal bankruptcy or other possibilities (adjourned or suspended proceedings, change of personal bankruptcy to bankruptcy etc.). Debtors, whose debt relief was approved in 2008, already have 60 instalments completed or are close to fulfilling the instalments. A situation emerges in which we can for the first time evaluate the success of creditors satisfaction on the basis of concrete data which we gained from the insolvency register. 191 debtors out of the surveyed sample of natural persons underwent the entire process of personal bankruptcy. When assessing the rate of creditor satisfaction, data on debtors from the category of debtors in and after debt relief and thereafter formed the departure point (i.e. 191 debtors). Among those, who completed the process of debt relief (i.e., they paid 60 instalments), the total paid amount was taken into account. Among debtors who have fewer than 60 instalments paid, the extrapolated total amount of instalments was taken to be the total amount of debt coverage. This extrapolated figure was thus taken as 60 multiples of the amount of their theretofore average monthly instalment. The extrapolated total amount of debt coverage was, however, limited by the total amount of debt.

Data concerning the level of debt and satisfaction of creditor according to individual characteristics – for instance, age, sex, position of secured creditor was acquired from the register; in the next part, the survey focuses on the length of insolvency rulings according to individual courts and position of secured creditors.

## **4 SURVEY RESULTS**

### **4.1 The focus on debtors**

The average level of debt and the average level of satisfaction of creditors were monitored especially in the categories of “women” (which represented 36.1% of the monitored sample) and “men” (representation 63.9%). The average level of debt among women was CZK 537 thousand, while the average level of creditors’ satisfaction reached 46.2%. Men in the monitored sample had an average level of reported receivables of CZK 652 thousand, satisfaction of creditors reached 58.8%.

The average amount of debt and the average rate of creditor satisfaction according to debtor sex are given in Tab. 1.

Tab. 1 – Average amount of debt and average rate of creditor satisfaction. Source: Insolvency register + own calculations

	Women	Men
Relative number of debtors in %	36.1	63.9
Average amount of debt in CZK thousands	537	652
Average amount of creditor satisfaction in %	46.2	58.8

From the gained and evaluated data on debtors, it stems that debt relief applies to all age categories. The average amount of debt was in the vicinity of between CZK 500 – 600 thousand. Men and women of so-called productive age between 35 – 60 years have the highest owed amounts.

When comparing the ability among men and women to repay their debts, there is a slightly lower ability among women between 30 – 60 years to repay their debts. This is probably caused by the fact that women in their productive years care for children whom they have in their care, and alimented persons, even after divorce, are included in the non-forfeitable minimum. Their economic situation thereby differs from that of divorced men.

### **4.2 Securing receivables**

One of the ways towards reducing creditor risks is the securing of loans. When collecting data, especially securing with a flat, detached house, cottage, plot of land or other item was monitored.

A secured creditor has a special position in insolvency proceedings. In insolvency proceedings, the secured creditor is satisfied especially from sale of the collateral, only under the assumption that it duly reports its receivable to the insolvency proceedings, its receivable is ascertained during review proceedings and such a creditor requests the insolvency administrator’s instructions as to the sale of this collateral. Secured creditors form a group in insolvency proceedings which, given its standing and its interests, markedly differs from the other groups of creditors. Precisely in view of their rights from securing gained prior to the commencement of insolvency proceedings, they are given the possibility to influence the course of the proceedings in a significant way.

In the event that debt relief is approved and a ruling on the form of debt relief by payment schedule is passed, the secured creditor's receivable is satisfied solely from the proceeds from monetization, which is reduced by a maximum 4 % for administration costs, 5 % for monetization expenses and 9 % for the insolvency administrator's fees, and this secured receivable therefore cannot be a part of the payment schedule.

The proportion of secured receivables to the total volume of receivables is 19.62 %. The representation of individual methods of securing in the total volume of secured receivables is shown on Figure 1.

Fig. 1 – Relative representation of individual types of secured receivables in % with a view to the total volume of secured receivables. Source: Insolvency register + own calculations

The graph on Figure 1 was compiled for assessing individual types of collateral. Let us mark the entire number of debtors that acquired a loan when they provided collateral  $I$ . Every such debtor is represented in our set by the pair  $\{ P_i, K_i \}_{i=1, \dots, I}$ , where  $P_i$  is the amount of the loan of the  $i$ -th debtor and  $K_i \in K$  a  $K$  is the set of all non-empty sets containing various combinations of one or more considered types of collateral. In view of the fact that the number of considered types of collateral is equal to 5, the power of set  $K$  is equal to  $2^5 - 1$ . Then in the graph, the value

$$r_k = 100 \cdot \frac{\sum_{\forall i: k \in K_i} P_i}{\sum_{\forall i} P_i}$$

pertains to the  $k$ -th type of collateral of relative representation of individual types of secured receivables in %.

The height of the column of type of collateral corresponds to the percentage of the given collateral in total secured receivables. The sum exceeds 100, as the debt is sometimes secured by several types of collateral. The amount of the due receivable always appears in the total for the type of collateral when the debtor stated the given type of collateral in a provided list of collateral types. The relative value is the total level of debt with a type of collateral.

Figure 2 shows the proportion of secured receivables for debtors in the categories “in bankruptcy from the beginning” and “in debt relief or debt cleared” is significant. The graph

represents the relative proportion of secured and non-secured receivables related to the total sum of receivables in a given category. The subject of collateral is, as a rule, real estate.

Fig. 2 – Relative representation in % of amount of secured and non-secured debts in individual debtor. Source: Insolvency register + own calculations

## 5 DISCUSSION

The conditions for secured loans are, markedly unfavorable for the debtor, as the loaned sum does not exceed the estimated price of the real estate, and if the debtor does not cover the owed sum within the fixed term, they lose their immovable property, as the creditor sells the subject of collateralized object.

This corresponds also to the results of similarly- focused foreign surveys. Davydenko and Franks (2008) have proved that banks in countries that provide debtors with less protection require higher collateral for their credits and vice versa.

## 6 CONCLUSION

The aim of this contribution was to gain a deeper insight on debtors who complete personal bankruptcy, both by analysis of the level of their debt with which they enter into insolvency proceedings and by surveying the level of creditors' satisfaction after the close of personal bankruptcy. We surveyed these categories in dependence to the age structure of debtors and according to a division according to sex of persons. The survey according to sex proved a lower initial debt among women, but at the same time also lower satisfaction of their creditors – the average level of debt among women was CZK 537 thousand, while the average level of creditor satisfaction reached 46.2%. Men in the monitored sample had an average level of reported receivables of CZK 652 thousand, satisfaction of creditors reached 58.8%. The division according to age proved (in both sexes) the highest growth of debt during productive age (35-60 years), while among women aged 30 – 50 years there is clearly a lower level of satisfaction of creditors in comparison to men in the same age category, which can be explained not only by generally lower income among women in comparison to men, but also by the fact that women care for children who are not provided for, which increases the non-forfeitable minimum sum, thereby decreasing the percentage of satisfaction of creditors.

The next part of the survey focused on creditors' securing of receivables. It was found that 19,62 % of receivables registered in insolvency proceedings consist of receivables secured by a certain form of collateral. Most frequently, a detached house, flat, plot of land or other form of collateral (e.g. an automobile) was at issue. In the course of the survey, it was also found that markedly more secured receivables appear when insolvency proceedings take place from the outset in the form of bankruptcy. This can be explained by the fact that personal bankruptcy has, since its implementation, been conceived of as a solution for debts predominantly from consumer loans which did not utilize the institute to a high degree.

From the data up to the present it can, for the time being, only be judged that this is among of the first completed debt reliefs, and the ascertained fulfilment expresses the debtor's real possibility to satisfy creditors' receivables. It can be expected that the position of the secured creditor and the level of satisfaction of receivables in insolvency proceedings will affect the approach of creditors in the Czech Republic in securing their receivables and the direction of their risk-management.

## **PERFORMANCE OF SMES AND THE ROLE OF RESILIENCE**

*Reinhard Paulesich*

### **Abstract**

Peak oil is increasingly seen as a major threat to economy as well as infrastructures. Peak oil either happened (2008) or is to be expected in the near future. European gas production has peaked and it is doubtful if imports will be sufficient. A decline in oil production will possibly trigger a decline in economic production or even a collapse.

Thus, regional development policies should consider regional resilience strategies. In order to do this it is necessary to clarify the resilience and operationalize resilience components: economic, ecological, social factors and factors of the built environment.

This describes the background for answering our research questions.

What can be SMEs contributions? How social sciences can measure their performance and their strategic options to get statement rich in scientific content. Regional, national and EU policies are challenged.

We carry out workshops with local entrepreneurs and their local stakeholders as well as interested public from May to July 2013 underpinned by social surveys within various organizations and business in order to crosscheck analyses from explorative interviews with key stakeholders before. The empirical data are basis for case studies in two regions rounded up by energy expert workshops in each region for analyzing sensitivity of empirical results (derived scenarios) against various expert scenarios.

*Keywords: SMEs Performance Measurement, Regional Development, Resilience and Innovation, Intervention in Social Capital.*

JEL Classification: L25, O31, R58

## **1 INTRODUCTION**

Let me first add measuring organizational capabilities to performance measuring of SMEs. It becomes clear when you get to know the background of the question which I will answer in this paper. The background refers to resilience. The question is, which methods and instruments do we need additionally to performance measuring for SMEs to assessing their resilience? Furthermore we have to take into account innovation because we propose that it is the back side of the same medal.

We – whatever you will understand by “we”: polity, community, region, organization or firm – we want to gain both (1) to be resilient and hence get the certainty to have capabilities to overcome possible crises and (2) to be progressive and hence get the certainty to have capabilities to move continuously forward to a more convenient life. Finally the question arises where and how to intervene for shaping and strengthening capabilities.

## **2 CONCEPTUAL BACKGROUND**

Resilience has become a prominent concept to understand system vulnerabilities and flexible ways of adapting to crises. Recently, it gained importance in discussions about the possible peak oil and its consequences, which might affect economic performance, social well-being

and political stability, and thus also the very energy transition to a low-carbon economy, which is the ultimate rationale of impact of a Peak Oil.

The resilience discourse seems to mark a significant shift in societal debates, as its upswing coincides with a range of intertwined dynamics that are now often discussed as multiple crises: the nearly breakdown of the world economy in 2008, with continuing economic, political and social challenges in its wake; the extraordinary price increases for food, energy and many other raw materials, which reshaped a whole socio-economic landscape from geopolitics to developmental issues and the stability of governments; and the seeming lack of climate policy success (Exner et al. 2013).

The innovation discourse seems to mark a program for redemption from crisis caused by economic and / or societal distortions. The sermon repeats investment in education, re-research and technology to create an appropriate climate for business founding and start-ups. Regions and nations should retain their competitiveness. This should be reflected mainly in media agenda main-streamed policy intentions, interests and attention.

What can we state by the look to regional policies? The concept of Regional Innovation Systems has evolved into a widely used analytical framework generating the empirical foundation for innovation policy making. Yet, the approaches utilizing this framework remain ambiguous on such key issues as the territorial dimension of innovation, e.g., the region, and the apparently important role played by “institutions” or the institutional context in the emergence and sustenance of regional innovation systems.

Institutions are “social relations” that frame the activities of production, consumption, and exchange - the substance rather than merely the boundaries of social life - and the guide to reduce uncertainty in human interactions. As such, institutions operate at and through different arenas. The medium is (verbal) (personal) communication.

This describes the background for my research question: What is the part of SMEs? How SMEs can contribute to resilience respective innovation? Can we directly conclude from performance measuring to resilience measuring? It is a challenge for social research to measure organizational performance and capabilities to get statements rich in scientific content. Which strategic options such statements provide at least?

Resilience is a matter of organizational slack – on firm level – and redundancies on regional level and as we mentioned above for innovative milieus too. When we accept this bivalent character we can open the door to multiple aspects of organizational development.

### **3 DATA AND METHOD**

What we want to measure? Slack or rather redundancy is to understand as a surplus to requirements. It can be measured by questioning what the volume is in time, intensity and satisfaction with verbal and personal communication. Another point of view is to look at the opposite pair of flexibility and idling. Flexibility is a highly valued property of an organization but idling is highly rejected as well. In conventional economic theory organizational slack is zero, at least at equilibrium. Cyert and March claim that organizational slack plays a stabilizing and adaptive role. Grabher describes organizational slack and regional redundancy as the provision of uncommitted and unspecific resources which then characterize and enable an organization to perceive various options

1. on the one hand to follow objectives and goals even in times of uncertainty and surprises,

2. on the other hand to experimental handling of resources through a “relaxed” communication, which is a prerequisite for creativity and innovation.

## 4 RESEARCH

Diversity and redundancy are preconditions for the availability of alternatives in cases of shocks particularly affecting single regions or industries. The research where the data which I will figure out come from was about resilience of regions. The data collection comprised criteria within five dimensions.

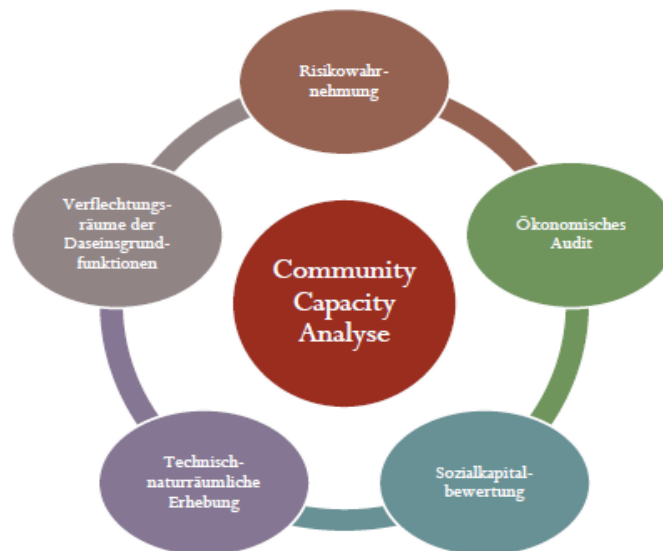

Figure 1: Community Capacity Analyses. Source: Own elaboration (ROE 2014, Klima- und Energiefonds)

Here I want to talk about the social capital and the economic audit dimension. For data collection we carried out workshops with local entrepreneurs and their local stakeholders as well as interested public from May to July 2013 underpinned by social capital surveys within various organizations and businesses in order to crosscheck analyses from explorative interviews with key stakeholders before. The empirical data are basis for case studies in two regions rounded up by energy expert workshops in each region for analyzing sensitivity of empirical results (derived scenarios) against various expert scenarios.

In each phase of our research process we patterned the communication relevant data by volume, intensity and satisfaction with personal contacts of our interview partners. Data for the other three dimensions was collected along the scheme described by the next table.

Table 1: Distribution of indicator data along scale levels Source: Own elaboration (ROE 2014 Klima- und Energiefonds)

	No of indicators per data level						total
	State	Federal states	Judicial parishes	NUTS3	Districts	Municipalities	
Energy			4			1	5
Spatial structure and mobility		1				4	6
Reciprocity		2		1			11
Skills							2
Conventional economy		1	2		2	1	9
Organizational capacity and collective competencies		1	5				8
		5	17	1	2	6	41

Three of the six research fields for the analyses of quantitative data - selection from various existing databases of Statistics Austria – provide various interfaces to qualitative data and the making of indices from social capital and economic audit, which is illustrated by the following table.

Table 2: Quantitative and qualitative data interface. Source: Own elaboration (ROE 2014 Klima- und Energiefonds)

Interfaces	Quantitative	Qualitative
<b>Energy</b>	<ul style="list-style-type: none"> <li>• Electricity consumption</li> <li>• Renewables Production</li> </ul>	<ul style="list-style-type: none"> <li>• Trust in institutions</li> <li>• Willingness to invest</li> </ul>
<b>Reciprocity</b>	<ul style="list-style-type: none"> <li>• Member of conventional associations</li> <li>• Engaged in volunteer work</li> </ul>	<ul style="list-style-type: none"> <li>• Social capital I</li> <li>• Social capital II</li> </ul>
<b>Organisational Capacity ...</b>	<ul style="list-style-type: none"> <li>• Income gap m/f</li> <li>• Regional energy &amp; social initiatives</li> <li>• Access to information &amp; knowledge</li> </ul>	<ul style="list-style-type: none"> <li>• Social capital I</li> <li>• Social capital II</li> <li>• Work place stress</li> </ul>

#### 4.1 Social Capital Analysis

Formation and description of qualitative indicators by 6 Indices are presented in Tab 3.

Table 3: Quantitative qualitative data interface. Source: Own (ROE 2014 Klima- und Energiefonds)

<p><b>Social Capital-Index 1</b> has 6 dimensions.</p> <p>A high value characterises the core property of social cohesion, which sometimes can coincide with understanding and practicing solidarity. Therefore the assumption is: high value correlates positive with the ability to overcome crisis.</p>	<p><b>SCI 1</b></p> <ol style="list-style-type: none"> <li>1. sense making work,</li> <li>2. friends will help in emergency cases,</li> <li>3. sufficient number of friends and acquaintances,</li> <li>4. aktive engagement,</li> <li>5. mixed work – community work,</li> <li>6. mixed work – aktive work.</li> </ol>
<p><b>Social Capital-Index 2</b> has two times 5 dimensions and is a composition of community and active work (for Mixed Work see ANNEX 2 figure 2).</p> <p>A high value in terms of time expenses characterises the second important property of social cohesion. The assumption is: high value – restrictions because of gainful occupation – correlates positive with resilience because there are more social and practical skills.</p>	<p><b>SCI 2</b></p> <ol style="list-style-type: none"> <li>1. time expenses,</li> <li>2. self assessment – satisfaction,</li> <li>3. intention to increase / decrease,</li> <li>4. feedback – acknowledgment,</li> <li>5. feedback – trust,</li> <li>6. feedback – respect,</li> <li>7. impact on family life.</li> </ol>

<p><b>Work Place Stress-Index</b> has 3 dimensions.</p> <p>A high value means high stress and would threaten respondents' health. The impact on the organisation is loss of resilience respective loss of productivity.</p> <p>There is an option to check the plausibility of answers by an European and additionally a national (AK OOE) survey.</p>	<p><b>WPSTI</b></p> <ol style="list-style-type: none"> <li>1. Stress exposure – physical,</li> <li>2. Stress exposure – mental,</li> <li>3. Work place well being.</li> </ol>
<p><b>Well being Index</b> has 6 dimensions.</p> <p>A high value means a sufficient well being. There is an option to check the plausibility of answers by UN Quality of Life &amp; OECD Better Life Index and additionally by an ongoing FP7 research project coordinated by the Austrian WIFO: <a href="http://www.foreurope.eu">wwwforeurope – welfare wealth work</a> <a href="http://www.foreurope.eu/">http://www.foreurope.eu/</a></p>	<p><b>WBI 1</b></p> <ol style="list-style-type: none"> <li>1. Stress – private life,</li> <li>2. social burdens,</li> <li>3. self assessment - position in society,</li> <li>4. assessment of living environment,</li> <li>5. succeeding private life,</li> <li>6. assessment personal health status.</li> </ol>
<p><b>Trust in Institutions Index</b> has 3 dimensions.</p> <p>A high value means a high trust in institutions of the state but particularly of the market. Additionally the intensity of the personal messaging believes in everyday communication was questioned.</p>	<p><b>TII 1</b></p> <ol style="list-style-type: none"> <li>1. Personal message at home, at work place and both,</li> <li>2. Trust in cohesiveness of family, society,</li> <li>3. Trust in capabilities of market institutions.</li> </ol>
<p><b>Willingness to Invest Index</b> has 5 dimensions.</p> <p>A high value means a willingness to invest in renewable energy projects (PVD, Wind Wheels, and innovative SMEs). The restrictions were: (1) spatially closeness (2) the profit does not exceed 3%. Additionally the amount willing to invest as well as the free disposable income was questioned.</p>	<p><b>WII 1</b></p> <ol style="list-style-type: none"> <li>1. Photo Voltaic Devices, Wind Wheels, SMEs;</li> <li>2. Income – free disposable,</li> <li>3. Amount willing to invest,</li> <li>4. Ethical ecological rating,</li> <li>5. Yield on share (max 3% - high valued).</li> </ol>

For ordering the results we choose a scale of 5 stages according to the school grades from 1 equals best to 5 equals worst. For displaying we choose colors from red to green Red equals 5, green equals 1. The results are presented in Fig. 2.

Figure 3: Resilience rating scale. Source: Own elaboration

high	
moderate	
medium	
poor	
insufficient	

Figure 2: Social Capital Lower Austria [LA] (n=165; 09 – 11 2013). Source: Own Elaboration (ROE 2014 Klima- und Energiefonds)

Both SC indices in Lower Austria are red. That means to less active engagement in associations etc. and subsequently less communication between communities. Community work and active work is underrepresented in comparison to the Austrian average.

The value (occurrence) of Work Place Stress and Willingness to Invest range in the middle: yellow. Work Place Stress corresponds to the annual survey which is published by the chamber of labor (Upper Austria). The Willingness to Invest is a little higher than we had collected 2004 and the Austrian Central Bank publishes annually for private investments even under mentioned restrictions of return. This seems to be due to the low interest rates banks give to conventional savings.

Private Well Being – ocher yellow – seems to be closer at value to both SC I & II than to Work Place Stress. That means respondents are more satisfied by their jobs than by their private circumstances. This has to be deeper questioned next time. Trust in Institutions is the only index in green: light green. In spite of a suboptimal value of Well Being the value of Trust in societal and market institutions is held up.

Only one SC index – the SC 1 – in Upper Austria is red but this is the core part with strong references to social cohesion. (It has a high scientific content.) That means the similar as for Lower Austria: to less active engagement in associations etc. and subsequently less communication between communities. Community work and active work is underrepresented in comparison to the Austrian average. The SC II has a poor value possibly due to the companies function as an incubation center. Most of the professionals there has an honorary office or are engaged in volunteer work. Results are presented in following Fig 4.

Figure 4: Social Capital Upper Austria [UA] (n=22; 09 – 11 2013). Source: Own elaboration (ROE 2014 Klima- und Energiefonds)

The value (occurrence) of Work Place Stress range in the middle: yellow. Work Place Stress corresponds to the annual survey which is published by the chamber of labor (Upper Austria). The Upper Austrians assess their work place situation above Austrian average.

The Willingness to Invest is as poor as we had collected 2004 and the Austrian Central Bank publishes annually for private investments. This looks embarrassing and needs a deeper questioning because most of the respondents are affiliated at an incubation center which has the function to advice and support start-ups.

Private Well Being as well as Willingness to Invest is colored in ocher yellow – seems to be closer at value to both SC I & II than to Work Place Stress. That means respondents are more satisfied by their jobs than by their private circumstances. This has to be deeper questioned next time. Trust in Institutions is the only index in green: light green. In spite of a suboptimal value of Well Being the value of Trust in societal and market institutions is held up.

#### **4.1.1 Discussion**

The data base is poor but for planning serious policy interventions it would need a policy committed regional programme development instead of research. The data base consists of 3 companies in Lower Austria and 1 company (and various single persons) in Upper Austria. In spite of it fulfils the intended purpose, to discover a track to methodologically combine existing data set with primarily generated qualitative data for deriving from analyses some statements with scientific content.

- The values of both social capital indices (measuring volume, intensity and satisfaction by communication) are red that means management should identify organizational weaknesses and conceptualize interventions for minimizing them.
- The values of wellbeing indices (concerning private life) in both regions are at a low level compared to the values for work place stress.
- The values of trust in institutions indices (both regions) are the only of the five within the green range.
- Maybe the difference between private and occupational wellbeing partly explains the level of trust in institutions. Family as an institution is lightly less weighted than society respective market. It seems that respondents would relax more at their workplace than at home.

## 4.2 Economic Audit Analyses

We analyzed 4 Indices. Formation and description of qualitative indicators are presented in Tab 4.

Table 4: Qualitative indicators. Source: Own elaboration

Certainty strategy	Intrinsic motivation, market pressure, state regulations, certainty of energy supply required
Change strategy	Intrinsic motivation, attitude to energy change, priorities energy change, required market transparency
Level of activities	Devices installed, energy saving concepts (management) employed, insulation, assessment of organisational preparedness
Willingness to invest	The same as above (investment target and restrictions)

The Economic Audit is a feature of our social capital research in the two mentioned regions. The intention is to collect verbal data from managers separately and with more focus on economic issues. When our research would have had a political commitment we would have made a programme for intervening in regional administration and market.

Respondents would have an equal distribution between certainty and change. The opinion dominates that an equal weighting would keep options for future decisions at an optimal level. Activities and Willingness to Invest are both on a poor level. Both can be explained by expenses for restructuring some important industries of the region in the last 2 decades. These industries were nationalized and were reorganized for privatizing. That implies a requalification of work force, rebuilding some sites to attract new businesses etc. Therefore we think that they will follow such developments in energy supply with a little time lag. Results of the Economic Audit in Lower Austria are presented in Fig 5.

Figure 5: Economic Audit Lower Austria [LA] (n=44; 11 – 12 2014). Source: Own elaboration (ROE 2014 Klima- und Energiefonds)

Respondents would have an equal distribution between certainty and change. The opinion dominates that an equal weighting would keep options for future decisions at an optimal level. But compared to the Lower Austria region the Upper Austria region climbs up to a higher level of resilience – dark green. Activities are on a middle level. They have invested in re-

newable energy more per capita than the others. But *Willingness to Invest* is valued almost as poor as Lower Austria. For that we don't have an explanation. The Economic Audit in Upper Austria is presented in Fig 6.

Figure 6: Economic Audit Upper Austria [UA] (n=20; 10 – 12 2014). Source: Own (ROE 2014 Klima- und Energiefonds)

#### 4.2.1 Analysis

- Comparing the willingness to invest between staff and managers / owners (see tables further down) the index value differs strongly. Staff in Upper Austria (Traunstein) have a significant lower interest to invest in spatial close projects than the managers (more than six tenth).
- Managers are weighting certainty of energy provision as equal as energy change by their strategy concept

#### 4.2.2 Discussion

First we have to mention that we have a significant low number of respondents in the Upper Austria region. But we have various analyses and survey which foster the impression we got by comparing LA and UA. The similarities of both regions are:

- Topographic structure,
- Number of small towns,
- Structure of educational institutions,

The differences are:

- a little more rural structure in UA region,
- big and former nationalized industry in LA,
- small und middle sized industry in UA,
- technology and innovation center in UA region.

The LA region shows positive values of indices for only 5 from 37. That is:

- electricity from renewable energy in relation to over all electricity consumption,
- some aspects of regional autochton food production,
- some aspects of traffic, and
- trust institutions.

The UA region shows positive values of indices for 8 from 37. That is:

- overall production of electricity from renewable energy and its future potentials,
- some aspects of regional autochton food production,
- some aspects of private independence from energy supply,
- some aspects of traffic, and
- trust institutions.

## 5 CONCLUSION

Where and how management can intervene? It is an issue for private firm management as well as for public management and policies / politics. The first request is for coalitioneers. Where and how regional policies e.g. public management on a communal level can intervene?

How to proceed and what to recommend?

1. The new institutional economics [NIE] are the ground from where we start to build the bridge from theory to policies;
2. When the criteria we have shown in table 1 are existing points for data generating than we should go backward from there;
3. The intention is to identify structures in public administration, market etc we can characterise them as institutions of the first order;
4. This procedure we can repeat by the qualitative criteria which we used for measuring social capital;
5. So will come to deeper laying structures which we can call institutions of second order;
6. From here we can start the final analyses to identify measurements for interventions (see the following table)

The differences we enumerated above imply different methods and instruments of intervention. We assign the categories of the two columns from table 2 at the formal and informal institutions of the New Institutional Economics and reason along our empirical analyses.

Table 5: Interfaces for Interventions. Source: Own elaboration (ROE 2014 Klima- und Energiefonds)

<b>Formal Institutions</b>	<b>Informal Institutions</b>	<b>Intervention - Change</b>
• Electricity consumption	• Trust in institutions	A voluntary reduction is not to expect, provision of security of energy supply requests for a network of regional organisations to establish various independent plants as well as grids etc.
• Renewables Production	• Willingness to invest	To reduce the pressure on public finance existing PPP models for financing renewable energy plants should not only pay attention to returns but also to secure supply.
• Member of conventional associations	• Social capital I	The numbers of both categories decrease in most of the EU states but solidarity is sotosay still alive – a more or less counter diction to the analyses of formal structures.
• Engaged in volunteer work	• Social capital II	

<ul style="list-style-type: none"> <li>• Income gap m/f</li> </ul>	<ul style="list-style-type: none"> <li>• Social capital I</li> </ul>	<p>Only interventions on nation level will help for equality policies</p>
<ul style="list-style-type: none"> <li>• Regional energy &amp; social initiatives</li> </ul>	<ul style="list-style-type: none"> <li>• Social capital II</li> </ul>	<p>Individual private contributions to PPP models could also consist of volunteer work (mixed work) and crowd funding.</p>
<ul style="list-style-type: none"> <li>• Access to information &amp; knowledge</li> </ul>	<ul style="list-style-type: none"> <li>• Work place stress</li> <li>• Well Being</li> <li>• Trust in institutions</li> </ul>	<p>The question is how new media will influence informal institutions in regions – the effect will become evidence when the young generation will come to the labour market</p>

This needs a scientific justification and discussion we want to perform at the conference.

## **MOTIVES FOR MERGERS AND ACQUISITIONS**

*Jan Pěta, Mária Režňáková*

### **Abstract**

It is a commonly held view that large companies are the decisive force in every economy. One of corporate growth strategies are mergers and acquisitions. Although some authors believe their development closely correlates with the development of the GDP, the number of transactions world-wide has grown continuously except slight dips in 2009 and in 2012 -2013. The average value of executed transactions has also grown. This paper looks into the motives for mergers and acquisitions. The authors analyze and systemize information about past mergers and acquisitions in terms of their motivation. The research conducted shows that in many cases it is not possible to unambiguously pinpoint the motive, or distinguish among individual motives at play. The performed analysis and systemization of findings, which are the main methodological tools of research in business and management, nevertheless help create new knowledge in the field of mergers and acquisitions.

*Keywords: mergers and acquisitions, tax motivation, synergy, motive of efficiency*

JEL Classification: G34

### **1 INTRODUCTION**

One of important areas for both research and strategic management of companies are mergers and acquisitions. Their volume is growing worldwide, even though they seem to come in waves. The reason may lie in the fact that large companies are generally considered as more stable, high performing and affecting the economic performance of the whole economy, in the case of large multinational corporations, the performance of the world economy. This fact is confirmed by research carried out in the field of bankruptcy, where the factor of company size (measured by asset value) is an important distinguishing feature marking the difference between prosperous businesses and businesses at risk of bankruptcy (see, e.g., Karas, Režňáková, 2013). Mergers and acquisitions are considered one of the ways how companies can grow and develop, and increase in value.

In general, mergers and acquisitions (M&A) are terms referring to the consolidation of companies, and many studies do not distinguish what type of consolidation it is. A merger is a combination of two companies to form a new company, while an acquisition is the purchase of one company by another in which no new company is formed.

The importance of M&A may be deduced from the data in Fig. 1.

*Note: Average values of M&A (right axis) are in million USD for World and North America, in million EUR for Europe*

Fig. 1 Numbers and Average Values of M&A. Source: Own analysis of data from Institute of Mergers, Acquisitions and Alliances (2014)

It clearly shows that the volume of executed M&A has been growing worldwide over time, and so has the average value of transactions completed. The highest values of transactions were achieved in 2006 and 2007, when also the number of transactions peaked. It is worth noting that the average growth rate of the number of transactions and the average value of transactions world-wide exceed the average rate of growth in Europe and North America.

What the situation is in the Czech Republic can be inferred from the results of research conducted by Ernst&Young (2014), according to which 38% of companies were planning some kind of an acquisition in the next 12 months, while in two previous years it was only 6%. Of the 38% of companies planning an acquisition, as many as 61% expected that the transaction size would exceed 50 million USD, which is also an increase compared to 39% in the previous year. The reason for the growing interest in acquisitions is a positive mood in the current economic situation in the Czech Republic, where 90% of managers think that the situation is stable or improving. A positive factor, which suggests that growth in M&A in the country will continue, is the opinion of 42% of the interviewed managers who believe that the difference between the expectations of buyers and sellers regarding the transaction price is lower than 10%. Nearly three-quarters of managers think that the convergence of transaction prices will stay at that level, or will continue.

## 2 RESEARCH OBJECTIVE AND METHODOLOGY

Each transaction can be assessed in terms of the objectives pursued. Although systemizing knowledge from this point of view, i.e. in terms of motives for the transaction, is very difficult because each transaction is unique, it is the goal that we set for ourselves in the present study.

For conducting research in the field of business and management, the choice of methodology is crucial. It significantly affects the credibility of the research and its depth. It helps to create high quality in knowledge (Arbnor, Bjerke, 2009). The main methodological approach in our research was the analytic approach supplemented by a systemic approach leading to the synthesis of the results.

Collis and Hussey (2003, p. 343) describe analysis as an ability to break down information into individual elements that can be more easily understood, and to decide what should be done with any particular element in the process. Synek et al. (2007, p. 20) claim that the breaking down into individual elements makes research and finding patterns easier. The aim of analysis is to get to know the individual elements and links between them, including patterns that apply there. In a broader sense, analysis can be understood as the acquisition, evaluation and sorting of information for the solving of a particular problem.

Collis and Hussey (2003, p. 343) define synthesis as an ability to build information from other information. For Synek et al. (2007, p. 20), synthesis means the combination of individual elements into a whole. By placing phenomena next to one another, mutual relationships can be identified and the set investigated more profoundly understood.

This paper presents results of the first stage of continuing research into reasons for the failure to attain expected benefits of M&A implementation. It is a part of a broader research focused on the modification of methods for determining the boundary price of the target company in M&A. The price paid for the target company influences the success of the M&A (e.g. Ismail, 2011 Netter et al, 2011 Zaheer et al, 2013). We will base our modifications on the assumption that the boundary price represents the value of the company being purchased for the individual investor. The maximum price depends on the motives and expected effects of the combination. The price should, however, be based on the value of the target company. The methods that can determine that value include discounted free cash flow or capitalized cash flow (see, e.g., Dutordoir et al., 2014).

### **3 RESULTS AND DISCUSSION**

M&A can be divided into four major groups:

- Horizontal M&A, i.e. a combination of two or more companies from the same market segment. The problem with these transactions is that they may lead to the establishment of a monopoly position for the successor company, and for that reason horizontal M&A are often investigated in terms of competition policy. According to Andrade et al. (2001), the number of horizontal M&A has been growing: from just under 30% in the 1970s to 40% in the eighties and almost 48% in the nineties.
- Vertical M&A are combinations of two companies that are in the customer-supplier relationship. The problem with vertical M&A is the possibility that they may influence market prices or discriminate against competing companies, and that is the reason why they are similarly scrutinized in terms of competition policy.
- Congeneric M&A are, from the economic competition point of view, on the borderline. The term is used for a combination of companies from the same industry but with different or completely unrelated products. They may be market extension mergers or product extension mergers.
- Conglomerate M&A represent the smallest problem from the competition perspective because they are concentrations of companies from different industries. An example might be when a company engaged in agricultural production buys a newspaper-publishing company Smrčka, 2013.)

Another approach to M&A classification has been proposed by Damodaran (2011), who distinguishes between friendly M&A and hostile takeover bids. Andrade et al. (2001) used his approach in their research of a total of 4,256 M&A. From their results, which they divided by decades, it follows that:

- in the 70s, of the total of 789 transactions only 8.4% were hostile takeover bids, of which only 4.1% were completed;
- in the 80s, of the total 1,427 transactions, 14.3% were hostile takeover bids, and 7.1% were completed;
- in the 90s, when their sample contained 2,040 transactions and the environment had calmed, the number of hostile takeover bids was 4%, of which 2.6% were completed. The cooling-off on the M&A market can also be observed in the number of bidders for one company, which decreased from 1.6 in the 80s to 1.2 in the 90s.

Mukherjee et al. (2004) think that the number of motives for M&A equals the number of transactions. Based on their research conducted between 1990 and 2001, they consider synergies (37%), diversification (29%) and restructuring (11%) the most common motives for M&A. After a detailed analysis of available literature, we identified the following motives for M&A:

### **3.1 Efficiency**

This motive is one of the most often cited. Its basic idea is that the combined company will perform certain activities more efficiently than two separate companies. The efficiency motive can be divided into synergy effects and economies of scale.

**Synergistic effects** are often further divided into operating and financial ones by many authors (e.g. Chatterjee, 1986 Trautwein, 1990; Mukherjee et al., 2004, Devos et al., 2009, Geiger, 2010, Vyas et al., 2012). According to Chatterjee (1986), operating synergies represent a class of limited resources which lead to the production and/or administrative efficiency. Trautwein (1990) adds that they can be attained through a common sales force or knowledge transfer. Chatterjee (1986) believes that financial synergies help reduce the cost of capital and hence increase the cost efficiency, which leads to lower prices that the competitors are unable to compete with.

Mukherjee et al. (2004) examined what are the percentages of the above synergies in the opinion of managers: 90% of managers mentioned operational synergies as the motive. The opinions of remaining 10% were evenly split between financial synergies and enhanced market power. Similar research was conducted by Devos et al. (2009), who examined 264 M&A. They found the synergy motive in 10.03% of executed M&A. Financial synergies due mainly to tax savings accounted for 1.64% of transactions, and operational synergies achieved principally by cuts in investment spending made possible by better use of resources made up the remaining 8.39%. Chatterjee (1986) came to the conclusion that financial synergies are influenced the relative size of the company: if the company makes full use the possibilities offered by financial synergies and benefits from M&A may be greater than those arising primarily from operating synergies. Motives for M&A were examined by Bhide (1990) between 1985 and 1986. The primary motive he identified in one third of the transactions were operational synergies.

Third category is mentioned by Trautwein (1990), who refers to it as managerial synergies. These are accomplished when bidder's managers have superior planning and monitoring abilities. Vyas et al. (2012) define managerial synergies as the ability to monitor and achieve the plan which has been set as a target.

**Economies of scale** can be looked at from two different angles, either as an increase in revenues, or a decrease in expenses.

Higher efficiency based on economies of scale can be achieved by increasing the volume of services offered, or by the sale of underutilized assets. Ross et al. (2008, p. 850) see three sources of revenue growth: improved marketing, improved distribution network and improved product mix. An example is the acquisition of the Vermeer company (FrontPage program) by Microsoft. Sales of the program increased immediately after the acquisition. The other category are strategic advantages that the company can transfer from one area to another. An example of that can be a company that produces sewing machine motors: thanks to its expertise, it can also make motors for printers.

Discussing economies of scale, Brealey et al. (2008) note that combining companies may merge together the managements, accounting, financial control and development. They give the example of the US banking sector from the early 1920s. Gaughan (2007) gives the example of a successful combination of Exxon and Mobil Oil Company, in which significant economies of scale were achieved. The merger was announced in 1998, with projected savings of 3.8 billion USD. Just two years after the transaction, it was announced that the objectives had been met and even surpassed by more than 20%.

Mellen and Evans (2010, p. 84) reported reduced costs achieved by consolidation of functions, positions and fixed assets that cause a reduction in overhead costs. For example, a merger of two major banks Chase and Chemical was motivated by a desire to reduce costs by up to 16% per annum, i.e. by 1.5 billion USD, by consolidating operations and eliminating unnecessary costs.

Smrčka (2013) notes that economies of scale may not always materialize and gives the example of the Skanska company, which acquired over ten construction companies through privatizations and acquisitions. The companies, however, were former competitors and their negative relationship spilled over into the new company. Individual divisions fought against each other by submitted bids for the same tenders. The problem lasted for over five years, and the main reason were unresolved issues concerning the choice of directors in individual divisions.

### **3.2 Economies of vertical integration**

Economies of vertical integration are another group of motives which was identified by Brealey et al. (2008). This type of savings is achieved when the company either gains control over the production process (combination with the supplier) or the distribution channels that are subsequently used for the sale of its products (combination with the distributor). Vertical M&A allow companies to control the quality of supplied raw materials, and such combinations can also increase the company's profit by eliminating at least one step of profit margins that existed in the supplier chain prior to the transaction. Brealey et al. (2008) give the example from the mid-20th century when General Motors produced most parts in companies it owned. That was an advantage over its competitors Ford and Chrysler.

Further savings can be achieved through coordination of related activities (see Ross et al., 2008). They give the example of wood-processing companies that often also own lumber companies or sawmills. Gaughan (2007) cites the case of the automobile company General Motors and the General Motors Acceptance Corporation, which provided low-cost loans to GM customers.

### **3.3 Enhancement of the market power**

The market power motive is not perceived uniformly by all authors. Some call it the monopolization of the market (e.g. Trautwein, 1990, Geiger, 2010). The monopoly theory is based on the belief that the company will be able to determine market prices thanks to the

increase in its power in the market, or even its monopoly position in the sector (e.g. Pawaskar, 2001, Devos et al., 2009, Asimakopoulou and Athanasoglou, 2013, Vyas et al., 2012). It needs to be added that this motive is only possible in horizontal and conglomerate M&A, as pointed out by Geiger (2010) and Vyas et al. (2012).

Gaughan (2007) states that there are three main sources of enhancing one's market position: product differentiation, barriers to market entry and market share. An example of a successful horizontal combination is the WorldCom Company, which, in the late eighties and in the nineties, successfully expanded its operations in the USA when it carried out over 40 transactions exclusively with regional telecommunications vendors. According to Sedláček et al. (2013), the growth of market power is cited as the reason by less than 7% of respondents in the Czech Republic.

### **3.4 Tax motive**

Lower taxes may be a strong motivation for M&A according to Ross et al. (2008, p. 852). That, however, applies only in countries where that option is allowed. The most commonly cited reason is the use of corporation tax loss. Another possibility is the increase in debt capacity. This has been highlighted by Pawaskar (2001) who believes that that is an important motive for M&A especially in companies in an uncorrelated sector. Companies with low debt levels become interesting for companies with high debt levels. Following a merger, they can claim a higher amount of paid interest and thus reduce the amount of taxes paid. The last option is the revaluation of assets and a related rescheduling of the depreciation plan. The result of this operation is again a reduction of the tax base and thus of the tax paid. The above motives have also been confirmed by Devos et al. (2009). Similarly, this motive is also confirmed by Mellen and Evans (2010), who see an opportunity to achieve financial savings by increased use of debt financing and interest tax shield. In the Czech Republic, the tax motive was responsible for more than 9% of transaction according to Sedláček et al. (2013, p. 73).

### **3.5 Excess cash motive**

Some companies may be tempted to merger with a company that has an excess of cash which it does not use at all either because of a lack of profitable investment opportunities or inadequate redistribution among the company owners. Brealey et al. (2008) pointed out that the retaining cash poses a risk for the company that it may become attractive for a raider interested in its cash. The raider theory has also been considered by Trautwein (1990). In an acquisition motivated by excess cash, wealth is being transferred from the purchased (target) company to the buying company (acquirer). It is not, however, possible to fully agree with this opinion because of the premium paid to acquire the stock of the company to be controlled. Discussing this M&A motivation, Jindřichovská (2013) adds that the acquirer restructures the target company and is able to use the excess cash more efficiently.

### **3.6 Managers' self-assurance**

This motif is specifically described by Trautwein (1990) in the empire building theory. According to this theory, managers maximize their goals rather than value for shareholders. The author mentions research conducted by You et al. in 1986, which indicated that the result of M&A is usually negative if managers own shares. Geiger (2010) adds that another reason for the negative outcome is that managers overestimate their managerial skills. The negative impact of managers' self-assurance on the success of M&A has also been investigated by other authors (see, e.g., Pawaskar, 2001, Huyghebaert and Luypaert, 2010, Vyas et al., 2012).

In their research, they agreed that management interests to carry out M&A usually have a negative effect on added value for the owners.

Also worth mentioning is another theory put forward by Trautwein (1990), namely the valuation theory. According to that theory, M&A are performed by managers who have better information than the stock market. He substantiates his claim by research results according to which 60% of managers believe that their company is undervalued.

### **3.7 Diversification motive**

Diversification outside the company's line of business prevailed in the late 1960s, i.e. at the time of the so-called third wave of M&A. A successful company with this motive is, according to Gaughan (2007), General Electric operating in electronics, which diversified into insurance, TV, healthcare and others industries. Mellen and Evans (2010) perceive the diversification motive as a broadening of the product line and the market in which the company operates that lead to higher revenues. According to Jindřichovská (2013), portfolio diversification may not always be the best of motives, because the company fixes a certain assets ratio and reduces the company's action-readiness.

Huyghebaert and Luypaert (2010) observed that just as a company can diversify into various industries, it can also diversify into various countries. Asimakopoulos and Athanasoglou (2013) see the advantage of cross-border M&A in access to a larger customer base and the related diversification of revenue sources. They explain this diversification using the Greek crisis as an example. The crisis did not occur in any other state, so that a bank that also operates on another market was not as severely affected as a bank operating only in the Greek market.

### **3.8 Complementary resources**

Asimakopoulos and Athanasoglou (2013) see the potential positives in the scope of services offered: the combined financial institutions will be able to offer a more comprehensive range of services and take advantage of an already well-established distribution network. The combination of complementary resources will, according to Jindřichovská (2013), improve utilization of production capacity. According to Brealey et al. (2008, p. 932), the reason may also be the fact that a small company may have a great idea that it cannot put into practice because it lacks the technology, funds, distribution network, etc. The missing resources preventing the implementation of the idea can be provided by a large established company, which, however, does not abound with ideas of its own - hence the name of resource complementation given to this motive.

An example given by Brealey et al. (2008, p. 932) is a merger of two companies manufacturing electrical instruments. Utah Power's manufactures air conditioning units and PacifiCorp's heating systems. Savings achieved thanks to this combination are estimated at 45 million USD per year.

### **3.9 Research and development**

Joint research or acquisitions of innovative companies is another reason mentioned. A huge potential for innovation exists outside the firm across the network of customers, suppliers and partners. According to research of Zizlavsky and Saghy Estelyi (2013) companies in Czech Republic are open to external cooperation. Gaughan (2007) gives an example of how a company can use M&A for its development: between 1995 and 2005, Johnson & Johnson carried out over 50 M&A. In all cases, it focused on innovative companies that had put a new product on the market. This procedure saves the cost of own research and development, which

may have uncertain results. On the other hand, Hall (1990) believes that M&A may have a negative effect on research and development. She argues that spending on research and development falls by more than 20% because of the need to repay debt, which arose as a result of the companies' merger. Valentini (2012) confirms her conclusions by the results of his examination of patent applications: M&A cause an increase in the number of patent outputs because of the pressure for immediate results. The downside of such pressure is the decreased effect, originality and versatility of inventions. He finds the reason in the motivation for M&A: if the connection was concluded because one of the companies had developed a specific patent of high quality, related patents of a lower added value will be derived from it after the transaction

## 4 CONCLUSION

Systematization of knowledge about motives for M&A shows that there are multiple reasons why companies resort to M&A. The groups of motives that were identified have no clear boundaries and in some cases they overlap each other, which, in an endeavour to synthesize the findings, can hardly be avoided. It also follows from different views on the consequences of specific motives for M&A. Results achieved in research and development as motivation for M&A can be cited as an example. On the one hand, it can be a path of development for the company if the acquiring company invests in innovative companies. On the other hand, it may lead to a decrease in added value (effect, originality and versatility of inventions), as well to decrease in research and development funding because of the need to repay a debt.

The results obtained will be used to modify the methods of determining the boundary price of the target company.

## **IMPORTANCE OF CLASSIFICATION AND CLEAR DEFINITION OF REWARDS TYPES IN RESEARCH, PRACTICE AND TEACHING**

*Petr Petera, Katerina Knorova*

### **Abstract**

Our review paper may be particularly interesting for researchers in the field of rewarding. We provide relatively comprehensive overview of alternative approaches to classification of rewards and we also offer a concise evaluation of these approaches. Furthermore, by means of content analysis of relevant literature, we highlight that there is no general agreement on definitions of basic concepts, which are used in the field of rewarding. Because of these differences in definitions of key concepts there is a high risk of serious misunderstandings and these problems grow when it is necessary to combine findings from multiple disciplines. There is little hope for fast unification of terminology in the discussed area and we believe that these problems may be at least partially solved by providing clear definitions of terms in the beginning of each discourse about rewarding.

*Keywords: reward types, classification of rewards, rewards terminology, motivation, incentives*

JEL Classification: M52

### **1 INTRODUCTION**

The issue of alternative classifications of rewards, as well as terminology used in the field of motivation and rewarding of employees, are of a great importance for research, practice and teaching. Motivation and rewards are addressed by multiple disciplines (e.g. economics, management, human resources management, management accounting, organizational behavior theory, psychology, industrial and organizational psychology), and as we will try to demonstrate in this paper, problems related to terminology and classification can significantly complicate communication between disciplines as well as within disciplines. Similarly in practice, motivating and rewarding are very often managed across several departments of an organization (especially HR department, controlling department, and in general by managers of all levels), and again, the clear definition and understanding of terms is the basis for effective cooperation among these departments.

Terminological clarity and ability to unambiguously and meaningfully classify rewards is indispensable particularly in research (and especially in the contingency-based research) because it is vital for the systematic examination and understanding of the various types of rewards in terms of their effect on the recruitment, retention and motivation of employees. Terminological clarity is also a necessary condition for ensuring cumulative character of research. And yet, as we will demonstrate in this text, the same term is by different authors often used in diverse meaning, which can pose a significant problem.

Although problems of terminology and classification are deeply interconnected, we will discuss them in separate chapters. For the sake of completeness we also shortly discuss problems of combining classification of rewards with other variables (e.g., type of work - creative or routine; personality traits of individual workers; national cultures etc.), nevertheless this topic is in this paper covered only marginally.

It is not our ambition to establish a "standard terminology" in the field of rewarding and motivation. However, it is our ambition to point out the existence of significant differences in definitions of various concepts and draw attention of researchers and practitioners to the fact that within their discourse is always necessary to carefully examine how individual participants understand these concepts.

Specifically are addressed two main issues. First, we provide an overview of comprehensive approaches to classification of rewards and consequently we identify key criteria that can be used for classification of rewards. We also outline why the individual criteria are important and what are their strengths and weaknesses. Second, we provide examples of the key concepts from the area of rewarding, which are in literature defined divergently and highlight the main terminological discrepancies. These objectives are accomplished through a content analysis of the literature, which was selected based on our expert knowledge of the field.

## **2 CLASSIFICATIONS OF REWARDS**

In this chapter we deal with classifications of rewards and we decided to structure this chapter into two sub-sections (parts) because we see such approach as the most suitable.

First, we provide a literature review of relatively comprehensive approaches to classification of rewards. Second, based on comprehensive literature review, we provide a short overview of various criteria, which are meaningfully usable for classification of rewards. These criteria may be combined in various ways (according to the specific needs of a given research).

### **2.1 Overview of approaches to classification of rewards**

In literature we identified several relatively comprehensive approaches towards classification of rewards. According to our opinion, each of these approaches deserves attention because they have their strengths and weaknesses and it is only up to a researcher (or practitioner), which of these approaches will be adopted or whether their combination will be used. In the following text we also provide short characteristics of discussed rewards, nevertheless it is important to notice that these characteristics are usually specific for an author of a given classification and are not generally accepted.

O'Neal (1998, p. 7-8) classified rewards into four quadrants. In the upper left quadrant is placed pay (base salary, variable pay, recognition, stock) and in the upper right quadrant are placed benefits (health care, retirement, savings, time off). Together these two components of total rewards represent "transactional rewards", i.e., rewards, which are financial in nature. In the bottom left quadrant are placed learning and development (career development, learning experiences, performance management, succession planning, training) and in the bottom right quadrant is placed work environment (organization climate, leadership, performance support, work/life balance). Together these two components of total rewards represent "relational rewards" which are essential to enhancing the value of upper quadrants. O'Neal emphasized that differentiation of rewards into transactional ones and relational ones is important because relational rewards are difficult to copy by competitors. Using relational rewards, a company may create a competitive advantage.

Chen, Ford and Farris (1999) classified rewards into intrinsic, extrinsic monetary and extrinsic socioemotional. They further divided each of these rewards types into two sub-types (individual based and collective based). Finally, they distinguished fixed and variable monetary rewards.

Another approach to classification of rewards was introduced by Zingheim and Schuster (2000, p. 13). As a model framework are used four quadrants. In the bottom left quadrant is

placed total pay (base pay, variable pay including stock, benefits or indirect pay, recognition and celebration) and in the bottom right quadrant is placed positive workplace (people focus, leadership, colleagues, work itself, involvement, trust and commitment, open communications); together these two components of total rewards comprise “foundation” because they are crucial for attracting and keeping individuals. Nevertheless these two components alone are not sufficient and should be supplemented with another two components. In the upper left quadrant is therefore placed individual growth (investment in people, development and training, performance management, career enhancement) and in the upper right quadrant is placed compelling future (vision and values, company growth and success, company image and reputation, stakeholdership, win-win over time). To obtain competitive advantage, a company should according to Zingheim and Schuster (2000) provide rewards from all these quadrants.

We like comprehensiveness of this classification. From the viewpoint of terminology we find inclusion of recognition and celebration under “pay” relatively unusual.

Balsam (2002) suggested a classification whose components are depicted below:

- salary (defined as fixed contractual amount of compensation that does not explicitly vary with performance);
- bonus (which may be conditioned upon individual, group, or corporate performance and performance conditions used to determine the bonus can be explicit or implicit, objective or subjective, financial or non-financial, based upon one measure or more measures, and may be based on short-term or long-term measures);
- stock options (which allow their holder to purchase shares of stock at a fixed “exercise” price over a fixed period of time);
- stock grants (i.e., corporation give shares to their employees);
- other stock-based forms of compensation (e.g., stock appreciation rights, which are equivalent to stock options with exception that with a stock option the executive has to purchase and consequently sell the shares to receive their profit while with stock appreciation rights corporation pays executive the excess of the current market price of the shares over the aggregate exercise price; privately held corporations or publicly held corporations which do not want to dilute existing ownership often grant executives phantom stocks or equity units);
- pensions (i.e. form of deferred compensation);
- other compensation (e.g. corporate cars, the use of corporate airplanes and apartments, special dining facilities, health care etc.).

According to our opinion Balsam’s classification is quite comprehensive, nevertheless excessively accentuates financial rewards and all non-monetary rewards are placed in the “other” category. Furthermore, bonuses are understood here strictly as performance-based while other authors define bonuses more broadly.

Kantor and Kao (2004) suggested to distinguish rewards according to two main criteria – first, “transactional rewards and relational rewards”, second “direct rewards and indirect rewards”. Components of total rewards can be consequently placed into four quadrants framework. In the upper left quadrant is placed compensation, i.e., transactional direct reward (e.g., fixed pay, bonus plan and long-term incentives), in the upper right quadrant are placed benefits, i.e., transactional indirect reward (e.g., healthcare and welfare, retirement, paid time off), in the bottom left quadrant is placed personal development, i.e., relational direct reward (e.g., performance management, training and development, career development) and in the bottom

right quadrant is placed work environment, i.e., relational indirect reward (culture and climate, work design & flexibility, quality of working life). Kantor and Kao's classification is interesting, facilitates thinking about implemented rewards system from the viewpoint of their belonging to transactional and relational rewards, but is relatively ambiguous.

Chiang and Birtch (2005, p. 365-367) launched interesting classification of rewards into three main types: financial (basic salary, annual increase, benefits, individual performance incentives, team performance incentives, organizational performance incentives), extrinsic non-financial rewards (relationship, balance, task-related, appraisal system, client relationships, security) and intrinsic work-related rewards (job nature, job challenge, responsibility, skills used opportunities, variety, accomplishment, job satisfaction). Moreover this classification was combined with examination which reward system is preferred (authors understand term "reward system" more narrowly than is usual, specifically they distinguish performance-based, skill-based, competency-based, and COLA (cost-of-living adjustment) - based reward systems) as well as with examination which reward criteria (performance, human capital, job inputs, gender, personal needs, organizational features, market features, environmental) should be used. Although terminology used by Chiang and Birtch (2005) is a bit unusual, we like comprehensiveness of their approach.

Ellig (2007, p. 4-8) distinguished following elements of compensation:

- salary (essentially no-risk form of pay, often serves as basis on which the other elements of compensation are determined; importance of salary depends on the fact whether other (risk) components exist and how significant are these components);
- employee benefits and perquisites. Benefits include for example time off with pay, employee services, health care, survivor protection, and retirement coverage. Perquisites are employee benefits that are designed only to apply to executives and are also called executive benefits (e.g., a company car, financial planning, supplemental executive retirement plans), some may have form of intrinsic rewards (e.g., large, well-furnished office);
- short-term incentives (designed to include both downside risk and upside potential based on performance targets; determined on the basis of the extent of accomplishment of a short-term, normally yearly target; existence of possibility to obtain short-term incentives is usually accompanied by corresponding decrease of salary; objectives may be group or individual and should be connected to annual business targets; according to Ellig incentive pay increases as a percentage salary and short-time incentive plans range from highly individual accomplishments to profit-sharing plans that emphasize corporate, group or division performance; used may be both financial measures and non-financial measures; payments are typically in cash, but may be also a combination of cash and shares of stock);
- long-term incentives (pursue similar objectives like short-term incentives; period for which is performance evaluated is multiyear in nature; normally used are group-based performance measures; incentive award is typically significantly higher than the annual incentive; form of payment follows type of plan – i.e., shares of stock or cash).

On the one hand, Ellig's classification is quite comprehensive and avoids overlaps of individual reward types. On the other hand, Ellig's understanding of the term "extrinsic and intrinsic" rewards is according to our opinion a bit unusual and confusing (see chapters 3.2 and 4).

Kaplan (2007, p. 16) suggested to classify rewards into the following four groups:

- compensation (base salary, annual incentives, long/term cash incentives, equity, spot awards, project incentives, employee referral program, signing bonuses);
- benefits (health care, life insurance, disability, retirement, child-care resources, fitness center, elder-care programs, legal assistance);
- learning and development (career planning, professional memberships, training programs, annual conferences, mentoring programs, lunch and learns, sabbaticals);
- work environment (flexible workweek, telecommuting, job design modifications, comfortable workstations, recognition programs, community volunteer opportunities, casual dress, free meals).

Shields (2007, p. 30-32) suggested the following classification of rewards:

- extrinsic rewards:
  - financial rewards or remuneration (fixed or base pay, direct benefits, performance-related pay);
  - developmental rewards (learning, training and development, succession planning, career progression, other indirect or non-cash benefits);
  - social rewards (organizational climate or management culture, performance support, work group affinity, work-life balance, other indirect or non-cash benefits);
- intrinsic rewards (job challenge, responsibility, autonomy, task variety).

A comprehensive approach to classification of rewards was proposed by association WorldatWork (2007). According to this approach the following types of rewards are recognized:

- compensation (by WorldatWork 2007, p. 624 defined as “cash provided by an employer to an employee for services rendered”); compensation is the largest component of rewards system and a major cost for organizations and includes (WorldatWork, 2007, p. 90-91):
  - base pay (fixed pay, which does not vary with achieved performance and results):
    - salary, hourly or piece rates;
    - knowledge or skill based pay;
    - competency based pay;
    - differentials (weekend/holiday, expatriate etc.);
    - pay increases (merit, lump-sum, step-rate, general, cost-of-living, equity-based adjustments, market-based adjustments);
  - variable pay (pay-at-risk, which depends on achieved performance and results, must be re-established and re-earned each performance period); includes especially short-term incentive pay that is designed to focus and reward performance over a period of one year or less and long-term incentive pay that is designed to focus and reward performance over a period longer than one year (WorldatWork, 2007, p. 9):
    - organizational/team/individual;
    - profit-sharing plans;

- performance-sharing (gain-sharing) plans;
  - group/team incentives;
  - individual incentives (short-term incentive plans, sales-incentive plans, executive incentive plans);
  - discretionary bonuses (annual or spot);
  - equity-based compensation (stock options, stocks grants, etc.);
- benefits (social insurance, group insurance, pay for time not worked; WorldatWork, 2007, p. 9);
  - work-life balance (especially workplace flexibility, paid and unpaid time off, health and well-being, caring for dependents, financial support, community involvement, management involvement/culture change inventions (WorldatWork, 2007, p. 9); often mentioned are also telecommuting, flextime, compressed workweek and paid family leave);
  - performance and recognition (according to WorldatWork, 2007, p. 10 rewards system should aim at alignment of organizational, team and individual efforts toward the achievement of business goals; recognition includes acknowledges and special attention to employee actions, efforts, behavior or performance);
  - development (learning programs designed to enhance employees' skills and competencies) and career opportunities (includes plan for employees to advance in their career goals (WorldatWork, 2007, p. 8).

We consider the classification suggested by WorldatWork to be extremely comprehensive, but there are some flaws (at least from the viewpoint of using it e.g. for survey questionnaire research), specifically:

- approach of WorldatWork covers all aspects of total rewards, but some terms are defined ambiguously or inconsistently. For example the word “cash” is used in definition of compensation, but obviously some parts of compensation may be deferred (and therefore not paid in cash);
- classification of items under the category “compensation” is not fully clear because of mutual overlays of some terms (e.g., profit sharing plans are group plans, equity based compensation in fact is not a type of reward, but a form in which reward may be paid etc.);
- classification of total rewards into 5 categories – compensation, benefits, work-life, performance & recognition, development & career opportunities does not cover full spectrum of rewards defined by the term “total rewards” and it is necessary to add category “other total rewards activities”, see e.g., (Christofferson & King, 2006, p.26);
- there is not enough emphasis on creating a positive workplace (leadership, culture, atmosphere of trust and commitment, work content etc.) - a component of total rewards highlighted e.g. by Zingheim and Schuster (2000).

Vandenberghe, St-Onge and Robineau (2008, p. 432-433) identified 3 major types of compensation and reward components:

- direct compensation (which is paid in cash to employees): attraction bonuses, salary, variable pay based on individual performance, variable pay based on organizational performance;

- indirect pay (all other non-cash components): fringe benefits and time off, flexibility of working conditions, job security;
- psychological recognition: development opportunities, career opportunities, quality of social relationships, authority and control, autonomy, feedback and recognition, the relevance of the job to others, the relevance of job to the person, work load, and work variety.

According to this classification, direct compensation and indirect pay belong among extrinsic rewards, while psychological recognition represent intrinsic rewards.

The importance of classification by Vandenberghe, St-Onge and Robineau (2008) is based on the fact that it primarily divides rewards into extrinsic and intrinsic. Also putting “attraction bonuses” outside compensation based on performance clearly indicates that there are bonuses, which are not performance-based. Unfortunately, the classification is a bit confusing e.g. because it ignores the fact that direct compensation may be paid also in non-cash form. According to our opinion form in which is reward paid may have a significant influence on rewards’ behavioral consequences.

Wilson (2008, p. 26-27) within his classification underlined the fact that there are both rewards programs that are available to virtually everyone just because they are employed by the organization (these programs are a foundation for the employment relationship) and rewards programs based on performance or meeting other requirements of individuals or groups (in these programs not everyone receives these rewards). Moreover, there are both programs that are clearly compensation based (i.e. these programs represent total compensation) and programs that meet the personal needs of individuals (i.e. these programs represent workplace opportunities, e.g., training and education).

Kwon and Hein (2013, p. 32-33) recognized:

- financial rewards (i.e. rewards with clearly defined value or cost) and (as opposite) experiential rewards (which are experienced by the employee through interaction with the company – e.g., leadership, management, relationships with employees and customers);
- personal rewards (which are tailored to the individual, e.g., salary, bonus, development plan etc.) and (as opposite) company-wide rewards, which are provided in more or less the same way to all employees, e.g., benefits, culture, work environment.

These rewards were by Kwon and Hein (2013) placed into a model framework comprised of four quadrants. In the upper left quadrant can be found experiential, company-wide rewards (e.g. medical care), in the upper right quadrant are placed experiential, personal rewards (e.g. wellness), in the bottom left quadrant are placed financial, company-wide rewards (e.g. pension plans) and in the bottom right quadrant can be found financial personal rewards (e.g. various work-life programs like child care etc.). We appreciate comprehensiveness of this framework, nevertheless specific examples of individual types of rewards, which can be found in Kwon and Hein (2013), are from our viewpoint confusing and ambiguous. For example we do not understand why “child care” is classified as “personal” reward while according our opinion it is typical company-wide reward. Well, more detailed discussion of these problems is above the scope of this paper.

### **Our suggestion of alternative classification**

It is possible to conclude that from the viewpoint of completeness and/or unambiguity and clarity all the above mentioned classifications have some imperfections, which may pose a

problem for research, especially when direct contact between researcher and researched subject is impossible and threat of misunderstanding is therefore high. We prepared our own classification and we are convinced that the classification is easily understandable as well as unambiguous and therefore suitable e.g. for questionnaire surveys. This classification was briefly explained in Petera, Wagner and Mensik (2014) and below we outline our classification in a more detail:

- non-financial rewards:
  - benefits (e.g. recreation, various insurance);
  - perquisites (e.g. the possibility of using a business car or a laptop for private purposes);
  - work-life balance programs (e.g. flexible working hours, work from home, take the opportunity to work children);
  - non-financial recognition (e.g. praise from superiors, diplomas, celebrations);
  - transferable skills training (e.g. qualification in a profession, language courses);
  - procedure in the corporate hierarchy (promotion);
  - other non-financial rewards (e.g. leadership, a shared culture);
- financial rewards:
  - fixed (base salary);
  - variable financial rewards:
    - one-time reward for achieving of certain qualification/skills;
    - bonuses regardless of performance;
    - financial recognition (spot bonus);
    - rewards for success in performing a specific task;
    - short-term variable financial rewards for performance (awarded on the basis of performance measurement in the short period, i.e. up to 1 year);
    - long-term variable financial rewards for performance (awarded on the basis of performance measurement in the long period, i.e. over 1 year).

The above mentioned classification of rewards can be easily combined with various classifications of workers (e.g., according to position – top management, middle management, line management, non-managerial workers; according to type of work – routine, creative, professionals; according to job – e.g., sales, research and development, purchasing; personality traits etc.). Utilization of all rewards types can be then examined for each of these categories of workers separately. Furthermore, impact of these rewards on behavior of the mentioned types of employees may be addressed separately within contingency-based research and therefore it is possible to obtain more detailed information about behavioral consequences of the rewards.

Furthermore, if needed, relevance of numerous other criteria (contextual variables), which are considered to have an impact on the intensity of utilization of different types of rewards, may be tested. Among contextual variables belong e.g. organization size; type of organization – for-profit (publicly traded, privately held), non-for-profit; life-cycle of an organization – start-

up, growth, mature, declining organizations; and affiliation of an organization to “new economy” or “old economy.”

## **2.2 Key classification criteria and their properties**

Based on various classifications of rewards we summarized key classification criteria and our findings can be found below:

- financial and non-financial rewards (classification according to the nature of reward; classification is unambiguous, but very descriptive and both “financial” and “non-financial” rewards are inherently heterogeneous as for their expected behavioral impacts);
- extrinsic and intrinsic rewards (classification based on differentiation of extrinsic and intrinsic motivation; classification is important especially from the viewpoint of expected motivational impacts on employees);
- collective (organization, division, team) and individual rewards (classification according to whom is reward primarily allocated or according to whose performance is measured and consequently used for allocation of rewards);
- cash-based and deferred rewards (according to how long it takes till reward is really paid to an employee/worker; classification is important from the viewpoint of expected behavioral effects – cash-based compensation is often expected to have more short-term impact);
- form in which is reward paid (cash, stocks, stock options, etc.);
- performance-based reward and non-performance based rewards, e.g. skill-based reward, competency-based reward, seniority-based reward, cost of living-based (COLA) reward, right behavior-based reward (classification according to criteria taken into account for determining the reward / what is rewarded).

Rewards for performance are often further classified according to the following criteria:

- length of period during which is performance measured (short-term, long-term);
- type of performance criteria:
  - objective and subjective or their combination (by objective measures are usually understood direct measures of countable behaviors or outcomes and by subjective measures are understood supervisor ratings of employee performance, see Bommer, Johnson, Rich, Podsakoff, & Mackenzie, 1995, p. 588);
  - based on one or several measures;
  - quantitative and qualitative;
  - financial (which may include criteria based on financial accounting measures without any adjustments or adjusted criteria) and non-financial (or combination of financial and non-financial criteria);
  - absolute (plan, history) or relative – Bebchuk and Fried (2004) pointed out that bonuses are often tied to whether the executive meets a budget or whether profits exceed those of the preceding period. Such approach enables employees to obtain bonuses even when firm perform poorly having worst profits in an industry and still beat the prior period results.

And yet, according to Bebchuk and Fried, large majority of companies which base their bonus plans on objective measures do not base bonuses on the organization's performance relative to its peer group.

### **3 EXAMPLES OF IMPORTANT TERMS FROM THE FIELD OF REWARDING, WHICH ARE BY VARIOUS AUTHORS DEFINED DIVERSELY**

In this chapter we shortly discuss key terms from the field of rewarding, which are by different authors defined substantially diversely. Because of space limitations of this paper we do not intend to be comprehensive, nevertheless we want to highlight the main discrepancies.

The main lesson learned from this chapter should be that in order to avoid misunderstandings, definitions of rewards have to be agreed (or at least explained) before or during the discourse (e.g., within a questionnaire, during an interview, or within a discussion of practitioners). This conclusion is of critical importance e.g. for researchers who want to ask their subjects which types of rewards they use (e.g., via questionnaire survey) and consequently examine on which contextual variables is utilization of different rewards dependent. Also in case of research into behavioral consequences of different types of rewards researchers have to unify (or at least clarify) their terminology with researched subjects.

#### **3.1 Bonus**

In chapter 2.1 we mentioned that e.g. Balsam (2002) understood "bonus" as a performance-based reward. Nevertheless more common is approach according to which some bonuses are performance based and other may be non-performance based. For example Biswas (2013) distinguishes sign-on bonus, referral bonus, spot bonus and retention bonus; in this sense the bonus is incentive (e.g. to stay in a company), but is not performance-based.

#### **3.2 Extrinsic and intrinsic rewards**

Extrinsic rewards are by WorldatWork (2007, p. 663) defined as "work-related rewards received for performance that have value measurable in monetary or financial terms" and intrinsic rewards are usually defined as "those that an individual experiences through performing a job well" (Chen, Ford, & Farris, 1999) or "Rewards that are associated with the job itself, such as the opportunity to perform meaningful work, complete cycles of work, see finished products, experience variety, receive professional development training, enjoy good relations with coworkers and supervisors and receive feedback on work results." (WorldatWork, 2007, p 697). Quite interestingly, Ellig (2007, p. 4), used terms "extrinsic rewards" and "intrinsic rewards" in a bit different meaning when he suggested to "... think of pay as a form of extrinsic compensation whereas work environment, type of work, learning, developmental opportunities, and extent of recognition form intrinsic compensation – often called psychic income." Division of rewards into extrinsic and intrinsic ones is based on so called "extrinsic motivation" and "intrinsic motivation". There is a heat debate about problems of extrinsic and intrinsic motivation in psychology, see e.g. Gagne and Deci (2005), Gagne, M., and Forest (2008), Latham (2012) or Gagne (2014).

#### **3.3 Fixed and variable rewards**

Variable pay is by WorldatWork (2007, p. 812) defined as "Compensation that is contingent on discretion, performance or results achieved." Nevertheless it is possible to find substantially narrower definitions – e.g. Belcher (1996, p. 10) defines variable pay as "An alternative compensation system that ties pay to business outcomes and supports a

participative management process. Cash payouts are based on a predetermined measure or measures of group or organizational performance” and according to this definition the term “variable pay” includes only cash profit sharing, gain sharing and goal sharing (defined as a system under which a predetermined amount is paid for the meeting of group or organizational goals).

### **3.4 Profit sharing, profit-related pay and gain sharing**

Profit sharing is understood as a typical group-based pay for performance. For example Milkovich and Wigdor (1991, p. 10) state that “... profit-sharing plans or equity plans link individual employee’s pay to the overall fortunes of the firm as measured by some indicator of its financial health.” The term “profit sharing” is sometimes used as a synonym with the term “profit-related pay”, nevertheless Bell and Hanson (1987, p. 1) claim, that there is a difference between these terms. Specifically, profit sharing is in the Western world understood as reward providing an additional bonus, related to profit, over and above established wages or salaries. On the contrary, profit-related pay is part of basic remuneration linked to profit and in case that profit decreases, decreases also basic remuneration.

Gainsharing is by Welbourne and Mejia (1995, p. 559-660) defined as “an umbrella for a family of aggregate pay-for-performance approaches that link financial rewards for employees to improvements in the performance of the entire unit.” Similarly Belcher (1991, p. 6) defines gain sharing as “A compensation system that is designed to provide for variable compensation and support an employee involvement process by rewarding the members of a group or organization for improvements in organizational performance. Gains, as measured by a predetermined formula, are shared with all eligible employees, typically through the payment of cash bonuses.” Nevertheless, it is possible to find substantially broader definitions, for example Strauss (1990) recognized the following types of gainsharing – piecework, group incentives, cost-savings plans (i.e. gain sharing in its narrow definition) and profit sharing.

We can conclude that it is absolutely necessary to be very cautious whenever terms “profit sharing” and “gain sharing” are used because there is a high risk that different people will understand these terms very differently.

## **4 DISCUSSION**

In our review paper we addressed two deeply interconnected topics - classification of rewards and terminological issues in the field of rewarding and in this chapter we discuss implications of our findings for research.

### ***Discussion of alternative approaches to classification of rewards***

We are convinced that all classifications of rewards mentioned in this paper have their advantages and weak points.

For the sake of transparency we partially discussed the advantages and disadvantages of various approaches to classification of rewards directly after giving a description of a given classification. Nevertheless there are some typical weaknesses and properties, which we would like to summarize here.

First, reward types within classifications sometimes “overlap”, which should be avoided. This happens for example in the case of classification given by Balsam (2002), where at the same level of classification are distinguished bonuses and various stock-based rewards while it is obvious that bonus may be paid out in the form of stock options - we recommend to more carefully distinguish types of rewards and forms in which rewards are paid.

Second, terms “short-term incentives” and “long-term incentives” are within classifications usually used as an abbreviation, more precise would be “incentives based on short-term performance measurement” and “incentives based on long-term performance measurement.” Ellig (2007, p. 8) in this context expressed opinion that the incentive award for long-term plans is typically significantly higher than the annual incentive and that “Normally, there is no individual performance component in long-term incentives.” We propose that both these statements are hypotheses that deserve to be researched and this especially goes for relative significance of short-term and long-term incentives (see Westphal & Zajac, 1994). Moreover it is important to notice that discussed terms may be also related primarily to behavior (i.e. understanding of long-term rewards as rewards supporting long-term oriented behavior and not necessarily awarded on the basis of long-term performance measurement).

### ***Discussion of terminological issues***

Our comprehensive literature review proved our hypothesis that in the area of rewarding different authors often give very diverse meaning to the same term. Because of the space limitations of this paper it was absolutely impossible to discuss all such differences and therefore we tried to illustrate this problem by an example of several selected terms. Well, this heterogeneity in terminology according to our opinion does not have to be very harmful. On the one hand we do not believe in the fast unification of terminology because individual subjects will probably continue utilizing their own definitions. On the other hand, if terms are carefully defined within discourse, everyone will be able to follow and understand ongoing debate.

Although there is no “preferred” definition of individual terms, we are convinced that it is reasonable to respect at least the following recommendations.

First, we do not appreciate “creativity” of some authors in the utilization of the terms “extrinsic rewards” and “intrinsic rewards.” We understand these terms as based in psychology, where “extrinsic motivation” in general denotes “doing of an action that is not interesting and enjoyable to get a separate consequence” (Gagne, 2010, p. 3) and “intrinsic motivation” denotes “doing something for its own sake, out of interest and enjoyment.” (Gagne, 2010, p. 1). For example we see as very unusual to give as an example of intrinsic reward “large, well-furnished office” (Ellig, 2007, p. 6). We advocate that such approach may obscure the essence of the problem because if somebody does an activity (work) to get large office, his motivation for activity (work) is not intrinsic but, just on the contrary, extrinsic. Similarly, we do not agree with an approach, which identifies intrinsic rewards with “psychic income” because some kind of “psychic income” may according to our opinion stem both from extrinsic and intrinsic rewards. We therefore see the term “psychic income” as redundant and unhelpful.

Second, we noticed a lot of controversy in the area of “variable pay”. We question usefulness of utilization of too narrow understanding of this term - a typical example of narrow definition is the one given in Belcher (1996, p. 10) and mentioned in chapter 3.3 of this paper. We prefer definition of variable pay as of any compensation, which is contingent upon performance or results achieved (WorldatWork, p. 91) and any narrower understanding of this term we consider atypical and even illogical.

Third, following the previous point, we would like to mention that we prefer understanding of bonuses as a form of variable pay, which may be connected with performance (spot bonus) or not to be connected with performance (for example sign-on bonus, referral bonus and retention bonus). Again, considering bonuses as solely performance-based kind of reward is according to our opinion too narrow and illogical.

Last but not least, some authors consider the term “bonus” as synonym of the term “incentive pay”. We advocate another view, which differentiates these terms and understands incentive pay to be a form of variable pay, which represents a highly consistent method to pay for performance (WorldatWork, 2007, p. 102).

## **5 CONCLUSION**

In our review paper, we presented several approaches to classification of rewards and we pointed out their strengths and weaknesses.

Probably the most comprehensive classification of rewards is provided by association WorldatWork, but it is not a panacea. The other approaches also have their unique strengths (for example division of rewards into transactional and relational ones facilitates better understanding the different functions and the complementary nature of these types of rewards; sorting rewards into extrinsic and intrinsic may be significant in terms of their impact on motivation; our own classification has advantage in its simplicity and clarity and is therefore suitable e.g. for questionnaire surveys).

On the basis of comprehensive literature review we derived typically used classification criteria, which can be combined to create new classifications of rewards. It is important to understand that taking these criteria into account is significant especially for contingency-based research aimed both at finding contextual variables, which predetermine utilization of different types of rewards and at behavioral effects (impacts) of various types of rewards.

We proved that many of the key concepts that are used in the field of rewarding, are used by different authors in diverse meaning. This implicates the necessity to always clearly define the meaning of the terms in order to avoid possible misunderstandings.

We are convinced that our paper may be particularly useful for researchers. Knowledge of alternative approaches to classification of rewards is indispensable for any researcher who wants to comprehensively assess the quality of implemented rewards system of an organization. Nevertheless, such knowledge is useful also for practitioners, because it facilitates analysis of rewards systems as well as better understanding the literature dedicated to the discussed topic.

Last but not least, for the sake of completeness, it is important to mention other relevant variables that are especially in contingency-based research often combined with classifications of rewards (e.g., because different types of rewards have different impact on different types of people or because intensity of utilization of some types of rewards is considered to be dependent on contextual variables). Effects of various types of rewards are often examined for example in combination with variables like strategy of a company, national cultural values (Chiang & Birtch, 2005), type of job, type of work (routine or creative) or personality traits of a worker (Vandenberghe, St-Onge, & Robineau, 2008).

## **ROLE OF INNOVATION ON FIRM PERFORMANCE: THE CASE OF SMALL AND MEDIUM-SIZED ENTERPRISES IN VIETNAM**

*Pham Tien Thanh, Pham ThiQuynhNhu, Nguyen DucTrung*

### **Abstract**

This study evaluates the impact of technology innovation on the performance of the small and medium-sized enterprises in Vietnam. This study applied independence sample t-test and propensity score matching (PSM) method to investigate the impact of innovation on firm performance. The results showed that innovation improves performance of SMEs in Vietnam via increasing revenue, value added and gross profit.

*Keywords: impact evaluation, SMEs, innovation, firms' performance, Vietnam*

JEL Classification:

### **1 INTRODUCTION**

In globalization period, transition and developing nations and their enterprises experience major obstacles for reinforcing their human and institutional capacities. SMEs contribute importantly to transition and developing countries. The performance of SMEs in terms of industrial regeneration, job creation, export evolution, and efficiency thus attracts the attention of policy makers.

The economic renovation started in Vietnam in 1986, but not until in 1989 did Vietnam actually apply a comprehensive and fundamental improvement package to stabilize and open the economy and enhance freedom of choice for economic units and competition as well. Also of importance is the fact that Vietnam's socioeconomic success has been remarkably attributed from SMEs. The SMEs account for a prodigious percentage in total number of nation's enterprises with 97 percent and 87 percent by regular workforce and registered capital in 2005, respectively. SMEs were found to account for 39 percent of gross domestic product (GDP) and 32 percent of total investment in 2006 (Ho, 2007), and about 85 percent of total corporate workforce in 2004 (Le et al. 2006). Apart from being a relatively dynamic sector in the economy, SMEs also play an important role in creating jobs, maintaining high mobility of the labor market, and reducing development gap among localities of the country.

There are many factors that may affect performance of SMEs, including innovation, capital, human resources, etc. This paper investigates the importance of technical innovation (product or process innovation) as a basis for improving performance of SMEs. Many studies about impact of innovation on firms' performance have been conducted, but the findings are inconsistent.

Innovation was considered as one of the most important drivers of economic growth (Grupp, 1998) and many researchers have paid attention on the subject since the 1920s. Nevertheless, only after a study by Solow (1957), the empirical researches indicating the connection between innovation and business accomplishment became more often. According to Drucker (1954), marketing and innovation play a vital role in the success of any companies.

Innovation was not only impact on the growth of an enterprises but also trigger social and economic adjustment (Cheng et al. 2013; Kim&Huarng, 2011; Wu, 2011). Innovation is fundamental to sustain competitive advantage (Chen & Huang, 2010; Subramaniam&Youndt, 2005). Innovation is significant to the development of modern enterprises (Ko et al.,2011). Even though enterprises frequently perceive innovation as innately positive for corporations (Liao & RICE, 2010), the connection between innovation and performance is still an unfastened question (Bowen, Rostami, & Steel, 2010).However, many researches concluded that there is no impact of innovation on firms' performance (Hitt et al., 1997; Ettl, 1983).

According to Tran, Le and Nguyen (2008), it should be noted that Vietnam is basically at the first stage among the three stages of technology development including adopting technology, mastering technology, and creating technology. Capacity utilization and technology efficiency of manufacturing SMEs in Vietnam was studied by Rand and Tarp (2007). This research found that when using current machine and equipment, only around 17 percent of SMEs in the survey were able to improve manufacturing performance and two-thirds could increase production by less than 25 percent.

In Vietnam, there are few studies about the impact evaluation of innovation on firms' performance. Unlike the previous studies in Vietnam, this study employs PSM with various techniques to assess this impact to capture the best conclusion. The analysis of this study relies on the data from two surveys on SMEs in Vietnam in the year 2009 and 2011.

The main objective of this study is to investigate whether innovation adoption has significant positive impact on firms' performance.

The structure of research as follows: Section 1 presents Introduction. Section 2 summarizes the relevant literature review. Section 3 describes methodology and data. Section 4 presents and discusses research results. Section 5 gives conclusion, policy implication and limitation.

## **2 LITERATURE REVIEW**

### **2.1 Determinants of the innovation adoption**

A study by Cuerva, Ángela and David (2013) suggested that there are four key factors that may drive innovation: (1) technological capabilities (2) organizational capabilities (3) market pull and (4) external influences related to regulatory push/pull and potential network connection. In this research, these authors conducted probit model to research on the determinants of innovation, including such variables as R&D, human capital, public subsidies, collaboration with competitors, suppliers, customers and public sector, firm age, firm size, etc. A research by Montalvo (2002) stated that innovation depends on firms' internal conditions (resources) and capacity; that is, knowledge resources, human skills and provision and access to finance are considered as determinants of green innovation. Innovation was also found to rely on resources as Physical, human and financial resources (Rumelt, 1984). Many studies for the case of environmental technology oriented firms, Horbach (2008) and Rehfeld et al. (2007) and Cuerva et al. (2013) concluded that technological capabilities is enhanced by R&D. Hemmelskamp (1999) found that high quality employment may result in high innovation probability; that is, high skill staffs are associated with more innovation. Aghion et al. (2009) and Cuerva (2013) concluded that financial constraint may be considered as a factor that limits firm's innovation. In a search for the case of SMES in a developing country, Forrero-Pineda et al. (2011) proved that firms' innovation capacity is associated with network connection. Montalvo (2002) confirmed the role of networks as a determinant of cleaner technologies.

## 2.2 Impact of innovation on firms' performance.

In the OECD Oslo Manual (2005), four various innovation types are presented including product innovation, process innovation, marketing innovation and organizational innovation.

Although many authors have conducted researches on the significance of innovation to firm success and performance (Han et al., 1998; Weerawardena, O'Cass, & Julian, 2006; Ngo & O'Cass, 2013). However, result findings from empirical studies were mixed.

Matsuo (2006) and Bolton (1993) found that there is a positive relationship. Kuratko and Hodgetts (1998) suggested that firms should concentrate on their business plans, especially on innovations. Researches by Tidd et al. (2001), Brown (1997) confirmed that innovation is considered as an extremely vital determinant in accomplishing firms' goals as well as achieve successful competition. Innovation was also found to be a dominant stimulus to national economic development in industrial, newly industrialized, and developing economies (Pavitt and Walker, 1976; Kim, 1980; Ernst and Kim, 2002; Guan and Chen, 2012). According to Guan (2005), effective diffusions of innovation played a significant role in the economic development. Alfranca et al. (2003) found that firm's returns and growth depend on its capacity to innovate. A research by Fagerberg et al. (2004) concluded that innovative nations had advanced productivity and more income than the less-innovative ones. McAdam and Keogh (2004) explored the relationship between companies' performance and innovation. They figured out that the companies with innovations are more dynamic in the competitive market. Geroski (1995) investigated the impact of innovations on firms' performance reflected via such criteria as profit, stock market rates of return and company growth. As a study on 113 automotive suppliers in Turkey, Atalay et al. (2013) stated that firms with innovation adoption have higher performance than firms without innovation.

Meanwhile, Hitt et al. (1997), Ettlie (1983), David et al. (2014), Koellinger (2008) concluded that there is no evidence for the innovation-firm performance nexus.

In a research for the case of firms in Brazil using structural equation modeling (SEM), David et al. (2014) proved that there is no relationship between innovation and firms' financial indicators. For the case of European firms, Koellinger (2008) investigated the impact of product or process innovation on firms' performance and found that innovation improves turnover and increases employment; however, there is no positive relationship between innovation and profitability.

## 3 METHOD

### 3.1 Model of determinants on probability of innovation adoption.

In order to identify the groups for comparison, we conduct a model to forecast the determinants on probability of innovation by SMEs, which can be later considered as the propensity score of each firms in PSM. Logit or probit model may be applied to estimate this probability. In this study, a probit model is employed to estimate the probability of firms' innovation. The following model was written as follows:

$$\Pr(INNOVATION_i=1) = \beta_0 + \beta_1 Z_i \quad (1)$$

Where  $INNOVATION_i$  represents adoption of innovation of firms (1 if firms adopt innovation; and 0 otherwise);  $Z_i$  denote vectors of variables that affect firms' innovation. Based on the literature review, to research on determinants of firm innovation, this research employed such variables as Firm age, firm size, total gross profits in 2008, total asset in 2008, member of a business association, R&D, Technology transfer certificate, business License, technology

sector, access to credit, new high skilled labors, share of unskilled production workers, professionals share of total workforce.

### **3.2 Impact evaluation of using PSM and DID method.**

PSM method was developed by Rosenbaum and Rubin (1983), Sascha&Ichino (2002) and Khandker (2010). Based on the impact evaluation procedure using PSM by these authors, the following steps should be conducted:

*Step 1:* a probit model of determinants on innovation adoption is conducted using probit model. The equation is written as follows:

$$\Pr(INNO_i=1) = \Phi(\beta_0 + \beta_1 Z_i + \varepsilon_i) \quad (2)$$

Where:  $INNO_{ij}$  denotes whether firm  $i$  adopts innovation; and  $Z$  represents determinants on innovation adoption. From this equation, probability of innovation adoption (propensity score of each firm) can be estimated. Literature on impact evaluation defines firms with innovation adoption as treatment units and firms without innovation as control units.

*Step 2,* the common support region will be determined; that is, some observations may be omitted due to their too low or too high propensity score. Also in this step is the balancing test conducted to check. Specifically, this testing process is conducted via categorizing the observations into blocks based on their propensity scores (Dehejia&Wahba, 2002).

*Step 3,* each treatment unit will be matched with one or some control units based on their most similar propensity score. Then, the difference in outcomes between each treatment and control units are calculated. This difference is considered as "individual gain". Various techniques of PSM such as Nearest-neighbor, Radius, Stratification and Kernel may be applied to match these two groups.

*Step 4,* mean of all individual gains will be calculated to achieve the program impact with respect to the participants.

*Step 5,* to overcome the problem of incorrect standard errors, it was suggested that estimating standard errors via using of the Bootstrap should be employed (Khandker, 2010). This technique draws repeated samples from original sample, and then re-estimates the properties such as standard error and bias with each sample.

PSM has become a widely applied method in impact evaluation of a program, activity or policy. PSM is considered as an effective technique to reduce the selection bias.

### **3.3 Data Description**

#### **3.3.1 Survey area**

Data is collected in the surveys of SMEs in Vietnam in the year 2009 and 2011. These surveys were conducted by the Central Institute for Economic Management (CIEM), Institute of Labor Science and Social Affairs (ILSSA), the United Nations University's World Institute for Development Economics Research (UNU-WIDER) Department of Economics (DoE) of Copenhagen University and Embassy of Denmark in Vietnam.

This dataset provides various information about firms' characteristics, firms' performance as well as adoption innovation. SMEs Survey is conducted nation-wide, specifically there are approximately 2,500 non-state manufacturing SMEs in 10 cities or provinces including Hanoi, Hai Phong, Ho Chi Minh City (HCMC), Ha Tay, Phu Tho, Nghe An, Quang Nam, Khanh Hoa, Lam Dong and Long An. SMEs survey is designed to be representative for the whole country.

### 3.3.2 Sample selection

In order to conduct impact evaluation of innovation adoption using PSM, cross-sectional data for the survey of 2009 and 2011 is employed. Based on the literature of PSM method, all the samples will be categorized into two comparison groups, including treatment group and control group. In this research, these two groups are defined as follows: (1) Treatment group includes the firms with innovation adoption within the survey of 2011. (2) Control group comprises the enterprises without innovation adoption. On the basis of this criteria, 374 firms are found to adopt innovation (Treated units) while there are 306 non-adopter (control units).

In order to investigate the probability of innovation adoption, this research applied the characteristics of firms before firms' innovation adoption (within 2 years of the SMEs survey in 2011); that is, these attributes were derived from the SMEs survey in 2009.

**Table 1** showed the characteristics of SMEs used for quantitative research in this study. Firms' attributes used for predicting the probability of firms' innovation adoption included such variables as Age of firm, Member of a business association, Research and development, Technology transfer certificate, Business License, Medium low technology sector, Medium High technology sector, High technology sector, Access to credit, Recruiting new high skilled labours, Share of unskilled production workers, Professionals share of total workforce, Real revenue 2008 (million 1994 VND) and Real total assets 2008 (million 1994 VND). The firms' performance is reflected via such criteria as Real total gross profits 2010 (million 1994 VND), Real value added 2010 (million 1994 VND) and Real revenue 2010 (million 1994 VND).

Tab. 1 – Characteristics of SMEs

Variable	All samples		Non-adopters		Adopters	
	Mean	Std. Dev.	Mean	Std. Dev.	Mean	Std. Dev.
Real total gross profits 2010 (million 1994 VND)	303.6	480.3	242.6	355.3	353.6	557.9
Real value added 2010 (million 1994 VND)	574.6	757.2	447.2	551.7	678.9	877.8
Real revenue 2010 (million 1994 VND)	1956.1	2819.0	1538.6	2431.7	2297.8	3061.2
Age of firm	12.8	10.1	14.1	10.8	11.8	9.3

## 4 Results and discussion

### 4.1 Results on Determinants of Innovation Adoption

Tab.2 – Probit Estimations of Determinants on Innovation Adoption

Variable	Coef.	Marginal Effect	Z	VIF
Firm age	-0.009*	-0.004	-1.830	1.10
<i>Member of business association</i>	-0.064	-0.025	-0.530	1.06
<i>Research &amp; Development</i>	0.023	0.009	0.210	1.09
<i>Medium low technology sector</i>	-0.270**	-0.107	-2.510	1.10
<i>Medium high technology sector</i>	-0.157	-0.062	-0.680	1.06
<i>High technology sector</i>	0.019	0.008	0.080	1.06
<i>Accessibility to credit</i>	0.153	0.061	1.460	1.11
<i>Recruiting new high skilled labours</i>	0.109	0.043	1.080	1.07
<i>Technology transfer certificate</i>	0.316	0.121	0.720	1.02
<i>Business License</i>	0.294	0.117	1.560	1.15
Share of unskilled production workers	-0.071	-0.028	-0.430	1.04
Share of Professionals	1.241*	0.491	1.740	1.15
Revenue in 2009	3.3E-05	1.3E-05	1.630	1.33
Total Assess in 2009	-6.2E-06	-2.5E-06	-0.390	1.33
Constant	-0.145	0.208	-0.700	
<b>Count R Square</b>		<b>61.18%</b>		

Notes: \*significant at 5% level, \*\*significant at 1% level, \*\*\*significant at 10% level.

*Dummy variables are in Italic*

The value of Percentage of Correctness Prediction (Count  $R^2$ ) indicates that the observed characteristics in the probit model are rather well-specified and reliable. VIF values that there is no multi-collinearity among the variables in the research model. This model is then applied to estimate the probability of innovation adoption that is considered as propensity score in PSM method.

### 4.2 Results on Impact of innovation adoption on firms' performance

From **Table 3**, it was found that there is difference in mean of revenue, value added and gross profit between adopters and non-adopter at significant level of 1 percent. Firms with innovation adoption are 759 million VND (equivalent 43.8 percent) higher in revenue. The value added of the innovation adopters is 232 million VND (equivalent 36.1 percent) higher than that of the non-adopter, while the gross profit is 74 thousand 111 million VND (equivalent 33.2 percent) higher.

Tab. 3 – Impact of Innovation using Independent Sample T-Test Methods. *Source:* Calculated from SME2009 and 2011

	Amount (Million VND)		Percentage (%)	
	Difference	t-Stat	Difference	t-Stat
Revenue	759***	3.604	0.438***	4.822
Value Added	232***	4.194	0.361***	4.341
Gross Profit	111***	3.147	0.332***	3.489
Observation	680			
<i>Adopters</i>	374			
<i>Non-adopters</i>	306			

*Note:*\*significant at 10% level, \*\*significant at 5% level, \*\*\*significant at 1% level

Independent-Samples T-test is a method to compare the difference in mean of outcomes between two groups. However, this method does not take into account other characteristics that result in the difference in firms' performance, so the improvement of firms' outcomes may be explained by other factors. Therefore, the result generate by this method is not as reasonable and accurate as those of other impact evaluation methods such as PSM.

Tab. 4 – Common Support and Balance Test. *Source:* Calculated from SME2009 and 2011

	Before match	After match
<i>Control</i>	306	301
<i>Treatment</i>	374	374
Balancing test	Satisfying	
Common Support Region	[.2976733, .89374515]	
Inferior of block of pscore	6	

**Table 4** shows that, the balancing property test is satisfied. The numbers of firms falling into common support region are 675, including 374 treatments and 301 controls; while there are 5 firms dropped out of the sample due to their two high or two low propensity score, so the rate of loss equals to 0.74%.

Tab. 5 – Results on the impact of innovation adoption on firms' performance. *Source:* Calculated from SME2009 and 2011

	No. of treatments	No. of controls	Amount (Million VND)		Percentage (%)	
			ATT	T-Stat	ATT	T-Stat
<b><i>Real Revenue</i></b>						
Nearest Neighbor	374	175	534**	2.091	0.297**	2.333
Radius Matching	372	301	649***	2.849	0.368***	3.679
Stratification	374	301	179***	2.600	0.278***	4.251
Kernel Matching	374	301	531**	2.480	0.306***	3.558
<b><i>Real Value Added</i></b>						
Nearest Neighbor	374	175	175***	2.725	0.251**	2.265
Radius Matching	372	301	201***	3.797	0.294***	3.700

Stratification	374	301	159***	2.863	0.216***	2.779
Kernel Matching	374	301	175***	3.791	0.244***	3.047
<b><i>Real Gross Profit</i></b>						
Nearest Neighbor	374	175	67	1.403	0.195	1.623
Radius Matching	372	301	96***	2.615	0.273***	2.627
Stratification	374	301	69**	2.126	0.174**	2.248
Kernel Matching	374	301	79***	2.618	0.207**	2.215

*Note: \*significant at 10% level, \*\*significant at 5% level, \*\*\*significant at 1% level*

*ATT estimation using Bootstrapped standard errors; 50 bootstrap replications are performed.*

**Table 5** showed that innovation adoption truly results in a higher increase in firms' revenue when using PSM. At the significance level of 5%, the increase in revenue of innovation adopters is higher by 534 or 649 or 179 or 531 million VND (equivalently 29.7 percent or 36.8 percent or 27.8 percent or 30.6 percent) than that of non-adopters via using NN, Radius, Stratification and Kernel matching techniques respectively. This finding is similar to the result in a research by Therrien et al. (2011) in which stated that product innovation will improve sales of innovative firms.

According to the result in **Table 5**, it is also found that innovation makes a higher increase in the value added of firms at the significant level of 5%. The value added of the adopting firms was found to increase higher by about 175 or 201 or 159 or 175 million VND (equivalently 25.1 percent or 29.4 percent or 21.6 percent or 24.4 percent) than that of non-adopting firms via using various techniques of PSM.

**Table 5** also showed that the innovation adoption results in higher firms' performance regarding gross profit. Innovation-adopting firms are proved to improve their gross profit higher by 67 or 96 or 69 or 79 million VND (equivalently 19.5 percent or 27.3 percent or 17.4 percent or 20.7 percent) than that of firms without innovation adoption via using such techniques as NN, Radius, Stratification and Kernel matching techniques respectively. This result is consistent with the conclusion in a study by Geroski et al. (1993). In this research, Geroski et al. found that firms with innovation adoption are more profitable than non-adopting firms.

The research results conclude that technical innovation (product or process) has positive effect on firm performance regarding revenue, value added and gross profit. The conclusions are consistent with the findings by Gunday et al. (2011) and Artz et al. (2010). The reason why technical innovation improves firm performance may be explained by the characteristics of the SMES in research data. The performance of SMEs in the manufacturing sectors are strongly affected by technical innovation activities, particularly product or process or technology innovation.

## 5 CONCLUSIONS

This study investigated the relationship between innovation and firm performance for the case of SMEs in Vietnam. To capture the best result and conclusion, this study applied such method as independence sample T-test and PSM with various techniques to investigate the impact of innovation on firms' performance. Probit model was also employed to estimate the probability of innovation adoption of each firm. This estimated probability was propensity score used for matching the observations in two groups when investigating the impact of innovation using PSM. From the results of Independence sample T-test and PSM methods, this study found that innovation adoption has positive impact on firms' performance via

increasing gross profit, value added and revenue. It is consistent with many previous studies (Roberts, 1999; Calantone et al., 2002; Cho and Pucik, 2005), and the impact in this study is remarkable. This provides an empirical evidence about role of technical innovation on firm performance. The research results may be considered as basis for appropriate policy implications that are useful for SMEs in Vietnam as well as transition countries. The findings from this study suggest that SMEs in developing countries should pay attention to innovation activities to improve firm performance.

PSM has been considered as a popular method to investigate impact of a program or a policy. PSM may reduce the selection biases; however, hidden bias may still exist because PSM does not take into account the unobservable characteristics. For further research, in order to reap the better result, this research will apply other different methods such as Difference in Difference, Difference in Difference with PSM or Instrumental Variable. Moreover, qualitative research should be also applied to better explain and consolidate the research findings.

## **THE IMPORTANCE OF CULTURE AS A FACTOR UNDERPINNING ACCOUNTING NATIONAL RULES: CONSEQUENCES FOR IFRS**

*Pietro Andrea Podda*

### **Abstract**

This paper discusses the importance of Culture and of the Social Environment as a factor underpinning Accounting Rules at a national level. The aim is to highlight the “embeddedness” of Accounting. Accounting Rules are not devised in a vacuum but are often introduced keeping the characteristics of the local economic environment into high account. These particular characteristics, in turn, reflect also cultural patterns which are specific in certain national societies. As an example, the study considers the economic and cultural reasons underpinning the importance of the *Vorsicht* (roughly translated as Prudence) principle in the German Accounting system and the correspondent different approach to Prudence in the Anglo-Saxon Accounting settings. As a consequence of the link existing between Culture and Accounting Rules, devising International Accounting Standards has been even trickier, because it is not straightforward to devise rules which could be suitable to countries characterized by different cultural environments and where economic systems are regulated in a different way. The need to set compromises is often one of the reasons why IAS/IFRS are sometimes providing ambiguous guidance or allow companies the discretion to choose among alternative options which would result in quite different figures accounting for the same element. This, unfortunately, may undermine the comparability of statements issued respecting the same rules but is a probably unavoidable side-effect of the internalization of Accounting Standards.

*Key-words: Accounting Rules, IFRS, Culture, Institutions*

JEL Classification : M40

### **1 Introduction**

This paper discusses the importance of Culture and of the general Social Environment as a factor influencing the development of Accounting Rules. As said in the Abstract, the aim is to highlight how Accounting Rules find their basis in Culture. We consider this as a topic worth of research because Accounting Rules are often embedded within the environment where they are developed. As discussed by Hall and Soskice (2001) and Mc Cann (2014), countries (i.e. USA, Germany, UK) differ substantially as for the mechanisms governing and the patterns characterizing their economic environments. As a result, there are noticeable differences regarding elements like for example the intervention of the State in the economy, the prominence of the role played by banks and the term-orientation of their relationship with clients, the strength of Trade Unions, the propensity of companies to merge or their preference to continue operating as smaller economic units, the importance of financial markets. These differences are evident also within the group of Western market economies, which are far from presenting a homogeneous internal setting as for those factors mentioned above. Moving from this evidence, there are consequences for Accounting Standard setters: Accounting Rules need to be devised having in mind the particular characteristics of that economic environment where they are expected to be enforced. Otherwise, the very devised

rules may turn out to lead to inefficient outcomes as for the impact they may have on the performance of companies and the reaction of investors and banks.

The paper is structured as follows. The next section is focused on the links between Rules (including Accounting Rules) and Culture. The third section will discuss the cultural (social and economic) basis of two important Accounting Principles underpinning Accounting Rules in Germany and in the Anglo-Saxon world. The fourth section will expound the consequences that the social and cultural embeddedness of Accounting Rules has for the process of creation of International Accounting Standards.

## **2 The link between Rules and Culture in a society**

The link existing between Culture and Rules (including also Accounting Rules) has been described by North (1990, 2005), who has used the terminology of Institutions. According to North, Institutions are those formal rules (i.e. law issued by Parliaments, standards issued by Associations when these standards are mandatory for the members) and those informal (unwritten) codes of conducts and habits regulating the behavior of Individuals in a given society. Institutions, Formal and Informal, are normally the result of historical and social processes and reflect often those cultural patterns existing in a Society. Overall, Laws, Habits, History and Culture in a society are inter-linked and influence each other mutually (Gray, 1988; Doupnik and Salter, 1995; North, 1990, 2005; Doupnik and Tsakumis, 2004). Sometimes, Formal Institutions may be introduced even when they are not in harmony with the historical, social and cultural environment of a society. However, this type of action may lead to inefficient results at both social as well as economic levels, because they are not respected by the local community or because the social and economic basis is different from that which would be needed. A blatant example of Formal Institutions not matching the local social and economic environment is represented by those liberalizing and privatizing laws introduced after the collapse of Socialism in countries (i.e. Russia, Ukraine) which were not endowed with a social background where these laws could have helped to restructure the local economies (Hunya, 2003). The result has been a multiplication of criminal activities related to the process of Privatization, hyper-inflation and also a general impoverishment, which was the very opposite of what those International Organisations (i.e. IMF, World Bank) officially intended to achieve. The reason is that these mentioned Organisations held a belief regarding the superiority of these rules as mechanisms able to entail economic prosperity and growth. This belief was based on the model provided by that country (USA) which appeared as the winner of the Cold War, where these rules were considered almost dogmatically as the reason underpinning the economic success of that country. Nonetheless, it was later realized that rules cannot be successfully transplanted to other countries irrespective of the presence of a suitable social background.

Accounting Rules are also examples of Formal Institutions, because they are mandatory for companies according to national and EU legislation. Hence, they often reflect the specific characteristics of the Economic and Social Environment where they are mandatory (Gray, 1988; Shultz and Lopez, 2001; Watts, 2003; Tsakumis, 2007; Nobes and Parker, 2010 Kanagaretnam, 2014). This is important because Accounting Rules not in harmony with the local environment may jeopardize the development of a given economic system, as the examples provided in the next section below will highlight. Thus, Accounting Rules are also a “socially embedded fact” (Granovetter, 1985; Choi and Meek, 2010; Salter et.al., 2013), a social construction which must take into account human factors and the whole social-historical context when the fact happens. It follows that it is meaningless to discuss which, among the various alternative methods available to measure accounting data (i.e. fair value vs.

historical cost, methods of depreciation) is the most efficient. There is nothing like a “superior” method which will better ensure the transmission of more accurate Accounting information (Siller and Podda, 2014). Accounting standard setters should, indeed, reflect on the correspondence existing between a specific Accounting rule and the wider cultural, social and economic environment where this particular rule would find its enforcement. The following section will focus better on this particular issue.

This paper has mentioned the link existing between Culture and Accounting Rules in a specific environment. Culture itself is a set of values, beliefs and “mental programming” diffused in a given Community and underpinning Institutions (Hofstede, 1980, 2001; North, 1990 2005). The study of Culture is normally carried on by scholars within the field of Sociology, however the effects, influence and links characterising the relations between cultural patterns and economic ones have been expounded for a long time (Veblen, 1999; Granovetter, 1985; North, 1990, 2001; Scott, 2001;). In particular, Hofstede has devised five parameters representing Culture in various societies, measuring them (Hofstede, 1980, 2001). These are:

- 1) Uncertainty Avoidance reflects the propensity of members of a society to refrain from introducing changes to their ordinary lives.
- 2) Power Distance measures the actual degree of formality existing among people working at different hierarchical levels.
- 3) Masculinity vs. Femininity (also known as Assertiveness vs. Nurturing) A masculine society rewards competitiveness, aggressive attitudes, whereas a feminine society is more prone to promote harmony of human relationships.
- 4) Individualism vs. Collectivism. A person considers him/herself as an individual entitled to pursue his/her own interest without accepting any responsibilities towards others (Individualistic societies) rather than as a member of a group with specific duties to care about other members of the group and about the group in general (Collectivist Societies ).
- 5) Long term vs. Short term Orientation. A long-term society is oriented towards the consolidation of personal (and economic) relationships among individuals, whereas a Short-Term oriented society is characterized by occasional and impersonal contacts.

### **3 Vorsicht and Fair Value: accounting principles embedded in a cultural social and economic environment**

The principle of Vorsicht characterizes and underpins Accounting Rules in Germany and in all those countries whose national Accounting Standards follow the German model i.e. Austria (Helmann, 2008; Hoogervorst, 2012). The principle of Vorsicht is often translated as Prudence, translation endorsed here even if the two terms are not really equivalent. On the basis of Vorsicht, Financial Statements should present information which should not lead to overstate the financial strength of the reporting entity, in other words, the statements should not offer a ‘rosier’ picture than the reality is. This may sound as a matter of course to non accountants and to the general public persuaded that Accounting can actually provide an objective representation of the financial position of a company. Nonetheless, it is assumed here that the reader is well aware that Accounting Rules do not entail to a perfectly objective representation of anything like for example Value of Assets and Liabilities, indeed there is often a subjective assessment underpinning the final figures reported. Moving from this assumption, the principle of Vorsicht prescribes that the Accountant should be as humble as possible whenever evaluating Assets and never risk to understate the actual strength of

Liabilities. There may be a trade-off between offering an optimistic overview of the financial position of a given entity and a pessimistic one and, whenever such a trade off applies, then the Accountant should choose the second option. In other words, financial statements may provide a bleaker picture than necessary, but not a rosier one.

There is not an objectively valid reason why Accountants, when involved in a trade-off of the type described above, should follow the bleaker option. However, the prominence of the principle of *Vorsicht* can be explained on the basis of the particular characteristics of the German economy. In Germany, the relations between banks and companies are often symbiotic and long-term oriented (or tended to work this way). Banks hold often a substantial amount of shares of their client companies. The idea of the *HausBank* represents a bank offering a broad range of services to a client, ready to provide support during crisis and not acting as a rapacious entity which would eventually cancel overdrafts and enforce a quick repayment of loans. On the other side, the company-client is expected to behave responsibly. It would not sever the cooperation as soon as short-term more favourable conditions are offered by another bank. Moreover, it would offer the most honest representation of its real financial position, allowing the bank-lender (and, eventually, investor) to be able to evaluate the risk in order not to over-expose itself. The principle of *Vorsicht* is well suited to serve these needs, as its enforcement guarantees that the provider of funds (*HausBank*) would not underestimate the constraints that lending funds to a particular client (and, eventually, investee) may create to the very bank's balance and risk exposure. There is a mutually convenient business relationship based on mutual trust and respect, long-term acquaintance supposed to curb Opportunism from either side.

On the other side, traditionally, German companies are less keen (if compared with their Anglo-Saxon competitors) to search funds from impersonal financial markets. This may be also one of the reasons why the German Stock Market has a low capitalization than the UK one. The relative importance of convincing a public of short-term oriented financial investors regarding the great performances of the listed company is relatively of less importance. Hence, there is less of need to boost indicators up.

The particular characteristics of the German economy, as described above, find an explanation if one considers German Culture. The indicator of Uncertainty Avoidance is among the highest, suggesting that Germans tend to be quite conservative, refrain from changing their behavioural patterns and accepting new ones. This explains the importance of the *HausBank* as a safe harbor, the prominence of long-term oriented business relationships, the relative lower financial capitalization of the stock market in comparison with the GDP. This discussion suggests that Culture shapes the economic system which, in turn, underpins the very Accounting System's characteristics. The enforcement of the principle of *Vorsicht* is necessary in order the whole system to work smoothly, otherwise the very relation existing between *HausBank* and companies would be in jeopardy. Companies would reluctantly increase their reliance on impersonal markets because the short-term orientation of investors and their volatility would lead to Uncertainty (which Germans tend to avoid).

As for Anglo-Saxon countries, the matter is quite different (Fasan and Marcon, 2014). The level of Uncertainty Avoidance in the UK and in the US has traditionally been quite low (in spite of changes in the most recent period), suggesting that there is little fear of experiencing new patterns (Nobes and Parker, 2010). An indication comes from the worldwide orientation of the UK, which has historically colonized a certain number of territories all across the Earth. In this type of countries, there is less of a reluctance to engage in impersonal financial investment, hence the comparative weight of the Stock Market is higher than in Germany. On the other side, UK and US are characterized by a relatively higher level of Individualism. Individualism leads to accept short-term business relationships as long as these are convenient

and allows or encourages the interruption of such relationships when not convenient any longer. The very presupposition of the existence of the HausBank does not find a ground in such settings (actually the US legislation has limited for a long time the legal possibility to create universal banks). Both banks as well as companies may interrupt business cooperation as easily as they may start new ones, moreover banks do not acquire shares of clients as often as it happens in Germany. As a consequence, companies would not benefit from a strong reliance on the Principle of Prudence as much as their German competitors would do, indeed they need to present a “reasonably rosier” (leaving aside any discussion about the border between a rosier representation and an unfaithful one) picture to a public of impersonal and often short-term investors in search of financial gains. The principle of Fair Value, which allows a high margin of discretion to the reporting entity, is, indeed, better suitable to companies that need to present encouraging reports with the aim to raise funds in impersonal and volatile financial markets. Fair Value Methods of evaluating Assets have traditionally been more commonly used in the UK than in Germany.

The pages above have demonstrated that, in both of the examples provided, there is a direct link stemming from Culture to the very organizational structure of the economic system and that this latter underpins Accounting Rules. Accounting Rules do not exist in a vacuum but are devised in order to match the needs and characteristics of the local economic (and social) environment. Abandoning the principle of Vorsicht and reinforcing the importance of Prudence would probably create economic difficulties in Germany and in the UK/US, as companies would find raising funds much harder. It is also possible to argue that reality is more complex, especially with the rise in the level of Globalisation, traditional Cultural Patterns tend to soften, traditional models are under discussion. Nonetheless, the points discussed above have a general relevance (naturally, considering all possible exceptions) and are appropriate to enrich with examples the discussion about the importance of Culture as for the development of Accounting Rules.

#### **4 IFRS/IAS: can we have uniform International Rules?**

The discussion developed in the previous sections leads to a consequence: developing International Accounting Rules becomes harder in view of the fact that it is often not possible to devise rules which could match with not only different but even opposite expectations and needs of the various environments. Going back, once again, to the example described above, there is not a mechanism which could lead to the introduction of uniform Accounting Rules suitable to regulate efficiently the German and the UK economic/business sectors. A compromise would risk to be a even less appropriate solution as it would probably end up to inefficiencies in both environments. Still, a globalized economy needs to have International Accounting Rules. This is an absolute necessity as international operators need to understand and compare Financial Statements issued by companies located in different countries. The conundrum is technically unsolvable. At the moment, IFRS/IAS leaves often the possibility to choose among different options in many cases (For example IAS 2 allows the use of the FIFO or of the Weighted Average Method when accounting for inventories, according to IAS 20 a grant related to an asset may be reported as deferred income or by deducting the grant from the carrying amount). This fact is certainly not consistent with the spirit underpinning the very idea to introduce International Accounting Rules and is often explained on the basis of the weight of specific lobbying groups participating in the decisional process. Certainly, this leads to a situation not very dissimilar to the one existing before the introduction of IFRS/IAS. Nonetheless, uniform rules are, in certain cases, simply speaking not usable because these specific rules would have deleterious effects when they are not suitable to the very characteristics of the economic environment of a certain country. In turn, the patterns

underpinning economic environments depend often on the local Culture, which is hardly changeable in the short/medium term.

## **5 Conclusion**

Accounting Rules are often devised according to the characteristics of the economic environments where the rules are to be enforced. In turn, Culture affects the development of these specific characteristics and, directly or indirectly, of Accounting Rules. Culture appears as one of those factors underpinning Accounting standards at the national level. This fact may complicate the introduction of IFRS/IAS because it is often difficult (let alone possible) to devise rules which can actually be suitable to countries characterized by different cultural values (saying this in North' terms, a different informal institutional environment). There is a constant effort to find a compromise between , on the one side, Uniformity as for International Accounting Rules and, on the other side, the need to avoid to introduce standards which could undermine the development of certain economies.

## **IFRS ADOPTION AND ITS IMPACT ON CAPITAL MARKETS IN THE NEW EU COUNTRIES: WHO ARE THE WINNERS AND LOSERS?**

*David Procházka, Jiří Pelák*

### **Abstract**

From 2005, the EU listed companies are obliged to prepare their consolidated financial statements in conformity with IFRS, which are viewed as high-quality financial standards (Leuz, 2003). To comply with the increased disclosure requirements, companies have to incur significant costs. However, the benefits from harmonised financial reporting are available only to those entities, which have serious incentives to report transparently (Daske et al., 2013). The benefits and costs following the changeover to IFRS are therefore neither unfolded equally across companies, nor countries. Empirical research (e.g. Lee et al., 2008; Christensen et al., 2013) reveals that the shortcomings in institutional setting may close off all potential benefits from harmonised accounting, which is pertinent mainly for the transition countries. The aim of this paper is to identify absolute and relative winners and losers among the new EU member states in terms of the progression of their capital market. The particular focus is put on the capital market size measured by a simple criterion “number of listed companies” and its changes in transitional and post-adoption period. The splitting of time-series into two subsets enables to eliminate the influence of different reporting incentives from the effects of change in reporting regime. As an unintended result, the paper’s empirical findings raise some doubts about the appropriateness of certain research designs for assessing the economic consequences of mandatory IFRS adoption.

## **1 INTRODUCTION**

Increasing economic globalisation and integration of capital markets push for the introduction of a single set of internationally harmonised accounting standards (Ball, 2006). Accounting harmonisation is defined as a process, which aims at increasing the compatibility of accounting practices by setting bounds to their degree of variation (Nobes & Parker, 2012). International harmonisation of financial reporting is motivated by investors who seek the best opportunities to invest their scarce economic resources. The investors look for the investments meeting their preferences on return, risk, and liquidity regardless the national boundaries. Financial statements of companies domiciled in a particular country are source of potentially useful information for all investors. However, home agents have better knowledge of local factors shaping the content of financial statements prepared in conformity with national GAAP, which may result in decision-making bias. Foreign investors, being exposed to an information risk, thus require risk premium for their investment (Gordon & Bovenberg, 1996), which increases the cost of capital of home investees. Both parties may profit from the harmonised accounting rules. On the one hand, investors are able to better assess the profitability and threads of a wider range of investment opportunities. Facing the reduced estimation risk, they are willing to accept a lower rate of return. On the other hand, the adoption of internationally accepted financial standards transmits a significant signal about the investees’ reporting incentives (Skinner, 1994; Burgstahler *et al.*, 2006). By incurring bonding costs voluntarily, they commit to prepare financial statements, which are supposed to

provide international investors with information useful for their decision-making (Dumontier & Raffournier, 1998). As remuneration, they obtain an access to cheaper capital.

The demand for internationally comparable financial statements is therefore of endogenous nature. In present, the international harmonisation of accounting is represented by worldwide adoption of the International Financial Reporting Standards (IFRS). According to the IASB's statistics, the IFRS were used in 114 jurisdictions as at the end of 2014. Regarding the EU, the process is driven by the Regulation (EC) 1606/2002 on International Accounting Standards. From 2005, companies publicly traded in the EU regulated capital markets are obliged to prepare their consolidated financial statements in conformity with IFRS. The changeover is connected with material benefits and costs, which are unfolded equally neither across companies, nor countries. The shortcomings in institutional setting may close off all potential benefits from harmonised accounting, which is pertinent mainly for the transition countries. The aim of this paper is to identify absolute and relative winners and losers among new EU member states in terms of the development of their capital market. In particular, we will assess its size measured by a fundamental criterion "number of listed companies". The paper is organised as follows: Chapter 2 reviews the literature on motivation for the IFRS adoption and its capital market consequences. Chapter 3 investigates the development of capital markets in the CEE region with reference to statistical data on number of traded securities. Chapter 4 concludes, outlines the main limitation of study, and suggests future direction of research in the field.

## **2 BACKGROUND**

The assessment of outcomes of accounting harmonisation requires the identification of the goals, which impelled policy makers to endorse the adoption of IFRS. Hope *et al.* (2006) discover that countries with a relatively weak investor protection are more likely to adopt IFRS. Imposing bonding costs, stemming from the switch to high-quality standards, on domestic entities should make capital markets more attractive for foreign investors. The study of Ramanna and Sletten (2009) concludes that strong economies are reluctant to hand the power over standard-setting to independent international authority. The authors also stress the importance of network effects, which are further elaborated in Ramanna and Sletten (2014). They found out the degree of IFRS harmonisation of a particular country increases in the perceived value of its IFRS network. High value of the network effects may result in adopting the accounting rules, which do not suit well to domestic institutions. In fact, some countries adopting IFRS may do it, even if it means the replacement of local standards of superior quality than IFRS. Political factors and dependence on imports of mineral and other resources could be another reason, why countries adopt IFRS (Alon & Dwyer, 2014).

Ramanna and Sletten (2014) explored that the European Union was the main driver of network benefits from international accounting harmonisation through IFRS. As the IFRS adoption has a wide range of economic consequences, their proper assessment requires a systematic approach. Brüggemann *et al.* (2013) propose the classification matrix with reference to the goals of the Regulation (EC). They distinguish intended and unexpected economic consequences based on whether they were assumed in the text of Regulation. According to the Regulation, the adoption of IFRS as an exclusive set of accounting standards for European listed companies is supposed to ensure a high degree of transparency and comparability of financial statements, and thus to enhance the functioning of capital markets. In the EU context, harmonised financial reporting is considered as a necessary condition for the completion of the internal market for financial services and free movement of capital. Broad, smooth-functioning and cost-efficient stock exchanges are expected to contribute to

higher economic growth and employment. A possible link “(foreign) investments – employment – growth” is analysed by Procházka & Procházková Ilinitchi (2011).

Based on the classification of Brüggemann *et al.* (2013), capital market effects are the intended consequences. Those effects are quite extensively scrutinised. The research splits up into two main categories. Firstly, a direct impact on characteristics of capital markets is explored; namely liquidity, cost of capital, bid-ask spread, and development of foreign equity and debt investments are under scrutiny. Secondly, indirect effects include e.g. informativeness of earnings announcements, the analysts’ forecast accuracy. However, the influence of IFRS adoption on quantitative features of capital markets (e.g. number of issuers; changes in composition of market segments; etc.) is rather undervalued. Furthermore, the research effort is concentrated mainly on former EU-15 countries. New member states are usually out of scope, despite IFRS adoption was expected to significantly enhance the quality of their financial reporting. There are two explanations for this inequality. Firstly, economic power of transition countries from CEE region is considerably lower in comparison with the old member states. According to the Eurostat, the old countries generates 91.8% of the EU gross domestic product, despite their population creates “only” 79.2%. Moreover, Germany, France, Great Britain, and Italy produce individually more than all 13 new EU states combined. The second reason behind the ignorance of transition countries is insufficient information coverage in databases used for empirical research (see e.g. the comment in Footnote No. 3 by Procházka (2012)). The paper focuses on publicly available data on a fundamental characteristic of capital markets, namely the number of listed companies. The main aim is to evaluate the progression of stock exchanges in new EU states compared to the development in old member states. The results of empirical analysis will be confronted against the principal goal of the Resolution (EC), which strives for the improvement of capital markets in order to attract new investment opportunities.

Economic consequences of the IFRS adoption are currently the top area in empirical accounting research. *Tab. 1* summarises the cardinal recent studies focusing on the impact of IFRS adoption on characteristics of capital markets. The researchers investigate esp. how the harmonisation of financial reporting of listed companies has affected the cost of capital and liquidity of their equity instruments. Furthermore, the influence on analysts’ forecast and their accuracy is assessed. The last major stream of research in this area deals with the changes in ownership composition, with emphasis on foreign investors.

Empirical research provides some evidence that the IFRS adoption contributed positively to progression of (EU) capital markets. However, the revealed benefits are limited to the occurrence of two concurrent conditions: (a) strong country’s enforcement regime; and (b) credible adopters’ incentives to report transparently. Despite the great contribution to our knowledge, research designs of above papers have some shortcomings, which restrict the feasibility of their generalisation. Firstly, a low number of transition countries are included in samples testing cross-country settings, e.g. three in Li (2010), Brüggemann *et al.* (2012), Florou and Pope (2012), Daske *et al.* (2013); two in Daske *et al.* (2008); and even not a single one in (Lee, Walker, & Christensen, 2008). Furthermore, the country-unique studies focusing on empirical exploration of capital market characteristics in transition countries are very rare. There is only limited evidence for Romania (Ionaşcu and Ionaşcu, 2012; Mihai *et al.*, 2012). Secondly, the research deals with changes in economic effects on companies listed in the pre-adoption compared to post-adoption period. However, the studies ignore the possibility that the positive (negative) change in financial reporting regime that followed the announced/completed IFRS adoption may have attracted IPO (i.e. new listings) or may have boosted exits from stock exchanges (i.e. delisting).

Tab. 1 – Capital market characteristics after IFRS adoption: evidence from research. Source:  
Authors’ review of the extant research

<b>Paper</b>	<b>Findings: Cost of capital and liquidity</b>
Daske <i>et al.</i> (2008)	Increase in market liquidity; decrease in cost of capital; increase in equity valuation around the IFRS adoption Positive effects only for the companies with reporting incentives for transparency and in countries with strong legal enforcement Stronger effects identified for the voluntary adopters
Lee <i>et al.</i> (2008)	Significant reduction in the cost of equity capital in countries having high-quality institutions; mixed evidence for countries with low financial reporting incentives and insufficient enforcement
Li (2010)	Once again, the reduction in cost of capital only in strongly enforcing countries Increased disclosure and enhanced information comparability are the drivers for the decrease in cost of capital
Daske <i>et al.</i> (2013)	Increase in liquidity and decline in cost of capital is present only for the “serious” adopters, but not in case of “label” adoptions
Christensen <i>et al.</i> (2013)	Capital market liquidity improved in five countries, which made substantial changes in enforcement regime simultaneously with the IFRS adoption The change in accounting regime did not affect the liquidity of capital market even in countries, who have strong regulatory and enforcement environment
<b>Paper</b>	<b>Findings: Analysts’ following and forecast accuracy</b>
Tan <i>et al.</i> (2011)	IFRS adoption attracts foreign analysts, particularly those from other countries simultaneously adopting the IFRS Mandatory IFRS adoption improves foreign analysts’ forecast accuracy, but not domestic analysts’ accuracy
Byard <i>et al.</i> (2011)	Analysts’ absolute forecast errors and forecast dispersion decrease only for mandatory IFRS adopters domiciled in countries with both strong enforcement regimes and domestic accounting standards that differ significantly from IFRS
Horton <i>et al.</i> (2013)	Quality of the information environment (including forecast accuracy) increased more for mandatory adopters relative to non-adopters and voluntary adopters
<b>Paper</b>	<b>Findings: Influence of IFRS adoption on investment allocation</b>
DeFond <i>et al.</i> (2011)	Foreign mutual fund ownership grows provided that mandatory IFRS adoption resulted in improved cross-country comparability of financial statements
Brüggemann <i>et al.</i> (2012)	Stocks experience a significant increase in trading volume, as global mandatory IFRS adoption enhances cross-border equity investments by individual investors
Florou and Pope (2012)	Institutional holdings increased for mandatory IFRS adopters; changes occur especially around the first reporting period Institutional investments are concentrated in countries with strong enforcement/reporting incentives and with relatively high differences between local GAAP and IFRS
Beneish <i>et al.</i> (2012)	IFRS adoption has a significantly greater effect on foreign debt than on foreign equity investment flows Post-adoption increases in foreign equity investment are conditioned upon high governance quality; however, growth in foreign bond investments has occurred regardless the quality of corporate governance

Therefore, we will investigate an aggregate development of regulated capital markets within the EU, with focus on transition countries. The countries from CEE region are viewed as having underdeveloped institutional framework, which influences the functioning of capital markets negatively. The switch to IFRS, which are generally considered as standards of significantly higher quality than local GAAP, may have contributed the improvement.

### 3 METHODOLOGY AND RESULTS

Based on the argumentation above, we will assess whether the adoption of IFRS have had any impact on the size of regulated capital markets in the new EU countries. The size of capital market is approximated by the number of listed companies. Tab. 2 captures the development of equity instruments listed on regulated markets of stock exchanges in EU countries from 1995 till 2012. In 1995, the European Commission published a strategy “Accounting Harmonisation: A new strategy vis-à-vis international harmonisation”, which expressed a strong EU support to the IASC activities. Five years later, “EU Financial Reporting Strategy: the way forward” communicated a commitment that issuers of securities traded on EU markets would prepare their consolidated financial statements using the same set of financial reporting standards. The Strategy was enacted by issuance of the Regulation (EC) 1606/2002 on International Accounting Standards, which mandated all companies listed on EU regulated markets to prepare their consolidated financial statements in conformity with IFRS for each accounting period starting on or after 1 January 2005.

Above mentioned benchmarks shaping the financial reporting of listed companies in the EU are highlighted in bold in the *Tab. 2*. In 2012, the biggest number of equity instruments was traded on the Spanish capital market. The second largest stock exchange was in the Great Britain, followed by France, Poland, and Germany. Poland is the exception among transition countries; the capital markets in new member states are quite underdeveloped (with Estonia

and the Czech Republic being the last, as far as the number of issuers concerns). However, the dynamics over presented period are of higher importance. E.g. in 1995, the second largest capital market (in terms of number of equity listings) was the Prague Stock Exchange. After next 15-20 years, the exchange is at the rear of the ranking with just a fraction of listed companies compared to the past years. The drastic drop can be explained with reference to the unique way selected for the transformation of former state companies in the communism era to a new model based on private ownership. Czech government opted extensively for the mass privatisation, which led to largely dispersed ownership of companies by millions of people. The following concentration of equity interests came about spontaneously via domestic stock exchange. The concentration turned to quite rapid delistings (from the RMS market). For the purpose of this paper, this pattern of ownership consolidation cannot be contributed to the IFRS adoption.

On the other hand, the Warszawa Stock Exchange has experienced the strongest growth; the number of issuers has risen by almost 300 % from 2002 till 2012. The success might have been a result of favourable institutional factors, including the change of financial reporting regime. These two examples motivate to analyse the development in each country in detail, because there can be relative winners and losers from the IFRS adoption on cross-country level. Similar findings are expressed by Christensen *et al.* (2007), who identified uneven cross-sectional dispersion of benefits from the IFRS adoption on company level. Using data of *Tab. 2*, we calculate the relative change in equity instruments traded in each country for two periods:

- the percentage change between years 2002 and 2005 (pre-adoption period);
- the percentage change between years 2005 and 2012 (post-adoption period).

The break-down into two subsamples follows the comments of Christensen (2012) to the Kim and Shi (2012) evidence on the voluntary adoption of IFRS. Despite EU announced its intention to mandate IFRS in 2000 and approved the Regulation (EC) in 2002 with effective date from January 2005, only an inconsiderable portion of the EU listed companies voted for quasi-voluntary application of IFRS during the transitional period 2002-2005. Moreover, the most of increase shall be attributed to the listings on Neuer Markt Börse Frankfurt (Leuz, 2003; Cuijpers and Buijink, 2005), for which issuers were supposed to submit their financial statements in compliance with IFRS or US GAAP. Christensen (2012) concludes that truly voluntary IFRS adoption was rare. Using the revealed preferences theorem (Samuelson, 1938), we assume that firms affected by Regulation (EC) were reluctant to adopt IFRS earlier than in year 2005, as they perceived the net benefits from early adoption to be negative.

Based on the reasoning above, the splitting of data into two subsets should control for two different factors determining the new listings and delistings. Firstly, the adoption of IFRS meant (a) significantly higher disclosure requirements compared to domestic standards for the majority of EU countries; and (b) relatively high administrative costs (IT systems; staff training; etc.) for the switch and compliance (ICAEW, 2007). This may impel companies to deliberate their abidance at regulated capital markets. The harmonisation of financial reporting may induce explicit and implicit cost pressing companies to exit the capital markets. The delisting is more likely to (a) companies with low reporting incentives and/or (b) countries with strong enforcement regime. These factors are relevant for delisting decisions during the transition period (i.e. between 2002 and 2005), which are mostly influenced by expected benefits and costs of remaining on the exchange.

Secondly, the separate analysis of the changes in number of listed companies in the post-adoption period allows assessing, whether the IFRS adoption has brought positive or negative effects in particular country. Companies listed before 2005 have already switched to the new

system, so there are no implementation costs. Holding enforcement, institutional, and other economic factors constant, the delisting in post-adoption era is then just the consequence of significant real costs for compliance with high quality standards, which are not accompanied by sufficient benefits. Contrariwise, if the quality of capital markets improves due to the IFRS adoption, new issuers may be attracted to enter the stock exchange with initial public offerings. The changes in size of capital markets measured by the number of traded equity instruments are presented in *Fig. 1*. To eliminate compounding time-dependent and institutional factors, we excluded Bulgaria, Romania, and Croatia from the sample, as these countries accessed the EU after 2005, when Regulation (EC) came in force.

Fig. 1 – Pre- and post-adoption period changes in the number of listed companies. Source: Authors' calculation based on *Tab. 2*

Data are divided into two subgroups. The horizontal axis captures the net growth of listed companies in period 2002-2005 (i.e. pre-adoption period); the vertical axis represents the development in post-adoption period (i.e. the relative change of year 2012 to 2005). Based on the results, countries are classified into four clusters. Group A contains countries, which could be considered as absolute winners, as they experienced the net growth of listed companies both in pre- and post-adoption period. Poland is on the top of rankings as the number of issuers has risen from 216 to 844 over scrutinised time frame. Despite included in this group, there is no significant change in the size of Estonian stock exchange, as the number of issuers was very low throughout the whole period – 14 issuers (2002); 15 (2005); and 16 (2012).

The majority of transition countries from CEE region are located in the lower left cell of the matrix (i.e. in Group D), which indicates a drop in traded equity instruments in both sub-periods. The greatest exits of listed companies are documented in the Czech Republic and

Slovakia, which cannot be attributed only to economic reasons (e.g. concentration of ownership following the mass privatisation). It could be assumed that IFRS adoption in these countries brings unintended negative consequences in terms of large-scale delistings. Lithuanian and Latvian stock exchanges have experienced a slightly better, but still very negative progression, losing almost 50 % of issuers compared to year 2002.

The rest of transition economies belong to Group B and Group C. Slovenian stock exchange underwent reforms in segmentation of markets in 2002, which consequently increased number of equity instruments reported in the World Bank Database in 2003. However, these companies were already present at the capital markets, so the positive movement is a just statistical reclassification. Taking into account further development, the capital market in Slovenia has developed in the same negative way as in the companies under Group D. Mixed evidence is available for Hungary. A fall by approximately 10 % in pre-adoption period is followed by the net new listings growth (almost by 20 %) in the post-adoption era.

To conclude this elementary analysis, Poland is the only winner among new EU countries from CEE region, regarding the size and efficient functioning of capital market in the era of internationally harmonised financial reporting. The Warszawa Stock Exchange is able to attract firms seeking the financing, including foreign issuers. According to PwC (2014), Polish capital market was the European No. 1 in 2012 and No. 2 in 2013 by the number of IPOs. On the other hand, there is a large group of companies, which might be considered as denoted as the absolute losers of a battle for benefits from accounting harmonisation, as their capital markets have substantially shrunk after the approval of Resolution (EC). This group encompasses the Czech Republic, Slovakia, Slovenia, Latvia, and Lithuania. The characteristics of regulated capital markets in remaining CEE countries (i.e. in Hungary, Estonia) have not significantly changed over the examined period. Compared to situation in other transition countries, these two economies may be viewed as relative winners, as they manage to avoid a quite massive process of going private.

Fig. 2 – Cluster dendrogram for pre- and post-adoption period changes  
Source: Authors' calculation based on *Tab. 2*

The intuitive conclusions on absolute and relative winner, which was based on a simple idea of changes in number of listed companies, can be also confirmed by statistical inferences using the cluster analysis. We used the methods of hierarchical clustering and centroid-based

clustering. Similarly to *Fig. 1*, Poland and Slovenia are considerable outliers, as captured in cluster dendrogram (*Fig. 2*). There are several subgroups identified by the hierarchical method, which rests on the concept of Euclidean distance among variables. E.g. Malta, Hungary, and Sweden create one of the classes. Another group is composed of the Czech Republic and Slovakia, which are also located relatively extremely in the Group C at *Fig. 1*. For the same reason (i.e. a significant drop in post-adoption period), the Netherlands and Belgium are close to previous two countries, and creates a joint class on a higher level. Finally, a quite large group of countries situated in the middle of cluster dendrogram exercises relatively indiscernible differences in pattern of pre- vs. post adoption development. These countries are located around the [0;0] point in the *Fig. 1*. Alternative clustering approach is followed by centroid clustering. Its results on same data as in *Fig. 1* and *Fig. 2* are presented in *Fig. 3*. Once again, one of the classes is made up by Malta, Hungary, and Sweden; Poland and Slovenia are spotted as extreme outsiders as well. The Netherlands and Belgium form a separate group, however, not so close to the Czech Republic and Slovakia as in case of hierarchical clustering. Finally, around the [0;0] point is situated the largest class of countries, for which detailed resolution is not achievable anymore.

## 4 CONCLUSIONS

The review of extant research, focusing on economic consequences of the IFRS adoption on capital markets characteristics across EU countries, revealed that the process is associated with relatively high benefits in some countries and relatively significant costs in other countries. The findings of archival studies investigating e.g. the change in cost of capital, liquidity, analysts' forecasts accuracy are also confirmed by the analysis of progression of capital markets in terms of their size (measured by the total number of equity instruments traded on particular national stock exchange). Despite simplicity, the measure of size allows identifying the absolute winner with a steadily and hugely increasing number of new issuers, which is Poland. Secondly, we may differentiate the relative winners, i.e. Hungary and Estonia; their stock exchanges remained relatively stable in period after the approval of Regulation (EC) in 2002. Finally, the biggest group contains absolute losers, as they experienced significant declines in number of publicly traded equity instruments during the IFRS era.

As far as the contribution to current state of art concerns, the empirical results presented in our paper partly support the findings of studies on relationship between quality of standards and quality of financial statements. For example, Skinner (1994); Ball *et al.* (2000); Ball *et al.* (2003); Burgstahler *et al.* (2006); Hail *et al.* (2010) point out that accounting quality depends on firms' reporting incentives and functional enforcement regime rather on quality of accounting standards. A widespread occurrence of benefits stemming from accounting harmonisation is therefore not guaranteed. This is highly relevant especially for those transition countries, who suffer from low quality of enforcement and insufficient incentives of domestic companies to report transparently. In addition, we provide supportive arguments for the conclusions of Christensen (2012), who argues that research tends to overestimate the benefits and undervalue the costs connected with the IFRS adoption. He concerns primarily about the empirical assessment of outcomes of voluntary IFRS adoption, but his critique may be generalised for the mandatory adoption, too.

Coherence of empirically uncovered effects of voluntary IFRS adoption is mainly restricted by self-selection bias. Voluntary adopters have strong incentives to communicate with public in a transparent manner, including the extended voluntary disclosures and timely recognition of bad news. The transparency is in turn appreciated by investors. The achievement of benefits (lower cost of capital, foreign analysts' following; etc.) by companies, which made a credible voluntary commitment to adopt high quality standards, such as IFRS, is then of endogenous nature and self-explaining. Research design must therefore incorporate certain dummy variables and employ other procedures in order to control for this self-selection bias and to get robust results. On the other hand, companies' reporting incentives are not a cardinal problem, when analysing the consequences of mandatory IFRS adoption, as all affected companies had to skip to a new reporting system compulsory and at the same time. Empirical research compares the selected characteristic in pre- and post-adoption era after controlling for concurrent events to avoid the distortion of results because of "seeming correlation". In order to avoid this distortion and/or to get more robust results, a comparative sample of non-adopting countries is used to control for other factors than the change in financial reporting standards (e.g. to control for the development of enforcement regime).

However, the inclusion of non-adopting countries as control group does not solve the main problem with the selection of affected companies in adopting countries. The transition from domestic GAAP to IFRS did not happen overnight. A relatively long transitional period (from the decision in 2002 to the effective start in 2005) provided companies with the opportunities to estimate the impacts of IFRS adoption properly and to accommodate to the changeover. Some entities decided to stay publicly traded; others selected to exit capital markets, as going private could have been the only vital solutions how to avoid expected net costs to comply with new reporting standards. Although economically rational on individual level, this kind of behaviour can have troublesome implication for research, provided that delisting is undergone by significant number of companies. Companies, which opt for delisting during the transition period, did not become mandatory adopters. Consequently, they cannot be included in the sample of companies, for which the impact from mandatory adoption was investigated. Let us suppose that a research study detected that IFRS adoption had reduced the cost of capital of companies listed on particular stock exchange. Even if the sample captured the whole population of companies listed on that exchange in the post-adoption period, the empirical results cannot be generalised by arguing that IFRS adoption has enhanced the capital market characteristics. If companies decided to go private during the transitional period because of expected negative impact from the IFRS adoption on cost of capital (e.g. lower profits may violate debt covenants, decrease dividends, etc.), then their omission in sample produces partially incorrect findings about the real effects of IFRS adoption. This remark is relevant

especially for countries clustered in Group C (including Germany, Italy) and Group D in Fig. 1.

However, there are important limitations to our study. Firstly, it deals with aggregate figures on net increase/decrease in number of listed companies. A detailed analysis would require a further break-down on new listings and delistings, which should help in identifying the individual incentives for entering/exiting the capital markets before and after IFRS adoption. Splitting-up is also necessary for resolving the methodological issue described above. Secondly, our elementary analysis assumed other factors (e.g. economic growth; strength of enforcement regime) stable over the whole period, which is not true. The influence of other factors than accounting standards on capital markets should be addressed in future research. Thirdly, more representative results require the comparison of progression in transition countries with development in EU-15 countries. Furthermore, the specifics of each country regulatory system (including the distinction of strength and credibility of reporting incentives among countries) shall be incorporated in the analysis. Finally, despite using the methods of cluster analysis, alternative research approaches (e.g. regression analysis) may yield additional/different insights into the cross-country impacts IFRS adoption on capital markets both on individual and aggregate level. Robust findings would require scrutinising other variables and their relevance (e.g. market capitalisation; trading volumes; etc.).

## **IDENTIFICATION OF BREACH OF GOING CONCERN ASSUMPTION BY COMPANIES IN BANKRUPTCY**

*Monika Randáková, Jiřina Bokšová*

### **Abstract**

The Czech accounting legislation defines annual, extraordinary and interim financial statements. The main task of published financial statements is to inform properly the external users. Entities registered in the Commercial register are obliged to publish financial statements not later than the end of the following accounting period into the Collection of Documents. This obligation of publication is based on the EU legislation. The aim of publication is to protect third party, especially business partners in commercial contracts. Unlike other EU countries, the Czech companies often do not comply with the publication requirement in practice. The paper deals with research of entities that have fallen into crisis economic situation and go through insolvency proceedings and answers two basic questions. Do those entities fulfil their legal obligations regarding publication of financial statements? Is it possible to recognize that the company is not a going concern or to recognize that the company is going bankrupt before the insolvency proceedings start?

*Keywords: Financial statements; Going concern assumption; Bankruptcy; Negative equity; the Principal of prudence.*

JEL Classification: G33, M41

## **1 INTRODUCTION**

The purpose of accounting information is to satisfy information needs of different users. Accounting must provide information to financial managers continuously. Management of a company can find this information in accounting books. But at certain intervals it is necessary, both for corporate managing authorities and all other users (owners, potential investors, creditors, suppliers, employees, state authorities, competing companies), to provide cumulative information about financial situation of whole company.

## **2 PUBLICATION OF FINANCIAL STATEMENTS**

### **2.1 Financial statements regular, extraordinary, interim**

„Financial statements, in connection with property transactions, prove financial situation in terms of preserving the estate, in terms of going concern, in terms of efficiency and liquidity and they are very important to participant entities (shareholders, investors, companies). Financial statements may indicate the possibility or necessity of certain property transaction and also prove its realization. Therefore, they are often required by owners and in many cases they are commanded by legal standards.” (Vomáčková, 2009).

The difference between extraordinary and interim financial statements is especially in the fact that within extraordinary financial statements are being implemented factual inventory procedures of assets and liabilities and closing the accounting books at the same time. On the contrary during the interim financial statements the inventory is made only for purposes of

valuation, it means for creation and use of impairment and provisions. During the interim financial statements the accounting books are not closed.

In cases of changing the dispositional authorization to dispose of the assets and liabilities of an entity (the debtor's bankruptcy), it is always necessary to prepare extraordinary financial statements with its relevant formalities. In case when there is no change in dispositional authorization to dispose of the assets and liabilities (declaration of bankruptcy), the entity prepares only interim financial statements.

## **2.2 Going concern in the foreseeable future**

Going concern is one of the fundamental pillars of financial reporting. Preparation of financial statements should be based on the assumption that company will continue in its business in the near future (Kovanicová, 2002). Acceptance of this assumption has serious consequences to the entity and its financial statements:

- Economic activity of the entity is always associated with uncertainty. Therefore it is important not to raise optimistic expectations of external users through financial statements and not mislead them. However, this does not mean that financial statements should be pessimistic. Financial statements should reflect realistic view of the financial position of the entity at the given time;
- “External users are not interested just in current financial position and business performance, but also in its ability to achieve economic benefits out of the potential of its assets, in short “make money”. Necessity to satisfy this intention results in balance-sheet expressing condition of the assets, liabilities and equity at balance sheet date with an eye to the future: assets should express the amount of the expected economic benefits, liabilities expected reduction of economic benefits.” (Kovanicová, 2002).

Financial statements should reflect the real financial situation of the entity with the look to the future, Hence, there must be a series of transactions, which can be undertaken only if company continues in its business and does not intend to end its business in the foreseeable future. E.g. provisions for future expenses, reduction of business results by losses expected in the future, accruals of income and expenses etc. (Bokšová, 2013).

The going concern assumption is (therefore) crucial in the financial statements. In case, when entity expects a breach of this assumption, it is required to apply accounting methods in appropriate way. There is an obligation to state information about used method in notes to financial statements.

The going concern assumption is breach e.g. at the moment of decision on entity's bankruptcy. There is an objective situation when the company gets:

- either into significant insolvency (it is not able to pay its financial liabilities for a period of more than three months overdue and also the creditor cannot reach its satisfaction in other way - enforcement or execution);
- or the company is in over indebtedness (primary insolvency means that the sum of its liabilities exceeds the value of assets of the entity).

There is an obligation of preparing the opening balance-sheet on the effective date of insolvency court's decision on bankruptcy. On a day preceding the day the bankruptcy takes its effect, the entity is obliged to prepare an extraordinary financial statements.

The duty of the insolvency court is to decide how to resolve insolvency no later than three months since issuing a decision of debtor's bankruptcy (Maršíková, 2011; Smrčka &

Schönfeld, 2012). In some cases, it may lead to concurrence of decision on bankruptcy and decision on way of resolving insolvency (declaration of bankruptcy). The preparation of financial statements must copy important moments in ongoing proceedings. In the case, when decision on bankruptcy is also associated with a declaration of bankruptcy, only the extraordinary financial statement is compiled preceding the date of the decision. In case these decisions are not issued at the same time, entity prepares extraordinary financial statements on the date preceding the date of the decision on bankruptcy. On the day preceding the date of effectiveness of declaring bankruptcy is compiled the interim financial statements. During the bankruptcy are compiled annual financial statements in regular period.

### **2.3 Identifiers of Going Concern Problems**

The crucial question is whether business partner or other party can identify that the company may no longer be a going concern according to the annual statements. The basic identifier of going concern problem is the equity value of the company. If it states negative value, it is clear that the debt oversized all of the assets. A business partner should not be closing a contract with such a company. If the equity value is in the black numbers, however smaller than the value of registered capital, the decision is more complicated. Without a question it is possible to assume that the entity functions at the expense of equity contributions (the owner would not in this case receive even the money they originally invested into the company). In that case it is necessary to focus on the equity development in the past few years. If the equity value oscillates around the value of registered capital, it is possible to detect beginnings of going concern troubles. The usual reason which causes this trend is cumulated retained loss (Altman & Hotchkiss, 2006).

Second identifier of going concern problems is the overrated assets and possible risks connected to the business which are not taken into account (undervalued provisions). The management is in many cases trying to adjust the annual statements in order to appear healthier even for the price of falsifying the net income of the company (Strouhal et al., 2014a, 2014b).

The third identifier tends to be the rising level of indebtedness of the entity (the overdue debts are raising). That of course can be related either to the deterioration of equity or to the rise of bad debts to which there are no provisions created (Mevorach, 2009).

For external users are the annual statements the most important source of information about the entity whether it is a well prospering company or a one nearly going bankrupt. However in the Czech Republic many companies do not fulfil the legal duty to publish annual statements. According to the press release of the CRIF – Czech Credit Bureau (2015) from the October 2013, which has made an analysis of annual statements that had been published in the year 2011, 79% of all companies had not published their annual statements for 2011, and therefore broke the law. From the long term point of view the number of companies which are publishing their annual statements decreases every year (Czech Credit Bureau, a. s., 2011).

Why are managers and owners of the entities in the Czech Republic only very unwillingly publishing any information about their own companies? They probably feel that this information could be used by their competitors and so they could lose part of their advantage. As a reason of that these entities often do not obey the law and they rather pay the fine, which is in the Czech Republic insignificant (Varvařovský, 2012). In some countries of the European Union it might be even considered a crime consisting of “falsification of data about the financial state and equity of the company” committed by the management not to publish annual statements of its company. For this crime it is possible to get as much as two years in

prison or prohibition of activity. In the Czech Republic there is no system which would be able to evaluate and create a list of companies which did not publish their annual statements.

### 3 METHODOLOGY

#### 3.1 Aim of Research

The aim of this research was to identify breaches of going concern assumption in the financial statements for 2010 and 2011 for entities that have been declared bankrupt (bankruptcy decision in the period from October 2012 to December 2012).

#### 3.2 Sampling

Period from October – December 2012 was chosen due to the requirement to publish financial statements for 2012 (to date of the bankruptcy decision) no later than 31. 12. 2013. The research was conducted in the second half of 2014. In case there would be the subject of research the entities in bankruptcy from 2013 there would not be the financial statements of these entities for 2013 in the period of research (second half of 2014) in the Commercial Register available.

Tab. 1 – Justification of sampling period for research Source: own analysis

Period	2010	2011	2012	2013	2014
1st quarter					
2nd quarter					
3rd quarter					research
4th quarter			sample		research
Publication of financial statements		For 2010 till 31. 12: 2011	For 2011 till 31. 12. 2012	For 2012 till 31. 12: 2013	For 2013 till 31. 12. 2014

#### Justification of sample selection of examined entities

Within the selected period of research (IV. Quarter 2012) there were found the entities in the Insolvency Register where the bankruptcy decision was executed. From this basic sample were then selected the entities where have been declared the bankruptcy. This was the sample of 103 entities. During the research every entity from the sample of entities in bankruptcy was gradually examined and three entities were omitted due to the lack of information. In case of one entity the bankruptcy was canceled so this entity was omitted too.

Tab. 2 – Sample of entities – bankruptcy in IV. Quarter 2012 that was solved by the bankruptcy process. Source: Insolvency Register

Default sample of entities according to the Insolvency Register – The bankruptcy decision in period October/2012 – December/2012 that was solved by the bankruptcy process	<b>103</b>
Omitted entities that were not found in Commercial Register – Bankruptcy decision in period October/2012 – December/2012 was solved by the bankruptcy process (are not the subject of research)	3

Entities where the bankruptcy process was canceled (are not the subject of research)	1
<b>Number of examined entities</b>	<b>99</b>

The sample of 99 entities in period 2010, 2011 a 2012 that became bankrupt corresponds to total of 297 financial statements. These statements should be stored in Collection of Documents of Commercial register according to the law.

Tab. 3 – Sample of examined financial statements. Source: Commercial Register

Number of examined entities	Number of examined financial statements		Unpublished	Published for 2010	Published for 2011	Published to date of bankruptcy decision 2012
	Unpublished	Published				
63	Unpublished	0	189	-	-	-
17	Published just in one year from three years	17	34	15	2	0
15	Published just in two years from three years	30	15	15	15	0
4	Published in all years	12	0	4	4	4
<b>99</b>	<b>Total</b>	<b>59</b>	<b>238</b>	<b>34</b>	<b>21</b>	<b>4</b>

The Tab. 3 and Fig. 1 show that in case of 63 entities were found no financial statements in Commercial Register for specified period. The remaining 36 entities in bankruptcy process published their financial statements (of which 17 entities just one, 15 entities just two and only 4 entities fulfil its legal obligation).

Fig. 1 – Number of examined entities in relation to the obligation to publish financial statements. Source: own analysis

The Tab. 3 and Fig. 2 and 3 shows that 99 entities should publish total 297 financial statements in period 2010, 2011 till bankruptcy in 2012. Already mentioned 36 entities published total 59 financial statements of which for 2010 it was 34 financial statements, 21 for 2012 and only 4 for 2012.

Fig. 2 – Number of published and unpublished financial statements. Source: own analysis

Fig. 3 – Number of published financial statements in particular years. Source: own elaboration

### **3.3 Procedure for processing information from the financial statements**

The aim of research was to find identifiers breaches going concern assumption already in 2010 in the published financial statements, i.e. almost two years before the bankruptcy decision and its bankruptcy process. Among the chosen identifiers were included in the research following criteria:

- entity does have a negative equity,
- entity does have share capital bigger than equity,
- entity shows corrections for the receivables,
- entity shows provisions,
- entity shows long-term liabilities,
- entity show its financial statements in full range (financial statements are shown in detailed distribution).

## 4 RESULTS

There were 59 published financial statements analyzed during the research, one of them was completely unreadable. The problem with identifying information, especially from a financial statement balance sheet, was that the financial statements in the Czech Republic do not have an electronic reporting format. It means that the information is inserted into public sources (Commercial register) exclusively in pdf format. Therefore not all information could be considered as high-quality based and well readable.

### 4.1 Evaluation of Results

The obtained information from research are summarized in the following Tab. 4

Tab. 4- Identifiers of going concern. Source: Commercial register

	2010		2011		2012			
	YES	NO	YES	NO	YES	NO		
Negative equity	14	19	<sup>1</sup> <sup>3)</sup>	11	9	4	0	
The share capital is higher than equity capital	<sup>1</sup> <sup>2)</sup>	20	12	<sup>1</sup> <sup>4)</sup>	14	5	4	0

Provisions	6	27		6	15	3	1	
Long-term liabilities	20	13		13	8	4	0	
The financial statements in its entirety	21	12		11	10	3	1	
<b>Total of financial statements</b>	<b>33<sup>1)</sup></b>		<b>21</b>		<b>4</b>			

1) one of the financial statements was unreadable

2), 4) the financial statement of government departments, it is not determined registered capital

3), 5) unreadable data

After conducted analysis of 58 financial statements it is possible to state the following conclusions:

- From 33 companies that published financial statements for the year 2010 lived 20 of them at expense of investments in registered capital. And even 14 of these companies already showed negative value of equity.
- From the total number of 33 companies, 14 companies were already in the real bankruptcy because of over-indebtedness in 2010. Act of bankruptcy was declared in the 4th quarter of 2012.
- Only 11 of 33 companies created adjustments for doubtful receivables and only 6 companies created provisions for future expenses. For all companies, it was the

undervaluation of these risks. Their aim was overvalue economic result for the current period, and thus improve the resulting value of equity and delay artificially the real decision on the company's bankruptcy (legislative act).

- From 21 companies that publish financial statements for the year 2011 was not possible to assess the trend for 3 companies. Two companies did not post financial statements in 2010. Some information from one of the financial statements (Tab. 4) could not be read.
- Only 18 companies, which posted financial statements for years 2010 and 2011, could be used in the research for trend analysis. Conclusions are that 16 companies reported deteriorating trend towards bankruptcy decision. Only with 2 companies was noted an improvement in the trend.
- Release of provisions (these transactions would lead to improvements of economic results in the current year) could have an impact on improving the trend for two companies. However, it was not confirmed. Improving trend for the two companies was mainly due to the fact, that one company did not carry any business in 2010, but in 2011 was achieved a positive economy result, which was subsequently used to reimbursed insignificant losses from previous years. In second company was reported significant loss in 2009. In the 2010, company started gradually reimburse the loss from its profit and managed to fully reimbursed in 2011. This impact was not for long, because even in these two companies had occurred the bankruptcy decision in the 4th quarter of 2012. The financial statements were not published in these two companies for year 2012 and therefore it is not possible to assess the real reason for entry into bankruptcy.

## **5 CONCLUSION**

For external users are the annual statements the most important source of information about the entity no matter whether it is a prospering company or a company on the verge of bankruptcy. Even though the entities are obliged by law to publish annual statements, only few of them actually fulfil this duty. The aim of our research was to discover, whether the companies which are entering insolvency, and are therefore under closer surveillance of courts, fulfil their legal duties and publish their annual statements. Outcomes of our research imply that in year 2010 out of 99 examined companies 66% and in year 2011 79% did not publish their annual statements according to the law. This leads us to similar conclusions as CRIF – Czech Credit Bureau from February 2013, which has analyzed all the companies in the Czech Republic.

The research shows that most of the companies prolong their entry into bankruptcy. By doing so they wait for even worse condition of the company and they try to continue doing business until one of creditors loses their patience and they propose for the company to go into insolvency. This trend is happening in the Czech Republic for a few years. Because of that in connection to the recodification of Czech law tougher legal regulations have come into force concerning the responsibility of statutory bodies for their decisions which could bring the company into bankruptcy. Along with that come financial penalties in case the statutory body knows about existing bankruptcy and they do not act accordingly.

Our research has shown that 14 companies at minimum have already in year 2010 stated negative equity and entered insolvency proceedings in the first quarter of the year 2011.

## **PERSONAL BANKRUPTCY IN THE CAPITAL CITY REGION IN THE CZECH REPUBLIC**

*Monika Randáková, Jiřina Bořková, Mikuláš Pýcha and Ondřej Buben*

### **Abstract**

The process of debt relief through personal bankruptcies grows in importance as a way how to solve a very complicated financial situation among debtors in the Czech Republic. Personal bankruptcy is therefore one of the possible and approved ways how insolvency can be declared. In the Czech Republic we can find two ways of processing personal bankruptcy, firstly assets of the debtor can be sold and used as the repayment of the debt (partial or whole). Secondly a debtor can repay part of the debt through repayment plan depending on the amount of debtor's income. This Research aims to describe the structure of debtors from capital city of Prague in the Czech Republic from all possible aspects. Amongst these aspects we are focusing belongs gender, achieved education, their age and their total amount of debt. This Paper also describes the structure of three groups of creditors among analyzed debtors. Moreover the primary aim is to analyze what kind of person (according to age, gender, and education level) is mostly susceptible to become indebted and what extent of the total debt certain person establishes before asks for debt relief.

*Keywords: Personal bankruptcy, Debtor, Insolvency, Czech Republic, Debt relief, Creditor*

### **1 INTRODUCTION**

“Personal bankruptcy in the Czech population increases by 30% annually, and personal bankruptcy is a new approach to debt relief.” (Paseková, M., 2013)

The only eligible person that may ask for debt relief is a debtor. However there must be an approval of the creditor. One of the most important facts is that debtor must be under bankruptcy to propose debt relief. The debt relief proposal has to contain specific information as identification of the debtor, presumed income in following 5 years, past income for last 3 years, type of the debt relief and list of debtor's possessions and liabilities. When a debtor fulfills all juristic requirements for debt relief, the court shall permit it. (Maršíková, J., 2011)

There are three categories of Insolvency: lack of knowledge, inaccessibility to debt, and economic climate (Carter, R., Van Auken, H., 2006). As we may assume, people do not always have the necessary knowledge about loans they consider taking. The financial rate of literacy is not equal among the population. Therefore people can take loans even though they are not going to be able to repay it. Inaccessibility to debt we understand such a moment, when banks (financial institution) refuse to process a loan because of debtor's bad financial situation. There comes a chance for non-financial institution to fill this market gap. In the end economic climate teach people to take loans with lack of responsibility. When we connect these three aspects together, we create a great place to take loans for people that will not be able to pay them back. Then we truly need such an institution of debt relief.

This paper presents the results of the analysis of debtors from the Prague city Region in the Czech Republic who are undergoing or already went through a process of personal bankruptcy. The main aim of this research is to analyze debtors whose inability to repay their

debts are being resolved through a debt relief. The secondary aim is to get the feel of results from the Research that was processed in Moravian-Silesian region (Paseková, M., Bařinová D., Personal Bankruptcy on the Moravian-Silesian region). However it is not the aim to compare the outputs. The fig. 1 shows the development of the amount of debt relief proposals and states how many of them were approved between years 2008 and 2013. The explanation why some of debt relief proposals have not been approved was already mentioned above. It is due to failing the juristic requirements that are needful for court to approve such a proposal.

The Insolvency Act settles citizen over-indebtedness through debt relief. If the debtor fulfils conditions prescribed by the state, the debtor can after 5 years rid itself of its therefore unpaid debts. (Paseková, M., 2013)

## 2 THEORETICAL BASIS

### 2.1 Debt relief

This research is focused on debt relief. But what a debt relief is and for whom it is intended? It is intended for individuals who do not have any debts out of the business, but still have more than two creditors and they are unable to pay their debts which are more than thirty days overdue (Smrčka, L., 2011). In such a case, they can submit a proposal for a debt relief and then wait for court's decision. Proposal must contain following information: *identification of the debtor, expected income of the debtor in next five years, debtor's income for the last three years, method of debt relief and the list of assets and liabilities*. The proposal also must convince the judge of debtor's honest intentions and that he is able to pay at least 30% of its debts to the creditors. If all conditions are fulfilled and local regional court will approve the proposal, the whole process of personal bankruptcy will start by assigning a bankruptcy administrator to the debtor. It is also very important to keep in mind that each person can declare personal bankruptcy only once in live without exception.

### 2.2 Methods of debt relief

Debt relief gives debtor a court protection from new fines, interest and penalties which could come from its creditors. But to have this protection, debtor should repay at least 30% of its debts and there are two ways of doing so. The first method is repayment plan through which

is possible to pay some or even all debts in next five years since the proposal for a debt relief was successful. Debtor remains with so-called subsistence minimum and everything else he gain is used to pay the creditors. Debtor is also constantly supervised by court for 5 years. Therefore applicant who has the best chance to succeed is the one with regular income. This is also the most frequently used method in the Czech Republic. The second method of debt relief (less used) is monetization of assets and using the money to pay creditors. With this method, there is a possibility of repaying creditors with monetized assets. In such a case, there is no need of supervision for 5 years.

### **2.3 Insolvency legislation in Czech Republic**

One of the most outdated parts of Czech legislation was the problematic section concerning about bankruptcies. Back to the history the Czech Republic had a long tradition in solving bankruptcy, starting in 1781 with the Josephine bankruptcy order. This order was novelized many times and in 1931 there was passed the law number 64/1931 Sb., which adjusted most of the problems at those days. This development was interrupted by the change of the regime, which did not demand such a law. The renewal of the insolvency legislation comes up after 40 years break in 1991 (law number 328/1991 Sb.). The interruption of the continual legislation development took its cost and this law evinced many imperfections.

In this point it is easier to understand that our legislation took the inspiration abroad, mostly in United States of America and in our neighboring country – Germany. In the USA, the issue of bankruptcies takes a huge importance, which is supported by the fact that the insolvency law, according to the first article of the American constitution, is adjusted by the federal law. The first new developing tendencies of insolvency laws showed up in the so called *Bankruptcy law* (Federal Judicial center, The establishment of Bankruptcy Courts), passed in 1978 in USA. This law became the foundation of insolvency laws in other countries. Moreover it influenced European law, the EU council regulation number 1346/2000 includes many principles of the mentioned law. Therefore Czech Republic is also more or less influenced by American bankruptcy legislation. Nevertheless the insolvency legislation in Czech Republic is mostly adopted from Germany and its purpose is more social than economic. In Germany the insolvency law is being divided in two parts. First is the common part, which adjusts the whole process. The second part can be called special, which adjusts the processes that differs from those that are common. Among common processes belong bankruptcy proceedings, liquidation and the distribution of proceeds. Contrarily in the special part we find solutions such as bankruptcy plan, debt relief, consumer's bankruptcy proceedings and other small proceedings (Raban, P., 2002). Insolvency law (law number 182/2006 Sb.) is still pretty new in Czech Republic and our legislation system is still getting used to it. (Frelichová, K., 2008)

## **3 METHODOLOGY**

This part of the paper describes the process used to obtain all the necessary information that was fundamental for the research itself. All the data were acquired from the Czech Insolvency Register. All of the debtors were listed in the register under the Regional Court of Prague. The time period being analyzed was from the 1<sup>st</sup> of January 2012 until the 31<sup>st</sup> of December 2013

The research is established on 100% sample. In order to ensure truthful and accurate results some adjustments had to be made. Firstly the list of debtors was shortened by duplicating individuals. If the married couples applied for personal bankruptcy together, their debts were divided in half and counted as two individual debtors and as such analyze. Most of the debtors proposed for a debt relief many times which means that their previous proposals were unsuccessful. But they are included just once in this research and it was the last proposal for a

debt relief, they made before 31st of October 2014, which was used. Among the debtors were many who had business debts as well as personal debts however the business debts could not be taken into account for the purpose of this research. The reason for having analyzed every debtor in certain region is to know exact output of the structures among debtors. This research targets debtors in the region of the capital city of Prague. Therefore we are going to use results from first two regions we have researched to determine the minimum size of a sample for other regions in Czech Republic that will guarantee statistically very qualitatively similar results as a 100% sample. This reduction will allow us to analyze every region in shorter period of the time with high quality outputs guaranteed.

As it was mentioned the research is focused on a personal bankruptcy, therefore it had to be analyzed for what form of insolvency the debtors applied for. As a result if it was debt relief proposal, it was examined in any way. Either the proposal was successful for the first time, later or not at all. If the debtor made a proposal more than once, he was analyzed for further information whether he was successful afterwards and when he applied for the last time. To ensure that data acquired from other regions in the Czech Republic will be comparable in the future, only the proposals filed as the last one, but only until 31<sup>st</sup> of October 2014 were taken into account. If the last proposal was filed after this date, data were taken from previous one which corresponded to the reference period. Income of each debtor was analyzed and divided into three groups – gross earnings, social contributions (including gift covenants) and net earnings. Gross earnings were afterwards modified onto net earnings. Further in this text only net earnings were used. Every debtor was then screened for their level of education whether they achieved any university degree or not. Each debtor was also divided into one of the six groups which were determined on the basis of debtor's age. The range of each group is comparable with commonly used standards (e.g. CBCB, as). It is also very important to analyze the structure of creditors of each debtor. The creditors were divided into three different groups – Banking Institutions, Non-Banking Financial Institutions and Other (for instance insurance companies, state institutions or individuals). Decision whether it is a banking or non-banking was made on the basis of a List of Monetary Financial Institutions in the Czech Republic administrated by the Czech National Bank.

#### **4 RESEARCH**

The long term aim of the research is to analyze the structure of debtors that undergo the process of debt relief in period 2012 - 2013 in all regions of Bohemian lands. Moreover it is the aim to compare these results from every region among each other. However the aim of this article is to give detailed description of the results in the capital city of Prague in Czech Republic. This part analyses the structure of the personal bankrupt statistics for capital city region of Czech Republic. The capital city of Czech republic is Prague, which has over 1, 2 million inhabitants. This paper is focusing on data that can explain which groups of people fall under personal bankrupt and should help improve Czech system of debt relief. All outputs for this paper are measured only for region of Prague and may also tell a different story then other Czech regions, because Prague keeps higher standards of living and also there are many related differences like higher living costs and also different social needs. The research will be sorted in few parts, where our measurements will be presented and examined.

Our plan is to analyze all regions in Czech Republic and systematically figure out who tends to have trouble with repaying loans according to data such as age, university degree, amount of income, types of creditors, total debt and whether it was the proposal approved or not. So after the region of Prague will be done, we move to another region and do the same research. The first part of the research examines the amount of approved proposals and afterwards we

take closer look on these debtors. This is basic distribution of persons that apply for debt relief and only output is a number of persons, that we actually examine as is illustrated in Tab. 1. We do not search reasons that lead toward refusal of the debt relief proposal. However as we have found out, more than 17 per cent were refused for debt relief.

Tab. 1 - amount of approved/refused proposals. Source: Insolvency register, Based on own research of authors

Number of debt relief proposals	approved	refused
2084	1724	360

All debtors, who were approved for debt relief, were examined for types of their loans, more precisely for different types of creditors. There were established three groups of creditors, that can possibly lend money. These are “Banking institutions”, “Non-Banking financial institutions” and “Other”. All licensed banks fit up in the group of banking institutions, which is very easy to examine, because banking industry is heavily regulated. Among non-banking financial institutions we can find companies that specialize in loan’s industry, but they have not a banking license. The last group “Other” are subjects that do not make their primary business on loans, such as insurance companies, state institutions, regular non-financial companies, lawyers and basically all other subject that would not fit to our first two limited groups. Each debtor can loan money from each of these groups. In Tab. 2 we examine how many debtors have taken loans from 1, 2 or 3 groups that have been mentioned above. It is clear that most of the debtors have taken loans at least from two of our groups (95, 42%) and in very rare cases they owe money only to one group of creditors.

Tab. 2 - Indebtedness towards creditors. Source: Insolvency register, Based on own research of authors

Indebted to	Absolute number of debtors	Proportional amount
Only one group of creditors	79	4, 58%
Two groups of creditors	746	43, 27%
Three groups of creditors	899	52, 15%

It is also interesting to have a look which group of creditors is being chosen most often among debtors. It is important to realize that banking institutions require stricter conditions for approving a loan than non-banking financial institutions. So those debtors who are refused from banks usually end up taking loans from non-banking financial institutions, which demand significantly higher interest, because they are burdened by a greater credit risk represented by these debtors. Results that we can see in Tab. 3 shows that over 88% of all debtors are indebted to banking institutions. The same number we can recognize with non-banking financial institutions. Basically nine out of ten debtors that ask for the debt relief have taken loans from banks and the same applies for non-banking institutions. It often might be the higher interest that non-banking financial institutions demand, that in the end drags debtors into personal bankruptcy. The least frequent group of creditors among debtors is the widest group, that we call “Other”. It is really the biggest group of these three, because it

contains all kinds of companies, but they do not lend money as their major business. Therefore we can assume that it is harder for debtor to borrow money from these companies, as it is usually connected with some goods that have not been paid for or especially in Prague it is very common that people owe money for fines in public transportation and these can rise to significant amounts that also pull people into personal bankrupt.

Tab. 3 - Indebtedness toward each group of creditors. Source: Insolvency register, Based on own research of authors

Indebted to	Absolute number of debtors	Proportional amount
Banking institutions	1529	88, 69%
Non-banking financial institutions	1510	87, 59%
Other creditors	1229	71, 29%

Another part of our research represents a proportion of approved debt reliefs depending on certain age groups. Fig. 2 presents certain dependence of debtors that announced personal bankrupt on their age. It is expectable that youngest group of debtors between 15 and 24 years of age do not have enough time to build extensive debts. Because of that they cover only slightly over 1, 6% of all analyzed debtors. Our research indicates that as people get older they become more predisposed to fall into problems with indebtedness. The age groups 25 – 29 and 30 – 34 support this fact and it peaks for the age group between ages 35 and 44, where we can find over 30% of all debtors. This age group resulted as the greatest and therefore it seems that these people are the most susceptible to go bankrupt. The other research tells very similar story that the largest group is located between 30 and 39 years (Paseková, M., 2013) In contrast the older groups weaken in susceptibility to bankrupt and the amount of debtors located in last two groups show slow falling tendency. However they are still higher than first three groups. It is important to state that the oldest group does not have the upper age limit, which makes this group more significant every year according to the fact that the population is getting older.

Fig. 2 - Distribution of debtors according to their age. Source: Insolvency register, Based on own research of authors

The Fig. 3 shows the distribution of people who applied for personal bankruptcy in Prague. From the starting sample of 1 724 people there were 914 females and 810 males. The differential is 4% which indicates the form of equality between the genders. One can say that in society we live males usually take more risk than females. The result of this research negates this historical based fact and says that the male and female are almost equal according to their gender. These numbers collides with results of comparing research, which stated men to have a stronger predisposition to become over-indebted. We have not found such a result in Prague region.

Fig. 3 - Distribution of debtors according to their gender: Source: Insolvency register, Based on own research of authors

Fig. 4 and Fig. 5 demonstrate the distribution of debtors according to the age compared to their gender. There are no significant differences between genders. These two figures are related to the Fig. 3 which says that the structure of debtors compared just to their gender is

almost same. In the city of Prague it is possible to argue that females are relatively older than male which is stated mainly in group 45 – 54.

Fig. 4 - Distribution of female debtors according to their age: Source: Insolvency register, Based on own research of authors

Fig. 5 - Distribution of male debtors according to their age. Source: Insolvency register, Based on own research of authors

In many articles a person can read about problems connected to indebtedness and also that personal bankruptcies do have negative effect on society. Our research uncovers that there is extreme significance between university degree and amount of debtors that have achieved such a level of “standardized intelligence”. Fig. 6 indicates this strong dependence between having a university degree and a probability of falling into personal bankrupt. Only little bit over 3% of researched debtors in Prague have achieved a university degree (at least bachelor’s degree). This number can be assumed as higher than in the rest of the country, because Prague is attractive for job opportunities and most of universities in Czech Republic

are located here. Moreover this strengthens the fact that people with the university degree are less often found under problems with repaying loans. It is also necessary to mention, that Czech Republic is one of the few countries that provide university studies for free and its quality cannot be considered significantly worse in comparison with certain universities abroad. This means that people in Czech Republic do not have to take loans for university studies as this seems absolutely common abroad, especially in western countries. Therefore this number of personal bankruptcies in western countries might reach higher figures than only few percents for university's graduates.

Fig. 6 - Distribution of debtors according to their level of education. Source: Insolvency register, Based on own research of authors

One of the most important things during approving the proposal for debt relief is the amount of the total debt that a person has to repay. The probability of approving a debt relief proposal is closely related to the size of the total debt. As our results in Fig. 7 implicates, there is just few approved debtors that owe more than 2 millions Czech crowns. On the other end, not many debtors have to ask for a debt relief when they owe less than 200 thousands Czech crowns. Even an under-average income should cover low debts, so the court does not often approve these low-debt proposals.

Therefore we can see that two most frequent groups of debtors that fall into troubles with indebtedness are people with total debts starting from 200 thousands CZK to 1 million CZK. This shows a little difference from research of M. Paseková, where the largest group was indebted between 300 and 600 thousands CZK. These debtors cover almost three fourths of all debtors that we have analyzed and it seems that these debts are most often considered as hardly repayable with an average income and the only possibility for these individuals to get rid of these debts is to declare personal bankrupt. We also plan to look for the relationship between the net income and the amount of total debt, where we expect that people with higher income might have a chance to indebt themselves more before they are forced to ask for debt relief approval. This will be presented in the widened part of this research.

Fig. 7 - Distribution of debtors according to their amount of total debt. Source: Insolvency register, Based on own research of authors

## 5 CONCLUSION

The results of the research show many interesting outcomes. We can assume that there is often strong dependence on certain variables like age of debtors, achieving a university degree or the total amount of the debt. All these results show which groups do most often become debtors and have to be asking for debt relief through personal bankruptcy. The research indicates that not either the youngest or oldest groups become indebted in such an extent. It is the group around 40s and 50s that have troubles with repaying their loans. Also very interesting output is, that the most common debtor announce personal bankruptcy before the total debt reaches one million CZK, but it is mostly higher than 200 thousands CZK. By comparing results with the research from Moravian-Silesian region, we have discovered few differences in age distribution, gender and total debt among debtors. These differences might be caused by analyzing different region or by changes in the structure among debtors during the time. Moreover the 100% sample also guarantee higher output quality compared to the other research that analyzed only 114 persons, whereas our research have searched through more than 1700 persons. To conclude we also need to mention the groups of creditors that we have searched through and we exposed the fact that almost every debtor in Prague is indebted to more than one of these three groups.

## **MUTUAL RELATIONSHIPS OF STOCK MARKETS: EXAMPLE FROM CENTRAL EUROPEAN STOCK MARKETS**

*Petr Sed'a, Juan Antonio Jimber del Río*

### **Abstract**

In recent years, an extensive literature has been developed on studying mutual relationships of financial markets. Recent period of global financial crisis and subsequent debt crisis caused some changes in integration of financial markets worldwide. Previous researches completed in this area were focused mainly on stock markets of new EU member countries and their integration with global markets or/and the Eurozone area. One of the most challenging problems is to analyse also integration among new EU member countries. Therefore, this paper deals with mutual interactions among stock markets of Central Europe Economies (CEE), the Euro area and global stock market in the period of 2007-2013 years. For the purpose of this paper the methods of vector autoregression and variance decomposition will be utilized. An impact of events from global market was clearly observable during the global financial crisis of 2008-2009 years. With regard to integration of CEE stock markets with leading global markets, the hypothesis that CEE stock markets are rather affected by the U.S. stock market than the Eurozone area cannot be rejected. The CEE stock markets are treated as homogeneous region during the global financial crisis period since negative shocks on one market affected development of other markets. In post-crisis period, the degree of integration rapidly decreased as proven by empirical findings.

*Keywords: global financial crisis, Granger causality, integration, VAR model, variance decomposition*

### **1 INTRODUCTION**

21<sup>st</sup> century can be considered as the epoch of information (see Suchacek, Sed'a, Friedrich & Koutsky, 2014). In latest decades, the Asian financial crisis in 1997 and especially the global financial crisis of 2008-2009 years can be referred as crisis that had the deepest impact on financial markets worldwide. Subprime crisis happened in USA in 2007 first, later on it developed to overall financial crisis and permeated to the whole world. The collapse of Lehman Brothers, a sprawling global bank, in September 2008 almost brought down the world's financial system. During this period, large movements in asset prices and related volatility complicated estimation of financial models in general. These crises dramatically influenced the market stability and investors' decision making in many ways (see Sed'a, 2012).

National stock markets may be logically influenced by events in foreign markets which may lead to the spread of financial contagion from one national economy to another (see Sed'a, 2013). High rate of integration among stock markets logically contributes to higher degree of transmission of shocks. Mutual relationships of stock markets therefore plays key role concerning the overall stability of the economy, as proved especially during period of recent global financial crisis and successive debt crisis and economic stagnation.

Therefore, it is obvious that mutual interrelations among stock markets plays important role also for new EU member states in Central Europe that include Czech Republic, Hungary and

Poland. These countries belong to open economies that strongly depend on foreign capital resources. Thus, potential financial contagion may spill over relatively quickly in these economies as happened during global financial crisis of 2008-2009 years.

The studies conducted in this paper may be described as follows. Section 2 is devoted to some theoretical aspects of financial integration and literature review. In Section 3, econometric methods utilized in this paper will be described, followed by Section 4 that is devoted to data samples used for the purpose of this paper. Empirical results and discussion are provided in Section 5. First, mutual interconnections will be investigated with a help of vector autoregression model. This model is then used to explore causality in Granger sense, followed by variance decomposition approach. Section 6 concludes this paper.

## **2 SOME THEORETICAL ASPECTS OF FINANCIAL INTEGRATION**

While research on the relationship of financial integration and globalization is relatively numerous, the implications of financial integration for financial stability and vice versa remain largely unexplored and less distinct topic. Abating financial crisis has greatly increased the interest of economists and regulators in the relationship between financial integration and financial stability in depth. The question whether financial integration support financial stability or contribute to financial instability, respectively whether financial instability affects financial integration, can be considered as crucial.

Process of globalization represents a factor that significantly affected development of financial markets. Therefore, one of the consequences of globalization of the world economy can be considered the process of integration of national capital markets. Deregulation and new legislation removes barriers to flow of financial funds and thus contributes to the integration of financial markets. The benefits of integration include efficient allocation of capital, because market agents can exploit the cheapest resources and excess capital can be allocated to productive opportunities. Efficient allocation of financial resources is also linked with economic growth. To summarize, integration of markets increases competition, leads to easier access to varied financial products and supports risk diversification. On the other hand, it increases the ability of outflow of huge volume of capital from respective country in a relatively short period of time. In addition to this, it creates a risk of disease transmission of financial crises from one market to another.

Highly integrated market, on the contrary does not contribute to financial stability if the system is not sufficiently robust and flexible to shocks like contagion or systemic risk. If financial institutions get themselves into trouble, they can undoubtedly contribute to financial instability of the economy. Moreover, an extensive development of financial innovations also helped to the process of financial integration.

Considering the importance of interconnection of capital markets for the stability of the economy the European Central Bank examined possible ways how it would be possible to measure the integration of the Eurozone area markets. Baele, Ferrando, Hördahl, Krylova, and Monnet (2004) examined the degree of market integration of the Eurozone area using yield differentials, dispersions of equity indices, regression analysis and quantitative factors, being able to demonstrate that integration is gradually increasing and the introduction of the Euro currency has strengthened this trend. This methodology have also been adapted Czech National Bank (CNB) which regularly publishes analyzes of degree of economic alignment of the Czech Republic with the Eurozone area.

The problem of integration with global capital markets connotes indeed very important task for central banks, especially if respective country use own currency. CNB (2012) stressed that

degree of integration of financial markets of new EU countries and the Eurozone area exhibited growth with relatively high speed of reaction on events that happened in the Eurozone from 2004. However, the global financial crisis caused a temporarily divergence of stock markets. A little bit different results were observed by Babetskii, Komárek, and Komárková (2010) who showed that a process of integration of new EU member countries with the Eurozone market amplifies and continues even in the period of the global financial crisis.

Cappiello, Gérard, Kadareja, and Manganelli (2006) concluded that stock markets of new EU members are increasingly influenced by common factors. However, although the significance of events in Eurozone markets grows, most variability is a result of global events. They divided new EU members into two groups: those that are integrated with the Eurozone area and also with global market, and those that are integrated just with the Eurozone market. More developed markets like Czech Republic, Poland and Hungary are then strongly synchronized, both among themselves and with the Eurozone area.

Babetskii, Komárek, and Komárková (2007) investigated selected aspects of financial integration in the Czech Republic, Hungary, Poland and Slovakia. The objective of their paper was to test for the existence and analyse the dynamics of integration in the stock exchange markets using  $\beta$ -convergence and  $\gamma$ -convergence.

Égerd and Kočenda (2007) found out that mutual relationships among new EU countries and developed countries are correlated only weakly when using intraday data. Baltzer, Cappiello, De Santis, and Manganelli (2007) observed that integration of financial markets of new EU member countries and the Eurozone area grew since 2004. However, political and economic events in the USA were still more important.

Voronkova (2004) and Calin-Vlad (2011) tested rate of integration of the CEE markets with the Euro area with a help of yield differentials, dispersions of stock indices, regression analysis and also other quantitative methods. They concluded that mutual integration rapidly increased. Moreover, an introduction of the Euro currency has significantly strengthened this trend.

Chaloupka (2012) reported in his relatively detailed study that new EU countries are perceived by investors rather as separate Eastern Europe area than a part of the European Union. When the global financial crisis appeared, the CEE stock markets are in general treated as one homogeneous region because negative information from one capital market significantly affects development on other markets. To sum up, a degree of mutual relationships of stock markets of new EU member countries with global market and the Euro area market was growing. Nevertheless, in some markets there are still very important also local events.

Syllignakis and Kouretas (2011) applied in their analysis dynamic correlation model. They found that correlations among Central and Eastern European markets are closely linked to market volatility. When volatility increases correlation among markets tend to be higher so that possible benefits from diversification are diminishing. Similar methodology was used by Baumöhl and Lyócsa (2014). They concluded that integration process of CEE emerging stock markets has graduated over time.

To sum up, the review of the literature indicates the fact that results of authors often differ. It is caused because of using different sample data, different frequencies of data and different analytical methods and approaches.

The goal of this paper is to estimate, describe, compare and interpret mutual relationships among new EU member states in Central Europe, namely Czech Republic, Poland and

Hungary, global financial market represented by the U.S. stock market and British stock market, and the Eurozone stock market approximated by German stock market during the period of 2007-2012 years.

### 3 METHODOLOGY

In view of the stated goal of this paper as given in Section 2, basic research hypothesis have been formulated as follows:

$H_1$ : CEE stock markets are rather affected by the U.S. stock market than the Eurozone area.

In order to test this hypothesis, it is necessary choose the appropriate methods. Therefore, the aim of this section is to describe methods that will be utilized for econometric analysis of mutual relationships among CEE stock markets, global stock markets and the Eurozone area. It includes the methods of vector autoregression model and Granger causality testing, followed by variance decomposition.

#### 3.1 VAR model and Granger causality

Vector autoregression model (VAR) can be characterized as a kind of generalized univariate autoregression process (see Lütkepohl, 2005). The VAR approach is commonly utilized for forecasting systems of mutually related time series, and also for analysis of dynamic impact of random disturbances on a system of variables. The VAR model avoids the need for structural modeling by taking into consideration every endogenous variable in the system in terms of functions of lagged values of all endogenous variables that are included in the system. For instance, the VAR(1) model when having two variables is given by:

$$\begin{aligned} Y_{c1,t} &= \alpha_1 + \beta_1 Y_{c1,t-1} + \gamma_1 Y_{c2,t-1} + \varepsilon_{1t}, \\ Y_{c2,t} &= \alpha_2 + \beta_2 Y_{c2,t-1} + \gamma_2 Y_{c1,t-1} + \varepsilon_{2t}, \end{aligned} \quad (1)$$

where  $Y_{c1,t}$  denotes returns of country  $c1$  at time  $t$  while  $Y_{c2,t}$  represents returns of country  $c2$  at time  $t$ ,  $\varepsilon_{1t}$ ,  $\varepsilon_{2t}$  are random terms.

The VAR model also represents relatively useful tool that allows investigate causality among stationary variables using the Granger test relatively easily (see Granger, 1969). The Granger approach to the question of whether  $Y_{c1}$  causes  $Y_{c2}$  is to see how much of the current  $Y_{c2}$  can be explained by past values of  $Y_{c1}$  and then to see whether adding lagged values of  $Y_{c1}$  can improve the explanation.  $Y_{c2}$  is said to be Granger-caused by  $Y_{c1}$  if helps in the prediction of  $Y_{c2}$ , or equivalently if the coefficients on the lagged  $Y_{c1}$  are statistically significant. Note that two-way causation is frequently the case;  $Y_{c1}$  Granger causes  $Y_{c2}$  and  $Y_{c2}$  Granger causes  $Y_{c1}$ .

It is important to note that the statement " $Y_{c1}$  Granger causes  $Y_{c2}$ " does not imply that  $Y_{c2}$  is the effect or the result of  $Y_{c1}$ . Granger causality measures precedence and information content but does not by itself indicate causality in the more common use of the term.

Any lagged values of one of variables is hold in the regression model if it is significant according to  $t$ -test and the other lagged values of the variable jointly add explanatory power to the model according to  $F$ -test. Then the null hypothesis of no Granger causality is not rejected if and only if no lagged values of an explanatory variable have been hold in the regression, (see Granger, 1969).

### **3.2 Variance decomposition**

The variance decomposition is useful approach when evaluating how shocks reverberate through a system. In other words, it is useful tool to assess the pass-through of external shocks to each economic variable (see Chaloupka, 2012).

Let's explain the sense of variance decomposition more precisely. VAR models itself concentrate on shocks. The structural form of the VAR model can then be conveniently described by either the impulse response functions or the variance decomposition. While impulse response functions trace the effects of a shock to one endogenous variable on to the other variables included in the VAR model, variance decomposition separates the variation in an endogenous variable into the component shocks to the VAR model. Thus, the variance decomposition provides information about the relative importance of each random innovation in affecting the variables in the VAR model. The variance decomposition based on the Cholesky factor may change significantly if you change the ordering of the variables in the VAR model.

To sum up, the variance decomposition approach evaluates the importance of different shocks by determining the relative share of variance that each structural shock contributes to the total variance of each variable. The decomposition of variance may be used especially when we are dealing with dynamic stochastic system. Stochastic system means a random value process.

For the purpose of this paper, the variance decomposition will be displayed in the form of figures. The combined response graphs option represents the decomposition of each forecast variance as line graphs measuring the relative importance of each innovation.

## **4 DATA DESCRIPTION**

In this paper, an empirical analysis will be applied on daily data of the CEE stock markets, namely in Czech Republic, Poland and Hungary, and developed markets, in particular USA, Great Britain and Germany. We used daily data of 2007 – 2013 years. It includes total of 1735 observations. This period was chosen intentionally. Our aim is to analyse changes of equity markets relationships during time emphasizing a comparison of mutual relationships in the time during and after the global financial crisis of 2008-2009 years.

Thus, the basic testing period of 2007-2013 years was divided into two basic testing periods. The crisis period of financial instability started at the beginning of July 2007 when first problems with Lehman Brothers Holding appeared and finished by March 2009 when US stock market bounced from the minimum values. Post-crisis period, that is typical by economic stagnation and debt crisis, was defined from April 2009 to December of 2013.

For the purpose of this paper, we utilized major stock indexes of respective CEE in terms of approximation of events on national markets, namely PX for Czech Republic, WIG20 for Poland and BUX in case of Hungary. Developments of all CEE stock indexes are illustrated in Fig. 1.

As a benchmark portfolio for the Euro area was selected German index DAX30 as a representative of the biggest economy in the Eurozone region while British index FTSE100 represents events on the biggest European stock market. The development of the DJTI index was chosen as an approximation of events in global stock market. We have nearly 7 years long time series of daily closing rates of respective stock indexes.

Fig. 1 – Development of BUX, PX and WIG 20 indexes. Source: own calculations in Eviews

Daily data are indeed more volatile than weekly or monthly data. For daily frequency of sampling the stylized features are well known (see Arlt & Arltová, 2003). Daily data samples contain more information that is crucial for mutual relationships among analyzed variables. In other words, some information can be lost through aggregation. Using daily data has some advantages. Firstly, financial markets are able to react to new information much faster than other markets. Secondly, daily data are observed without measurement errors and are not subject to later review.

In addition, we need to work with stationary data to be able to meet with the goals of this paper. Basic way of changing the data from non-stationary financial time series to stationary data is to create a time series of daily returns and continue using the time series of daily returns in all following calculations. The following inference into logarithmic returns confirms stationarity of the daily return time series:

$$r_t = \ln(1 + R_t) = \ln \frac{P_t}{P_{t-1}} = \ln(P_t) - \ln(P_{t-1}), \quad (2)$$

where  $r_t$  represents the absolute increment of logarithmic price and is called logarithmic return. Tab. 1 shows several descriptive statistics for all stock returns.

Tab. 1 – Descriptive statistics. Source: own calculations in Eviews

Index	Mean	Standard deviation	Skewness	Kurtosis	<i>J-B test</i>
<i>Crisis period</i>					
<i>CZ</i>	-0.00246	0.02512	-0.39388	12.10448	1492.7790
<i>POL</i>	-0.00222	0.02176	-0.21868	4.70664	55.4824
<i>HUN</i>	-0.00259	0.02325	-0.13316	10.16916	919.9856
<i>USA</i>	-0.00190	0.02239	-0.16184	7.38068	344.9002
<i>GER</i>	-0.00185	0.02059	-0.46537	9.10886	682.5470
<i>GB</i>	-0.00149	0.02064	0.05052	6.93299	276.6804
<i>Post-crisis period</i>					
<i>CZ</i>	0.00056	0.01520	-0.04394	5.70858	239.9079
<i>POL</i>	0.00057	0.01582	-0.02337	5.41427	190.4755
<i>HUN</i>	0.00081	0.01841	-0.25157	5.18019	163.5416
<i>USA</i>	0.00092	0.01352	-0.10653	6.39383	377.7391
<i>GER</i>	0.00079	0.01506	-0.14181	4.92623	123.8331
<i>GB</i>	0.00065	0.01209	-0.02877	4.66354	90.5087

The means of all sample returns are quite small, in crisis period reached only negative values while in post-crisis period are always positive. Values of standard deviations are significantly higher, especially in crisis period due to higher volatility. On the basis of the values of skewness, high kurtosis and *J-B* test of normality it can be concluded that all daily return series show mostly leptokurtic distribution with higher peak and heavy tail, compared with normal distribution.

## 5 EMPIRICAL RESULTS AND DISCUSSION

In this section, empirical results and findings will be presented and discussed. The studies will be summarized as described in the Introduction section. In other words, all the methods defined in Section 3 will be used for empirical analysis.

### 5.1 VAR model and Granger causality

Results of estimated VAR(10) model for the crisis period of 2007-2009 years are presented in Tab. 2, while estimation of VAR(6) model for the post-crisis period is shown in Tab. 3. Order of delay in VAR models was specified using the Akaike information criterion (AIC) and both VAR models were estimated with a help of Huber-White estimator (HC1). Therefore, standard errors are expected to be robust to heteroscedasticity. Because of limited extent of this paper there are presented just those parameters that are significant at least at the 10% significance level.

Adj. $R^2$	0.384		0.241		0.298	
<i>F</i> -stat.	6.691		3.399		4.545	
<i>p</i> -value	0.000		0.000		0.000	

In the period of global financial crisis, all CEE indexes are included in all equations of estimated VAR model in terms of independent variables with exception of Polish market that is affected just by Czech and Hungarian innovations. Our findings indicate quite significant coherence of CEE stock markets. German stock index DAX30 belongs to significant independent variables only in a few cases. The same is true for British index FTSE100. On

the other hand, innovations that happened in the U.S. stock market are imported to all CEE stock markets. One day lagged DJTI returns are always statistically significant. In addition to this, estimated coefficients reached the highest values. If we consider the values of adjusted  $R^2$  it can be concluded that estimated VAR(10) model can explain 38% (CZ), 24% (POL), respectively 30% (HUN) of variability of returns.

It is worth to notice that especially 2- and 4-days lagged values of Czech stock index PX plays surprisingly important role for all CEE markets. We can even say that shock from Czech Republic affects other market in Granger sense. As a possible explanation of this phenomenon one can consider the fact that investors tend to perceive group of countries in the CEE region as one entity since all CEE were hit by crisis significantly. It may be caused especially because of their pro-export oriented economies and/or big losses caused by falling of their national currencies. The fact that investors can perceive negative shocks more than positive ones may deliver another explanation.

Empirical results would confirm the hypothesis  $H_1$  that the CEE markets are rather integrated with global stock market represented by U.S. stock index DJTI. It can be also said that the CEE markets are integrated more with other CEE markets than the Eurozone area or British stock market.

Results of VAR(6) model that applied data from post-crisis period differs significantly from those achieved by VAR(10) model in crisis period. In post-crisis period, the most important independent variables were mainly the CEE lagged returns complemented by lagged values of the DJTI index. German and British markets become practically insignificant. It is worth to note that estimated parameters of returns from U.S. market reached the highest values. In addition to this, they were always positive while parameters representing DAX 30 and FTSE 100 indexes influenced all CEE markets in negative way.

Tab. 3 – Estimation of VAR(6) model for the post-crisis period. Source: own calculations in Eviews

	<i>CZ</i>		<i>POL</i>		<i>HUN</i>	
Regres.	CZ_1	-0.137**	CZ_1	-0.107**	POL_2	-0.142**
	POL_2	-0.113**	POL_2	-0.199***	HUN_6	-0.108***
	GER_2	-0.189***	POL_5	-0.137***	GB_1	-0.252**
	GB_1	-0.191**	HUN_5	0.121***	USA_1	0.308***
	USA_1	0.414***	GER_2	-0.181**	USA_2	0.281***
	USA_2	0.284***	GB_1	-0.288***		
			USA_1	0.363***		
			USA_2	0.340***		
			USA_4	0.138**		
Adj. $R^2$	0.159		0.124		0.085	
<i>F</i> -stat.	3.315		2.478		1.626	
<i>p</i> -value	0.000		0.000		0.067	

Notable is also the fact that values of adjusted  $R^2$  decreased significantly in post-crisis period comparing with previous years of financial turbulence. In post-crisis period, we can still confirm relatively high coherence of the CEE markets even though values of adjusted  $R^2$  decreased. Estimated VAR(6) model was able to explain only redundant share of variability. It seems that other factors were probably more important for development of the CEE return series.

On the basis of estimated VAR models it can be concluded that developments in other markets became more important for the development of Polish returns in crisis period since nearly 25% of the variability in returns can be explained by events on foreign markets only. On the other hand, Czech and Hungarian markets were affected also by domestic events. Moreover, the values of adjusted  $R^2$  reached higher values, namely 38%, respectively 30%.

Although we applied the HC1 estimator when estimating both VAR models, it is necessary to test residuals for autocorrelation, normality and stationarity. When testing autocorrelation, standard Ljung-Box test was used to test significance of  $k$ -th comprehensive autocorrelations. The null hypothesis of no autocorrelation in residual component cannot be rejected. Normality of residual series was tested again with a help of Jarque-Bera test. The null hypothesis of normal distribution can be clearly rejected for all residual series since  $J-B$  test statistic falls into critical field.

It is also clear that the estimated VAR models are stationary. Both inverse roots of autoregressive polynomials in both periods lie within the unit circle in the complex plane, as can be proved by Fig. 2.

Fig. 2 – Inverse roots of VAR models. Source: own calculations in Eviews

As it has been already mentioned in subsection 3.1, estimated VAR models can be also used to test the Granger causality when using the overall  $F$ -test and partial  $t$ -tests. Results given in Tab. 2 and Tab. 3 implies that according overall values of  $F$ -test of estimated VAR models the null hypothesis of absence of Granger causality can be rejected at the 5% significance level for all CEE countries. The only exception is Hungarian market in post-crisis period. Granger causality tests were applied also separately for all pairs of indexes and both periods. We achieved entirely same results.

Empirical analysis completed in this paper suggests that the CEE stock markets were quite well synchronized in the period of global financial crisis. In other words, all CEE stock markets followed common trend during the period of financial instability. On the other hand, development of the CEE stock markets became less affected by innovations from other markets in the periods of economic stagnation after March 2009.

In the period of global financial crisis it is also worth mentioning the fact that especially development of Czech stock market played significant role for development of other CEE

stock markets comparing with other CEE markets. In other words, events in Czech market are important factor for changes in all CEE stock markets.

To conclude, our results suggest that after an outbreak of the global financial crisis we observed greater spillover of shocks across the CEE markets. This idea corresponds with an assumption of high sensitivity of investors to new information which can lead to herd behavior.

If we consider mutual relationships of the CEE markets with global stock market and the Eurozone stock markets it can be summarized that these markets are rather influenced by the US stock market than the Eurozone area instead. Innovations coming from USA played more important role than innovations coming from the Eurozone area. This fact is more significant in the period of global financial crisis but it is important also in post-crisis period so that the basic research hypothesis  $H_1$  cannot be rejected.

This finding is not surprising since USA is still the most important economy in the world, and their financial market disposes of the largest market capitalization. Therefore, it is logical to assume that negative innovations can be easily transferred to other markets as a result of globalization process.

## 5.2 Variance decomposition

When having estimated VAR model, further step of our analysis is to provide variance decomposition analysis as described in subsection 2.2. Variance decomposition is a tool that decomposes variance of endogenous variable into component shocks to the VAR model. This approach provides information about relative importance of each random innovation that affects variables in VAR model.

If we look on estimated values of coefficients of determination of VAR(6) model were very low for all indexes. That is why the variance decomposition analysis was carried out just for the data covering the period of global financial crisis. Fig. 3 shows variance decomposition for all CEE stock markets, namely PX, BUX and WIG20 indices. Results differ significantly for each investigated CEE stock market.

Fig. 3 – Variance decomposition for PX, BUX and WIG20 indexes (2007-2009). Source: own calculations in Eviews

Fig. 3 shows that the proportion of variability of unexpected differences in profitability of index that can be explained by new information from domestic market is about 60-75% in Czech Republic and about 55-70% in Hungary. This finding implies that local events are still crucial for development of domestic stock markets, even though transfer of information and

capital became relatively easy and fast in recent years. Interesting is also a fact that 20-30% of proportion of variability of Hungarian index can be attributed by innovations from Czech market.

The proportion of variability that can be explained by domestic factors is only about 40-50% in Poland. Nevertheless, more than half of variability can be attributed to external events which correspond to the hypothesis of high capital mobility. The highest proportion is again attributed to Czech market.

To sum up, the most important stock market that caused a relatively high proportion of variability in other CEE markets is Czech Republic. Information from other markets, including USA, Great Britain and the Eurozone area, are not so important for explanation of variability in returns of the CEE stock markets in crisis period.

## 6 CONCLUSIONS

Previous literature dealing with mutual relationships among new EU member stock markets concluded that the degree of their interdependence with the global stock market is gradually growing. The aim of this paper was to estimate, describe, compare and interpret mutual relationships among new EU member states in Central Europe, global financial market, and the Eurozone stock market during the period of 2007-2012 years. For the purpose of this paper the methods vector autoregression, Granger causality testing and variance decomposition were applied.

On the basis of empirical results it can be stated that the basic research hypothesis  $H_1$  that CEE stock markets are rather affected by the U.S. stock market than the Eurozone area cannot be rejected. Furthermore, empirical analysis completed in this paper indicated that recent period of global financial crisis of 2008-2009 years and subsequent debt crisis changed a system of mutual relationships among the CEE stock markets, the Eurozone and US stock market considerably. During term of financial instability developments of the CEE stock markets became more synchronized since events on other CEE markets played more significant role on national markets. The CEE stock markets can be treated as homogeneous region.

## **MEASURING THE PERFORMANCE OF CLUSTERS**

*Hana Scholleová*

### **Abstract**

This article aims at solving the problem of measurability of the success of clusters as a whole. The cluster has long been associated group of companies which have the ability to realize the benefits of this merger. The prerequisite is a combination of suitable companies that develop themselves and that are oriented cooperatively and innovatively. There are many doubts whether the clusters are a modern form groups that thanks to the support of institutions can obtain a number of subsidy program or indeed expanding form of cooperation. To dispel those doubts, it is necessary that the performance of clusters as such was measurable. The problem of measurability of performance of individual companies is handled by financial and market benchmarks, which are oriented in the short term. Similarly is also measured the performance of companies in the cluster or aggregate performance cluster. This, however, has defined a four-layer structure, and each level has a different role, objectives and thus ways to measure effectiveness. This article focuses on the hard scale and evaluation focuses mainly on the core of the cluster, because the core is the most important part of the cluster.

*Keywords: cluster, measurement of efficiency, indicators of strategic cooperation*

JEL Classification: O31, O32, M21

### **1 INTRODUCTION**

Cluster is defined as a group of the same or similar elements gathered or occurring closely together; a bunch. Business cluster was introduced and popularized by Michael Porter (1998), who saw clusters potential by increasing the productivity of the companies in the cluster, by driving innovation in the field, and by stimulating new businesses. If it all is true, that clusters are more effective in operating and also in strategic way, we can propose, that it is possible to measure the rate of efficiency. All of them effect from synergy and value of synergy is the same as the value of cluster.

Cluster can be defined as geographically close groups of interconnected companies and associated institutions in a particular field, linked by common technologies and skills. They normally exist within a geographic area where ease of communication, logistics and personal interaction is possible. Clusters are normally concentrated in regions and sometimes in a single town. (Porter, 1998) Another definition characterizes clusters as networks of production of strongly interdependent firms (including specialized suppliers), knowledge producing agents (universities, research institutes, engineering companies), bridging institutions (brokers, consultants) and customers, linked to each other in a value-adding production chain (OECD, 2009). The European Union (European Commission, 2003) defines cluster as “a mode of organization of the productive system, characterized by a geographical concentration of economic actors and other organizations, specialized in a common field of activity, developing inter-relations of a market and non-market nature, and contributing to the innovation and competitiveness of its members and the territory”. Porter means that through the interaction in a cluster the firms are able to produce goods with a higher value than average enterprises and sectors. (Porter, 1998). There is not a sharp distinction between corporate networks and strategic alliances - in both cases, this is a free enterprise

collaboration partnership (Pavelková, 2009). In enterprise networks, cooperation is usually bound in a separate agreement but it is a more equal relationship partnership.

The major external benefits for firms in the cluster (Czechinvest, 2005):

- easier availability of skilled staff,
- specialization and greater collaboration with suppliers,
- attracting customers, mutual reference,
- new and faster flow of information and innovation.

Clusters are a catalyst for the development of innovation and innovation is one of the building blocks of national competitiveness (Nečadová, 2013). Increasing the potential competitiveness is one of the reasons cluster support policies from the state.

The cluster concept is often questioned. Martin and Sunley (2003) are skeptical, because “the cluster concept should carry a public policy health warning”. Government intervention caused, that “cluster initiatives have become a ‘magic recipe’ to meet the challenges of the new economy, to the point that they have become dangerously fashionable” (Andersson et al., 2004). Ultimately, whether the cluster concept is useful, whether cluster development is possible, or whether government intervention is warranted, are matters for evaluation. It is possible to evaluate only the aspects that are measurable. There exist a number of experiments to systemize individual elements of clusters and measure their performance. At the same time the others (Solvell, Linquist and Ketels, 2003) point out that the quantitative measures often use inappropriate data, and the qualitative ones often result in ambiguous outputs. As with any investment, particularly involving public funds, there is having, or will have, net positive benefits. Unfortunately, there is a scarcity of comprehensive evaluations of clusters, and cluster benefits are still often taken for granted rather than systematically documented (Andersson et al., 2004).

### **1.1 Structure of cluster**

We can provide (Czechinvest, 2005) a well-built cluster layers: core, complement, soft infrastructure and hard infrastructure. Core consists of companies whose revenues come mostly from the external environment - outside the cluster (environment in terms of micro and macro economic conditions). Complements are the company's subsidiary, suppliers for companies in the nucleus. In relation to cluster are the so-called soft infrastructure companies which are knowledge delivering organizations, R & D and to this belongs hard infrastructure which is distributing road, telecommunications, waste management. The fourth layer in the cluster is often missing. Each layer of the cluster has specific goals and objectives, and should use specific indicators of success. Interrelations and external links of clusters on a global scale can increase the competitiveness and innovation of firms within the cluster. (Wolfe et al., 2005).

### **1.2 Preconditions success of cluster**

The basis for long-term prosperity of the cluster is at its core. Ideally compiled core of the cluster should be compact, connected, non-competitive, but cooperative, homogeneous. The work of nuclei can be continuously measured and improved. Ways to improve are two - internally can be improved relationships between companies and externally can expand the cluster of other companies, which will improve its core.

### 1.3 Life cycle of cluster

Similarly to companies, even clusters possess a life-cycle. Cassidy et al. (2005) classifies individual phases of development depending on the rate of cluster activity as latent, developing, established and transformational (see fig. 1).

Fig. 1 – Cluster Lifecycle. Source: Cassidy et al. (2005)

## 2 MEASUREMENT OF CLUSTER EFFICIENCY

Tools that measure the efficiency of clusters are difficult to apply or are not sufficiently developed. The aim of this paper is to create appropriate indicators for evaluating the success of the cluster. We show problems and evaluate the effectiveness of a particular cluster. For creating efficiency indicators will be used basic methodology for financial analysis. To evaluate the homogeneity of the cluster will use statistical tool. Net benefit of the cluster will be evaluated by an index, which will be formulated based on the correction of composite indices of growth of aggregate inputs.

### 2.1 Factors of cluster's success and its criteria

The question was: When companies improve over time and are also better than the average company in the industry, does that mean the cluster is successful? And how successful is it?

The success of the cluster, can be measured with these indicators

- hard
  - financial - financial indicators such as profit, ROE, EVA, Assets Turnover, growth of revenues...
  - non-financial - market shares, the share of innovative products, the number of patent ...
- soft
  - quality of products, environment indicators – they are harder to measure, but oriented in the long term.

Success can be measured in several layers

- The success of individual companies

- The success of the cluster where it is inappropriate to treat businesses layers
  - the core layer
  - the closely cooperating entities - suppliers in B2B customers, complements,
  - and other companies.

## **2.2 Efficiency measurement for supported clusters**

Andersen et al. (2006) define four steps to cluster evaluation in case of supported clusters:

(1) Identify and measure key economic outcome

(2) Identify drivers of outcome

We take at first the four growth drivers developed by OECD (2001): human resources, knowledge building and entrepreneurship. Some indicators of cluster performance can be derived from hard data (statistics). Other indicators of cluster performance can only be examined with more qualitative data collection methods such as surveys.

(3) Identify the framework conditions which have an impact on cluster performance and cluster outcome

Understanding the conditions that drive cluster performance will help policy - makers in formulating more effective measures supporting clusters to innovate.

4) Examine 'top performing cases' in detail

A sufficient level of knowledge of political instruments can only be determined through in-depth peer reviews of particular policy areas of the best-performing clusters to understand how and why particular policy instruments work.

## **3 MEASUREMENT ACCORDING TO STAGE OF THE LIFE CYCLE OF CLUSTER**

Experts say (Pavelkova et al., 2013) that clusters are going through life stages and therefore the ways of measuring success is good to develop depending on the stage, in which the cluster is located. At all stages is to evaluate companies as to individual subjects. But it is also good to distinguish effects that bring its own involvement in the cluster.

This article focuses on the evaluation of the core of cluster.

### **3.1 Measures for beginning phases – latent and developing**

In the first phase of the lifecycle of the cluster can then be quantified for each important indicator of corporate Net Cluster Efficiency (abbreviated NCE). NCE can be applied to various indicators of business success. The advantage is that each company can compute cluster NCE just for these indicators that are important to it.

We can use some indices of growth indicators, which is important for the development of the company, such as sales growth (Sales Index), but it can be also used for relative indicators also (for example for ROE). The growth of the cluster development involved the macroeconomic situation, the industry, but also the position of firms in the sector, and finally a synergistic effect of the cluster.

If X is an indicator of success, then we denote that for the cluster (for the core) in the case of successful development should be

$$\frac{X_{CB}}{X_{BB}} \leq \frac{X_{CN}}{X_{BN}}, \quad (1)$$

where  $X_{CB}$  is value of indicator  $X$  for cluster, but before it enters to cluster,

$X_{BB}$  - value of indicator  $X$  for branch in this same year as  $X_{CB}$ ,

$X_{CN}$  - value of indicator  $X$  for cluster now (in this year),

$X_{BN}$  - value of indicator  $X$  for branch now (in this year).

We can also write that 
$$\frac{X_{CN}}{X_{BN}} = NCE_X \cdot \frac{X_{CB}}{X_{BB}}, \quad (2)$$

where  $NCE_X$  is Net Cluster Efficiency in indicator  $X$ ,

$X_{CB}$  and others – as seen above.

Then we can write, then the Net Cluster Efficiency (NCE) can be calculated as

$$NCE_X = \frac{\frac{X_{CN}}{X_{BB}}}{\frac{X_{CB}}{X_{BN}}} \quad (3)$$

What does the indicator  $NCE_X$  correctly say?

The  $NCE_X$  eliminates the success that is not the result of any collaboration in the cluster and measures, how the growth in  $X$  has caused the cluster efficiency.

In case, that  $X$  is indicator, for them is optimal maximization:

If  $NCE_X > 1$ , that means, the cluster position in sector is better than when they were separate companies, cluster efficiency is better, if  $NCE_X$  is higher,

If  $NCE_X = 1$ , that means, the cluster position in sector is the same as when they were separate companies, activity of cluster is probably weak,

If  $NCE_X < 1$ , that means, the cluster position in sector is worse than when they were separate companies.

The indicator  $NCE$  can be calculated in the same way for any maximization economic indicator, including growth indices. In the case of minimizing indicator, calculation is similar; one just has to replace the fraction in the formula (3). Therefore, if the  $Y$  is indicator, which has minimum in the optimal value, then

$$NCE_Y = \frac{\frac{Y_{CB}}{Y_{BB}}}{\frac{Y_{CN}}{Y_{BN}}} \quad (4)$$

Meaning that applications  $NCE_Y$  are exactly the same.  $NCE$  indicators can be used to assess the significance of the cluster in the sector but also to assess core companies in the cluster.

$NCE$  is a good benchmark for companies, for which it is participation in the cluster core and the effects should be visible. For companies of third- and fourth-layer cluster, which have other objectives (research centers) or elsewhere (logistic company for which firms in the

cluster is only an insignificant part of the effect of development) does not provide the desired pointer evaluation.

### **3.2 Homogeneity of cluster**

One of the prerequisites for a successful existence cluster is composed of a core in terms of mutual cooperation among companies, which should be based on a win-win strategy. One of the hypotheses beginning of this type of cooperation is somewhat equal status companies (ie. companies of approximately the same size, life cycle phase, market status and performance).

Before we begin it is important that the core is formed by companies, which can be seen as a homogeneous group.

Homogeneity can again be measured in any, for the functioning of the significant indicators for the cluster core businesses. This may be an indicator of absolute, relative, financial and non-financial - the only requirement is measurability and computability.

Homogeneity is measured by using a coefficient of variation ( $V_{coef}$ ) for indicator X:

$$V_{coef}(X) = \frac{\sigma(X)}{E(X)}, \quad (5)$$

where  $\sigma(X)$  is standard deviation on X,

$E(X)$  - mean of X.

If  $V_{coef}(X)$  is less than 50%, the cluster can be considered as a homogeneous set in key indicator X. (Synek et al., 2009)

Rating homogeneity is appropriate to do both before the establishment of the cluster, and during his life. Homogeneity of key indicators should not be reduce, the core foundation of success and the success of the core is the foundation of the success of the entire cluster.

There are two ways to work with good homogeneity:

- Intensive, in which the existing cluster firms converge in results (ideally improving)
- Extensive, in which the homogeneity reduces the company's newly involved in the activity of the cluster.

The above two indicators (NCE and homogeneity) can be used, in conjunction with and in the first stage of life indicator cluster evaluate homogeneity NCE.

Then we can dynamically evaluate the uniformity of development in the cluster - if the NCE of the firms in the cluster core is significantly different, it does not indicate good functioning of the cluster.

### **3.3 The criteria for the growing life-cycle phase (established)**

Due to changing conditions we can no longer (after some time) compare the success of companies in the cluster with success before joining the cluster, because the company already had another factory sector and I could pass key changes. Therefore, it is necessary for the growth phase to define other scales.

We recall that the foundation is still measuring Key Performance Indicators (KPI) – there are the indicators relevant to the evaluation of companies of the sector.

Let X be the key indicator.

Then, each company is successful in the cluster, if this is true:

$$X_F \geq X_C \geq X_B,$$

where  $X_F$  – value of indicator  $X$  for firm,

$X_C$  – value of indicator  $X$  for cluster,

$X_B$  – value of indicator  $X$  for branch.

When we talk about the cluster, we mean its core. For the evaluation of the success of the cluster core can be evaluated

- KPIs core aggregated values and compared with the values for the branch,
- homogeneity in the core KPIs and monitoring its development.

In the following text will be developed two methods, whose basis is used for multicriteria evaluation of alternatives, or are used for intercompany comparison (Synek et al., 2009).

### **3.4 Method standard deviations of normalized variables**

In order to expand options of homogeneity assessment we work with a group of KPIs by standard deviations of normalized variables.

When applying the method it is possible to proceed as follows:

- 1) Find the companies from core of cluster.
- 2) Define the key indicators indicative of the success of the company.
- 3) Minimizing indicators convert to maximizing.
- 4) For a set of corporate data for each indicator to determine the mean and variance.
- 5) Convert the pointer value  $X_{ij}$  on normalized values  $X_{jn}$  using the formula

$$X_{jn} = \frac{X_i - E(X_{ij})}{\sigma(X_{ij})}, \quad (6)$$

where  $X_{ij}$  is value of indicator  $X_j$  for company  $i$ ,

$E(X_{ij})$ , - mean of  $X_j$ ,

$\sigma(X_{ij})$  is standard deviation on  $X_j$ ,

- 6) For each company to calculate the average of normalized values of all indicators.
- 7) Calculate the indicator of homogeneity of these values as standard deviation of values for all companies.

The standard deviation in ideal case is increase in the time line.

### **3.5 Method standard deviations of distance from the fictional ideal company**

Advanced method for evaluating homogeneity in the development of the core is another application of the method distance from the fictional ideal company.

When applying the method it is possible to proceed as follows:

- 1) to the point 6, as in the previous case,
- 2) establish the so-called ideal fictional company, ie., one that in all monitored indicators achieves the best scores,

3) for each monitored subject (company) to calculate the distance from a fictional company using the Euclidean distance, ie.

$$d_i = \sqrt{\sum_j^m (X_{ijn} - X_{jf})^2}, \quad (7)$$

where

$d_i$  – distance company i from ideal company,

$X_{ijn}$  – normalized indicator j for company i,

$X_{jf}$  – normalized indicator j for ideal company,

m – number of indicators.

If the cluster benefits all firms in the core, the average distance from a fictitious company should not grow. It is also possible to evaluate the homogeneity of variance using the distances, it would also not grow.

For homogeneity in the development would be possible to use some of the bankruptcy or credibility models, which are also composed of indicators, standardization is here replaced with weights, but you need to pay attention to their weaknesses, which are described (Čámská, 2014). Furthermore the use of the standard model does not change the indicators used by specific clusters.

## **4 VERIFICATION OF METHODS IN APPLICATION**

The above-described methods were applied to the example of two clusters in the early stages of development and one already in the growth stage. First reference set of companies are companies in the Cluster Nutripol, for the second stage and demonstrating indicators was selected Plastic cluster.

### **4.1 NCE – Nutripol**

Nutripol Cluster is an interest association of legal entities with focus on the CZ NACE 72 190 Other research and experimental development of natural sciences and engineering. But firms in core of cluster are in CZ NACE 10.6 Flour and starch industry and 10.7 Bakery and Bakery and Confectionery, benchmarking is made with them.

Cluster Nutripol's declared aim is to strengthen the competitiveness of its members in the main directions: increase capacity for innovation by joint development of technological processes that can be used by more cluster members, the common procedure of verification and certification of the product or in the direction of the cluster allergenic security – offer of services to third parties in determining the allergenicity of their products and common procedure in marketing and by the realization of research and experiments for the health claim, which significantly increases the effectiveness of communication with customers and defines the product being offered. (Nutripol, 2012). The cluster was founded in 2009 and operates throughout the country. The cluster now has only few companies in the core and very many companies in soft infrastructure.

Chosen for benchmarking data (Czech Ministry of Agriculture, 2011) as a key indicator of the growth index of sales and will be compared to the period before the cluster and then in the cluster. Table 1 shows that although the cluster is better than the industry growth rate and its sales are increasing, the position has worsened - as 10.6, and also as 10.7 (NCE indicator is less 1). That means, the cluster effect is not positive at this time.

Tab. 1 – Indicator Sale index and his NCE indicator for Nutripol Source: own processing

Sale index	2009/08 (befor cluster)	2010/2009 (in cluster)
NACE 10.6	0.725	0.924
NACE 10.7	0.887	0.958
Nutripol (nucleus)	1.016	1.078
NCE (10.6)	0.833	
NCE (10.7)	0.982	

## 4.2 Homogeneity

We can also calculate cluster variation coefficient, which can say anything about homogeneity, key indicator for this measure - Sales, Assets, Profit and Assets Turnover (AT). Tab. 2 shows low homogeneity in absolute but also in relative indicators of firms in core of cluster.

Tab. 2 – Homogeneity – measured with variation coefficient (in %) Source: own processing

Key indicator (index)	2008	2009	2010	2011
Sales	71	64	62	72
Assets	79	65	81	93
EAT	162	164	128	174
AT	36	44	89	51

We can see that in the core businesses have low homogeneity, all indicators are very high.

## 4.3 The criteria for growing phase – Plastic Cluster

The plastics cluster was established in February 2006 as an Interest Association of Legal Entities with the aim to create a communication platform for its members – plastic product manufacturers. The main reason for cluster establishment was especially strong position of the plastics industry in the Zlín Region (together with rubber industry it represents the most productive sector of the region). Another reason is a shortage of qualified working labour force, missing research and development background for plastic product manufacturers, need of an appropriate negotiation position for services and products and effective enforcement of the sector interests. Cluster has enough companies in the nucleus, these were included and evaluated by the methods described above.

For the application of multi-criteria evaluation was selected the routine monitoring criteria of successful companies:

ROE = EAT/Equity

ROA = EBIT/Assets

AT = Revenues/Assets

L1 = (Current assets/Short term liabilities),

L2 = (Current assets – Inventories)/ Short term liabilities

Coefficient of selffinancing = Equity/Assets

The evaluation of cluster development is carried out in the period from 2008-2013, the nucleus included 25 companies meeting the conditions of the core of business, all companies are part of the group 22 - Manufacture of rubber and plastic products by CZ NACE, thus the values are compared with the results in this sector.

In subsequent years the above indicators were calculated aggregately over the entire core. The tab. 3 shows the evaluation of the cluster in terms of trends in the cluster. It can be stated that the core of the cluster has a growing trend; weakness is the development trend indicators Assets Turnover.

Tab. 3 – Indicators in Core of cluster. Source: own processing

	ROA	Trend	ROE	Trend	AT	Trend	L1	Trend	L2	Trend	E/A	Trend
2008	0,10		0,12		1,18		1,36		0,90		0,57	
2009	0,11	OK	0,14	OK	1,10		1,58	OK	1,07	OK	0,62	OK
2010	0,11	OK	0,15	OK	1,10		1,68	OK	1,15	OK	0,65	OK
2011	0,12	OK	0,15	OK	1,18	OK	1,68	OK	1,10		0,65	OK
2012	0,12	OK	0,16	OK	1,18	OK	1,63		1,06		0,63	
2013	0,22	OK	0,30	OK	1,07		2,02	OK	1,48	OK	0,66	OK
change		223%		252%		90%		149%		165%		223%

The obtained values of cluster cores are then compared with the industry according to NACE CZ (see Table 4, where PC values Plastic Cluster and PB values Plastic Branch).

Tab. 4 – Key indicators for core of cluster and for branche. Source: own processing.

	ROA	ROA	ROE	ROE	AT	TA	L1	L1	L2	L2	E/A	E/A
	PC	PB	PC	PB	PC	PB	PC	PB	PC	PB	PC	PB
2008	0,10	0,15	0,12	0,10	1,18	1,69	1,36	1,37	0,90	0,93	0,57	0,58
2009	0,11	0,15	0,14	0,11	1,10	1,47	1,58	1,92	1,07	1,49	0,62	0,58
2010	0,11	0,17	0,15	0,22	1,10	1,57	1,68	2,08	1,15	1,59	0,65	0,60
2011	0,12	0,18	0,15	0,22	1,18	1,66	1,68	2,14	1,10	1,66	0,65	0,61
2012	0,12	0,21	0,16	0,36	1,18	2,06	1,63	2,50	1,06	1,95	0,63	0,66
2013	0,22	0,19	0,30	0,34	1,07	1,92	2,02	2,53	1,48	2,00	0,66	0,65
Δ	0,12	0,04	0,18	0,24	-0,11	0,23	0,66	1,16	0,58	1,07	0,09	0,07

In addition to ROA, the growth in all sectors of the selected indices was higher than the growth of the cluster core. In particular, the relationship between ROE and ROA shows a possible cause is not so much the underperformance of the cluster as a greater fear of financial risk, where accumulation and retention of profits in unproductive assets may be one of the causes of limited growth of AT.

Evaluating homogeneity will be assessed by methods described in chapter 4.4 and 4.5, the same indicators are used, as we have defined above (ROA, ROE, AT, L1, L2, E/A).

The results of method deviation of normalized variables and also methods of distance normalized variables from a fictitious company are in Tab. 5.

Tab. 5 – Homogeneity of core of Plastic cluster in time line. Source: own processing

	Method of normalized variables	Method of distance		
	var (averagea norm X)	E(d)	Stdeva(d)	var (d)
2008	44%	9,02	0,64	7%
2009	46%	8,39	0,95	11%
2010	56%	7,01	1,07	15%
2011	48%	7,84	1,10	14%
2012	57%	6,50	1,21	19%
2013	66%	7,22	1,22	17%

Unfortunately, we see that both methods show a decreasing level of homogeneity core cluster's homogeneity. Although both indicators alone, as compared to the industry cluster can be assessed positively (and certainly other indicators could be selected that would reflect even better in light of its positive aspects), it can be seen that the homogeneity of the core, which is one of the prerequisites for long-term prosperity worsens the cluster.

## 5 DISCUSSION

The aim of the article was to create a set of measures based on logical deduction. It would be very interesting to create actual statistical investigation and verify established benchmarks. Unfortunately, there is not sufficient statistical data for us to receive general conclusions.

The Czech Republic currently contains 79 active clusters (Czechinvest, 2013). The very first cluster was formed in 2003, 53% of clusters are supported by data of less than a five years history (established 2009 or later). Most clusters were formed in 2006 (as well as Plastic cluster) and 2009 (like Nutripol). A greater rate of cluster formation in certain years is also influenced by the support of the state. According to the investigation of an international benchmarking, carried out by the German consultant company VDI/VDE Innovation + Technik GmbH (Czechinvest, 2015), 67% of Czech clusters are sufficient in size. Clusters are spread in almost all sectors according to CZ NACE. No industry contains more than 6 clusters. The aforementioned facts support the idea, that statistical significance of monitoring benchmarks in proportion to size, age or the sector of the cluster is impossible to track in the Czech Republic - the reason being insufficient relevant data. The aforementioned data for two clusters are not a statistical research of substantiation of benchmarks, but just a test for their actual usability. The homogeneity of the nucleus is a measure realistically applicable even for

the advanced part of the life cycle. Evaluation requires the homogeneity of the core not to be reduced, but it is impossible to predict, that it will further increase, because a certain amount of inhomogeneity testifies that we evaluate a cluster that includes multiple firms, not just one big one.

## **6 CONCLUSION**

The aim of the article was to create benchmarks for measuring the success of clusters and determine their suitability depending on the life cycle of the cluster. The article highlights the principles of how to evaluate the functionality of cluster worth as a whole, without neglecting the interests of individual companies. It is also taken into account that the cluster is part of the sector. Defined criteria are developed with respect to business results depending on the macroeconomic situation. It should not be used to measure impact. It is also possible to change the used key indicators - both their amount and their structure. Our proposed method was demonstrated on two clusters, which at the first observation had to be successful clusters - their results are improving. In both cases, they subsequently prove weaknesses – the growth sector is less than or decreasing in homogeneity in the cluster. The benchmarks suggested in the article show their usability and are based on the assumption, that the core of the cluster is the most important and cluster should support all firms in the core. If the homogeneity of the core decreases, it means the development of firms is irregular, which can result in the cluster being isolated by certain firms. The article shows benchmarking timeline for one cluster at a time in comparison to given sector. Given certain circumstances, it would be possible to use benchmarks for comparing multiple clusters at once. It would be useful to compare clusters of comparable size, lifetime, and sector - which is not yet possible, as discussed. If we compare different clusters it would be used same primary indicators. These indicators should have a clear optimum, the same for all companies (maximization and minimization). It is questionable whether they could be better chosen KPIs, such as objectively measurable, but non-financial indicators, those would also better fit the goals of the cluster. Our derived methods allow the use of any quantifiable indicators, so each cluster can be selected according to your goals.

## **IMPACT OF COMPETITION ON RETAILING IN THE PERIOD OF ECONOMIC CRISIS AS PERCEIVED BY THE CZECH CLOTHING RETAILERS**

*Jozefína Simová*

### **Abstract**

This paper attempts to explore perceptions of clothing retailers in the Czech Republic in relation to the impact of competition on retailing in the period of economic crisis. It presents the findings of the research conducted in 2014. The research was designed to investigate the impact of market environment on competition in clothing retailing in the Czech Republic at two levels: external (clothing retail managers' perceptions of competition and its impact on company performance) and internal (quantitative changes in company's turnover, if any). The first part of the study explores the impact of competition on company's turnover. The second part examines the extent to which competition influenced performance of the Czech clothing retailers, the most frequent changes in competition and the most common competitive responses of clothing retailers to changes in the competitive market.

*Keywords: Clothing, retailing, competition, Czech Republic, turnover, changes, economic crisis*

JEL Classification: M31

### **1 INTRODUCTION**

The business environment of the last few years has become more turbulent. Rapid changes in the market caused mainly by the global economic crisis in 2007-2012 have brought considerable challenge as well as new possibilities and opportunities to companies (Antonová & Zapletalová, 2014). Significant changes have arisen in the retailing sector, as well. The battle for customers has become very intense. Retailers have been forced to respond to changes in consumer behaviour and demand, to increasing and also changing competition, to adapt new technology and look for new management practices and market opportunities.

The impact of the global economic crisis on company management and performance is evident and has been described by many academics and practitioners (Hájek & Režný, 2014; Kraft, Bednářová, Lungová, Nedomelová, & Sojková, 2010; Kraft, Bednářová, Lungová, Nedomelová, & Sojková 2011; Švihlíková, 2010; Kislíngerová, 2010; Kohout, 2009). The new market conditions force managers to develop new strategies, build sustainable competitive advantages and expand their product portfolio and market segments in order to survive, to ensure sufficient company performance and become competitive (Antonová & Zapletalová, 2014; Dědková & Blažková, 2014).

There have been a few attempts made to define company performance in the literature. Knapková, Pavelková and Šteker (2013, p. 149) state that company performance is related to all company activities needed to make a company functioning and prospering in a long-term perspective. The others understand company performance as a well-planned creation of prerequisites for a company long-term survival and a value creation for continuous and sustainable existence of the company. Wagner (2009, p. 18) specifies two basic dimensions of company's performance - the need to do the right things and to do the things right. Basically, most of company performance definitions are associated with the objective achievements,

changes in financial indicators of the company including return on investment and the ways how company runs its business activities (Štamfesová, 2014, p. 522; Carton & Hofer, 2006, p. 2-3; Lebas, 1995, p. 23).

It is important to note that the definitions of company performance are mainly company focused. They do not reflect the market environment and the impact of external factors on company performance, such as competition. The objective of the paper is to explore perceptions of clothing retailers in the Czech Republic in relation to the impact of competition on company performance measured by turnover in the period of the economic crisis. It presents the findings of the research conducted in 2014. The research was designed to investigate the impact of market environment on competition in clothing retailing in the Czech Republic at two levels: external (clothing retail managers' perceptions of competition and its impact on company turnover) and internal (quantitative changes in company's turnover, if any). The first part of the study explores the impact of competition on company's turnover and its correlations with changes in competitive behaviour of clothing retailers. The second part examines the extent to which competition influenced turnover and activities of the Czech clothing retailers, the most frequent changes in competition and the most common competitive responses of clothing retailers to changes in the competitive market.

## **2 COMPETITION AND CONFLICT-BASED THEORY**

Conflict-based theoretical concepts have attracted moderately little academic attention. However, some authors (Gist, 1968; Stern & El-Ansary, 1977; Markin & Duncan, 1981; Brown, 1987a, Brown, 1987b, Brown 1988a) made their contributions. Some of these theories concentrate upon behaviour and reaction of the established retailing institutions to the threat of competition coming from new institutional retail formats (Brown, 1987a). They explain the inter-institutional competition that occurs when new retail institutions enter the market as the dynamic interaction between the old and the new retail establishments (Markin & Duncan, 1981; Brown, 1987b).

Other theoretical concepts focus on retail innovations representing some competitive advantages that threaten conventional retailers and force them to respond or adapt to the competitive challenge. Retailers may respond in many different ways. Usually, retailers with the innovations are at first maligned, boycotted, accused of unfair selling practices or at least, subjects to attempts to stifle their success (Brown, 1987a, Brown 1988). Basically, threatened retailers can respond in the following ways. They either strive to avoid direct competition by differentiating the threatened institution from its challengers or they try to adapt the best features of the new system and thereby negate some of its competitive advantages. The specific example of the first type was the response of traditional stores to the threat of low price policy offered by discount stores. Many traditional stores moved further upmarket and relinquish the merchandise sold by discounters. Other stores applying the imitative response to the threat of discount stores established their own chains of discounters, cut prices and services to match those of the discount stores. In this way, they not only reduced a perceived threat but also assumed the operation of the discounters.

The models to mention are dialectical model (most notably, Gist (1968) and the crisis-response model (Stern & El-Ansary, 1977).

**The dialectical model** describes dynamic interaction (action, reaction and assimilation sequence) and competitive conflicts between retailers (old and new retail formats) as a series of stages, each of which represents a rejection of a prior institutional format (Mason & Mayer, 1978; Brown, 1991). It states that a retail institution (in this case a "thesis") develops. After a while, a position apposed to the thesis - antithesis will likely develop. The thesis and

antithesis have opposite characteristics. Nevertheless, they do not necessarily represent complete opposites. The existing thesis is threatened by its antithesis. As a result of their competitive strife, they “melt” in the synthesis - an institution between the original thesis and the antithesis. With a time, the synthesis becomes the thesis for a new round of negation and assimilation, so the dialectical process continues. According to the dialectical theory, therefore, inter-institutional competition inevitably leads to a diverse retail structure and completely new retail formats may appear (Gist, 1968; Brown, 1988).

A good example of this process can be identified in the self-service grocery store that represents a synthesis of the traditional counter-service grocery store (thesis) and the supermarket (its antithesis) (Brown, 1987b).

**The crisis-response model** of competitive conflict distinguishes four stages from the emergence of a threat caused by innovation or new retail institution to the resolution of the inter-institutional conflict: shock, defensive retreat, acknowledgement and adaptation (Stern & El-Ansary, 1977; Brown, 1991). The first phase is associated with a shock caused by appearance of innovative retail activities that are perceived as a threat for some companies. At this stage, the threatened companies often refuse to recognize the extent of such threat. In the second phase of defensive retreat, the companies start to react to their challenger. They may attempt to discredit, control or generally impede the innovator. The third phase – acknowledgement is related to the situation when threatened retailers realize that the innovator is likely to remain and that they need to apply some positive countermeasures. In the final, adaptive phase, conflict is resolved and a new competitive power balance is created in the market. This, however, may initiate a competitive threat to other companies and conflict breaks out once again. What is more, not only threatened institutions have to respond to a challenge but also the attacker is sometime forced to react to the rejoinder of the retail establishment (Brown, 1987b; Brown, 1988).

The concept of the crisis-response model can be found in another theory that argues that a dominant group of competitors in any sector of the economy is counterbalanced by the appearance of another equally powerful opposing force. Whenever some companies are threatened by a concentration of power elsewhere in the system, they will counteract. This concept of countervailing power was first noted by Galbraith (1956) and later, further developed by Izraeli (1970) (quoted in Brown, 1987b).

### **3 METHODOLOGY**

The findings presented in this paper are based on the research focused on analysis of competition and competitive behaviour of clothing retailers in the period of the economic crisis determined by retailers themselves, in particular the inter (competition between different retail formats) and intra-type competition (competition among the same type of retail formats). It was an exploratory research expanding into the qualitative area trying to identify competitive factors affecting retailing based on the perception of clothing retailers.

The research included different formats of clothing shops regardless their location. It included clothing shops located in small and large towns, in town centre and in shopping centres built in or in the outskirts of towns. The study focused on five different formats (quotas) of clothing retailers – department store, mid-range clothing store, boutique, discount and second-hand stores since they represent a significant proportion in the market structure. The mid-range stores represented a category including clothing stores that could be positioned as a store between a boutique and a discount store (somewhere in the middle of the price and quality continua). This category of clothing stores comprises both multiple and small independent clothing retailers of the same price-quality market position.

Non-probability sampling strategy, particularly quota sampling was applied in the research. Structured interviews using a questionnaire were used to collect the data. In designing the questionnaire, the present knowledge on conflict-based theory was considered. To measure the extent of the influence of competition on changes in company performance, a five point rating scale was used. The ordinal scale was used to measure the most frequent changes in competition and retailers' competitive responses to those changes in the period of the economic crisis. The data on a company such as the name of the company, the year of establishment, the number of years present within the Czech market, type (independent, multiple retailer) and format of retailer (department store, discount store, boutique and the like), ownership, number of employees, assortment and turnover, changes in turnover were placed at the end of the questionnaire.

Descriptive analysis using mainly percentage cross-tabulation and arithmetic means was used to summarize the data and understand the nature of the relationships by making relative comparisons. Ranking was used to identify the main (most important) factors associated with the most frequent competitive behaviour as perceived by clothing retailers. To explore the differences in retailers' perceptions of the impact of mentioned factors on company performance in clothing retailing by retail formats, the size of population (town categories) and changes in retailers' turnover, an analysis of contingency tables (categorical data) was applied. The relationship between independent variables (retail formats, town categories, changes in competitive behaviour) and the dependent variables (turnover change categories) was measured by Pearson Chi-Square test and one-way ANOVA test.

#### **4 PROFILE OF RESPONDENTS**

Around 500 retailers were contacted in judiciously selected towns representing all five town population categories (less than 10,000 inhabitants, 10,000-19,999 inhabitants, 20,000-49,999 inhabitants, 50,000-99,999 inhabitants and more than 100,000 inhabitants) in different regions of the Czech Republic.

The sample consisted of 409 responses. The largest proportion of clothing retailers (45 percent) was interviewed in the towns with more than 100,000 inhabitants and the towns with 50,000-99,999 inhabitants. The sample included 31 percent of mid-range clothing stores, 29 percent of boutiques, 28 percent of department stores and hypermarkets selling clothes, and 12 percent of discount and second-hand stores.

Approximately one third (32 percent) of them stated the year of their founding in the period 1991-2000. Most of the interviewed retailers were established after the year 2000 (67 percent). About 55 percent of respondents have been operating within the Czech Republic for less than 10 years. Regarding the size of the interviewed clothing retailers in terms of their turnover, 13 percent did not state their turnover category at all. From those who indicated their turnovers, about 37 percent were small clothing retailers with a turnover of less than CZK 2 million per year, almost 19 percent of the retailers achieved a turnover of CZK 2-5 million per year, 8 percent of clothing retailers stated a turnover of CZK 5-10 million per year and 36 percent of retailers belonged to the category with more than CZK 10 million per year.

Analyzing the sample structure in relation to the number of employees, about 71 percent of selected clothing retailers were companies employing fewer than 10 people, 12 percent of them employed 11-25 people, 3 percent employed 26-50 people, 3 percent employed 51-100 and about 11 percent employed more than 100 employees.

## **5 THE INFLUENCE OF COMPETITION ON CHANGES IN RETAILING AS PERCEIVED BY CZECH CLOTHING RETAILERS**

The economic crisis in the Czech Republic, primarily in its early stage in 2008, accompanied by the GDP decline, the slump of the Czech currency and a rapid decline of the retail turnover generated problems not only for companies involved in exports and imports but for retailers as well (Antonová & Zapletalová, 2014). The annual decline of the non-food retail turnover reached 10.2 percent in January 2009 (Český statistický úřad, 2015). Many companies struggled and competition got more intense.

This chapter explores how clothing retailers perceived the impact of competition on their business performance in relation to intra-institutional (competition among the same type of retail formats), inter-institutional (competition between different retail formats), domestic (Czech) and foreign (foreign retailers operating in the Czech market) competition. The impact of competition on clothing retailing was measured quantitatively by changes in their turnover, and qualitatively by retailers' perceptions and reactions to competitive activities in the period of economic crisis.

### **5.1 Retail turnover development in the period of economic crisis in the Czech Republic as perceived by clothing retailers**

Clothing retailers were requested to state trends in their company performance measured by changes (if any) in their turnover. Particularly, they were asked to indicate whether their turnover had increased, remained rather stable or declined in the period of economic crisis. The findings gathered out of those who responded the question (about 88 percent of all respondents) show that 23 percent declared a growth in their turnover, 37 percent of interviewed clothing retailers expressed no changes in their turnover and 40 percent of them stated that their turnover had declined.

Based on the results gained from those whose turnover increased, 58 percent of retail companies achieved turnover increase up to 5 percent, 32 percent of interviewed clothing retailers achieved increase between 6 to 15 percent and about 10 percent of clothing retailers stated an increase in their turnover by more than 15 percent.

Clothing retailers that admitted decline in their turnovers experienced decline from up to 5 percent (47 percent of them) to more than 20 percent of their turnover (19 percent of them). Approximately 34 percent of them expressed a decline in their turnover by 6 to 15 percent. The largest decline in retailers' turnovers in the period of economic crisis in range from 40 to 70 percent was declared by 6 percent of clothing retailers.

The characteristics of clothing retailers that stated an increase, no change or a decline in their turnovers are shown in the table 1.

Tab. 1 – Characteristics of clothing retailers by turnover changes

<b>Characteristics of clothing retailers</b>	<b>Growth (%)</b>	<b>Stability (%)</b>	<b>Decline (%)</b>	<b>Pearson Chi-Square</b>	<b>Sig.</b>
<b>Towns up to 10,000 inhabitants</b>	22	20	58	19.630	0.012
<b>10,000 – 19,999 inhabitants</b>	20	31	49		
<b>20,000 – 49,999 inhabitants</b>	19	41	41		
<b>50,000 – 99,999 inhabitants</b>	34	47	19		
<b>Over 100,000 inhabitants</b>	24	43	33		
<b>Small independent stores</b>	16	35	49	16.021	0.042
<b>Multiple retailers</b>	28	39	33	23.138	0.001
<b>Private ownership</b>	17	32	51		
<b>Limited reliability company</b>	24	38	37		
<b>Foreign company</b>	34	47	20	38.613	0.000
<b>Turnover up to CZK 2 mill.</b>	10	37	57		
<b>CZK 2 – 5 mill.</b>	43	34	23		
<b>CZK 5 – 10 mill.</b>	28	41	31		
<b>More than 10 mill.</b>	25	46	30		

Clothing retailers experiencing a growth in their turnovers during the period of crisis were located mostly in large towns with more than 50,000 inhabitants. In terms of their size, they were multiple retailers owned by a foreign company with annual turnover of CZK 2 – 5 million.

Most clothing retailers reporting a turnover decline were located in smaller towns up to 50,000 inhabitants. They were privately owned by small independents with annual turnover up to CZK 2 million.

No statistically significant differences in company performance of clothing retailers in terms of turnover were found by retail formats (Pearson Chi-Square=8.163, p=0.416) and the number of employees (Pearson Chi-Square=10.324, p=0.243).

Differences in clothing retailers' perceptions of changes in competition and their responses to the changes were examined in relation to changes in their turnover, as well. No statistically significant differences were found in responses of clothing retailers to competitive threats in relation to the changes in their turnover. However, perception of competitive activities by clothing retailers in terms of price and in-store ambience differed significantly as shown in the table 2.

Tab. 2 – Clothing retailers' perception of competitive activities by turnover changes

<b>Retailers' perceptions of competitive activities</b>	<b>Growth (%)</b>	<b>Stability (%)</b>	<b>Decline (%)</b>	<b>Pearson Chi-Square</b>	<b>Sig.</b>
<b>Price ranked the 1<sup>st</sup></b>	17	35	48	20.824	0.053
<b>Price ranked the 2<sup>nd</sup></b>	18	33	48		
<b>Price ranked the 3<sup>rd</sup></b>	25	44	31		
<b>Store ambience ranked 5<sup>th</sup></b>	15	32	53	26.759	0.021
<b>Store ambience ranked 6<sup>th</sup></b>	25	35	40		
<b>Store ambience ranked 7<sup>th</sup></b>	25	31	43		

Clothing retailers that indicated a decline in their turnover perceived competitive activities in terms of lower price, discounts and sales to be more frequent and important than the retailers that experienced a growth of turnover. On the other hand, clothing retailers with a turnover decline considered competitive activities of clothing retailers associated with in-store ambience to be significantly less frequent and important in comparison to the retailers that stated a growth.

### **5.2 Clothing retailers' perceptions of changes in competition in the period of economic crisis in the Czech Republic**

This part of the study explores the impact of different types of competition, i.e. intra-institutional (competition among the same type of retail formats), inter-institutional (competition between different retail formats), domestic (Czech) and foreign (foreign retailers operating in the Czech market) competition on retail turnover and activities in the period of economic crisis. It describes changes in competitive behaviour in clothing retailing as perceived by clothing retailers as well as responses of clothing retailers to competitive changes. The impact of competition was evaluated using a five point scale where 1 meant very weak (almost no) competition and 5 meant very strong competition.

Approximately three quarters of interviewed clothing retailers in the Czech Republic stated that intra-institutional competition (competition among the same types of retailers) and inter-institutional competition (competition among different types of clothing retailers) had influenced the performance of their companies in the period of the economic crisis considerably. In terms of the Czech and foreign competitors, the Czech competition was perceived to have slightly higher impact on company performance.

The extent of the impact of competition on clothing retailing as perceived by different types (retail formats) of clothing retailers is shown in the table 3.

Tab. 3 - The impact of competition on company performance in clothing retailing as perceived by different retail formats

**Legend:** DS .... Department store  
1 ..... Very small impact on changes in clothing retailing (weak competition)  
5 ..... Very high impact on changes in clothing retailing (strong competition)

Rank of competition by their impact on company performance in clothing retailing as perceived by different retail formats of clothing retailers:

1 .... The highest impact on changes in clothing retailing  
4..... The lowest impact on changes in clothing retailing

Most retail formats (department stores and hypermarkets, boutiques, discount stores and second hand stores) perceived intra-institutional competition (competition from the same formats) to have the highest impact on company performance in clothing retailing. Mid-range stores perceived themselves to be threatened by inter-institutional competition – competition from other retail formats.

The finding of the one-way ANOVA test shows significant differences in retailers' perceptions of competition and its impact on their turnover. Discount stores, hypermarkets and department stores considered competition from the same retail formats significantly more threatening than from the other ones. Discount stores, hypermarkets and department stores felt to be influenced by competition from other retail formats, and by the domestic and foreign competition to a greater extent than other retailers. Boutiques and second hand stores apprehend themselves as rather differentiated retail institutions that were influenced mainly by the same type of Czech clothing retailers. The biggest competitive threat that they perceived was from the clothing retailers of the same retail format.

As perceived by retailers, company performance of clothing retailers was influenced mainly by competition among the same types of retail institutions. Significantly greater impact ( $F=4.713$ ,  $p=0.001$ ) of this type of competition was perceived by retailers in the largest towns with more than 100,000 inhabitants.

The research also attempted to explore the type of competitive behaviour of clothing retailers in the Czech Republic throughout the period of economic crisis. The most frequent changes in

competition as well as competitive responses of clothing retailers to these changes in competitive practices were examined in more detailed way. In both cases respondents were asked to choose and rank factors from the most frequent/important (ranked 1) to the least frequent/important (ranked 7) or add other factors.

The rankings for the four most frequent competitive behaviour that clothing retailers faced in the market are shown in the table 4.

Tab. 4 The most frequent competitive activities in clothing retailing as ranked by clothing retailers

Competitive activities	Ranked (%)				
	1st	2nd	3rd	4th	Top 4 rankings
<b>Lower prices, discounts, sales</b>	45	21	11	10	86
<b>Wider assortment, more brands</b>	14	22	22	17	75
<b>More advertising, promotion</b>	11	20	17	15	63
<b>More competitors</b>	13	16	17	15	61
<b>Services</b>	6	10	18	20	55
<b>Greater concern for customer satisfaction</b>	6	7	9	16	38
<b>More pleasant in-store ambience, staff</b>	5	5	6	5	21

*Legend:* 1 ... the most frequent competitive behaviour  
7 ... the least frequent competitive behaviour

Lower prices and wider assortment were ranked as the most frequent type of competitive behaviour of clothing retailers in the economic crisis. About 86 percent of the interviewed clothing retailers ranked lower competitive prices on the first four the most frequent positions of retailers' competitive behaviour. Similarly, approximately 75 percent of clothing retailers ranked wide assortment and more brands on the first four the most frequent positions of retailers' competitive behaviour.

The least frequent competitive activities used by clothing retailers in the period of economic crisis were services, marketing activities focused on greater concern for customer satisfaction, more pleasant in-store ambience and personnel.

Changes in the competitive behaviour of clothing retailers were also analyzed by perceptions of different types of clothing retailers. The aim was to explore how different retail formats competed in the market and what competitive activities they considered to be the factors that influenced their businesses to the greatest extent. The means of competitive activities, ranked from the most often occurred (signed 1) to seldom occurred (signed 7), for each type of interviewed clothing retailer are presented in the table 5 below.

Tab. 5 - The most frequent competitive activities as ranked by different retail formats

Competitive behaviour	Retail format									
	DS, HPM		Mid-range store		Boutique		Discount store		Second hand store

<b>Concern for customer satisfaction</b>	4.86	6	4.61	6	4.73	6	4.94	6	5.67	7
<b>More pleasant in-store ambience, staff</b>	5.87	7	5.43	7	5.58	7	5.55	7	5.59	6

*Legend: DS ... Department store, HPM ... Hypermarket*

*1 ..... The most frequent way of competitive behaviour*

*7 ..... Infrequent way of competitive behaviour*

*Rank of competitive behaviour by its frequency as perceived by different types of clothing retailers:*

*1 ..... The most frequent way of competitive behaviour*

*7 ..... Infrequent way of competitive behaviour*

It is apparent that the price was the factor that played an important role in competitive strategies and company performance of all five formats of clothing retailing. Clothing retailers perceived wider assortment and more advertising and promotional activities of their competitors as the next most frequently used activities. Less attention was certainly devoted to competitive strife by services, greater concern for customer satisfaction, in-store ambience and personnel.

The significance of differences in perception of competitive activities among different retail formats was examined by Pearson Chi-Square test. The results show that statistically significant differences in perception of competitive activities by the selected retail formats were found in lower prices and discounts (Chi-Square=44.816, p=0.006) and retailer's concern for customer satisfaction (Chi-Square=41.707, p=0.046).

Lower prices and discounts were competitive activities perceived to appear in the market more often by boutiques. Second hand stores, mid-range stores, department stores and hypermarkets also perceived lower prices and discounts to be the competitive strategy most often used by retailers, however to a significantly lower extent than boutiques.

Retailers' concern for customer satisfaction was perceived to be less often used activity in general. Nevertheless, mid-range stores and boutiques perceived marketing activities of their competitors oriented on greater customer satisfaction to be more frequent than other retail formats.

Significant differences in retailers' perceptions of competitive activities in terms of lower prices and discounts were found among clothing retailers in towns by population size (Pearson Chi-Square=36.986, p=0.044). Stronger price competition was perceived by retailers in smaller towns. Clothing retailers in towns up to 10,000 inhabitants perceived competitive activities associated with low price and discounts significantly more important in their retail operations than retailers in larger towns.

Significantly different competitive behaviour also appeared between small independent clothing retailers and multiple clothing retailers in terms of advertising and promotion (Chi-Square=17.537, p=0.007). Multiple retailers were aware of competitive threats from advertising and promotion to be more frequent rather than small independents. The perception of other competitive activities did not vary significantly in towns with a different size of population and between small independent and multiple clothing retailers. However, clothing retailers in smaller towns (up to 50,000 inhabitants) evaluated competitive activities in terms of increasing number of competitors, their wide assortments and low prices to be more intensive than the activities of clothing retailers in large towns. On the other hand, clothing retailers in larger towns (over 50,000 inhabitants) evaluated competitive activities associated with services, advertising, concern for consumer satisfaction and pleasant in-store ambience as a whole (expressed by the total means) as more intensive.

To explore the impact of competitive activities on changes in company performance of clothing retailers, the responses of clothing retailers to competition in the market were examined as well. The responses of clothing retailers to the changing competitive practices are shown in the table 6.

Tab. 6 - The Most Frequent Responses of Clothing Retailers to Competitive Activities in the Market

Retailers' responses to competition	Ranked (%)				
	1st	2nd	3rd	4th	Top 4 rankings
<b>Lower prices, discounts, sales</b>	47	17	10	8	82
<b>Wider assortment</b>	17	28	24	20	89
<b>Greater concern for consumer satisfaction</b>	18	16	17	22	72
<b>More services</b>	9	12	28	28	78
<b>More advertising, promotion</b>	8	22	12	15	57
<b>Extended opening hours</b>	1	4	8	8	21

**Legend:** 1 ... the most frequent competitive behaviour  
7 ... the least frequent competitive behaviour

Clothing retailers most frequently responded to changing competitive activities by lowering price (receiving 47 percent of the rankings in the first category). However, a greater concern for consumer satisfaction (18 percent of responses ranked in the first position) and a wider assortment (17 percent of the first rankings) was already apparent. Other activities concerning clothing retailers' responses to the changes in competition including more services (9 percent

of the first rankings), advertising and promotion (8 percent of the first rankings) were stated by clothing retailers as rarely used responses to competition in the market.

The responses of different types of clothing retailers to their competition are presented in the table 7.

Tab. 7 - The most frequent responses to competition by retail formats

Retailers' responses to competition	Retail format									
	DS, HPM		Mid-range store		Boutique		Discount store		Second hand store	
	Mean	Rank	Mean	Rank	Mean	Rank	Mean	Rank	Mean	Rank

*Legend: DS ... Department store, HPM ... Hypermarket*

*1 ..... The most frequent way of response to competition*

*6 ..... Infrequent way of response to competition*

*Rank of competitive behaviour by its frequency as perceived by different types of clothing retailers:*

*1 ..... The most frequent way of response to competition*

*6 ..... Infrequent way of response to competition*

Based on the findings of the analysis of retailers' responses to the threat of competition, it was evident that retailers did not adopt simple reactions that would correspond to the strategy associated with a particular retail format. They responded with a combination of a few different activities instead. However, low price, discounts and sales were dominating activities for all selected retail formats except of second hand stores. Second hand stores focused on widening clothing assortment accompanied by low price and services. Boutiques responding to the economic situation by lower prices focused on greater concern for consumer satisfaction, wider assortment, and eventually services in their competitive strategies. Discount stores and mid-range stores responded to competitors' activities by lower prices as well as by widening assortment, greater concern for customer satisfaction and adding more advertising and promotion activities.

To identify differences in the reactions of clothing retailers to their competitors, the statistical significance of differences in retailers' responses to competitive activities was examined by Pearson Chi-Square test.

Statistically significant differences in retailers' responses to competitive activities by retail formats were found only in retailers' approach to advertising (Pearson Chi-Square=33.725, p=0.028). Advertising and promotion were regarded to be more important for discount stores

and mid-range stores, whereas boutiques and second-hand stores represented the opposite end of retailers that used promotion activities to a lower extent.

When analyzing responses of clothing retailers to changes in competitive activities in towns by their population, significant differences were identified in advertising (Pearson Chi-Square=33.255,  $p=0.032$ ) and retailer concern for customer satisfaction (Pearson Chi-Square=36.720,  $p=0.047$ ). Clothing retailers in towns with more than 100,000 inhabitants and in small towns up to 20,000 inhabitants responded to competition with a greater concern for consumer satisfaction than the retailers in other towns. Clothing retailers in large towns with more than 100,000 inhabitants used advertising and promotion to a greater extent than retailers in other towns. Differences in retailers' responses to competition in terms of advertising and promotion were also found between small independent and multiple clothing retailers (Pearson Chi-Square=41.789,  $p=0.000$ ). Multiple clothing retailers responded to competitive threats by more advertising and promotion to a greater extent than small independent retailers that focused more on widening assortment (Pearson Chi-Square=11.214,  $p=0.047$ ).

## **6 CONCLUSION**

The paper explores perceptions of clothing retailers towards the impact of competition on retail turnover and business activities in the period of economic crisis in the Czech Republic. It was found that competition had a considerable impact on most clothing retailers.

Evaluating the impact of competition and economic crisis on clothing retail companies, it was found that turnover of a large proportion of clothing retailers (40 percent) declined or remained the same (37 percent). Growth of turnover was declared by one quarter of interviewed retailers only. It is obvious that there were many factors that had contributed to this situation, be they external and/or internal to the business itself. Whereas the impact of the external factors (competition) on changes in retail turnover in the period of economic crisis was approved, the impact of internal factors in terms of managers' perception of competitive activities and their decision making process in responses to competitive treats were not approved. There were neither any statistically significant differences in clothing retailers responses to competitive activities, nor any correlations found between the responses and trends in turnover changes. The question that arises is whether responses to competitive activities and strategies of clothing retailers in economic crisis were appropriate to the market situation.

Competition among the same types of retail formats of clothing stores located in large towns (with more than 100,000 inhabitants) was considered to influence retail turnover to a greater extent than elsewhere. The strongest impact of competition on turnover was perceived by discount stores followed by hypermarkets and department stores. Other retail formats (boutiques, mid-rang stores and second hand stores) felt to be less influenced by competition. Lower prices, wider assortment, more advertising and promotion were competitive activities applied by clothing retailers most often. These activities generated similar responses from clothing retailers, although some retailers attempted to compete by increasing concern for customers' satisfaction (mainly in large towns and the smallest towns with less than 10,000 inhabitants).

Clothing retailers in smaller towns (up to 50,000 inhabitants) evaluated competitive activities in terms of increasing number of competitors, their wide assortments and low prices to be more intensive than the activities of clothing retailers in large towns. On the other hand, clothing retailers in larger towns (over 50,000 inhabitants) evaluated competitive activities associated with services, advertising, concern for consumer satisfaction and pleasant in-store

ambience as a whole (the total means) as more intensive. This can be seen as a tendency of clothing retailers in smaller towns to focus on functional aspects of their competitive strategy defined by the rational and economic attributes including the quality of the product and service, whereas clothing retailers in larger towns seemed to focus on affective aspects of their strategy that included emotional (relating to feelings and internal emotions) and social (related to the social impact of the purchase) aspects of the individuals.

The research found out that all examined retail formats of clothing stores in the economic crisis competed in the same way – by lower prices. For some reasons they ignored competitive strategies associated with their retail formats. Competition by price is common for discount and second hand stores that focus on low cost – low price strategy. However, boutiques and mid-range stores focusing on customer satisfaction through services and customer care to differentiate from others lowered their prices and used price as a competitive advantage, as well. For this reason, there were no statistically significant differences in responses to competitive activities in the market found among different retail formats. When exploring reactions of clothing retailers to a competitive threat, there was hardly any sign of avoiding direct competition by differentiating. Primarily, all retail formats adapted strategy of competitors in order to negate their competitive advantage, i.e. to compete by lower prices. Statistically significant differences in responses of clothing retailers to competition were found in the use of advertising and promotional activities. Discount stores, department stores and hypermarkets, mostly as multiple retailers with higher turnover located in large towns used advertising and promotion to communicate their sales and low-price offers to customers to a greater extent than other clothing retailers.

## **GOVERNMENT DEBT AND ECONOMIC GROWTH: A GRANGER CAUSALITY ANALYSIS OF PANEL DATA EVIDENCE**

*Sinh Vo The, Hieu Le Minh, Phung Tran Thi Phi*

### **Abstract**

This study examines the causal relationship between Economic Growth and Government Debt using a panel Granger causality test. The empirical results based on 159 countries show that the relationship between these two variables differs depending on the income cohort to which a country belongs. The findings also suggest that differences exist in the long run and short run causality patterns between growth and debt. In short term, the results reveal that there is unidirectional causality running from economic growth to public debt at all income levels. However, when we test the long run equilibrium relationship by VEC model, there are three distinct outcomes for each different income group. First, the model shows that an increase in government debt will lead to an acceleration in economic growth for low income countries. Moreover, Granger causality analysis for the middle income level investigates the long-run co-movements and interaction between growth and debt. While it explores the unpotential contribution growth-debt and vice versa in high income countries.

### **1 INTRODUCTION**

Sovereign debt has been shooting up as a grave consequence of the recent global financial crisis in 2008. This should not be surprising, given the experience of earlier severe financial crises (Reinhart and Rogoff, 2010). Sovereign debt crisis erupted and has been rigorously distressing many countries in the European Union (EU), threatening the charisma of the euro and even the EU itself. The contemporary public crisis with its epicenter in the euro area has forcefully revitalized the academic and policy discussions on the economic effects of government debt levels (Baum, Checherita-Westphal, and Rother, 2012).

Market concerns about fiscal volatility in defenseless countries may be increasing and spreading to other countries, raising the anxiety that high government debt may damage economic growth. Furthermore, the Maastricht Treaty (The treaty led to the creation of the euro) has distinctively pointed out government debt as major criteria. It was crucially mentioned in the Treaty that high debt levels could be inflationary and obstruct growth. In addition, most market economists have been concerned for a long time about the possibility that excessive government spending could badly impede growth and be inflationary (Taghavi, 2000).

Against this background, empirical studies have started to focus on possible correlations within the growth-debt nexus, with specific attention given to large public debt. However, the earlier researches of the relationship among all of two variables GDP and debt are extraordinarily rare. Until now there have been merely two researches, one of Reinhart and Rogoff (2010) and another one of Taghavi (2000), concentrating on this causality. Surprisingly, Taghavi (2000) was the only one at the time paying attention to the European zone, though it is a dynamic economic area and the current core of the sovereign debt crisis. His was the only study using the Vector Auto-regression Model (VAR) to check the debt-growth relationship. For this reason, it is suggested that more studies on this topic should be carried out.

The purpose of this paper is to figure out some additional empirical evidences of the relationship among gross domestic product growth per capita (GDP), and gross government debt (DEBT) based on the 15-year period from 2000 to 2014. The 159-country sample was divided into 3 groups consisting of high income, middle income and low income countries, of which many are presently confronted by

government and financial crises. The stationarity of GDP and government debt were tested by Augmented Dickey–Fuller test (ADF test) for unit root hypothesis. The causal relationship between GDP and government debt was later investigated by VAR ( Vector autoregression model, VECM (Vector error Correlation) model and Granger causality testing.

### **1.1 Research objectives and contributions**

According to the research background and motivation mentioned earlier, the major contribution of this paper is to examine the causal relationship between economic growth and government debt since there have been few studies conducted under the same framework in these two advance economy areas. The following are the research objectives of this study. First, we study the causality relationship between GDP and government in 159 countries. Second, we classify levels of countries in High, Middle and Low income and compare the relationship between GDP and government.

As mentioned above, the preceding researches usually focused on the marginal effect between pairs of variables instead of three. Studies on the correlation among all two variables GDP and debt are very rare with barely two researches, one of Reinhart and Rogoff (2010) and another one of Taghavi (2000). Furthermore, Taghavi (2000), was the only one focusing on the European zone, and the only one using the VAR and VEAM methodology to examine the causality. Although VAR and VEAM methodology was applied in this study, it was pure VAR Granger Causality, which is different from pair-wise VAR and VEAM Granger Causality exploited in Taghavi (2000). Therefore, this paper is the only one to discuss both pure VAR and VEAM Granger Causality of GDP and debt in 159 countries. Moreover, this is also the first paper using panel data of 159 countries in over the world with dividing into three main groups: high, middle and low income.

### **1.2 Scope of the study and research procedure**

The time series data of two variables applied in this study cover historical data period from 2000 to 2014 on annual basis which conducted by the World Economic Outlook Database (International Monetary Fund) updated on December 2014 for Gross Domestic Product Growth per capital (US dollar, Current price,) and Gross Government Debt (Percent of GDP).

To analyze the data, time series methods are employed in this research include ADF unit root test, Johansen's multivariate co-integration test, Vector Auto-regression (VAR), Vector Error Correlation (VEC) and Granger Causality test.

## **2 LITERATURE REVIEW**

The empirical literature on the relationship between government debt and economic growth, despite its importance, is scarce (for example, (Schclarek, 2004); (Reinhart and Rogoff, 2010); (Kumar and Woo, 2010); (Checherita –Westphal and Rother, 2010, 2012), (Checherita-Westphal and Rother, 2012)).

Some literatures point out the uncertain relationship between government debt and GDP. Taghavi (2000) investigated whether debt hampers growth by using the hybrid techniques of co-integration and vector autoregressive model (VAR) employing data on real GDP growth and real debt ratio in the four economies (France, Italy, Germany, UK) throughout the period 1970-1997. The results implied that debt's effect on growth was ambiguous. They concluded that the short run impact of debt on growth diverged quite considerably from one country to another. While in France and UK a one percent debt increase led to nearly 0.4% growth in the short run, Germany and Italy experienced negative short run growth rates of around 0.65%. Similarly, as the cumulative figures suggested, even as Italy experienced a significant plummet in its growth of about 2.2%, the UK gained a significant improvement in growth of around 1.2%. On the other hand, the cumulative impact of debt on growth was inclined to support the view that could induce growth in each of the four countries and the EU in the longer term. It meant growth was slightly and insignificantly enhanced by changes in debt in the long run, but gave no clear result in the short run.

Schclarek (2004) inspected this topic in a broad view including the role of external debt in both emerging and advanced economies. No strong evidence of a statistically significant connection was found for a sample of 24 industrial countries with data averaged over seven 5-year periods between 1970 and 2002.

On the same token, some other findings specified the relationships of those two variables. The theoretical literature had tendency to point to a negative link between the public -to-GDP ratio and the steady-state growth rate of GDP (for instance, (Saint-Paul, 1992); (Aizenman, Kletzer, and Pinto, 2007)). Some growth models showed that a positive impact might be possible in the transition stage to steady-state, depending on the type of public goods financed out of (Aizenman et al., 2007) or up to certain limits when was used to finance productive public capital (Aschauer, 2000).

More obviously, there are a small number of researches using a non-linear impact approach. The empirical evidence on the relationship between government debt and economic growth have recently been pointing at the role of external debt in developing countries (for instance, (Smyth and Hsing, 1995), (Cohen, 1997), (Pattillo, Poirson, and Ricci, 2002), (Clements et al., 2003), (Schclarek, 2004)), while analyses across developed countries, particularly in the euro area, have been barely considered.

A recent study by Reinhart and Rogoff (2010) analyzed (through simple correlation statistics) the developments of public gross government debt and the long-term real GDP growth rate in a sample of 20 developed countries over a period spanning about two centuries (1790–2009), discovered that: (i) the correlation between government debt and long-term growth was fragile for /GDP ratios below a threshold of 90% of GDP and (ii) above this threshold, the median growth rate went down by one percent point and the average by considerably more (about 4 percentage points).

In another recent study, Kumar and Woo (2010) explored a linear inverse relationship between initial and subsequent growth in a sample of emerging and advanced economies, with the impact being somewhat smaller in the latter group. Nevertheless, they also uncover some evidence of nonlinearity. For example, only high levels of debt (above 90 percent of GDP) had a significant negative effect on growth for the sample of emerging and developed countries.

While the study of Checherita-Westphal and Rother (2012) was similar to Schclarek (2004) and (Kumar and Woo, 2010) by proposing the same empirical question, it differed in several respects. They focused only on the euro area countries, with an aim at providing probably more relevant evidences for the current sovereign debt crisis. In consequence, their implication were more readily applicable in the current circumstance given that euro area members presented specific policy characteristics not found in other advanced economies. They did not find a statistically significant linear impact of debt on growth. Their main focus was to investigate a non-linear impact of debt on growth and to determine this threshold endogenously. Last but not least, similar to previous research (Checherita-Westphal and Rother, 2010), Checherita and Rother (2012) again employed a quadratic functional form for the growth-debt estimation equation and checked the robustness of results with other polynomial functions. Besides, Checherita and Rother (2012) also analyzed empirically the channels through which public debt might potentially affect economic growth. For the euro area countries, they found some evidence that the channels through which public is likely to have a non-linear impact on economic growth rate were private saving, public investment and total factor productivity.

The papers worked by Chang and Chiang (2009) and Cecchetti et al. (2011) were both employed the threshold methodology for non-dynamic panels. Chang and Chiang (2009) analyzed a sample of 15 OECD countries and used yearly observations for the period 1990–2004. They found two threshold values in a regression of GDP per capita growth on the debt-to-GDP ratio. Using two control variables (unemployment and gross fixed capital formation), they indicated that debt-to-GDP threshold values of 32.3% and 66.25%. Specifically, the impact of the debt ratio was positive and significant in all three regimes, higher in the middle regime and lower in the two outer regimes. Cecchetti et al. (2011) applied a sample of 18 OECD countries for the period 1980–2010 and achieved a threshold for government debt at 85% of GDP. In contrast to Chang and Chiang (2009), they explored a negative impact on growth in the high regime.

The recent paper that relates more closely to the non-linear panel threshold methodology employed in Chang and Chiang (2009) and Cecchetti et al. (2011) is Baum et al. (2012). A dynamic threshold panel methodology was used to inspect the non-linear impact of public debt on GDP growth. Their empirical

results proposed that the short run impact of debt on GDP growth was positive and highly significant. But when it decreased to around zero, it lost significance beyond public debt-to-GDP ratios of around 67%. An additional to the high amount (above 95%) had a negative impact on economic activity.

The latest research, Afonso and Jalles (2012), utilized a panel of 155 countries to assess the linkage between growth and government debt. They confirmed a negative effect of the government ratio for the full sample; a quadratic term was not statistically significant; and for the OECD, the longer the average maturity, the higher the economic growth.

### 3 SAMPLE SELECTION, RESEARCH METHODOLOGY

#### 3.1 Sample selection

Based on popular patent databases is currently available, the time series data of two variables applied in this study cover historical statistics for the period from 2000 to 2014, conducted by the World Economic Outlook Database (International Monetary Fund) updated on December 2014 for Gross Domestic Product Growth per capital (US dollar, Current price,) and Gross Government Debt (Percent of GDP). The data length was determined based on the availability of the data values at the time of this research began. Both variables are conducted in annual basis and expressed in their natural logarithms to capture growth effects where GDP is measured in current U.S. dollars and DEBT is measured as a percentage of GDP.

#### 3.2 Research methodology

Unlike previous research that used panel data analysis, this study employs a more advanced Granger causality technique for fixed coefficient panels that was developed by Hurlin and Venet (2001) and Hurlin (2004). In order to examine the causal relationship between GDP and DEBT empirically, the Granger causality was used with two controlled variables to test for the impact of Gross Government Debt to Economic Growth and vice versa. Granger causality becomes a powerful tool to investigate the causal effect and functional relation from numerous temporal data (Luo, Ge, & Feng, 2011).

##### 3.2.1 Granger Causality test

We specified the following bi-variate vector error correlation and vector auto-regression system of order  $p$  for the pair of the two variables GDP and DEBT. Such VEC, VAR system were recommended as it provides more robust estimates. In this study, the following hypotheses are considered to examine relationship between Economic Growth and Government Debt by using Johansen test and Granger-causality test (Kim, Chen, & Jang, 2006):

$$GDP_t = \mu_1 + \sum_{i=1}^p \alpha_i GDP_{t-i} + \sum_{j=1}^q \beta_j DEBT_{t-j} + \varepsilon_{1t} \quad (1) \quad DEBT_t = \mu_2 + \sum_{k=1}^p \alpha_j GDP_{t-k} + \sum_{i=1}^q \beta_i DEBT_{t-i} + \varepsilon_{2t} \quad (2)$$

Where:  $\mu$  is intercept;  $t$  is time trend;  $\alpha$ ,  $\beta$  are coefficients;  $p, q$  is optimal lag length and  $\varepsilon_t$  is residual.

The null hypothesis of “DEBT does not Granger cause GDP (DEBT  $\neq$  >GDP)” was tested by using a standard Johansen test and Granger causality test of the Joint Hypothesis

$$H_0 : \beta_{11} = \beta_{21} = \dots = \beta_{p1} = 0$$

DEBT was said to cause GDP in the Granger sense if the above null hypothesis was rejected (that is, at least one of the  $\beta_j$  s for  $i = 1, \dots, p$  was statistically significant). Similarly, the null hypothesis of ‘GDP does not Granger cause DEBT (GDP  $\neq$  >DEBT)’ was tested by defining the null hypothesis.

$$H_0 : \alpha_{11} = \alpha_{21} = \dots = \alpha_{p1} = 0$$

GDP was said to cause DEBT in the Granger sense if the null hypothesis was rejected.

For the above hypotheses testing, it was assumed that the time series of GDP and DEBT involved in Equations (1) and (2) are stationary. If the time series are non-stationary, then we could use the stationary differenced form of the time series. Sims (1980) recommended against differencing, even if the time series are non-stationary. They argue that the goal of VAR and VEC analysis is to determine the interrelationships among the variables, not the parameter estimates (Enders, 1995). However, if the two time series GDP and DEBT are non-stationary (or contain a unit root), it is important to test whether they are co-integrated, as this affects the causality test results such as Engle and Granger (1987), Sims C. A (1994), Mosconi and Giannini (1992), Toda and Phillips (1993).

### 3.2.2 Co-integration test

Co-integration method has been developed by Granger (1969) as a tool in order to investigate a long-term relationships among variables. Later on, Engle and Granger (1987) formed a linear combination of two or more non-stationary series that might be stationary. When such a stationary linear combination endures, the series are regarded as be co-integrated and long-term relationships among them exist. Because of the existence of co-integration, although the series are originally independent in their motion, they cannot advance away from each other in the long run. Co-integration entails stationarity.

Engle and Granger (1987) explained that if co-integration exists between two variables in the long run, and then there must be either unidirectional or bi-directional Granger Causality between these two variables. As mentioned earlier, if they have one unit root and are co-integrated, then the bivariate VECM is specified and estimated. The Granger causality test is then conducted in the context of the VECM. If the two series have one unit root and are not co-integrated, then the bivariate VAR is specified and estimated.

### 3.2.3 Unit root test

We then formally tested co-integration of DEBT and GDP variables by employing the Engle and Granger (1987) procedure, which is based on testing for a unit root in the residual series of the estimated equilibrium relationship by employing the Dickey–Fuller test. It is recommended to examine the stationary of the variables. Stationary means that the mean and variance of the series are constant through time and the auto covariance of the series is not time varying. In this study, each series is tested for unit roots on the levels and first-order differences of them by using the Augmented Dickey-Fuller (ADF) tests presented by Dickey and Fuller (1979). Both the Akaike Information Criterion (AIC) and Schwartz Bayesian Criterion (SBC) are used to select appropriate an optimal lag lengths. The ADF test practices the following regression,

The Augmented Dickey-Fuller (ADF) (Dickey & Fuller, 1979) unit root tests are generally used in most researches.

According to Greene (2003), the hypothesis to be examined with unit root test is presented below:

$H_0$ : There is a unit root (data series are non-stationary)

$H_1$ : There is no unit root (data series are stationary)

Three different assumptions regarding stationarity of time series of the ADF test are examined as follows.

Model I: Trend and drift (Trend  $T$  and drift  $\mu$  are included in the model)

$$\Delta Y_t = \mu + \rho_0 Y_{t-1} + \eta T + \sum_{i=1}^p \rho_i \Delta Y_{t-i} + \varepsilon_t$$

Model II: Drift (Only a drift  $\mu$  is included in the model)

$$\Delta Y_t = \mu + \rho_0 Y_{t-1} + \sum_{i=1}^p \rho_i \Delta Y_{t-i} + \varepsilon_t$$

Model III: Neither trend nor drift (Neither trend  $T$  nor drift  $\mu$  are included in the model)

$$\Delta Y_t = \rho_0 Y_{t-1} + \sum_{i=1}^p \rho_i \Delta Y_{t-i} + \varepsilon_t$$

Where  $Y_t$  is the observation of the data series. In our case,  $Y_t$  may represent GDP or DEBT;  $\Delta Y_t$  is the first difference of the variable  $Y_t$ ;  $\mu$  is intercept;  $t$  is trend;  $\rho_0$  and  $\rho_t$  are coefficients;  $p$  is optimal lag length and  $\varepsilon_t$  is residual.

According to Enders (1995) unless the researcher knows the actual data generating operation, it is unclear whether it is most appropriate to include a constant term and a trend factor in the unit root process. It might seem reasonable to test the existence of a unit root in the series using the most general of the models.

### 3.2.4 Optimal lag length

A significant note about Granger causality test is that the results depend on the lag length. Thus, it is assumed that the lag length is long enough to reflect the effects of the past values of these time series on the current value. For robust estimation of VAR or VECM, optimal lag length is compulsory to capture autoregressive correlation in residuals of the estimated model (Schwert, 1987). The proper optimal lag length should be determined in order to avoid the error as much as possible since Lütkepohl, (1993) explained that over fitting (selecting a higher order lag length than the true lag length) causes an increase in the mean-square forecast errors as well as under fitting the lag length often generates auto correlated errors.

The number of lagged terms is chosen to ensure that the errors are uncorrelated. The number of lags is crucial. If not enough lags are included in the model, the model could contain serial correlation and it would provide biased estimators.

To determine the suitable optimum lag length: the Akaike's information criterion (AIC), Schwarz information criterion (SIC) or Bayesian Information Criterion (BIC), log-likelihood ratio test (LR) Criterion, and the Hannan-Quin information criterion (HQC) may be employed. However, two most popular methods are AIC and SIC. Their rationales are similar. VAR or VECM with the optimal lag length will make the estimated model have higher explanatory power than using the other lag lengths. The smallest AIC and SIC are can be applied for choosing the most efficient and accurate optimal lag length. Hence, this research determines optimum lag length by employing these two criteria AIC and SIC.

According to Greene(2003), AIC and SIC measures are presented as below:

$$AIC = \ln|\tilde{\Sigma}| + \frac{2}{T}$$

$$SIC = \ln|\tilde{\Sigma}| + \frac{\ln T}{T}$$

Where  $\tilde{\Sigma}$  : the estimated covariance matrix and T is is the number of parameters

## 4 EMPIRICAL RESULTS

### 4.1 Descriptive analysis

The most frequently adapted methodology is that which starts with a descriptive statistics of the two variables. So we will start this methodology by descriptive statistics (See Table.1). After that we pass to apply unit root analysis, cointegration analysis, causality analysis. The mean, standard deviation, minimum values and maximum values of the debt and GDP variables are given in Table (1) below:

Table 1 – Descriptive Statistic			
	High income	Middle Income	Low income
ln(GDP)			

Mean	9.81	7.76	6.23
Std. Deviation	0.85	0.76	0.85
Minimum	7.42	5.66	4.69
Maximum	11.66	9.26	10.27
ln(DEBT)			
Mean	3.64	3.70	4.05
Std. Deviation	0.71	0.78	0.71
Minimum	-0.60	0.88	2.48
Maximum	5.50	11.29	6.68

List of countries:

**High income:** Luxembourg, Norway, Qatar, Switzerland, Australia, Denmark, Sweden, Singapore, United States, Canada, Netherlands, Finland, Austria, Ireland, Belgium, Iceland, Kuwait, Germany, United Arab Emirates, France, New Zealand, Brunei Darussalam, United Kingdom, Japan, Hong Kong SAR, Israel, Italy, Spain, Bahrain, Saudi Arabia, Cyprus, The Bahamas, Slovenia, Malta, Greece, Oman, Portugal, Taiwan Province of China, Trinidad and Tobago, Equatorial Guinea, Czech Republic, Estonia, Slovak Republic, Uruguay, Chile, Lithuania, Latvia, Barbados, Seychelles, Argentina, Russia, Antigua and Barbuda, Poland, Hungary, Gabon, Brazil, Panama, Turkey, Libya, Mexico, Costa Rica, Malaysia, Lebanon, Suriname, Mauritius, Romania.

**Middle income:** Colombia, Azerbaijan, St. Lucia, Grenada, Venezuela, Bulgaria, Turkmenistan, Botswana, Dominica, China, Maldives, South Africa, St. Vincent and the Grenadines, Peru, Angola, Ecuador, Serbia, Dominican Republic, Thailand, Namibia, Algeria, Jordan, Jamaica, FYR Macedonia, Islamic Republic of Iran, Bosnia and Herzegovina, Belize, Fiji, Albania, Tunisia, Paraguay, Ukraine, El Salvador, Guyana, Indonesia, Guatemala, Swaziland, Republic of Congo, Sri Lanka, Armenia, Morocco, Nigeria, Vanuatu, Bolivia, Philippines, Bhutan, Honduras, Moldova, Papua New Guinea, Sudan, Vietnam, Uzbekistan, Nicaragua, Ghana, Zambia, Lao P.D.R., Djibouti, Yemen, India, Côte d'Ivoire, Cameroon.

**Low income:** Kenya, Kyrgyz Republic, Pakistan, Chad, Lesotho, Mauritania, Senegal, Tajikistan, Cambodia, Comoros, Haiti, Benin, Sierra Leone, Tanzania, Rwanda, Nepal, Mali, Togo, Uganda, Mozambique, Korea, Guinea, Eritrea, Ethiopia, Guinea-Bissau, Madagascar, Liberia, The Gambia, Niger, Democratic Republic of Congo, Central African Republic, Burundi.

Table 1 shows the descriptive statistics of GDP per capital and Gross Government or three different income groups. The statistic clearly indicates that GDP are substantially higher in high income countries than in middle income countries and low income countries. On the contrary, the mean of Gross Government Debt in countries has a tendency small in high income, larger in middle countries and the highest in low income countries.

#### 4.2 Non-stationary and Stationary Tests

We begin with examining the stationary properties of the variables employing the Augmented Dickey Fuller (ADF) unit root test determining the maximum order of integration of the variables. The findings that all variables have a different order of integration allowed us to directly test VEAM Granger causality in 159 countries because of same order of integration. Using significant at 10%; \*\*: significant at 5%; \*\*\*: significant at 1%;

Table 2 – Unit root test for panel data

Variables	GDP per capital (2000-2014)				Gross Government (2000-2014)			
	t- statistic with no intercep t	Critical (5%) with no intercept	t- statistic with intercep t	Critical (5%) with intercep t	t- statistic with no intercep t	Critical (5%) with no intercep t	t- statistic with intercep t	Critical (5%) with intercep t
Overall sample (N= 159)								
<i>Level</i>								
High income (N=66)	-0.13	-1.94	-2.56	-2.86	-1.56	-1.94	7.05	-2.86
Middle income level (N=61)	-0.48	-1.94	-2.01	-2.86	-1.50	-1.94	-8.89	-2.86
Low income (N= 32)	-0.48	-1.94	-4.98	-2.87	-0.51	-1.94	-7.35	-2.87
<i>First difference</i>								
High income (N=66)	-8.38	-1.94	-8.37	-2.86	-28.89	-1.94	-28.88	-2.86
Middle income level (N=61)	-9.50	-1.94	-9.50	-2.86	-27.70	-1.94	-27.69	-2.86
Low income (N= 32)	-21.56	-1.94	-21.54	-2.87	-6.90	-1.94	-6.89	-2.87

This table uses Augmented Dickey–Fuller test to analysis the stationary of time series. Null hypothesis is  $H_0$ : data has unit root with  $H_0$  indicate Gross Domestic Growth (GDP) or Gross Government Debt (DEBT). If the test statistic (p value) is less than the critical value, then the null hypothesis is rejected and no unit root is present. The time series are stationary. If  $H_0$  is non-significant, time series have unit root. Where notes \*, \*\*, \*\*\* show significant at 10%, 5% and 1% respectively.

Table 2 reports the results of the panel data unit root test by Dickey and Fuller (1979) for Gross Domestic Product per capita and Gross Government . The test is conducted for sub-income groups countries. The panel unit root of GDP per capita results indicate that all t-bar statistics successfully reject the null hypothesis of non-stationarity at level for being constant with intercept models. Moreover, the t-bar statistics of DEBT variables could be rejected at the 5% significance level when estimating level. Overall, the panel unit root test results reveal the absence of any unit root at the level. Hence, The panel data series are stationary at level or generated by an I(0) process.

### 4.3 Optimal lag length

A The unit root tests are sensitive to differences in the model lag structure. The optimal lag length model must be determined to capture autoregressive time series and a residual in the process of ADF unit root test (Schwert, 1987). In this paper, the optimal lag length test is a compulsory step to identify autoregressive time series and residuals for VAR Granger causality. Akaike information criterion (AIC), Schwarz information criterion (SC), Hannan-Quinn criterion (HQ), Final prediction error (FPE) and likelihood ratio test (LR) are frequently in use to decide the appropriate lag length. As mentioned above, only AIC and SIC criterion were employed to choose the optimal lag length in the study. The lowest value of AIC and SC will be preferred.

Table 3 – Optimal lag length for group of income countries

Countries	Lag	AIC	SC	HQ
High Income	0	5.19	5.2	5.19
	1	1.28	1.30*	1.29
	2	1.26*	1.31	1.28*
	3	1.27	1.34	1.29
	4	1.27	1.36	1.31
Middle Income	0	4.57	4.58	4.58
	1	2.17	2.2	2.18
	2	2.1	2.15*	2.12*
	3	2.10*	2.18	2.13

	4	2.11	2.2	2.14
	0	4.42	4.44	4.43
	1	1.32	1.36*	1.33*
<b>Low Income</b>	2	1.31*	1.4	1.35
	3	1.32	1.44	1.37
	4	1.32	1.48	1.38

\* indicates lag order selected by the criterion

AIC: Akaike's information criterion

SIC: Schwarz information criterion

HIQ: Hannan-Quin information criterion

Table 3 presents different results of optimal lag length for sub- income groups data sets.

In related to the high income countries, AIC has the smallest number at lag 2 equal to 1.26, while SIC has the smallest figure at lag 1 equal to 1.30. Moreover, due to the conflict of the results between AIC and SIC, further criterion to choose optimal lag length was taken into consideration. Result of SIC is chosen because it is more accurate than that from AIC based on the principal parsimony. In other words, lag 1 is the best choice for group of high income countries. As in the previous case, lag 2 and lag 1 are fixed to middle and low income groups respectively.

#### 4.4 Co-integration test

The second test of multivariate co-integration was applied to examine whether GDP and DEBT interact, or the long-run relationship between the GDP and DEBT was estimated of the same order one I(1). The multivariate co-integration test was employed with five different models. Specifically, when the series do not have co-integration and no long-run equilibrium relation among time series, Vector Auto-Regression (VAR) model is applied to measure Granger causality effect. On the contrary, if there is interrelation among the time series, a Vector Error Correlation model is used to examine Granger causality.

The procedures described above are only able to indicate whether or not the variables are co-integrated. We proceed to examine whether there exists any long-term equilibrium relationship between the variables under investigation. For this purpose, we resort to Pedroni; 1999, 2001, 2004; Kao, 1999) for co-integration tests, Two or more variables are said to be co-integrated, if the share a common trend and are linked with long-run relationship i.e exhibit the same stochastic trend.

In this paper, to strongly explore whether DEBT and GDP have co-integrated to test the long run relationship or not, the results in Table (4) below:

Table 4.1 – Co-integration Tests based on the Johansen Approach between GDP and DEBT in High income country

<b>Rank Test (Trace)</b>										
	<b>Model 1</b>		<b>Model 2</b>		<b>Model 3</b>		<b>Model 4</b>		<b>Model 5</b>	
	Trace	0.05	Trace	0.05	Trace	0.05	Trace	0.05	Trace	0.05
	Statistic	Critical Value	Statistic	Critical Value	Statistic	Critical Value	Statistic	Critical Value	Statistic	Critical Value
R=0	42.83	12.32	68.00	20.26	67.98	15.49	73.17	25.87	72.78	18.40
R≤1	0.05	4.13	20.63	9.16	20.61	3.84	23.33	12.52	22.98	3.84
<b>Rank Test (Maximum Eigenvalue)</b>										
	Max-Eigen	0.05	Max-Eigen	0.05	Max-Eigen	0.05	Max-Eigen	0.05	Max-Eigen	0.05
	Statistic	Critical Value	Statistic	Critical Value	Statistic	Critical Value	Statistic	Critical Value	Statistic	Critical Value
R=0	42.78	11.22	47.37	15.89	47.37	14.26	49.84	19.39	49.80	17.15
R≤1	0.05	4.13	20.63	9.16	20.61	3.84	23.33	12.52	22.98	3.84

The results in Table(4.1, 4.2 and 4.3) show that the null hypothesis of no co-integration ( $r=0$ ) on both trace test and maximum eigenvalue test between DEBT and GDP can not be rejected at 5%, However, the null hypothesis of no co-integration ( $r\leq 1$ ) could be rejected at 5% meaning that there is only one co-integration vector.

#### 4.5 Granger causality testing procedure for causality

The causality between GDP and DEBT was enhanced by using the recently developed Granger causality testing procedure for causality (1988) for testing that if two series are co-integrated, and then there must be Granger-causation for at least one direction. Basically, the idea is that if changes in X precede changes in Y, then X could be a cause of Y or vice versa. Because the co-integration test indicates that the time series are co-integrated, the causality relationship can be controlled out. Hence, checking of the causal relationships as well as directions of the series could be done directly through Granger causality test. Because all of these variables are integrated of order  $I(0)$ , their levels are used in the Granger-causality test which requires the use of a stationary process.

In this paper, we wish to test granger causality between GDP and DEBT in both long run and short run in order to find out the differences results between each group of countries in short term and long term. Moreover, we carried out comparison among sub- groups.

Table 5 – Granger causality relationship between DEBT and GDP time series in sub-countries in short run

<b>Sub-income</b>	<b>Lag</b>	<b>Null Hypothesis</b>	<b>Probability</b>	<b>Conclusion (Hypothesis)</b>
High Income	1	GDP does not cause DEBT	0.0021	Reject
		DEBT does not cause GDP	0.1074	Accept
Middle Income	2	GDP does not cause DEBT	0.0159	Reject
		DEBT does not cause GDP	0.6965	Accept
Low Income	1	GDP does not cause DEBT	0.0784	Reject
		DEBT does not cause GDP	0.6425	Accept

This table illustrates Granger causality test between GDP and DEBT. The test is performed for the whole sample period. For each GDP measure, we first test the null hypothesis that GDP does not Granger cause the DEBT in short run. We report probability for each test. We choose optimal lag length 1 or 2 for each income group to prove strong causal relation results and denote a rejection of the null hypothesis with note: \*, \*\* and \*\*\* indicate statistical significance at 10%, 5% and 1% levels, respectively.

Consistent with our prediction and previous results, this table demonstrates the mutual impacts among the data variables of chosen countries. It is obvious that the result of Granger testing may be summarized as follows: There was a positive short run causality relationship running from GDP to DEBT in all groups of countries. It presents strong evidence to convince that movement of GDP will affect fluctuations of DEBT. The direction of causation also runs from GDP to DEBT in groups of high income, middle income and low income countries with p-value 0.0021, 0.0159 and 0.0784 respectively.

Table 6 – Granger causality relationship between DEBT and GDP time series in sub-countries in long run

<b>Sub-income</b>	<b>Lag</b>	<b>Null Hypothesis</b>	<b>Probability</b>	<b>Conclusion (Hypothesis)</b>
High Income	1	GDP does not cause DEBT	0.1257	Accept
		DEBT does not cause GDP	0.2123	Accept
Middle Income	2	GDP does not cause DEBT	0.011	Reject
		DEBT does not cause GDP	0.0397	Reject
Low Income	1	GDP does not cause DEBT	0.9347	Accept
		DEBT does not cause GDP	0.023	Reject

When we tested the Granger causality relationship between Economic growth and Government Debt in the long term, the result of Table 6 above indicated that there was no causality relationship running from either inflation or government debt to GDP in group of high income countries because p-values (0.13 and 0.21 respectively) were not significant and bigger than 10 percent. Importantly, in case of middle income countries, there was a bidirectional causality running from GDP to government debt since p-values for Granger causality tests were all significant under 5 percent (0.01 and 0.04 correspondingly). The above evidence also implies that government debt had an impact on economic growth in the low income countries with p-value lower than 5 percent.

It is clearly seen that the outcome case was not entirely satisfactory due to the fact that it has not absolutely supported the findings cited in the literature review. As mentioned above, the former studies verified the unidirectional relationship from debt to GDP, along with the bidirectional correlation between DEBT and GDP. However, the result only indicated a unidirectional relationship between DEBT and GDP. More to the point, it confirmed the reversed correlations running from GDP to DEBT as compared to those in the literature review. This might be a remarkable finding because there has yet been no proof of the existence of the influence of GDP on government debt. It could be put into consideration for further studies.

## 5 CONCLUSION

This study analyses empirically the causal relation between economic growth and debt in various sub-groups of countries which are based on the level of per-capita income of these countries in long run and short run over the 2000 – 2014.

Public debt has become an increasing serious problems for various countries in the world. It is due to unexamined public expenditures, bureaucracy, tax evasion and corruption. In order to classify whether government debt cause economic growth or vice versa, an auto regression model is developed in short run and a vector error correlation model is built in long run.

The results showed that there was at least one co-integration relationship among the variables in the VEC model. The evidence of multivariate co-integration testing results suggest that debt and economic growth are co-integrated. That is, these variables move together in the long run.

In the long term, we found that there were different results among the three income groups. High income countries' results implied that there was no causality relationship between economic growth and government debt as p-value significant a higher than 5 percent. On the contrary, the result of middle income countries is totally opposite. The increasing or decreasing trends of economic growth will strongly affect public debt and vice versa. We also found out the potential contribution of debt to growth.

In relation to short term analysis, the presence of a causal link between growth and debt has implications of great importance on development strategies for developing countries. Our findings provide evidence to support the growth-led debt hypothesis in all groups of countries.

## **CLASSIFICATION OF BUSINESS MODELS**

*Štefan Slávik*

### **Abstract**

Business model shows and explains the logic and principles of the operation of a company. In business practice several dozen real operating models naturally evolved. The article describes these models and tries to create a primary typology, which would arrange the models in a systematic whole. The purpose of the typology is not only to clarify untidy set of models, but also to explain the principles of their operation, the sources of earnings and lay the foundation for their further innovative development.

*Keywords: business model, visualization of business models, typology of business models, products and solutions, resources and processes, business, communities, prices and payments, sources of earnings*

JEL Classification: M10, M21

## **1 INTRODUCTION**

The business model is a conceptual and economic notion of how the enterprise works and how it makes money. It is simplistic, but principal image of a company that contains resources and processes to convert them into value for the customer and way of appropriation of a part of produced value. Joan Magretta (Magretta, 2002) considers the business model in its deepest essence for a story that explains how business works. Good business model according to its view answers to the old question of the entrepreneur: Who is the customer? What the customer considers valuable and useful? How to make money in the given business? What is the economic logic that explains how to bring value to customers (benefit) at a reasonable cost? John Mullins and Randy Komisar (Mullins, Komisar, 2010) approach the topic specifically from the positions of business economics and the achievement of earnings. They think under the business model some structure of economic activities – a cash flowing in and out of the business for various purposes and timing, which dictates the acquisition or loss of money and the ability to offer attractive returns to investors. In short, the business model is the economic underpinning of the company in all its aspects. Mark Johnson, Clayton Christensen and Henning Kagerman (Johnson, Christensen, Kagerman, 2008) do not strive for too explicit definition of the business model, but they take a view that every successful company works according to an effective business model. If its essential parts are systematically identified, then the highest managers understand how the model addresses (offers) to meet the needs on a profitable basis, while it uses the key resources and key processes for this purpose. With this understanding they can assess whether the original model could be used to meet the radically different needs and what they would need to do to build a new model to make money on new opportunities.

## **2 REASONS FOR THE CREATION AND VISUALIZATION OF BUSINESS MODELS**

Drivers of growing interest in business models have been the emergence of the knowledge economy, the expansion of the Internet and electronic commerce, outsourcing and the off-shoring of many business activities and the global restructuring of financial services. A way

how companies are at this time earning money differs from industrial era, for which a volume of production was important and realization of value was relatively simple. Enterprise simply put its technology and intellectual property in a product that sold as a single item or a more complex whole. Driving forces such as globalization, deregulation and technological progress (and these are just some) have got their contribution to the development of this theme too. They deeply affect to the rules and usages of competing. The fastest growing companies in rapidly changing environment are those that use the structural changes to upgrade their business models to compete otherwise.

Visual and functional display of the business model is a good tool for a better understanding of company operation, it is also a means to formulate its purpose and the conditions of its existence. It is a transparent scheme which displays essential characteristics of the business on the small space. It provides a platform for the identification of vulnerabilities, therefore those with poor effectiveness and efficiency, while ensuring to look for exceptional elements and links. Visualization can be used for innovation, experimentation, stimulating creativity, creating hypotheses and variations of the business model.

Alexander Osterwalder and Yves Pigneur (Osterwalder, Pigneur, 2009, pp. 15-44), along with other collaborators have created a more complex concept of the business model (Fig. 1) called Canvas. At the core of this business model there are customers, customer value proposition, infrastructure and financial viability. It is the most comprehensive among the described models. It captures the economics side of the business through streams of incomes and expenditures, it records the places where costs are consumed and revenues are generated. It describes the value that a firm makes to the customer. Model, however, does not serve only for the description of business, but it is also an instrument for its innovation. The method used for imaging allows to study concrete businesses efficiently, to formulate specific business model and can be the basis for a more general typologies of real business models. The main parts of the model are shown in fig. 1.

Key partners	Key activities	Customer value propositions	Customer relationships	Customer segments
	Key resources		Channels	
Cost structure			Revenue streams	

Fig. 1 – Scheme of the business model Canvas. Source: Osterwalder, Pigneur, 2009

### **3 PURPOSE AND METHODS OF RESEARCH**

Imaging method and the actual, real models are not identical. Imaging method shows different real models in the same way. Imagining method is general, does not substitute a real model, because model is concrete, and it can be unique and original moreover. Goal of the paper is to create a systematic and ordered conception on varied types of business models. Typology of real business models is used for clear grouping of large volume of various models into a small number of types that will represent the predominant characteristics of the respective group. Typology will bring clarifying and organizing similar and different models, and thus provides orientation in a complex set of models, generalizes perception of models and explains their different functionality in particular groups. Classification of business models into groups (classes) and possibly subgroups is also the starting point for their innovation, or the formation of entirely new models.

Sources of knowledge about business models were the examples given in the books of professional literature and scientific journals. Another source of examples of models was professional journals and observation through questionnaire research, which has been carried out in 208 companies (Slávik, Bednár, 2014). Groundbreaking piece of work by Osterwalder a Pigneur (Osterwalder, Pigneur, 2010) deals with visualization instrument (Canvas) particularly, with structuring a model and its use in business practice. It introduces a few patterns of models, which illustrate visualization method, but they are not a systematic typology (unbundling business model, the long tail, multi-sided platforms, free as a business model, open business models). One the first books on business models by Debelak (Debelak, 2006) addresses to framing a business model. It shows some case studies, which are illustrations only again and they do not create a typology (case studies on retail businesses, service oriented, product oriented, personal service, distribution companies, Internet company). Afuah (Afuah, 2014) studies innovations of five kinds of business models (the long tail, crowdsourcing, social media, less-is-more innovations, disruptive technologies), but he does not look for and not formulate any links and connection among them. Kaplan (Kaplan, 2012) describes in very detail innovations of business models, but without picturing a system of models, which would be delineate innovation scope, or potentially white spaces for origin of new models. Casadesus-Masanell a Ricart (Cassadesus-Masanell, Ricart, 2011) write about features of the right business model (Is it aligned with company goals? Is it self-reinforcing? Is it robust?), but they do not try to make a clasification of models into some groups, they introduce an individual and generalizing feature of business model only. Johnson formulated three business models archetypes: solution shop, value-adding process business, facilitated network (Johnson, 2010, p. 84) a nineteen business model analogies (Johnson, 2010, p. 131), which are submitted in shape of list without classification and structure. Muehlhausen (Muehlhausen, 2014, p. 38) presents twenty four examples of business models, however without any attempt to systematize. Gassmann, Frankenberger, Csik (Gassmann, Frankenberger, Csik, 2014) provide with the largest so far published list of fifty five kinds of models, but again without studying similarities and effort to establish a transparent system, which would enable to understand better principal operation of models. It is a pity, because facto-graphic material is very large and models are described in detail enough. Concrete business models coming from quoted authors and their publications are enumerated only, they do not have a unifying content and formal base, although they are interesting and challenging. There are some lists only without explicit internal connections. After a thorough study of relevant literature there was not recorded any case of a coherent or partial typology, with the exception of business models tied exclusively to the Internet (Wirtz, Schilke, Ulrich, 2010).

For clustering models to groups there was used the concept of vertical integration, and then particularly the concept of aggregation of single models according to their main or dominant characters. Groups of models are distinguished by whether their centre of gravity and essence is the product (solution for the customer), resources and processes, trade activities, consumer communities and pricing together with methods of paying for the product (service). For each of groups there are identified financial-economic manifestations and consequences.

#### **4 CLASSIFICATION OF BUSINESS MODELS**

Multi-level typology describes business models that express the essence of enterprise and entrepreneurship since the inception of the primary product (raw materials) to the delivery of the final product or personal service to the final consumer. Typology follows the line of vertical integration with some relatively closed models at the stages of raw material mining and quarrying, manufacturing, trade, services.

The structure of the model will be determined by the extent of vertical integration, which is bounded by partial integration and full integration. The essence of the model in mining and quarrying of raw materials is to find a way to extract the raw material, re-elaborate it into the necessary purity, concentration and shape. Business model in production is mainly engaged in the decision to produce or buy the relevant part of the product, respectively decision on the extent of outsourcing or insourcing. The business model in trade industry determines a method of sale and delivery of the finished product, possibly modifying its size, weight and packaging to another trader or to the final consumer. The space between the finished product and the final consumer fills model of wholesale and retail. Business models of services represent a way how to compile and provide added value in the form of standardized (postal forwarding, voice mobile services), customized (warranty on software, a personal trainer in the fitness centre) and unique (legal action, surgery intervention) solution of customer needs.

Cluster typology divides and classifies real business models on the base of retaining cores (clusters), which are typical for models, dominant and distinguish them from other models. It was formed five groups (clusters) models. Target of study and clustering were real models described in the literature or identified in own research observations. These clusters were subsequently aligned with imaging method Canvas:

A. Products and/versus solutions. An equivalent in the Canvas method is the value that the firm provides to customers. Centre of the business model are products that act more as a way of solving customer problems, rather than as material things, or are necessarily composed of several related products that only jointly and in cooperation can satisfy customer needs, or were previously unavailable because, e. g. they were expensive and in small quantities inaccessible and become available only in the restricted range and large quantities. Examples include the following specific models:

**Sale of solutions** (Johnson, 2010, p.84): Experts use their skills in intuition and solving problems and then they recommend solutions. The model is extended at system integrators, law and corporate consulting firms and advertising agencies. It may be called a consultative model too. Instead of selling a complete product is sold benefit offered by the product. A simple example is: "If it is necessary to construct a hole, it is not necessary to buy a drill and drill machine. Another solution is to order the work of a skilled craftsman."

**Multi-component system/model with a basic product** (Wheelen, Hunger, 2008, p. 110): Gillette invented this classic model to sell razor holders at prices on the level of the break-even point, then that made money on the blade with a higher margin. Hewlett-Packard does the same with printers and print cartridges when it offers the cheap printer and expensive toner. The product is therefore a system, not just one product with one component providing the most profit. This model of a complementary product has got a reverse variant, which uses, for example iPod/iTunes and Amazon Kindle when offering expensive player and cheap music or a book.

Financial-economic manifestations and consequences of this type of model are:

- higher unit margin for more effective (quality) way of solving problems and needs of the customer,
- unit margin, which is the sum of the margins of complementary products. Due to functionally necessary complementariness it is possible to increase margins of complementary products to such an extent as it would not be possible with independently functioning product,
- revenues from products that were previously unavailable.

B. Resources and processes. Equivalents in the Canvas method are key activities, key resources. Centre of business model are the resources and processes that are for the purpose of their better functioning, production and implementation of value allocated out of the company (outsourcing), incorporated into company (insourcing), exchanged with other companies, used in comparison of competitors faster, mixed in a different sequence and other quality in the value chain structure, or disseminated (transferred) to another business. Representatives of this kind of models are, e.g.:

**Unbundling business model** (Osterwalder, Pigneur, 2009, p.46): The company is comprised of three very different types of business with different economic, competitive and cultural essence. Customer relationships, product innovation and infrastructure usually coexist in an enterprise, but it is ideally "untie" into separate entities in order to avoid conflicts or undesirable compromise. For example, the unbundling occurred in the gas industry, when the transit of gas has been separated from the wholesale and then the retail separated again from the wholesale and distribution of electricity, when the retail stores have been separated from the wholesale.

**Bundling business model** (Johnson, 2010, p.131): Simple and more complete shopping through grouping related products, for example a meal from fast food as a combination of a few simple meals and beverages in one package, offering music and player in one whole of iPod / iTunes.

Financial-economic manifestations and consequences of this type of model are:

- cost savings as a result of a suitable combination of external and internal location of the sources and processes, that is, where it is the lowest cost,
- exchange and replenish of resources through cooperation and alliance that enhance the performance and efficiency of the use of combined resources, and resources can be obtained and used without imposing own particularly long-term funds,
- cost savings due to faster turn of resources which is generated by faster processes,
- rapid processes that enable advance and market leadership and earning high profits in the early stages of industry development,
- cost savings due to the use of a single source for multiple uses.

C. Trade. Equivalents in the Canvas method are relationships with customers, distribution channels. Centre of the business model are intermediate platforms and networks mainly based on information and communication technologies and the Internet, variations of free sale and simplifying of sale and diversification of goods sold. Specific business models e.g.:

**Model of multi-sided platforms** (Osterwalder, Pigneur, 2009, p.76): Multilateral platform, or even multilateral markets are known for longer time, but they were extended until the advent of information technology. These are platforms that put together two or more clearly distinct but interdependent groups of customers. Credit cards, for example associate traders with cardholders, newspapers associate readers and purchasers of advertisement, computer operating systems combine hardware manufacturers, software developers and computer users. It is essential that the platform must attract and serve all the groups simultaneously in order to create value.

**Free as a business model** (Osterwalder, Pigneur, 2009, p.88): At least one major customer segment is able to continually draw benefit from free offers. Non-paying customers are financed another part of the business model or other customer segments. The onset of free offers is closely associated with very different economics of digital products and services.

Financial-economic manifestations and consequences of this type of model are:

- higher revenues on the electronic marketplace, which creates favourable conditions for matching supply and demand, simple and convenient process of trade exchange, the possibility of reconciling supply and demand for the rare goods and services,
- revenues that are obtained later after tying customer with free merchandise or service, or it is being paid for additional services and additional product, or it is not being paid for the benefit at all because income comes from sponging off-product, which is advertising most frequently,
- higher revenues is achieved by the discount retailing.

D. Communities. Equivalents in the Canvas method are key partners, customer segments. Centre of the business model are communities of consumers, the shareholders, contributors and users who by participating in the community or in a group receive a benefit that is otherwise unavailable. Some examples of community-based models are:

**Communities of owners:** Users possess a part of the product, but they may take many benefits of full ownership at a fraction of the total price, for example condominiums of recreation facilities whose owners in a reality buy a time share on the use of real estate, or NetJets, where owners can buy flying hours of a small jet airplane.

**Communities of users:** Granting access to the network, generating revenue through membership fees and advertising, for example Angie's List, which is a web portal that collects reliable information and recommendations on companies and medical specialists with high quality of services.

Financial-economic manifestations and consequences of this type of model are:

- revenue comes from payments for a share of the use or consumption of products from a customer who is a member of the community. If the customer was not a member of the community, or the product was not divided into shares, the revenue would not ever arise.
- reducing the unit cost of operation due to the increasing number of community members,
- community has greater bargaining power than individual (customer or company) and can
- negotiate lower purchase prices.

E. Prices and payments. Equivalents in the Canvas method are revenue streams, cost structure. Centre business model is a discrepancy between the time of sale and use of the product and payment for the product, payment of partial price, floating price, interconnected prices of several products, change or substitution of sources of income. Some good examples are the following models:

**Inverse payment cycle:** Generating high profits through maintaining low inventory and customers who pre-pay for a product or service to be delivered in the future, for example Amazon.

**Combined price lists:** Sale of service through multiple price lists that contain price ranges depend on the different degrees of usage and number of services purchased, for example Orange, Telecom, Telefonica O2.

Financial-economic manifestations and consequences of this type of model are:

- generation of high profits by maintaining low inventory and customers who pre-pay for a product or service to be delivered in the future, for example Amazon,
- charging subscription or deposit and gaining access to the product or service, for example journals, music service (Spotify). Cash ever comes up in a few month lead time before the delivery of benefits.
- products with high margins and high operating costs, which are available for customers to rent rather than to buy, for example complex and expensive technologies, luxury cars, aircraft engines (Rolls-Royce). Revenues are fees for leasing, without the possibility of rental, the revenues from the sale of finished products were lower.
- customer pays for services as measured by their actual use, for example phone calls, data transmission, consumption of electricity, water and gas, selling music to songs (iTunes). Minimum income can be achieved by fixed payments independent of actual consumption.
- sale of services through multiple price lists that contain price ranges dependent on the varying degrees of usage and number of services purchased, for example Orange, Telecom, Telefonica O2. Revenues can be increased by the disproportionate decrease of unit price and increase of total sale.
- diversification of revenue sources, for example traditional revenues source of banks are income interests. Due to changing markets, technologies and state regulation this source of revenue is weakening and banks are looking for new sources of revenue in fees for banking services. Currently, object of regulation become fees, and therefore banks are faced with the task of inventing a new business model. Similarly, manufacturing companies add to products more services, which are a source of additional revenue. Slovnaft (oil refinery) will adjust production to what makes the most of money (Haluza, 2012). This company will monitor the correlation between the prices of crude oil and petroleum products and production executives will receive instructions to rapidly change the assortment in favor of more attractive range of products.

## **5 DISCUSSION**

Functionality and diversity of **A. model** (Products and/versus solutions) reside in the product which features, specifications, design serve for satisfying customer needs. Meeting a need means to solve a task, problem, or situation in which a customer is found. If the available solutions are expensive, cumbersome, lengthy, uncomfortable or put various other unacceptable demands on a customer, then cheaper, easier, faster and convenient solution of the problem is the task for this kind of model. The product is matter-of-fact bearer of utility attributes only, and therefore matter-of-fact, material aspect is secondary if compared with primacy of utility attributes of the product, because product features solve customer problem only. The product may be in the process exceptional and usually expensive or vice versa ordinary and cheap, but it can provide the basic functionality of the same quality, for example. wristwatches. The product can be decomposed even into several parts and provides a solution only in coordination of all elements. It may not just be a notorious model of holder and razor, it is also a model of cheap cars and expensive spare parts and service work, the model of the teaching process and textbooks, iPod player and iTunes e-music store and the like. Another version of the disassembled product is a furniture of brand IKEA, which is assembled by a customer, because in fact a semi-finished product is being bought. Source of inventiveness in this model is far from being technological development only. New or higher value of the

product is achieved by a combination and variation of existing products or their introduction in new contexts, it is not only technical, but also entrepreneurial innovation. E.g. it is noteworthy, as a model of hotel has been gradually developed. The original accommodation capacity has been added with variable congressional background for up to 450 guests, a lot of sport, recreation and regeneration equipment from squash to own riding school and a number of related services. New apartments were added up, the car parks were extended (Trend No 12/2012).

**B. Model** (Resources and processes) is based on the addition or removal of resources and processes involved in the formation of the product. Creating such a combination of resources and processes that are the most effective for a given enterprise, although not sufficient to form the finished product, and are therefore supplemented from outside in the form of cooperation or exchange with other companies. Value chains arise with original and new combinations of resources or with a faster transformation of resources. Some types of resources can be scattered and used in other than the original business, so they are multiply valorised. Specific way of multi-use of resources is sponging on the resources of related business. E.g. model of tabloid is virtually dependent on the content of TV program. This newspaper does not almost open own themes about politics or criminal cases, relies on the flow of news about television formats and their performers, because writing about real causes and paparazziing are expensive. This TV model is a way how to work well and cheaply in a small market (Trend No 6/2012). Unsuitable combination of resources and processes is a common reason for failure of the model, because excellently designed product or solution for the customer are realized with the expensive resources, processes are lengthy or fault, possibly they fail to produce or provide the product or service with expected useful parameters for the accepted market price. An example, how to save resources while maintaining quality of service, is the booking internet portal, respectively call centre, in which twenty people were sitting in the room and handled orders. After the new arrangement people are doing the same thing from their houses, which are often hundreds of kilometers away from the headquarters of the company. Company saves on renting premises and wages corresponding conditions in the capital, and thus saves up to a quarter of the cost (Horváthová, 2012).

**C. Model** (Trade) was developed mainly under the influence of the internet, which enabled electronic commerce, the emergence of virtual market platforms and virtual auction halls. Fundamental change of business model was the emergence of a supermarket in the 30s of the last century and the next trade forms that developed this concept. Ingenuity of trade models residue on such a combination of supply and demand, which would be impossible to carry out without electronic support at all or only clumsily and without proper effects. Another powerful concept tries to attract customer through free or very cheap buying. It is believed that after creating addiction to the product the customer will be willing to pay for the next purchase, or pay for a higher version of the product. Model must substitute the losses (costs) for providing the free of charge products with takings of other products. Supermarket model and its other versions almost removed from stores sales personnel, retail chain Lidl uses standardized building according to a pattern of industrial buildings, goods are not unloaded on a shelf but mostly remains in pallets, so shop recalls a warehouse, an assortment is dominated by private or non-premium brands. Who does not mind, makes a cheaper purchase, though perhaps with less comfort than in other stores. The antipole of simplifying are the shopping malls, trade centres and shopping palaces, which have impressive architecture and a relaxed atmosphere. Synergistic effect is a consequence of the grouping of stores, bank branches, restaurant services, entertainment, fitness and wellness services in one building unit. Sometimes just only a partial change in the business model is enough and the difference from competitors is obvious.

**D. Model** (Communities) is formally similar to the market platforms from the previous model, but does not link the supply and demand as an intermediary platform. Earnings are from paying membership fees, for placing ads on the website of the community, for making available data on the community to other businesses or community does not earn, but provides members with a benefit from joint ownership which is adequate to their share of the common property. Community is autonomous and its activities are almost exclusively oriented inwards. Community is stronger, more powerful and more efficient than an individual. Community cooperates mainly internally, but can share or exchanges results of its work with other communities. Community but primarily brings some benefit to its members.

The purpose of the **E. model** (Price and payment) is not only to achieve a payment of the price, but make this process attractive, convenient and tailored to the needs and possibilities for both the customer and the provider of goods and services. Therefore, it does not address only the technical and organizational aspects of the process of determining the price and method of payment, but tries to find in this process a source of competitive advantage for the company and comfort for the customer as well. If the customer can not afford or is not convenient for him to pay the full price at once, he/she can pay in instalments, for rental, or for a specific consumption. For provider there are preferred models, if the customer pays the full price in advance, e. g. for travelling check, trip, tuition, rent, journal subscriptions, or at least an advance, e. g. for a material or provides a guarantee of payment, e. g. credit card, escrow deposits. For the customer there are attractive a deferred payment, especially deferred instalment during the initial use of the product, purchases at a discount and the possibility to achieve a lower price by choosing a variable product with less number or features or a set of products whose prices are linked, and therefore the price of product in the package of products is less than the price separately purchased product. If the customer is sufficiently attached to the company, model may focus on achieving higher payments for repeated purchases or expand revenue sources and therefore payments.

Typological boundedness does not mean easy mastering the business model. Significant differences between companies are already based in the selection of an appropriate business model. The business model is typically several times being varied until the right kind is found, and then there are significant differences in the speed, perfection and source possibilities for its implementation. Classification of business models into five classes highlights the essence and principled characteristics of business models and creates a transparent basis for the variations between them, which greatly extend the set of business models, with the proviso that the variations are internally logically and functionally consistent. The greatest variability and differentiation can be expected in models dominated by products/solutions and resources with processes. These two classes will be more resistant to imitation as models, which have the main topics of trade, communities, prices and payments, although fundamentally new models can be probably expected in these topics.

## **6 CONCLUSION**

Outlined typology is trying to present a coherent and consistent concept of the real business models in operation. Explains under what tenet these models work, what are their main characteristics, and what stage or type of business are generally suitable for. The proposed typology support to innovate business models, because class of models are also centres of innovation space from which they can spread more simple or more difficult variations and innovations based on the principle of operation of the respective class of models. With the support of visualization schemes, identified typology can become a platform for the

construction of new models or although just models that are consistent with the terms of the relevant business very well.

Financial and economic implications of business models undergo metamorphosis, which tracks the development of the essence of the business model since the inception of the product through the process of its realization, finding appropriate forms of sale, formation of exclusive communities of customers to sophisticated forms of product monetization. It is obvious that this is a process that progresses usually if its initial or any subsequent stage has got exhausted the revenues and innovations. Recapitulation of this sequence is as follows:

A. Model, in which the source of effect (earnings) is a new and improved product with better utility parameters or instead of the product there is sold a solution of problem, thus the utility parameters are not tied to a single product. Solution can be a joint use of a few products or a use of accompanying service increasing the full benefit of the product, or their combination. The result is more profit as a result of greater added value and revenues.

B. Model, in which the source of effect is economical source or efficient or faster process. Results are cost savings and higher returns.

C. Model, in which the source of the effect is the sale process of a product or service. Results are higher revenues from greater sale volume.

D. Model, in which the source of the effect is a community whose members pay for a share of the consumption or use of the product. The bigger community, the greater revenues and lower costs.

E. Model, in which the source of the effect are the price to stimulate the customer to a larger purchase, payment in advance (effect of time value of money), fees for rental, fixed payments regardless of consumption, sale of product and service according to currently the highest prices, which are stimulated by currently increasing demand. Results are higher revenues.

Models and their effects can be complementary. New product may require new ways of implementation (resources and processes), a new way of selling, the new environment for a sale (community) and new pricing and method of payment. Innovation of business model applied to the model Canvas can be carried out in one or more modules and the model is a result of a change of one type or a combination of several types of models. Similarly, effects occur in one module, or are formed by cluster, or at better case they are multiplication of several effects of several modules and models.

## **THE HIDDEN COSTS OF “HOW” COMPANIES**

*Karel Slinták, Zuzana Jurigová*

### **Abstract**

The article deals with the issue of hidden costs that arise from the traditional management model. With respect to this article, two techniques were used, namely quantitative research and literature analysis. Consequently, from the research, it can be predicted that most companies prefer a management principle which inclines more towards efficiency than to performance. This principle is a part of the traditional management system through which the organizational culture of “HOW” is implemented. The relevance of this culture directly increases with increasing organizational size. Nowadays, most large organizations employ a management system that suppresses human potential. This system is based on rules, orders and controls. Thus, the hidden costs of this model are apathetic staff, lost revenues and mainly work-related stress. These factors, which cause a lack of participation in the workplace, similarly lead to poor performance capacity on the part of companies. They negatively affect the overall productivity of the economy and cause considerable social costs. Therefore, a new management system based on the WHY culture will be suggested as an alternative to the traditional management system. This system, which releases initiative, creativity and enthusiasm, was investigated in the Toyota and FAVI companies. Its aim is to eliminate the negative consequences of the traditional management model. The key features of this model are autonomy, freedom and responsibility, all three of which enrich the system with the ability to learn iteratively from one’s own mistakes.

### **1 INTRODUCTION**

The stimulus for writing this article was a research report by Towers Perrin (2007-2008). The aim of this study was to conduct a survey looking at employee satisfaction in eighteen countries in the world. The researchers succeeded in addressing 90,000 respondents. Subsequently, extremely surprising conclusions arose from the research. Firstly, only one fifth of employees were fully engaged, in the sense that they were willing to fulfil work tasks beyond their duties. Secondly, two-fifths of employees were totally unengaged while committing work tasks. The remaining respondents were included in the category characterized by formal obedience.

The question which arose while reading this report was: what causes such low involvement of people in the workplace? Looking at the prevailing management ideology, where profit is the only or main priority, the answer was offered directly. Companies often deal with an inability to define actual performance and to identify the factors that affect it. Most managers do not realize the connection between involvement and performance. However, there are several studies which clearly demonstrate such a connection (see Towers Perrin 2006, 2007 - 2008; Sisodia, Wolfe and Sheth 2007).

This article will extend the knowledge already revealed in previous studies. Therefore, it will address the question of efficiency and performance and subsequently uncover the

management model which is taken as a consequence of the ideology of classical management. Moreover, it will attempt to map the hidden costs that this model involves. It will also propose an alternative model of management and governance that should mean a radical cultural change in the conception of the human in the workplace.

## 2 OBJECTIVES AND METHODS

The purpose of this article is to reveal the hidden costs of the management model known as the “HOW” company management model and to propose an alternative management model that will be able to eliminate these costs. This requires us to focus on the following research questions: 1. What does the concept of a “HOW” company mean? 2. What are the social and economic consequences of a “HOW” company? 3. Is there any alternative to a “HOW” company which is able to eliminate the hidden costs? The first two research questions fit into the area of performance measurement and management. The last research question deals with innovations in the management system. The effectiveness of the studied organizational model (called a “HOW” company) will be evaluated according to the performance capacity that companies can achieve by using rare resources (the intellectual and creative abilities of human beings).

The article will be supported by data gathered from quantitative research. Descriptive statistics will be used as the method for processing the relevant data. Table 1 shows the details of this research. In addition to own questionnaire survey, the authors will also refer to studies completed by other teams of authors; they will also evaluate case studies of two companies, namely Toyota and FAVI.

Tab. 1 – Characteristics of quantitative research. Source: own processing.

<b>Statistical sample:</b>	About 850 organizations were approached; fifty-six completed questionnaires were returned. The frequency of organizations by size: <ul style="list-style-type: none"> <li>• 20 % large enterprises, 43 % medium-sized enterprises, 21 % small enterprises, 16 % microenterprises.</li> <li>• The survey return was 6.6%.</li> </ul>
<b>Characteristics of the respondent:</b>	The respondents were employees at the level of middle and upper management.
<b>Evaluation and form processing:</b>	Data were organized into absolute and relative frequencies. Inductive statistics were not used because of the small size of the statistical sample and the low return of questionnaires.
<b>Data collection techniques:</b>	Interactive questionnaire

## 3 DISCUSSION

### 3.1 Efficiency and/or performance?

Most of today’s companies prefer the term “to manage” than “to lead”. As Fig.1 shows, the relationship between leadership and management is characterised by the ratio of 1:2 in favour of management. The fact that most companies prefer management is not strongly dependent on the size of the company (as Fig 1 shows, managing and leading only closely approach each other in micro-enterprises). Managing is related to the concept of management as a discipline strictly focused on the results of measurement and thus it is more oriented on the results needed for the evaluation of its own performance. In terms of time, management examines factors that are bounded by a short-term perspective. This characterizes the lower limit of performance. On the other hand, the principle of leadership focuses on areas that are typical for the upper limit of performance. It contributes to the formation of results that fit into a

long-term perspective. By using the words of Peter Drucker (2002) and Warren Bennis (1994), “to manage means to do things right, to lead means to do right things.”

Fig. 1 – The attitude toward management and leadership. Source: own research (n = 56).

The performance of individuals, businesses, and society as a whole is directly affected by these two principles. Covey (2010) explains the importance of these two principles and their application in the context of a story about a group of people placed on a mysterious island. These people want to get to a particular destination. The planners attempt to create a plan and devise a strategy according to an old map. They measure time by a stopwatch and, with the help of organizers and supervisors, they watch over the ordinary workers using machetes in order to hack a way through the vegetation fast enough and in the desired direction. If they work according to the plan, they are rewarded appropriately; however, if not, they are punished accordingly. In this group, there are also people with leadership abilities. One of them climbs the tallest tree, looks around, and shouts: “We are on the wrong island!” The whole group is so busy with operative work that they do not hear him. The man continues to scream and therefore the managers (namely, the planners, organizers, supervisors) silence him since they are too engaged in their management procedures to listen. “Be silent,” they say. “We are still moving forward.” This metaphor does not involve only the diversity of the central principles of management but also touches on the principal foundation of performance, its concept and importance. Therefore, if the concept and meaning of performance change according to the approach to management, we can, according to Kouzes and Posner (2003), see two basic levels of performance in the meaning of the two rooted words, i.e. management and leadership. These two basic levels of performance are namely to manage things (in other words, to achieve the realization of things) and to get to certain point (or to focus).

### 3.2 “HOW” Culture: How to do things right

Most large companies are organized on the basis of bureaucracy. This assumption is confirmed by research, according to which eight out of ten large organizations operate on the basis of bureaucratic structures (see the graph below). In this context, Zobrist talks about “HOW” companies (Morel 2007). A “HOW” company is characterized as a bureaucratic institution in which people have to follow many regulations. The coherence of these companies is ensured by a dense network of commands and controls. The original assumption of this model is based on the unwillingness of people to work. Therefore, the aim of management is to tell people how to do their work (lead) and constantly check their activities

(manipulate). This model was created at a time when the world gave birth to the first modern business organization, i.e. in the middle of nineteenth century (Drucker 2002). For businesses at that time, this step meant an enormous increase in the productivity of manual workers and an enormous increase in their performance (Drucker 2001, 2002, 2004). Subsequently, this increase in performance economically transformed the whole of western society. According to Angus Madison (1991), from 1820 to 2001 gross income per capita in western countries increased about twenty times.

Fig. 2 – The prevailing organizational structure. Source: own research (n=56).

However, performance was primarily understood in terms of economic growth. A “HOW” company identifies itself with industrial age. According to this equation, profit is always in first place followed by people (Hamel 2013). Working conditions prevailing in “modern” companies at the height of the industrial revolution were very similar to the working conditions that prevail in manufacturing plants today – and not only in the developing world, with its “sweat shops” and child labour (Carney and Getz, 2013). In both cases, the same management model is implied. In this model, there are people who have the right to dictate (to give precedence) and people who have a duty to listen and obey (to conform).

### 3.3 Hidden costs of the “HOW” culture

Nowadays, the topic of managing for “three percent” is becoming an increasingly discussed problem (Carney and Getz, 2013). These managers should introduce new rules that limit undesirable behaviour in 3% of employees. However, these rules have a subsequent negative effect on the remaining 97% of employees. We cannot be surprised by the traditional manager’s thinking when talking for instance about the problem of theft in the workplace. In this case, the manager’s suggestion might be to introduce measures to search all employees even though the problem is related to only a very small minority. The hidden social costs of this precaution would be the dampening of the initiative and involvement of all employees who were affected by this decision. And the fact that this is not unusual is demonstrated in research by Towers Perrin (2007 - 2008), which revealed that only 21% of employees were truly engaged (see also Hamel 2013). Research by the same company two years later revealed that only about 14% of employees felt engaged in their work (Tower Perrin, 2006; Hamel and Breen 2008). In the case of involvement while meeting corporate goals, the initiative of employees is even weaker, as shown in research by Haris Interactive. S. Covey (2010) makes reference to this research in his book *The 8th Habit* (see the table below).

Tab. 2 The involvement of workers while meeting targets. Source: Covey (2010).

<b>Questionnaire survey (n = 23 000)</b>	<b>Frequency of positive answers</b>
Do employees realize their organizational goals with engaged passion?	9 %

Low interest among employees indubitably leads to lost income. These kinds of costs arise from low performance capacity – employees simply do not perform extra tasks. The level of commitment among employees does not only affect the internal operations of the company. As illustrated in one study, 73% of customers went to a competitor due to the insufficient engagement of the company or its employees (Carney and Getz, 2013). Thus, when looking at the ability of companies to make a profit through the prism of engagement, we can observe interesting results. According to one survey (Tower Perrin, 2007), it is proven that companies with involved employees can increase their profits in the long-term (in the monitored companies, the average operating profit increased by 3.7% over a period of 3 years). However, the companies with uninvolved employees had reduced profits (in the same period, profits decreased by an average of 2%).

Parkinson’s First Law, which affects all organizations, increases with the size of the organization. As companies increase in size, they not only have to deal with bureaucracy (see Fig.2) but, moreover, also need to reflect on two related problems. The first problem is called creeping inefficiency. For a small company, the ratio of managers to other employees is typically 1:10 (9% of employees are managers); one superordinate is in charge of 10 subordinates. For an organization with 10 000 employees, due to Parkinson’s First Law, the number of leading employees and managers may increase up to 1 250 employees and, therefore, the ratio of managers to other employees is reduced to 1:8 (11% of employees are managers). Supposing that the manager’s salary is three times higher than that of his subordinates, it can be quantified that the salaries of the managers represents 38% of the total wage costs. In the first example with small companies, the salaries of the managers represent 27% of total wages. The second problem is related to the oppressive atmosphere that “HOW” companies create. Our own research shows that, in general, the so-called motivation pressure system predominates in companies, a structure which significantly contributes to a culture of fear and mistrust (see table 3 and figure 3 below).

Tab. 3 – The prevailing motivation in practice: Source: own research (n = 56).

<b><i>How do you motivate your employees?</i></b>	<b><i>Relative frequency</i></b>
Force factors (these factors comprise the survival factor, the fear factor and the money factor)	61 %
Inspirational factors (these factors comprise the enjoyment of work, praise, and self-realization)	39 %

Fig. 3 – Factors of motivation in practice. Source: own research (n = 56).

The result of this atmosphere is so-called work-related stress (Atkinson 2000; Cartwright and Cooper 1997; Cortina et al. 2001; Wojcik 2001). Stress is activated by so-called stressors that cause a feeling of physical and psychological threat. Stressors can be personal conflicts, unrealistic goals, psychological bullying (being mocked or isolated, for example), a feeling of injustice, or various forms of force motivation (see Neuman, 2004). Stress may also appear in situations in which employees lose control over their work. Work becomes even more stressful when employees do not have sufficient freedom and space to make their own decisions. A sense of hopelessness emerges afterwards. In most cases, growing emotional stress leads to the collapse of goals and corporate vision. However, work-related stress affects not only large organizations. It is an unintended consequence of the “HOW” organizational culture, which can be applied in any organization regardless of its size. This culture prefers obedience before initiative. It appreciates uniformity (and agreement) instead of originality (and disagreement). Animals react to stress by escaping. People react to it simply by avoiding other people or demanding situations that cause stress. Therefore, it can be assumed that apathy at work is influenced by stress. According to The National Institute for Occupational Safety and Health, 40% of US employees are subject to stress at work (comparison with the motivation survey is essential and its results are shown in the table below). In light of this, there exists a legitimate suspicion that work-related stress causes so-called civilization diseases such as headaches, anxiety, stomach cramps, loss of energy, and many others. Therefore, it is not surprising that stress at work is the reason for approximately 80% of visits to general practitioners (Carney and Gets, 2013). What is then the total cost of work-related stress to the economy? In the case of the UK, it is estimated that, due to stress, the economy loses 40 million working days per year and seven billion pounds spent on health care (Handy, 1999). According to Gallup research in 2006, unconcerned behaviour and disengagement caused by stress creates an annual loss of productivity to the US economy amounting to 328 billion dollars.

### 3.4 A new alternative: the “WHY” company

Work-related stress is the most important source of hidden costs with respect to the traditional management model. Not only companies but also individual states have to deal with it. According to the US Bureau of Labour Statistics, the annual costs associated with work-related stress are 10 000 dollars for each individual employee. The study of work-related stress is closely related to the subjective feeling of the loss of control over a certain situation.

So what does it actually mean in terms of the prevailing management system? “HOW” companies apply the technology of traditional management. It is based on the assumption that people are naturally lazy and do not want to work. Therefore, this model uses techniques that are intended to stimulate (activate) human beings to work. The backbones of this model are commands and controls that restrain the feeling of freedom (and responsibility). The “HOW” culture deliberately deprives its employees of the possibility to choose and thus increases the tendency of workers to experience stress. Companies that apply the traditional management model to the imaginary hierarchy of human capabilities, try to put an emphasis on obedience, diligence and intellect (see Fig. 4).

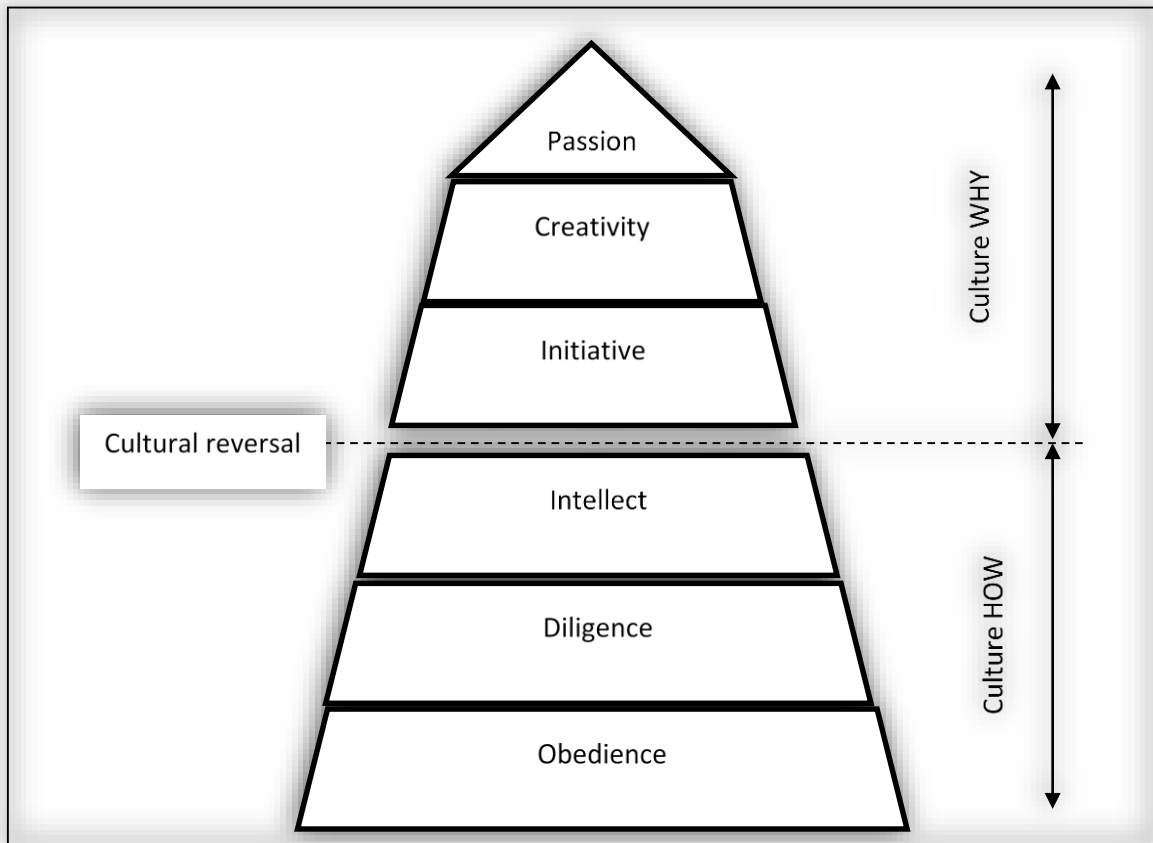

Fig. 4 – The human capabilities in context of culture Why. Source: own processing.

The hierarchy of human capabilities is similar to Maslow’s pyramid of needs. For human beings, higher order needs are combined with greater motivation and satisfaction. For companies, human abilities are assessed according to the benefits of individuals to the whole group (personal performance). In the workplace, people can present themselves by various abilities as indicated in Fig. 3. When analysing the hierarchy of human capabilities, one question arises and that is whether, in addition to the tradition model, an alternative model of governance can coexist. This alternative model is capable of placing human abilities above the level of obedience, diligence and intellect. In this imaginary model, words such as vanity or misappropriation would lose their meaning. Its aim is to humanize the organizational environment. Yet, an important question remains unanswered: are there any companies in the business environment that could become prototypes of companies applying the “WHY” culture?

## **Cultural reversal**

When searching for a prototype of the “WHY” company, we can start with a brief analysis of Toyota. This company, straddling the border of both cultures, has an undoubtedly bureaucratic structure. All processes are planned to the smallest detail. Each employee is governed by predefined working procedures in order to complete a given task in the most efficient way. Consequently, very strong standardization is obvious. The central principle of the company is efficiency, which is ensured by a management technique known as management through procedures. All processes must be measured and controlled. What makes this company different from other similarly bureaucratic companies is its approach to ordinary employees. These ordinary employees are governed by procedures which are not constructed by executives but by the employees themselves. They have only one aim, which is perfection. Everyone is governed by the procedure only until he/she discovers a new and better procedure. Therefore, procedures are not enforced by the head of a certain department. Meeting the goals of procedures is dependent on the employees themselves. In the case of Toyota, effectiveness as a central value is accomplished by autonomy. This autonomy is used by employees and teams in order to adjust their working environment. Toyota believes in people’s willingness to learn and this is the clear difference in contrast to other bureaucracies. Only through this idea is Toyota able to strengthen the authority of ordinary employees and create a cultural environment that values initiative.

An even more interesting example of the transition from the industrial model to a model of the WHY culture can be seen in FAVI. Originally it was a brass foundry which was typical of the industrial era until J.F. Zobrist became its director. After he joined the company he realized that a huge difference exists between the real economy (which includes opportunity costs) and the corporate economy (which works only with the explicit costs). He was inspired by an experience with one of his employees who wanted to change his old gloves for new ones. Zobrist found out that this exchange took place according to a clearly defined procedure. If a worker had damaged gloves, he had to show them to his manager, who would, in turn, furnish the worker with an order form for new gloves. Subsequently, the worker had to visit the store, where, on the basis of a correctly submitted application form, he received new gloves. The entire process of replacing old gloves with new ones took approximately 10 minutes. Zobrist calculated that the cost of operating the machine used by the worker was 100 dollars per hour. From this calculation, he determined that the changing of gloves resulted in opportunity costs of 17 dollars per hour. The gloves themselves cost less than 10 dollars! This “economy” persuaded Zobrist to re-evaluate FAVI’s original management philosophy. A new management philosophy was created, based on the idea that there are two types of firms: a “HOW” company and a “WHY” company. FAVI was an example of a “HOW” company. According to this model, it is usual to tell employees what to do, how long they should work, and when to go to work. Obviously, at FAVI, this behaviour had two consequences. Firstly, employees were evaluated according to all possible scales (number of hours worked, number of units produced, etc.) but not by the scale which is really important (customer satisfaction). Secondly, employees did not have the opportunity to influence their work routine. They were, figuratively speaking, bound by the chains of bureaucracy (a change had to be approved by a manager, who had to seek the approval of *his* manager, and so on, *ad absurdum*). By its transition from a “HOW” to a “WHY” company, FAVI had to learn to ask different questions from the ones they had been used to asking for decades. Thousands of HOW questions were replaced only by one question: WHY? The new emerging culture at FAVI no longer wanted to dictate to its employees about how they should do their work. It gave them greater freedom with the proviso that they had to learn to ask the question WHY? In the case of FAVI, asking the question WHY changed the overall focus of the company. As a result, its approach to

performance changed, too. By using the question WHY, all corporate efforts began to orientate toward one central point – the customer. This cultural change turned attention away from narrow specialization, strict qualification, and a particular department towards the performance of the whole. And the consequences of this change for the company were radical. The time clock was removed. The new management concept led its employees not to consume time but to produce results. According to the new model, the HR department was closed due to the fact that people were no longer seen as machines but as human beings with specific psychological and physiological needs. Production also underwent several changes. It was restructured into units that formed self-managed teams with approximately 24 employees (an organization that was similar to the self-organization of workshops applied in the Bat'a Shoe Company). Every production team was responsible for a specific customer and a tailored product. The attempt to change the management model led not only to the invigoration of autonomy in individual workplaces but mostly to the elimination of a formal hierarchy. Each team was able both to choose its own leader and to dismiss its own leader. In general, the transition to the new model has brought significant results. From a long-term perspective, the company has been able to reduce prices to its customers by about three percent per year. Over a period of twenty-five years, it has never experience delays in delivery. It has become the European leader in the production of shift forks for the automotive industry. The size of its market share is reflected in the fact that one half of cars produced in Europe have shift forks produced directly by FAVI. Finally, the company has introduced entirely new products manufactured from brass, which have been exported to China.

As evidently demonstrated by the experience of Toyota and FAVI, it is possible to create alternative management models in which the culture encourages initiative, creativity and passion in each employee. People engaged in these companies work in favour of the profit of their company beyond their work duties. This is so because these companies recognize the huge potential that is hidden in people. The cultural feature of this model is the belief that people together know more than the smartest person among them. And what is the purpose of this model? To manage as little as possible – in other words, to allow people to learn from their own mistakes.

#### **4 CONCLUSION**

The most serious consequences of the traditional “HOW” management model are the paralyzing of involvement, the loss of income, and work-related stress. These hidden costs are caused by one factor, namely the lack of employee involvement in the decision-making structures of organizations. “HOW” companies do not trust their own employees and are not willing to pass a large proportion of “management” responsibilities onto their shoulders. Consequently, this causes the suppression of the intellectual potential of companies. Therefore, most companies achieve low performance capacity. An alternative to this management model is a management system based on the “WHY” culture. In the Brazilian company SEMCO, this procedure is called participative management (Semler 2011). The principal value espoused by companies that begin to apply this model is freedom (and responsibility). In these companies, bureaucracy is replaced by a culture of discipline. Employees in this culture are encouraged to experiment (examples of companies with such a culture are Google, IDEO, SEMCO and others) and to build working relationships based on personal commitments. This latter feature is evident in companies such as Morning Star and W. L. Gore.

As demonstrated in several research projects (e.g. see Collins, 2008), the difference between good and great companies is related to the organizational ability to balance on the fine edge

between order (responsibility) and chaos (freedom). Overall, this means to build a culture based on personal responsibility in which people are given considerable freedom to realize their own ideas. To create a working environment in which workers are given freedom is not easy. It requires the ability of organizations to build a shared vision, to determine operating principles, and to define core values.

Looking further into the business environment, we can see that there exist many interesting companies that could become prototypes of the “WHY” company. Therefore, further research will be focused on the analysis of companies that apply the principles of trust, freedom and responsibility, these being the typical values of such a new and innovative management model.

## **THE PRINCIPLES OF BIOTIC ORGANIZATION**

*Karel Slinták*

### **Abstract**

The article deals with creation of a model of biotic organization with the aim to measure the level of representation of biotic organizations in the economic environment. The model of biotic organization is created and based on a four-dimensional model. The basis of this model is to define organizations like living systems.

The model of biotic organization is formed by four principles, and these are amorphous structure, leadership, shared vision and service to its own environment. The existence of individual elements of biotic organization in practice was evaluated by means of a survey of fifty-six organizations within the Czech Republic. The research was divided into four areas, namely purpose of the existence, structure, alignment, and coherence. These areas correspond to the four basic principles of biotic organization. From the data obtained, it was found out that only two of these principles, shared vision and service, are applied by more than a third of organizations. Other principles are underrepresented. The majority of the firms surveyed are not organized on the basis of the amorphous structure and do not frequently use the principle of leadership.

There is only a five per cent representation of biotic organizations within the economic environment, which confirms the research hypothesis regarding a very low representation of this organizational form in the current economic environment. A low level of biotic principles representation was caused by conventional way of organizing mainly. This is based on a formal hierarchy, a pyramidal structure and traditional management that create an environment of command and control at the expense of creativity and commitment which can exist due to the biotic principle of leadership.

*Key Words: Adhocracy, Biological system, Leadership, Mechanistic system, Service to society, Shared vision.*

JEL Classification: M20, O30

## **1 INTRODUCTION**

The current perception and conception of organizations as social products of industrial society is based on two simultaneously applied theories. These theories are the theory of mechanistic systems and the theory of living systems. The aim of this article is to determine the principles of biotic organization. It is therefore necessary to focus on the theory of living systems. This concept is different from the traditional perception of an organization within the meaning of a mechanistic system. The reasons can be found in historical analysis.

From the mid-seventeenth century, the general worldview inclined to perceive the world as a mechanistic universe (Drucker, 2002). The essence of this worldview was based on mechanistic ideology. According to this ideology, all processes can be evaluated using analytical tools. In a mechanistic system, the whole is equal to the sum of the individual parts. For enterprise environments, this meant that companies were perceived as machines with different combinations of the factors of production, and clearly defined target behaviour. The traditional theory also introduced concepts for the more efficient administration of these

organizations. The language of managers focused on inputs and outputs, innovation, manufacturing, personnel, logistics, marketing, control devices, static planning, and profit as the only possible measures of performance. It was also assumed that organizations achieved higher performance only by increasing their size, which is an unquestionable fact if organizations are conceptualized as mechanistic systems. In line with this logic, it is true that larger inputs mean larger outputs, and what is larger is better. On the basis of these facts, a classic form of management arose, whose principles created a form of traditionally designed organization, which, according to its nature, could be described as a mechanistic organization.

The main principles of classical management have resulted in a form of mechanistic organization whose specific characteristics describe scientific article *The Principles of Mechanistic Organization* (Slinták, 2013). On the basis of historical analysis, the following principles were incorporated into the model of mechanistic organization: the division of labor, bureaucracy, command and control, and profit. The thesis of mechanistic organization was completed in 1922 by Max Weber (1978).

It took almost forty years for a critique of the concept of mechanistic organization to appear – this by the British theorists Burns and Stalker (1961). They criticized the rigidity and low adaptability of bureaucratic organizations. This critique was undoubtedly related to the increasing complexity of the external socio-economic environment. Influenced by the dynamic complexity of the business environment, Burns and Stalker started to look at enterprises as organic systems. Since then, however, the shift in the concept of the organization has reached a limit due to the enormous growth of the developed economies of the western world.

The return to the thesis of the organization as a living system was caused by the significant economic and social changes that occurred in the 1990s. At that time, it was already apparent that size cannot be an independent variable function of performance, as, at times when demand exceeds supply, enterprises cannot have the character of predictable machines in an environment that is close to biological complexity. In their work, many authors began to explore terms reflecting the area of biology, such as the immune system (Hammer, 2002)<sup>16</sup>; homeostasis (Senge, 2009); dynamic complexity (Forrester, 1987)<sup>9</sup>; cyclic systems and the circular economy (Senge, 2007, 2009); system archetypes (Senge 2009), the DNA of a company (Bateson, 1972; Hock, 2000)<sup>20</sup>; the soul of an enterprise (Handy, 1999); network structure (Kelly, 2007); synergy (Covey, 2010, 2013; Harung 2004; Senge, 2007, 2009); and collective intelligence (Hamel & Breen 2008; Hamel 2013). This change in terminology implies a gradual passing from the philosophy of natural sciences to the philosophy of the biological sciences (Sandow & Allen, 2005).

A more thorough exploration of the regularities of biological systems indicated that in these systems there was little dependency between inputs and outputs (e.g. in the context of business, the allocation of a greater number of staff to a task almost always leads to a situation in which these workers do less than they would have done in smaller numbers), because in biology size is always the result of features (Drucker, 1989). It was also discovered that in a biological system, the whole is something greater than just the sum of the parts. If we express it mathematically, this means that  $1 + 1$  is not two, but rather 4 or 5 or 20. New knowledge from the theory of living organisms has also led to a correction in the conception and perception of organizational size. The information revolution that began in the 1990s, prompted enterprises to address the central question of what the correct size for a task is. In the information era, size becomes a function, and instead of an independent variable it becomes a dependent variable (Drucker, 2002). The nature of the information even shows that the best size will be the smallest effective size (Drucker, 1989).

Defining a custom size, therefore, became important at the end of the last century, a major point in the existence of any enterprise. In thrall of biology, the correct size was transformed into a factor ensuring the efficient processing of information needed to ensure both the mission and performance. Therefore, this article will deal with the new requirements facing current organizations and examine the extent to which the organization has adapted to these requirements, which arise from fundamental changes in external environments.

## 2 METHODOLOGY AND OBJECTIVE

The article aims to create a model of biotic organization and to measure the extent of the principles of biotic organization in the practices of Czech companies. The result of these efforts will be the characterization of biotic organizations in the economic environment of the Czech Republic, based on verification of the following research question: “Is biotic organization in the population of organizations represented in more than 10% of cases?” The model of biotic organization, which is necessary to measure the extent of biotic organizations, will be based on an analysis of the theoretical bases of other authors. The procedure for creating a model of biotic organization is described in chapter 1.3.

### 2.1 Quantitative research

The occurrence of individual elements of biotic organization in operating practice was evaluated by means of a survey of fifty-six organizations operating in the Czech Republic. Data resulting from this quantitative research was processed in the form of descriptive statistics and then categorized into absolute and relative frequencies. Some data tables were converted into graphic form.

The basic parameters of the quantitative research – the details of the statistical sample, the characteristics of the respondents, the field of research, the character and evaluation of the data, and the data collection techniques – are summarized in the following table.

Tab. 1 – Basic parameters of quantitative research. Source: own.

<b>Statistical sample:</b>	About 850 organizations were approached; fifty-six completed questionnaires were returned. The frequency of organizations by size: <ul style="list-style-type: none"> <li>• 20 % large enterprises, 43 % Medium-sized enterprises, 21 % small enterprises, 16 % microenterprises.</li> <li>• The survey return was 6.6%.</li> </ul>
<b>Characteristics of the respondent:</b>	The respondents were employees at the level of middle and upper management.
<b>The field of research</b>	I. Purpose of the Organization, II. Structure, III. Empowerment, IV. Shared Vision
<b>Evaluation and form processing:</b>	Data were organized into absolute and relative frequencies. Inductive statistics were not used because of the small size of the statistical sample and the low return of questionnaires.
<b>Data collection techniques:</b>	Interactive questionnaire

### 2.2 Qualitative research

In addition to quantitative research, the principles of biotic organization was evaluated through qualitative research. For these reasons, selected principles of biotic organization will be explained in context of practical experiences of some companies. These companies were selected based on specific features of their management system.

List of these companies comprises following table.

Tab. 2 – List of companies investigated for the purpose of qualitative research. Source: own.

Specific features of management system	Surveyed firms
Culture of freedom	W.L. Gore, Sun Hydraulics, Semco, SOL, FAVI, IDEO
Unusual form of structure	Harley-Davidson, Semco, W. L. Gore, Visa
Limit of size (specific attractor)	Asea Brown Boveri, W. L. Gore, Google, Semco
Reciprocal obligation	W. L. Gore
Agreement of colleagues	Morning Star

### 2.3 Construction of the model

For the construction of the model of biotic organization, the four-dimensional model of an organization created by S. Covey was used (Covey, 2010). This model is based on the theory of a healthy organization and the motivation that originates from a holistic paradigm (Covey, 2010). The form of the four-dimensional model is shown in the following figure.

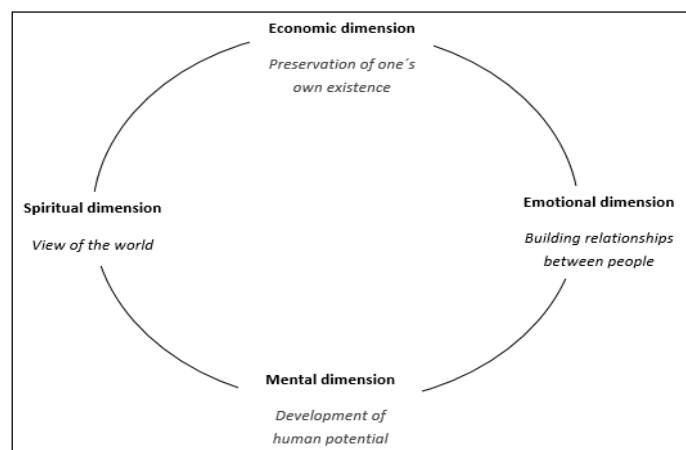

Fig. 1 - Four-dimensional organizational model. Source: own.

Each of these dimensions of the organizational model is defined by specific needs. The economic dimension (the body) lies in the creation of a suitably adapted structure that will be able to generate profit. The emotional dimension (the heart) touches passion and enthusiasm. The emotional dimension is thus linked with involvement and initiative. The mental dimension (the mind) reflects the need for innovation and growth. The spiritual dimension (the soul) represents a search for deeper meaning.

The four-dimensional model was chosen mainly for the reason that it takes into account the experiences of empirical studies (Collins, 2008; Nohria, Joyce & Roberson, 2003) which show that organizations achieve long-term results only if their business model (their ideology) takes into account the human dimensions in the context of the holistic paradigm, which are body, heart, mind and soul.

## 3 MODEL OF BIOTIC ORGANIZATION

The model of biotic organization arises from the technology of postmodern management, which takes into account changing environmental conditions, reflects new assumptions, and recognizes the principles of living systems rather than the principles of mechanistic systems. These principles include an amorphous structure (i.e. adhocracy), shared vision, leadership, and service (to its own environment). Each of these principles is based on natural law,

because all living systems are of a cyclical and self-regulating character. In natural communities there is often the phenomenon of collective intelligence (by analogy with human systems, it can be understood as a certain form of shared purpose observed, for example, in birds or fish); they are self-organized, which means that they are not controlled by others, but rather self-organized through their own unconscious instincts. Finally, each animal fulfills its specific task according to the environment in which it occurs. These principles are in some sense a response to the specific characteristics of the external environment, illustrated in the following figure.

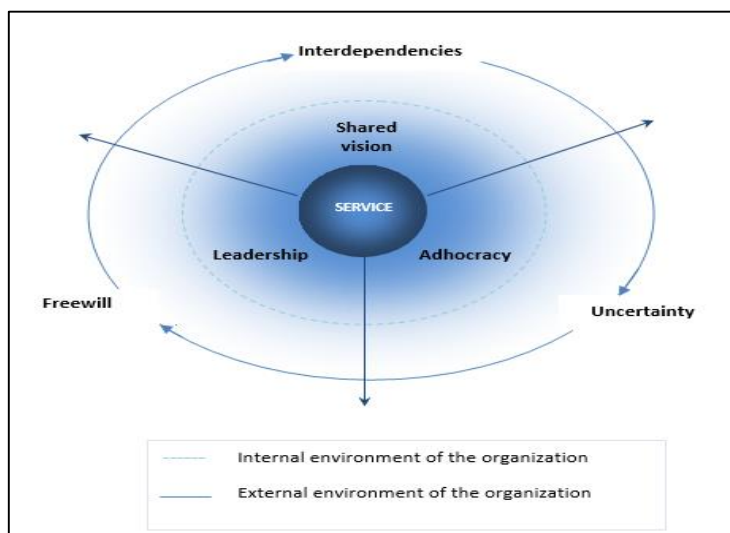

Fig. 2 - Model of biotic organization. Source: own.

In practice, these principles may take different forms. Shared vision is the result of system thinking, on the basis of which the dynamic complexity of the world of interdependencies can at least be partially understood. It sets out a common path and evokes a feeling of partnership and shared purpose. In an environment of chaos and uncertainty, shared vision creates needed islands of order and safety within organizations. The common objective thus defines the limits of individual behavior. In a sense, it replaces the original philosophy of management based on the fragmentation of the organization, in which people are working on the basis of functional classification in order to achieve only partial objectives (not companywide objectives). The amorphous structure creates the internal form of an organization, depending on the task which the organization is engaged in. It is thus a specific kind of adhocracy, which is the counterpart of bureaucracy (Mintzberg, 1979). This approach to the internal configuration of the organization is based on the assumption of the instability and unpredictability of the external environment. It creates a high degree of freedom inside the organization. In practice, this form of organization spread particularly in the creative industries. Structuring for a particular purpose, for example, is typical for Hollywood movie studios, as well as for companies that deal with advanced technologies, including Apple and Google. These companies face enormous pressure from competitors and powerful dynamics in the development of new technologies. In this case, it is obvious that the new technology of postmodern management can be directly enforced by the specific circumstances of the environment.

Biotic organizations are harmonized and, above all, have a culture of trust (and freedom), which gives people considerable power and freedom to focus on what they want to do (Carney & Getz, 2013). This type of culture has been identified in the companies W.L. Gore, Sun Hydraulics, Semco, SOL, FAVI, IDEO, and several others (Carney & Getz, 2013). The amorphous structure, however, can't exist without institutionalized moral authority. As Carney with Getz discovered when they researched freedom in work (Carney & Getz, 2013),

real leaders become guardians of culture in a more free working environment. Companies applying this specific culture include FAVI, IDEO, SEMCO, SeaSmokeCellars, and, previously, Radica Games. The authority of a biotic organization is thus institutionalized by leadership, i.e. a new management function that puts an emphasis on enhancing powers in order to release human potential through specific types of motivation in the form of self-management. However, the core of a biotic organization resides in the ability to reveal a deeper purpose, which grows out of the holistic paradigm. This paradigm can be simply defined in the sense of the attitude reflecting “our world”, not “my world”. Living organizations must be engaged in something bigger than themselves. High performance is achieved only if companies become excited about something more than simply making a profit (Google wants to change the world, Apple wants to create revolutionary products, Walt Disney wants to bring happiness to people, Whole Foods Market wants people to improve their health and well-being etc.). Simply put, living organizations have a purpose that provides their workers with a deeper motivation.

The nature of these organizations requires us to look at them as organs of society with clearly identifiable characteristics, these being an amorphous structure, leadership, a shared vision, and service to one’s own environment. On the basis of these attributes, we can explore the extent to which current organizations approach an organizational form based on biotic principles, and how far such biotic organizations are representative of the business environment.

## **4 PRINCIPLES OF BIOTIC ORGANIZATIONS IN PRACTICE**

Quantitative research aimed at mapping the occurrence of biotic principles was carried out in the following areas: purpose of existence, structure, alignment, and coherence.

### **4.1 Service to society**

Classical economic theory defines the company as a machine for making money. According to this theory, each enterprise should follow a simple rule: to use resources (including human) in order to maximize earnings. In view of this goal, the enterprise is the creator of resources, the purpose of which is to transform inputs into outputs. Of course, outputs must exceed inputs. In financial terms, this means that a positive economic result is achieved, one which usually reflects accounting profit rather than economic profit.

An alternative theory, which is based on the profit motivation, involves the idea of *the market value of the company*. However, because the market value of a company grows when the company makes a profit and falls when the company makes a loss, it can be argued that the goal of increasing market value springs from the same base as the profit motive. These are, therefore, two theories describing the same idea. In both cases, performance is measured by short-term, and usually only financial, indicators. In the background of these concepts is the assumption that every enterprise is a machine that consists solely of the economic dimension.

Research conclusions by Collins and Porras (1994) summarized in the book entitled *Built to Last*, as well as the famous study of the longevity of organizations conducted by Royal Dutch / Shell in 1983 (Handy, 1999; Senge, 2009), however, show that the ability to exist for a long time in a business environment deviates from the mere satisfaction of economic needs. The function of each organization, as an organ of society, must be to satisfy the specific needs of the external environment. The purpose of the existence of a biotic organization is to serve society (its own environment). This definition of the corporate sense corresponds with research findings according to which the vitality of organizations is very closely related to the ability of organizations to satisfy the needs which emerge from the external environment. In

contrast to traditional economic theory, the criteria of success in the case of biotic organizations lie only in the external environment. The purpose of biotic organizations, therefore, will always be limited by the external environment. The conditions, characteristics and requirements of this environment can redefine the business tasks and change the default mission of these organizations. The primary function of these organizations is, therefore, to reveal this task, which requires not only external orientation toward the customer, but also internal orientation in the form of the creation of a work environment that reflects the needs and interests of other stakeholders, which are associates and owners. This demonstrates the interdependence of biotic principles, when a deeper sense cannot be created without leadership, an open structure, and shared vision.

The three objectives are clearly rooted in the practice of contemporary organizations. They show their attitude to their customers, employees, shareholders, and society as a whole. Surprisingly, the survey revealed considerable orientation towards the external environment (41%) and a lower than expected proportion of companies oriented towards the profit motive (29%). The following table presents the results of the research.

Tab. 3 - Purpose of existence in practice. Source: own.

<i>What is the purpose of existence of your organization?</i>	<b>Frequency</b>	
	<b>Absolutely</b>	<b>Relatively</b>
Earning	16	29%
Market value	17	30%
Service to society	23	41%

Organizations whose purpose of existence is defined as service to society are still in the minority (41% of the total). Among other things, this means that the majority of organizations (more than 50 %) are too focused on the internal environment and ignore the external one. On the basis of research findings, we can conclude that most companies are, in terms of their actual purpose, still defined as mechanisms for making money (59% of the total).

#### **4.2 Amorphous structure**

Three basic types of structures have been developed in the economic environment over the last three hundred years. These structures are the haphazard structure, the hierarchical structure, and the amorphous (i.e. network) structure. Each of these structures arose in a specific environment. The haphazard structure was the result of the agrarian society that predominated from the 17th to the 19th centuries. It began to transform into industrial society from the 19th century. At that time, people created the first modern business organizations organized on the basis of a hierarchical structure. At present, however, an entirely new kind of structure is emerging, one that symbolizes the age of information. These structures are amorphous, or network structures. In the W. L. Gore company, this new type of organization is referred to as a lattice organizational structure (Hamel & Breen, 2008; Hamel, 2013; Harung, 2004). In the Semco or Harley-Davidson companies, so-called circular structures were established (Carney & Getz, 2013; Semler, 2011; Senge, 2009). No matter what this new type of structure is called, they share one particular feature; that is, they are not built on the principles of formal hierarchy, but rather on a network of relations, which is defined by reciprocal obligations towards colleagues and co-workers.

Research work therefore focused on two basic organizational approaches, namely pyramid schemes and network configuration settings, in order to determine to what extent network

structures are applied in practice in current enterprises. The Results are given in the table below.

Tab. 4 - Typology of structures in practice. Source: own.

<i>What kind of structure is applied in your organization?</i>	<b>Frequency</b>	
	<b>Absolutely</b>	<b>Relatively</b>
Amorphous structure	8	14%
Hierarchical structure	48	86%

The research indicated that only one in seven organizations is organized by means of a network without a stiff formal hierarchy, despite a radically changing ecosystem, which causes the increasing institutional collapse of bureaucratic organizations built on formal hierarchies. In the current environment, it appears that bureaucracy is not able to respond quickly enough to the frequent changes in the environment. The proof of this assertion can be seen in the recent past. It was the collapse of the Soviet Union and other centrally controlled economies, as well as the bankruptcy of the automobile giant General Motors (GM), that provided a great deal of knowledge about the limits of hierarchical structures. Both of these examples are of identical origin. They were social systems built on the technology of traditional management, which does not take into account the conditions of discontinuity, uncertainty, and variability.

Fig. 3 - Aligning system. Source: Senge & Carstedt (2001)

Nowadays, many organizations strive to take advantage of the effects of synergy. However, these effects are related to the way individual elements within the system are organized. Experience in the building of sports teams suggests that the effects of synergy are achieved by the so-called concept of aligning illustrated in the previous figure. The essence of aligning is ensuring that team members strive to achieve the same goal. Having a common goal affects behavior in such a way that the energy of individuals is multiplied rather than fragmented. Aligning also demonstrates that a network structure cannot work effectively without the existence of a shared vision, which is an integral part of it.

In practice, the outlines of a network structure can be seen in Visa Interactive, W. L. Gore, Semco, and Morning Star, and also partly in Google and Apple. These companies have created a new trend: management without a formal hierarchy. Obviously, this does not mean that there isn't some form of hierarchy, but the hierarchy has, rather, a more natural than formal character, because people working in these companies become leaders due to their competence and knowledge, and not on the basis of contacts and mutual sympathy. In most cases, leaders are elected by members of teams or working groups, as well as recalled by them. The teams can also determine who will work in them. In these organizations, there are no superiors or subordinates, only associates and colleagues. People acquire the freedom (to do what they want), which is balanced by reciprocal obligation (in W. L. Gore) or the agreement of colleagues (in Morning Star) (Hamel, 2011).

Based on the research of organizational practices, the abovementioned firms have acquired two basic characteristics of amorphous structures: firstly, structures without a formal hierarchy require a common focus (i.e. the creation of a shared vision as a common goal); secondly, they require the identification of operating principles that reinforce core values, namely freedom, openness, transparency, and responsibility. These conditions, which are related to the principle of shared vision and leadership, are described in following chapters.

### 4.3 Shared vision

According to our research, most organizations (71% of respondents) have a vision about the future direction of their business. However, this vision does not always lead to an aligned system. The level of inner harmony affects the organization's ability to share its purpose and to evoke a feeling of partnership and solidarity. Alignment of the enterprise requires, apart from a deeper sense and amorphous structures, also the ability to share its vision. If we look at mechanistic organizations, we find that these organizations cannot really communicate. They can only transmit information from top to bottom. They create visions, but the visions are not compatible with the personal visions of individuals. These organizations do not achieve internal harmony, as individuals tend to move in different directions (see figure below).

Fig. 4 - Misaligned system. Source: Kiefer & Stroh (1983)

22

The research was therefore aimed at mapping not only an organization's ability to create a vision, but also their ability to share that vision, the ability to communicate and to seek a common path or to define a common direction. The results of the research are presented in table 4. It was found that more than 60% of organizations which create a vision (71% of organizations from the sample) are not able to communicate that vision. In most cases, the vision takes the form of either a financial target or a list of positive values or corporate policies. It is a tool of top management rather than an organizing principle that would support the creation of an environment of creativity and collaboration.

Tab. 5 - Shared vision in practice. Source: own.

<i>Is your vision shared throughout the organization?</i>	<b>Frequency</b>	
	<b>Absolutely</b>	<b>Relatively</b>
Yes	22	39%
No	34	61%

The research data supported one of the basic assumptions, according to which the application of the principles of mechanics (we may understand them as traditional management practices) limit the true potential of organizations. Great results cannot be achieved without the alignment of individual parts with the whole. This special conformity can be called metaphorically the conformity of souls, which releases the so-called “E factors” (energy, enthusiasm, effort, excitement, excellence) (Handy, 1999). The E factors are released by those

organizations that combine their own values and goals with the values and goals of individuals. These are companies that are able to apply the principle of biotic organization known as shared vision. It is coincidentally the same principle that has been detected in enterprises encouraging freedom at work (Carney & Getz, 2013). In practice, the atmosphere of mutual sharing and understanding is present in smaller organizational units (see table below), where the “rule of ten” is preserved. This rule is related to the principle of confidence, which is obviously limited by the number of people which an individual can trust, based on personal experience. Simply put, I can’t trust someone I do not know. Previous research focused on the performance of people in working groups has revealed that the best results are achieved in relatively small working groups, so-called specific attractors (i.e. 8-12 people) (Kelly, 2007), in which people know each other and therefore can build relationships based on mutual confidence without the use of compensators in the form of impersonal control mechanisms, which involve additional social and financial costs.

If we build on the practical knowledge of some companies, we can identify, for example, a “rule of 50” applied in the Asea Brown Boveri company, which employs 250 000 people, divided into more than 5000 units (Handy 1999). These departments are further divided into basic units comprising an average of forty-five people. W. L. Gore is organized on the principle of 200, according to which each production unit should comprise no more than 200 people. (It must be noted that each unit is formed by many small creative teams constructed on the basis of personal responsibility, which means that each co-worker can determine what to do, where to do it, and with whom. For this purpose, a specific structure known as the *lattice structure* was created) (Hamel & Breen, 2008). Simultaneously, individual organizational units are organized into industry-related clusters, so that the company as a whole does not lose synergies resulting from intensive, interdisciplinary, and cross-functional communication. The organizing principle limiting the size of organizational units was also reported in the Brazilian company Semco, which decided in the late nineties to organize production at its factories according to production cells including a maximum of 24 workers and 1 coordinator (Semler, 2011). Google, which attracts considerable attention with respect to its rapid development and economic success, excels in the formation of ultra-thin structures consisting of self-managed teams of just 3-4 members (Hamel, 2013).

These practices indicate the efforts of these organizations to avoid the hidden costs of traditional management based on the principles of mechanics (the cost of mistrust resulting from the implementation and maintenance of control mechanisms) and at the same time so unwittingly they took into account principles of the biotic organization that encourage openness, transparency, collaboration, and especially confidence.

Tab. 6 - Conformity of values and objectives in practice. Source: own.

<i>Is there conformity between the values and objectives of your organization and the values and targets of your employees?</i>	<b>Microenterprises</b>	<b>Small organizations</b>	<b>Medium-sized organizations</b>	<b>Large organizations</b>
Yes	78%	42%	46%	45%
No	22%	58%	54%	55%

The shared purpose observed in organizations with ten or fewer employees demonstrates the importance of a personal approach to people and takes into account the importance of the freedom that people need in order to be able to identify with the company itself and especially to be able to develop and grow.

It turns out that in the light of practical experience, organizational size affects the alignment of the whole system. Large organizations have considerable difficulties in reconciling individual parts and, thus, behave as a single unit. The absence of shared purpose in larger organizations results in insufficiently developed system thinking on the part of managers and, thus, the inability to create a process of shared vision. There may also be an unwillingness to lead arising from an excess of traditional management. This assumption will be verified in the next chapter.

#### **4.4 Leadership**

The theory of management has developed two basic principles to ensure the internal consistency of organizations. These principles were identified by Peter Drucker (1998) when considering the nature of organizations. According to Drucker, the organization of type commands and controls is similar to an organism that holds together in its shell. A new form of organization which is appearing today is based on a supporting framework of information. Information is the new integration system of enterprises (it is a necessary precondition for internal cohesion, because responsibility and, thus, self-management cannot exist without shared information) and expression (the ability to acquire information determines the future of the company, because information can be seen as a tool for wealth creation). Traditional management therefore assumes that people must be controlled. The emerging postmodern form of management, by contrast, argues that people must be led. In the economy, information is a new source of wealth; it also means power. Each of these principles, however, shares information within organizations in quite different ways. While traditional management shares only some information, successful leadership is based on the creation of a transparent, open environment in which information becomes the essence of independent and responsible behavior. Simply put, if companies do not share information, they cannot expect people to manage themselves.

The functioning of complex living systems is characterized by the fact that perception and action always take place on the local scale. The existence of centralized control is therefore possible only due to a complex network of local controls. This regularity corresponds to the principle of subsidiarity, according to which decision-making and responsibility within the system should be transmitted to the lowest possible level. In an unstable environment of many variables, the principle of leadership (i.e. to create a vision, to share and communicate the vision, to inspire) appears as an important principle for the strengthening of subsidiarity. The principle of leadership is becoming an alternative to the principle of traditional management, which accumulates too much power in one function (or site), which, in turn, may cause hierarchical breakdown in conditions of uncertainty. The correlation between the ability to share a vision and strengthen the powers that relate to these principles is illustrated in the following figure.

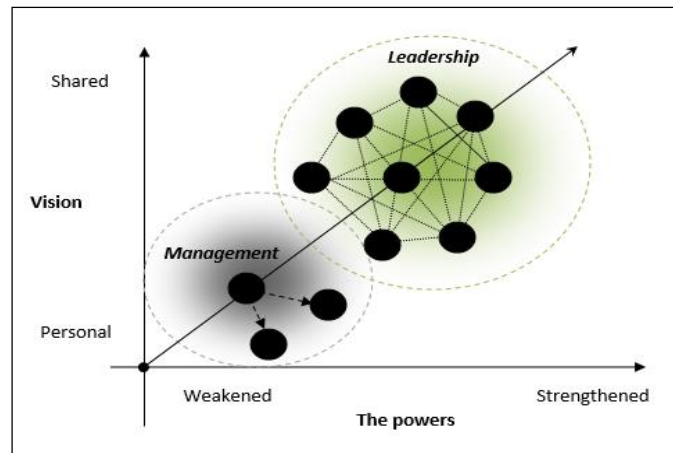

Fig. 5 - Influence of management and leadership in shared vision and empowerment. Source: own.

Management (i.e. planning, organization, and control) is appropriate only when it is applied to non-living parts of the organization (property and financial capital). Leadership is the key to creating the structure of the engagement which offers the required degree of freedom (and responsibility) in workplaces characterized by synergies in things and relations. The importance of leadership, which increases with increasing complexity and interdependence, is underlined by John Kotter (2000) who sees leadership as a fundamental principle affecting the ability of organizations to adapt to a world of constant change. This research therefore focused on the occurrence of these principles in practice in order to determine whether and to what extent leadership, as one of the principles of the biotic organization, is rooted in the practice of contemporary enterprises (namely in the context of fundamental changes which the external environment has undergone in the last forty years).

The results in table 6 indicate that leadership is still insufficiently exploited due to the character of the environment in which enterprises exist today. (The characteristic features of the current environment are uncertainty, nonlinearity, and free will.)

Tab. 7 - Principles of coherence in practice. Source: own.

<i>Which of these principles is applied more in your organization?</i>	<b>Frequency</b>	
	<b>Absolutely</b>	<b>Relatively</b>
Management (control and planning)	40	71%
Leadership (sharing vision and inspiration)	16	29%

Management, as one of the most important principles of mechanistic organizations, is an integral part of the management systems of more than two thirds of the organizations included in this study. The ability to create a shared vision and transform working conditions to encourage inner motivation was observed in less than a third of organizations. It was also discovered that the size of organizations significantly influences the occurrence of the principle of command and control. The environment of engagement and freedom occurs especially in small organizational units (no more than ten employees). The backbones of most large organizations are constituted by an authoritarian form of management based on predictability and controllability, which are the basic assumptions of traditional management.

## 5 POPULATION OF BIOTIC ORGANIZATIONS

On the basis of our own earlier research, it was found that the predominant organizational form is a hybrid organization combining mechanistic and biotic elements. The predominance of mechanistic principles in the operational infrastructure of business organizations supports the research assumption that the principles of biotic organization in the practices of current companies are underdeveloped.

The research thus focused on exploring the four areas of the organization which deliberately follow the four dimensions of holistic man as a prototype for creating the model of a living organization in order to verify the initial assumption about the occurrence of biotic organization in the business environment. The previous chapter introduced a quantitative survey, according to which the level of structuring in organizational entities and their abilities to empower, share purposes, evoke a sense of partnership, and define their own purpose of existence were evaluated.

The results of the survey, which were assessed in order to form a four-dimensional model of the organization, are shown in the following table.

Tab. 8 - Occurrence of the principles of biotic organization in practice. Source: own.

Dimension of organization model	Subject of research	Relatively frequency	
		Principles of biotic organization	Occurrence of biotic organization in the business environment
Economic dimension	Amorphous structure	14 %	biotic organization comprising 5 % of the total
Emotional dimension	Leadership	29 %	
Mental dimension	Shared vision	39 %	
Spiritual dimension	Service to environment	41 %	

Data from the previous table provided answers to earlier research questions regarding the representation of the principles of biotic organization in practice. Network-organized institutions, whose coherence entails the principle of leadership as a tool for sharing visions and empowering individuals and the principle of a widely shared vision as a discipline creating an environment of shared purpose and partnerships with a purpose that goes beyond just making money, represent only a minority of organizations in the economic environment (approximately 5% of the total organizational population). Analysis of the data also showed that the principles of biotic organization are not dependent on organizational size. This fact is illustrated in the following figure.

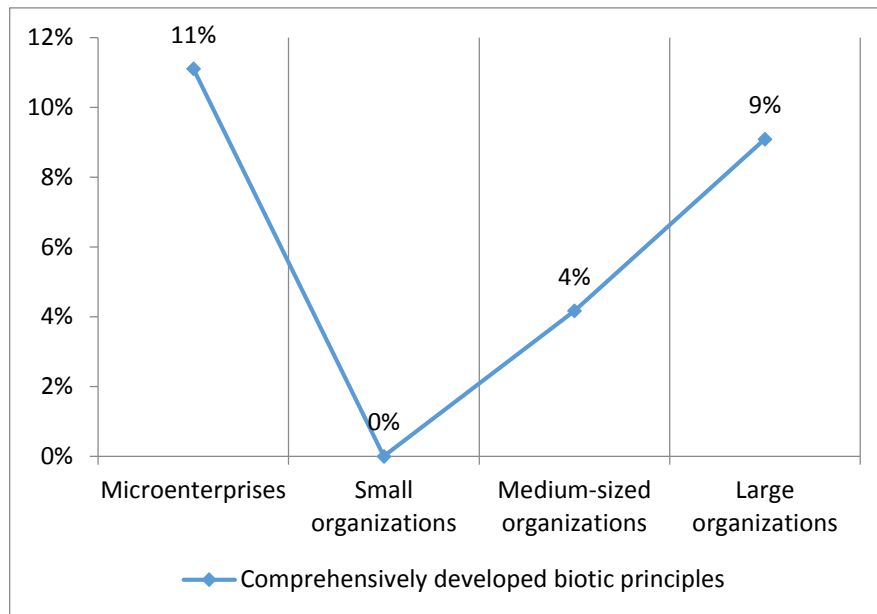

Fig. 6 - Comprehensively developed principles of biotic organization in practice. Source: own.

## 6 CONCLUSION

The aim of the article was to construct a model of biotic organization to map the occurrence of biotic organizations in the economic environment. The research conclusion emerged from an effort to answer the question of whether biotic organizations are represented in practice in more than 10 percent of cases. Based on the analysis of theoretical assumptions, we identified the principles of biotic organization. These principles, which are amorphous structure, leadership, shared vision, and service, created the final form of the four-dimensional organizational model. The occurrence of these principles in practice was verified by survey. Data inserted into the model of biotic organization revealed the relatively low frequency of these principles. The processed data revealed a relatively low frequency of these principles in the practice of contemporary organizations.

The hypothesis that, in practice, biotic organizations represent less than ten percent of cases was confirmed. According to the created model, approximately 5% of organizations may be considered as biotic organizations. Organizations have particular problems with the creation of a network (amorphous) structure and the more frequent application of soft management practices that create space for self-management.

Future research work should therefore be focused on an analysis of the main management techniques taught mainly at economic universities, with an emphasis on promoting support courses relating to change management, the creation of a shared vision, inspiration, and the creation of an internal environment that will build on the principles of freedom and confidence. Of special note is the prevalence of traditional methods of organization and structural forms in current organizations, where, as it turns out, there is almost no alternative to the current pyramidal structure. This is probably a result of the fact that very few companies build management systems without formal hierarchies, ones which are based more on leadership than on management and control, and thus there are too few positive exceptions in the economic environment that could inspire other companies with respect to specific management practices. In this area, it is the practice of some companies more than pure theory that offers much interesting material, whether it is the lattice structure in W. L. Gore, the

circular structure in Semco, the inverted pyramid in the Indian software firm HCLT, or the specific structure formed on the basis of agreements between colleagues in Morning Star.

These firms should be subjected to deeper research in order to discover the common characteristics of these new organizational forms and to create a real alternative to the dominant management system built on the principles of mechanics, which prevails not only in the theoretical background, but also in the practice of today's companies.

## **THE SPATIAL BREAKDOWN OF INVESTMENTS WITHIN THE OPERATIONAL PROGRAMME TRANSPORT IN THE CZECH REPUBLIC**

*Lenka Smékalová, Pavel Grebeníček*

### **Abstract**

In the period 2007–2013 implementation of the cohesion policy in the Czech Republic represents the most important source for financing transport infrastructure, especially via Operational Programme Transport. The objective of this paper is to analyse all projects approved from 2007 until January 2012 which will enable to study the spatial characteristics of evaluated programme and discuss the breakdown of the beneficiaries at different levels of spatial hierarchy or the eventual volume of intervention in individual districts. The volume and the direction of the investments in relation to the spatial dimension present a new view on the cohesion policy instruments.

*Keywords: cohesion policy, cohesion funds, Czech Republic, districts, European Union, transport infrastructure, transport policy*

JEL Classification: H54, R42, R58

### **1 INTRODUCTION**

The question of importance of the transport and the transport infrastructure for further economic development of any region is long discussed. The fact that the transport infrastructure is one of the important prerequisites for successful development of an area is supported by plethora of authors (for example Rietveld and Nijkamp, 1992; Banister and Berechman, 2001; Ivanová and Masárová, 2011; Marsden and Docherty, 2013 and many others). The majority of course states that the transport infrastructure is not the sole factor in the question of the economic development albeit it still is a very pertinent one (see Álvarez-Herranz and Martínez-Ruiz, 2012; Ding, 2013). Deficiency in transport infrastructure often poses a problem in more urbanized areas and contributes to stronger core-periphery polarization (Meijers et al., 2012).

The topic of transport infrastructure is notably important also within the European Union measures aimed at the reduction of the regional disparities in the member countries. There is an assumption of this topic being of particular interest to the newer member states who suffer from noticeable regional disparities that are oftentimes increased by insufficient transport infrastructure especially in the peripheral regions. This is corroborated by the fact that an operational programme aimed at the topic of the transport services and the infrastructure is present in every new member country that accessed the European Union in 2004 and 2007. Lakshmanan (2011) specifies the benefits of investments into the regional transport infrastructure leading to increase in the transport performance (reducing the distance, improvement of the time of accessibility, and others) which in turn leads to increased accessibility of new markets in cases of the entrepreneurs using the infrastructure in question which are then able to specialize further and produce greater output. The entrepreneurs outside the region have equal chances of better accessibility and naturally increase their import thus affecting the production prices within the region and increasing pressure on efficiency. This finally results in restructuring of the regional economies.

The significant benefits of the transport infrastructure and services are reflected also in model of regional competitiveness by Lengyel (2004) as one of the success determinants of the regional competitiveness, the influence of transport infrastructure in Spain was researched by Cantos, Gumbau-Albert and Maudos (2005), the impact of Dutch transport infrastructure investments by Annema, Koopmans and Van Wee (2007) and many others. The importance of the transport infrastructure for entrepreneurial activity and behaviour is mentioned in case study by de Bok (2009) who researched Dutch entrepreneurs and on this specific example concludes that successful businesses tend to relocate to relatively well accessible locations which offer economies of agglomeration and positively influence the labour market in such locations. Bilan (2013) shows that transport is of importance in many national economies including those who accessed the European Union among the last.

As was previously mentioned the European Union, too, strongly accentuates the transport sector. The Europe 2020 strategy deals with multiple topics among them education which is undisputedly connected to economy, research and development especially in connection with encouraging private investments to R&D (De Wit, and Dearing, 2003; Coccia, 2009 or Moncada-Paternò-Castello et al., 2010), employment, potential of the newly emerging services concerning media and digital content (Horváth, & Machyniak, 2014), climate change and energy sustainability which is closely related to transport issues (Berritella et al., 2008; Dickson et al., 2010 or Marsden, and Rye, 2010), and questions of poverty and social exclusion. The strategy (EC, 2010) mentions transport infrastructure especially with regards to ensuring better accessibility of the shared European market to all entrepreneurs and further explores the topic in connection with the environmental friendliness and the sustainability concept which is based on balancing economic, social and environmental aspects (Hájek et al., 2011a). Sustainability in the transport sector at the level of the European Union is connected with following policy objectives (EC, 2009):

Quality transport that is safe and secure

- A well-maintained and fully integrated network
- More environmentally sustainable transport
- Keeping the EU at the forefront of transport services and technologies
- Protecting and developing the human capital
- Smart prices as traffic signals
- Planning with an eye to transport: improving accessibility

Sustainability of transport is strong topic emphasized in strategic documents (Janic, 2006, van der Heijden, 2006; Shen et al., 2011 or Santos et al., 2010) such as The Greening transport package (EC, 2008), long-term sustainability of transport is further explored in White paper Roadmap to a Single European Transport Area (EC, 2011).

Sustainability of the transport in the Czech Republic supported by the cohesion policy measures has been called into question by Hájek et al. (2011a). While some of the indicators pertaining to the transport sustainability, such as number of deaths in traffic accidents, show overall positive trends there is a marked preference for investments in environmentally less sound types of the transport. The cohesion policy measures in this instance are noticeably focused on road transport expansion as opposed to other types, especially the railroad transport. This likely scenario of the difficulties connected to the environmental aspects of transport infrastructure and services support was noted already in the pre-accession period by Zahradník (2003).

At this point it is necessary to include that procurement of transport infrastructure which is the main topic of the Operational Programme Transport is possible through other way which might be less straining for the state budget. Such possibility is presented by use of public private partnership projects. This particular phenomenon is rather problematic in the Czech Republic as evidenced by frequent changes in legislature (see e.g. Jurčík, 2012), or strain on banks concerning the loans (Blanc-Brude and Strange, 2007 and Belás et al., 2012, Cipovová and Belás, 2012). This particular problem further aggravated by growing insolvency rate in Czech firms (Paseková, 2013) and in cases relatively negative perception of entrepreneurship in the Czech Republic (Smékalová et al., 2014).

This article builds on previous research of the transport in connection with the European Union cohesion policy in the Czech Republic (see Hájek et al., 2011a, Hájek et al., 2011b) and on cohesion policy in general (Hájek et al., 2012) and aims to evaluate the spatial dispersion of the EU Cohesion policy funds in the districts (LAU 1 units) of the Czech Republic with particular focus on support of the economically lagging regions delimited by the Czech government in the frame of national regional policy. The secondary aim is to verify whether this programme in some way contributes directly to the support of small and medium entrepreneurs in the Czech Republic.

## **2 METHODOLOGY**

Information about implemented projects were obtained from the web presentation of the Regional Information Service which maintains a regularly updated database of the implemented projects with complete information about the budget composition and the territorial impact of each project. This database contained the necessary information about the projects themselves and was further complemented by the list of beneficiaries published by the managing authority of the Operational Programme Transport. When combined these two sources provided the authors with information about projects and with basic identification of the beneficiaries. The information about spatial impact was enhanced by determining whether the impacted municipalities at the time of start of the project were located within an economically less advanced region as per governmental regulation no. 560/2006.

The beneficiaries are, too, of importance with regards to their position within public or private sector, their size or the territorial location. This information is however not included in either of the already mentioned databases and as such must have been filled in into the intended comprehensive matrix that would include data about every project and its beneficiary. The information about beneficiaries that was necessary to add is collected in the “Register of economic subjects” database maintained by the Czech Statistical Office. The information from the two databases was connected with the unique identification number of each beneficiary. And thus the data matrix was complemented by the information about institutional sector of the beneficiary, their size, CZ-NACE, and information about residence of the beneficiary. Contents of the resulting data matrix can be seen in table 1. All information concerning both the projects and the beneficiaries were then processed using methods of descriptive statistics and visualised in the geographic information system, namely the ArcGIS software by ESRI.

Authors

Attribute	Possible values
Name of the project	Unique values
Budgetary composition of the project	Unique values of EU contribution, national contribution and private contribution to the total of the budget in CZK
Thematic focus of the project	Road transport infrastructure; Railway transport infrastructure; Other transport infrastructure; Technical assistance
Spatial impact of the project	Impacted municipalities, districts and regions
Impacted municipality located in economically less advanced region	No; Structurally affected region; Economically weak region; Region affected by above-average unemployment
Identification number of the beneficiary	Unique value
Name of the beneficiary	Unique value
Institutional sector of the beneficiary	Enterprises under foreign control; Non-profit institutions; Other public institutions; Private national enterprises
CZ-NACE of the beneficiary	Unique values as per the Czech Statistical Office classification
Size of the beneficiary	Micro enterprise; Small enterprise; Medium enterprise; Large enterprise
Residence of the beneficiary	Municipality, district, region

### 3 RESULTS AND DISCUSSION

The analysis dealt with 139 projects that were implemented since the beginning of the current programming period in 2007 until January 2012 with the total allocation of CZK 124,2 bn. Out of these the projects of Technical Assistance were omitted as they ensure the day to day management of the Operational Programme Transport. After the data matrix contained 121 projects with total EU allocation of CZK 123 bn which at the time corresponded with approximately 70 % of total allocation of CZK 173 bn.

The calls for proposals issued within the Operational Programme Transport are strongly focused on the intended beneficiaries named already in the Operational Programme Transport document. These are the owners and managers of the transport infrastructure and providers of public transport services (Ministry of Transport, 2011). This very detailed definition of the beneficiaries and the thematic focus prevents this programme from being focused directly on either the small and medium enterprises or the state supported economically less advanced regions. The intent of the Operational Programme Transport is further evidenced by the results of the analysis. Table 2 shows the share of differently sized enterprises on EU support allocation in various region types. When focused solely on the enterprise size it clearly shows that the large enterprises gained overwhelming majority of EU financial support. All these

beneficiaries but three of them are represented by the public sector institutions namely the Road and Motorway Directorate of the Czech Republic, the Railway Infrastructure Administration and Capital Prague. The same beneficiaries also applied for the majority of approved projects as evidenced in Table 3.

Tab. 2 – Share of EU support allocation across region and company types in period 2007- Jan. 2012. Source: Authors' calculations based on data by Regional Information Service

Region type	Enterprise size			
	Small	Medium	Large	Total
Not supported	2,29%	0,02%	58,14%	60,44%
Structurally affected	0%	0%	18,01%	18,01%
Economically weak	0%	0%	9,62%	9,62%
Affected by an above average unemployment	0,12%	0%	11,81%	11,93%
Total	2,42%	0,02%	97,57%	100%

Tab. 3 – Share of number of projects across region and company types in period 2007- Jan. 2012. Source: Authors' calculations based on data by Regional Information Service

Region type	Enterprise size			
	Small	Medium	Large	Total
Not supported	12,88%	1,89%	52,65%	67,42%
Structurally affected	0%	0%	10,42%	10,42%
Economically weak	0%	0%	12,12%	12,12%
Affected by an above average unemployment	4,55%	0,38%	5,11%	10,04%
Total	17,42%	2,27%	80,30%	100%

The small enterprises that took part in implementation of project are connected solely with the water transport and are of both public and private sector. The percentage of allocation they gained is rather small but still amounts to almost CZK 3 bn. in 25 projects.

As for the location of the projects and the financial support into the regions the analysis distinguished among four types of regions. Those that were not supported by the state and the three state supported types as per the governmental regulation no. 560/2006: the structurally affected regions, the economically weak regions and the regions affected by the above-average unemployment. As was previously mentioned the nature of the Operational Programme Transport does not particularly encourage the spatial distribution to be in favour of the state supported regions as the projects mainly concentrate on the infrastructure maintenance or the construction of new following sections of road transport infrastructure. Therefore the spatial dispersion does not reflect the state supported regions but rather the already existing transport infrastructure (compare Fig. 1 and 2). Nevertheless the sum of EU support invested into the transport infrastructure in the state supported regions amounts to CZK 48,6 bn., approximately 40 per cent of total EU allocation. In this context it is rather prudent to check the national intervention of the Czech state in terms of national support and compare it with national support awarded in other regions. Private co-funding of the projects is of little importance compared to total allocation as previously indicated public sector enterprises are by far the most active applicants in the Operational Programme Transport.

The average EU support in the Operational Programme Transport project amounts to 72,5 per cent of the total project budget and remaining 27,5 per cent were provided by the national public resources mostly from the central government. The ratio of EU to state funds is the same in the non-supported regions and well as in the supported regions of the structurally affected type. The ratio is slightly changed in the economically weak regions where the Union support amounts to 79 per cent and the involvement of the national funding is somewhat smaller. Directly opposite case are the regions affected by the above-average unemployment where the EU support declines to 65,5 per cent of the total budget and the state provides residual 34,5 per cent of funds. In comparison with the sum of the supported versus the non-supported regions there is, however, no visible difference therefore no claim of stronger support for regions delimited as support by the Czech government can be made.

The thematic focus of the implemented projects is shown in table 4 which gives evidence of the road transport infrastructure preference to any other transport type. The building and modernization of the motorways, the expressway and the class I roads accounted for 63 per cent of so far assigned funds. Slightly more than one third was concentrated in the railway infrastructure and 2,5 per cent approximately in the other types of transport infrastructure. This marked preference for road transport is in disaccord with the effort to limit the negative influence of transport on the environment.

Tab. 4 – Thematic focus in regions as per the EU allocation in period 2007- Jan. 2012.  
Source: Authors' calculations based on data by Regional Information Service

Region type	Thematic focus				
	Building and maintenance of motorways and expressways	Modernization of class I roads	Modernization of railways	Water and other transport infrastructure	Total
Not supported	20,56%	12,82%	24,75%	2,31%	60,44%
Structurally affected	6,57%	7,34%	4,09%	0%	18,01%
Economically weak	1,85%	3,31%	4,46%	0%	9,62%
Affected by above-average unemployment	10,35%	0,41%	1,04%	0,14%	11,93%
Total	39,33%	23,88%	34,34%	2,45%	100%

As previously evidenced by the results of the analysis and further confirmed by the analysis of issued calls for proposals the Operational Programme Transport does not particularly target economically less advanced regions delimited by the governmental regulation in terms of the spatial dispersion of the EU funds but focuses rather on the districts where there is transport infrastructure to maintain or be newly built as can be seen in Fig. 1 which compares the Union financial support with the road infrastructure existing at the beginning of the year 2012.

The most supported districts in the Czech Republic as shown in Fig. 1 were sites of implementation to major projects. In Prague, the capital of the Czech Republic these were projects concerning the railway station and the road circuit around the capital, in Frýdek-Místek district these were projects concerning the optimizing of presently existing railways and construction of new expressway no. R48. In the most support district of Tábor again a

combination of railway reconstruction and major motorway construction met, in this particular case the railway in question was the fourth transit railway corridor and the road in question was the D3 motorway.

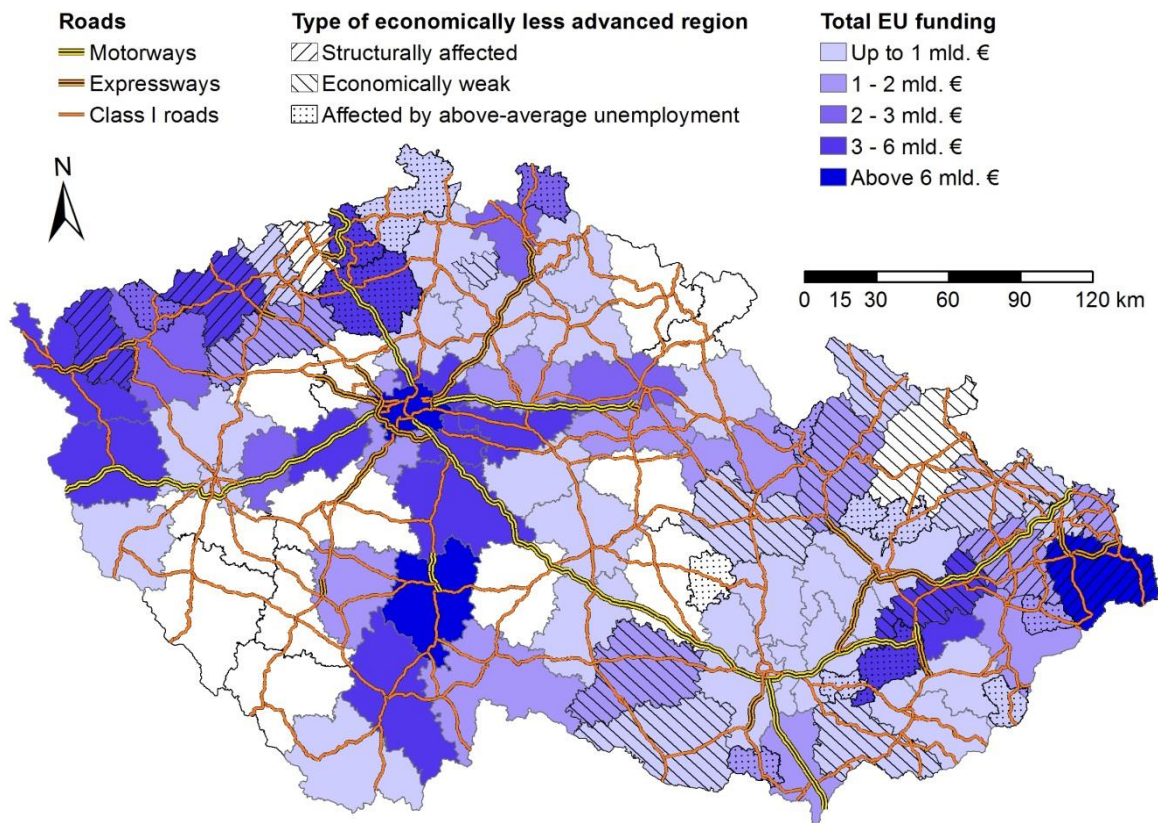

Fig. 1 – Total European Union support in districts of the Czech Republic and state of the road infrastructure as of 1<sup>st</sup> January 2012. Source: Authors' based on Ministry of transport and Regional Information Service

The focus on the economically less advanced regions is evaluated also in Fig. 2 which shows the EU funds allocation per inhabitant in the districts of the Czech Republic with emphasis on the representation of the economically weak regions as per the governmental regulation no. 560/2006 which are delimited on district level or lower levels of Czech administrative structure.

The picture demonstrates little evidence as to the intentional advantage for the economically less advanced regions. The cases of several economically less advantaged districts that also received largest amounts of EU funds are due to their location on the route of planned infrastructure, for example Sokolov district, a structurally affected region, received the second largest amount of EU funds per inhabitant (more than € 61 000) in correlation with that this district noted the largest increase in length of expressways. The same goes for Kroměříž district which is counted among the regions affected by the above-average unemployment where the EU funding per inhabitant amounted to more than € 45 000 and the district noted increase in both the length of motorways and the expressways in period 2007-2012, whereas Tachov district received large allocation of almost € 59 000 per inhabitant which was caused by implementation of railway related project and the construction of new class I road. Other most supported regions were outside the scope of economically less advanced but what they have in common is the spatial nearness as the infrastructure construction often overreaches

the district borders – for example Tábor and Benešov districts located in South Bohemia and Central Bohemia region both gained substantial support of € 114 000, respectively € 59 000 per inhabitant. This was caused by the aggregation of projects related to modernization of the 4th railway corridor (route Prague – České Budějovice – Austrian Summerau) which belongs among the TEN-T railways.

#### 4 CONCLUSION

The importance of the transport and transport policy as a factor of regional development is broadly discussed and the particular discussion is still very much active recently. The transport and particularly its often negative impact on environment is also one of the focus points of the European Union policies in terms of its sustainability. In the Czech since 2004 the environment, the transport, and related infrastructure are strongly connected to the cohesion policy funding - currently within the Operational programme Transport. However, the presented structure of projects gives clear signal that the Czech Republic is in this regard more focused on the issues of road transport. This kind of attitude may present a certain drawback as the preference for the road transport does not particularly correspond with the European wide efforts to make transport more sustainable and environment friendly. The overall significance of the operational programme is suggested by its allocation alone. The largest allocation of all operational programmes of the 2007-2013 period suggests the immense importance that the Czech government ascribes to the transport infrastructure and its state. Given also the continuity of the Operational programme Transport it is clear that the infrastructure issues of the Czech Republic are persistent and given the central geographic

location of the Czech Republic in the European Union are of interest to more than merely Czech actors.

As this paper posed the question of whether the nationally delimited regions with economic and social disadvantages are the main beneficiaries of this particular operational programme it is necessary to say that the overall concept of the Operational Programme Transport does not favour intentional support of the economically less advanced regions as they are delimited by the Czech government. It focuses rather on the Convergence regions of the Czech Republic as a whole and the spatial dispersion of the Union funds has strong relation to already existing transport infrastructure that is being either modernized or whose routes are gradually extended according to the national plans with emphasis on Trans-European transport networks.

The necessary detailed determining of the beneficiaries in the programme documents and calls for proposals also prevents the Operational Programme Transport from being focused on small and medium enterprises as the managers of the infrastructure recruit from large public sector enterprises. However the support of the small and medium enterprises in terms of allocating funding for them is understandably not the focus of the Operational Programme Transport. Rather the concept of better accessibility is fulfilled by the implementation of the Operational Programme Transport especially in terms of the construction and renovation of the transport infrastructure and the small and medium enterprises as well as other subjects of both private and public sector are indirect beneficiaries. On the other hand some of them particularly the ineffective subjects may cease to exist due to the strengthened competition that the improved infrastructure and services attract as Lakshmanan (2011) points out.

## **PROBLEMS WITH FINANCING OF SMES AS ONE OF THE BUSINESS RISKS IN THE CONDITIONS OF SLOVAKIA**

*Monika Sobekova-Majkova, Jan Solik, Juraj Sipko*

### **Abstract**

The main aim of this paper is to outline the barriers where SMEs face Slovakia in terms of financing. Moreover, closer attention is paid to the issue of fund-raising and financial risk perception, as one of the potential business risks. After the detection and analysis of barriers of financing this business segment, we provide suggestions of possible measures that could improve current situation.

The paper is based on two surveys conducted in Slovakia. The first dealt with the barriers of youth entrepreneurship, which reviewed the current situation and bring inspiring ideas to promote business in this group of entrepreneurs. This survey was conducted in collaboration with the Association of Young Entrepreneurs in Slovakia and Iuventa within internal grant to the Pan European University in 2011 and 2012. The second survey dealt with the business risk in Slovakia. Survey was part of an international research project undertaken in cooperation with the Czech Republic, results were processed in 2013 and 2014. Survey examined the differences between firms in Bratislava, Trenčín and Žilina.

In this paper we addressed, because of the limited scope, only narrow topic problems in finding finance and financial risk. We believe that linking the two surveys, which are devoted to small and medium-sized enterprises in Slovakia can bring a more comprehensive view on this issue. In this paper we focused due to limited scope only narrow topic problems in finding finance and financial risk. We believe that linking the two surveys, which are formulated to small and medium-sized enterprises in Slovakia, can bring comprehensive view on this issue.

*Key words: small and medium enterprises, access to finance, barriers of financing, barriers of business, financial risk, business risk*

JEL Classification: G32, G39

## **1 INTRODUCTION**

Small and medium-sized enterprises (SMEs) are the most important building part of a market economy. In the European Union and in the US account for 99% of all enterprises (Bhaird, 2010). In other words, this creates a segment in our country almost 50% of the national added value and provides about 70% of employment. SMEs are becoming increasingly more important component of all economies in the world (Karpak, Topcu, 2010). In this context, Henderson and Weiler (2010) indicate that SMEs can be characterized as a major engine of economic growth. The latest statistics of Slovak Business Agency report that Slovakia SMEs constitute 99.9% of all enterprises. After the outbreak of the financial and economic crisis began SMEs, which are characterized by considerable vulnerability, even more exposed to business risk. Moreover, the decline in orders, its production, and profitability caused the rise in unemployment in the context of global instability and reduced access to finance, there has been a declining number of SMEs.

However, the importance of the SME segment is clear, and this group is equally important in Slovakia. We believe that the analysis of one of their biggest problems - funding will bring

adequate benefits. Our goal is by linking the results of two surveys that we conducted among entrepreneurs, to bring comprehensive view on this issue in Slovakia.

## **2 BUSINESS RISKS OF SMES AND THEIR ACCESS TO FINANCE IN THE LITERATURE**

The introductory part of this paper presents the theoretical perspective of the business risks, including financial risks, which we will analyze by using results obtained in the surveys. The second part of the section will logically continue in the issue of financing of small and medium-sized enterprises.

### **2.1 Business risks, including financial risks for small and medium-sized enterprises in the literature and practical studies**

Shadbolt et al. (2010) agrees with the Chavasom (2004) that define risk as any situation, where results are not known with certainty. Smejkal and Rais (2003) associated risk with the following concepts: the uncertainty of the outcome - when we talk about risk, there must be at least two variants. Another condition is that at least, one of the possible outcomes is undesirable. At a similar definition provides the OECD (2008), according to which the risk of uncertainty, in various forms, such as loss of money or events with the potential harmful effects on health and other events that affect human well-being.

Another view, Veber (2004) perceived business risk as the risk of failure associated, however, with the hope to achieve good economic results. Despite many approaches to dealing with the risk Adásková (2009) presents the results of research in which 76% of the polled companies address the risk most often implemented via an intuitive approach, 36.5% used the set systems, 33% use emergency plans and 24% have a designated person responsible for risk management.

Fotr and Hnilica (2009) identify business risk as the possibility that the actual business results will deviate from the expected results with deviations may be desirable (towards higher profits) or side (towards loss), respectively different size (deviations from small to large scale variations). A similar approach to understanding business risk have Chodasová and Bartošová and Belanova (2012). They defined risk as two essential components of business risk and financial risk.

Business risks (market, production, personnel, legal, security etc.) are integrated into financial risk. Viewed in this light, optimal management of these risks will determine the existence of a market, respectively its bankruptcy and closure.

Financial risk is related primarily to the availability of financial resources, changing interest rates, respectively the use of different forms of capital. Nevertheless, research of financial risk, but from different point of global views the examined several authors. Torre et al. (2010) presents a group of SMEs as a core business for the bank through credit lines. According to the authors of the big banks can offer SMEs a lot more services, the relationships were problematic at a time of crisis.

Some academic studies analyzed financial products, but focused instead on credit products. (Bitler et al, 2001) Agostino, M. Gagliardi, F., Trivier, F. (2012) examined the concentration on the local credit market may affect the riskiness of SMEs. Boyd and De Nicolo (2005) report that less competition leads banks to increase charges for loans and earn more. This fact increases the risk of bankruptcy of the debtor. Dierkes et al. (2013) found that the share of corporate credit information improves forecasts of default and thus are better, the lower

failure rate. Other authors Ono, Ueshugi and Roll (2009) in their findings show that the riskiness of businesses have no significant impact on collateral. On the other hand, they found that banks that have claims collateralised try to monitor these borrowers intensively.

Authors Behr and Guttler (2007) propose a new model that predict the probability of default of German SMEs taking advantage of the unique data of German SME loans. They consider financing of bank as the dominant source of external finance for German SMEs. Viewed in this light, it is a new approach that analyzes the relationship of the bank and the customer, and a new feature allows to measure the risk of default of the borrower. Behr with Norden and Noth (2013) found that an increase in borrowing by local state-owned banks significantly reduce corporate financial exposure, while is not effect in private banks.

Italian researchers Gambini and Zazzaro (2013) examined whether the borrowing of the companies from banks can have beneficial effect on their growth. The basic finding is that borrowing money from banks provides smaller businesses the opportunity to grow, while on the other hand, loans can alleviate problems of medium-sized companies.

The problem in the SME sector is also limited awareness of enterprises. This situation in Slovakia confirmed Sobeková (2011), as well as foreign authors Dierkes, Erner, Langer and Norden (2013), who argue that companies in the SME segment are small businesses that are less informed, more risky and more dependent on trade and bank loans.

The question is: How to look the financial risk to businesses in Slovakia during the crisis? Sobeková (2011) analyzes on the basis of the published results of the banking sector, that the situation of loan financing in times of crisis and also on the side of supply and demand. Demand also fell for consumers and for businesses. On the other hand, the number of defaults began to increase. Banks have responded to this problem by tightening credit conditions, which began in the second half of 2008, when standards have tightened up 69% of the banks.

The standards for lending banks tightened particularly in the SME segment. More than 50% of banks significant change of credit standards for large enterprises did not record. The most noticeable change was in the amount of margin for risky loans. The third largest category of tightening occurred in the required collateral loans. This can be a major barrier to accessing credit just for small to medium enterprises. Particularly small and medium-sized businesses suffer from weak capital strength and often have problems with liability.

## **2.2 Access to finance for SMEs in the literature and practical studies**

SMEs have problem with many obstacles of business not only in Slovakia. According authors Pissarides (1999) and Steinerowska-Streb and Steiner (2014) is lack of the finance considered for the main problem to the growth of SMEs. That access to finance is necessary for growth and next developing of SMEs prove also authors Mercieca, Schaeck and Wolfe (2009). Many Slovak authors who know special situation in Slovakia declare lack of capital or access to finance as a one of the biggest problems of SMEs (Sobeková – Majková, Fetisovová, Vlachynský, Sirotko etc.) The authors Dong and Men (2014) informs about this findings about financing of SMEs. They confirmed that relatively small, young firms in nonmanufacturing sectors consistently face more severe financing obstacles/constraints and rely heavily on internal financing. The availability of credit information and the bank concentration ratio have a significant impact on SME financing. The authors Cheng, Tang and Shi (2012) present also weak capital power and credit degree as one of the biggest problems of SME financing.

In comparison of Slovak and German companies there is interesting fact - we can say that German small entrepreneurs do not have problems with obtaining financial resources because

they make a profit also used as internal financial resources. For example French entrepreneurs are somewhere on the board between Slovak and German companies as on July 2011 published the website Euractiv. On the other hand, problem is that during the crises is their situation worse and their support is so small. Business conditions in Slovakia – increasing VAT, decreasing flat expenses, etc. have bad impact on their financial situation.

The results coming out from NADSME (2011), the current Slovak Business Agency (SBA), it is clear that the outbreak of the crisis experienced relatively steep decline in earnings primarily of small businesses. The crisis in the form of a negative impact on their operation experienced 87% of SMEs but with varying intensity. The later survey of 2013 indicates that 45% of respondents used when starting a business support from the Ministry of work. Only 4% of businesses use when starting a business bank loan because the bank calls for collateral for the loan, which were unable to meet. One of the biggest problems identified by survey is obtaining of financial resources to challenging projects. It is alarming that none of the surveyed enterprises used credit resources for the development of international activities.

Most studies, however, engaged in financial and business risks exempli gratia Majková (2008) as the main barriers identified - weak financial strength makes it impossible for small businesses to get loans and provide security and low awareness of the various funding opportunities.

More to the point, research of the needs of young entrepreneurs and the obstacles to their business implemented, according to the survey of the Association of Young Entrepreneurs (AIPL) in collaboration with Jakubec, Sobeková and Solík (2012), that the first hurdle in business perceived lack of start-up capital (77.64%) and the second most marked the lack of experience, knowledge and professional contacts (71.70%).

### **3 OBJECTIVE AND METHODOLOGY OF THE RESEARCH**

First, the importance of the SME segment is undeniable. Second, it seems that one of the biggest problems which this group of entrepreneurs struggling is a lack of funding and financial risk. In this context, our goal is by combining the results of two surveys we conducted among entrepreneurs, to bring a more comprehensive look at this issue in Slovakia. The contribution is due to the limited informations, we focus only narrow topic - problems with obtaining finance and financial risk. We believe that the analysis of one of the biggest problems of SMEs in Slovakia - funding will bring appropriate benefits.

Moreover, analysis of the results based on the results of two surveys conducted in Slovakia. The first survey dealt with the barriers to youth entrepreneurship, which reviewed the current situation and bring inspiring ideas to promote business in this group of entrepreneurs. The survey was conducted in collaboration with the Association of Young Entrepreneurs in Slovakia and Iuventa within internal grant to the Pan European University in 2011 - 2012. The second survey dealt with the business risks in Slovakia in 2013. Survey was part of an international research project undertaken in cooperation with the Czech Republic and examined the differences between undertakings in Bratislava, Trenčín and Žilina.

The first research that we composed in cooperation with Association of Young Entrepreneurs, we examined obstacles in doing and starting business in Slovakia. We prepared online questionnaire so the choice of respondent type was stochastic. Our research group was divided to two parts, in one there were respondents, on the one hand young people who were potential young entrepreneurs and second young entrepreneurs to 34 years old. Only one fact could influence group of young people not entrepreneurs, therefore we assume that online questionnaire filled more people that would like to be in future entrepreneurs that not to be.

The questionnaires were filled in 2011, from July to November and the results were analyzed in 2012. Whole group had 1232 respondents: 324 were young entrepreneurs chosen by random selection and 908 young people not yet entrepreneurs, but they are thinking about starting their own business. (Jakubec, Sobeková, Solík, 2012)

We consider this survey for representative survey proving barriers in doing business of young entrepreneurs in Slovakia. According following Tab. 1 young entrepreneurs in Slovakia have 28 % share on total count of entrepreneurs in Slovakia. Also our sample was representative. We decided for random selection through internet by online questionnaire (50 %) and also personally by interview (50 %). The online questionnaire was published at the website of the Association of Young Entrepreneurs so all of them had the chance to fill it.

We counted the size of representative sample. We realized with 95 % of reliability of data, so we consider with sampling error +/- 5 %. The minimum size of sample should be according formula  $n = (1,96)^2 * \sqrt{p * (1 - p)} / 0,052$  where p is share of the sign. The size of our minimum sample size was 310 and real size of our sample was 324. Our sample was too closed with basic file in dividing by region and also by gender. According to Slovak Business Agency data, in the basic file there are 76.70% male and 23.30% female members. In our selection file, the numbers were very close, we found 64.20% men and 35.80% women.

Tab. 1 - Numbers of Entrepreneurs in Slovakia according to Legal Form and Size Group in 2012 (Basic file). Source: SBA

Legal Form	Total	Share of total companies	Share of young entrepreneurs to 34 years old	
			Total	in %
<b>Entrepreneurs individuals</b>	<b>402 325</b>	<b>72.3%</b>	<b>112 967</b>	28.1%
- tradesman	375 722	67.6%	108 489	28.9%
- free enterprise	19 069	3.4%	3 920	20.6%
- independent farmer	7 534	1.4%	558	7.4%

Following Tab. 2 shows regional structure comparison of basic and selection file. In the column difference we see the difference % between selection and basic file. But in each category it is smaller to 7 %.

Tab. 2 - Regional structure comparison of basic file and sample in 2012 (selection file).

Source: Slovak Business Agency

Region	Sample		Basic file*	Difference
	Total respondents	% respondents	% companies	% companies
Bratislava	92	28.40%	34.70%	- 6.30%
Žilina	52	16.05%	9.40%	+ 6.65%
Prešov	38	11.73%	9.20%	+ 2.53%
Košice	37	11.42%	10.30%	+ 1.12%
Trenčín	34	10.49%	8.30%	+ 2.29%
Banská Bystrica	31	9.57%	8.80%	+ 0.77%
Nitra	21	6.48%	10.00%	- 3.52%
Trnava	19	5.86%	9.20%	- 3.34%

*Note: Company distribution according to headquarters region.*

The second survey of business risks in selected regions of Slovakia we conducted by using a questionnaire inquiring about two years later in 2013. In this light, our sample included 371 enterprises: 102 enterprises from Bratislava region, 164 companies from Zilina region and 105 companies from Trencin region. The scope of the sample ranged from 0.2% to 0.09%. Similarly, it was a random choice and questionnaires were composed and distributed directly - the personal meetings or through the Internet. Representative sample was evaluated similarly as in the previous research.

Bratislava region is economically the strongest of all the regions, survey shows that nearly twice the number of small and medium-sized enterprises than in other regions. While in the Bratislava region's unemployment rate is about 6% in Trencin region is 11% and 13% of Žilina.

### 3.1 Analysis of results and hypotheses

We used for the analysis of percentage share table software Excel (Office 2007) and its possibilities to process data using pivot tables. It was important to use tools of descriptive statistics (averages and percentages). For the analysis, we used the method comparison and deduction. Than we used statistical method especially Pearson's chi-square and P-value to identify statistical differences, which was done in statistical software R. By using methods that are mentioned above we verify our hypothesis. We will present only some problems from our research because of article length limits. These arguments we constructed using our experience and estimation. Our hypotheses were built on the assumption of different points of view between young entrepreneurs and potential young entrepreneurs and on differences between men and women.

In addition, to the analysis of statistically significant differences we selected part of the results, where were also used data mining (decision tree method). The calculations were implemented in Weka software.

### 3.2 Testing Hypotheses

In both academic researches we had many hypotheses but in this article (because of the length) we prepared only 3 alternative hypotheses (H1 – H3) connected with financing of SMEs. Following hypotheses we will try to verify by using statistical methods. To each alternative hypothesis, there is also a null hypothesis that assumes there are no statistical verified differences between observed groups.

**Null hypothesis**  $\pi_1 = \pi_2$  so  $\pi_1 - \pi_2 = 0$

**Alternative hypothesis**  $\pi_1 - \pi_2 \neq 0$

We prepared the five following alternative testing hypotheses, which were done by expert's estimation:

**Hypothesis 1:** One of the biggest barriers in SMEs financing in Slovakia is access to finance and lack of capital. Young entrepreneurs sense different lack of information in starting business as young people that are potential entrepreneurs. We suppose that there is the dependence of sensing the lack of information and status of people. Young people that are not entrepreneurs do not have enough experiences and so their view is quite different.

**Hypothesis 2:** One of the major business risks within the surveyed regions is market risk and financial risk. Companies in the Bratislava region perceive it the least intensively, as it operates in the most developed region.

**Hypothesis 3:** Firms in the Bratislava region can better manage financial risk and easier to obtain the necessary financial resources.

## 4 The results of research and discussion

In this section of the paper we focus on analysis of the results and the verification of set of alternative hypotheses concerning with the financing of SMEs in Slovakia.

### 4.1 Problems with financing of SMEs in Slovakia

We supposed that young entrepreneurs and also potential young entrepreneurs think that people do not have enough information, especially majority about obtaining financial resources and also about tax and insurance law. Our results show that when young entrepreneurs started the business, they had lack the most information about obtaining financial resources 54.01%. On the other hand, during current times potential young entrepreneurs think that the most lack of information about how to manage the employee and about establishment the business, administrative duties during starting business. In sum, their views are quite different as is presented in following table 3.

Tab. 3 - The lack of information about business in group of entrepreneurs and potential entrepreneurs. Source: results of scientific research

<b>Answer – the lack of information</b>	<b>Entrepreneurs</b>	<b>Potential entrepreneurs</b>	<b>P-value</b>
About obtaining financial resources	54.01%	36.34 %	0.3935
About health and social insurance, accounting and laws	50.00%	29.85 %	0.0347
About administrative duties of the entrepreneurs to the authorities	48.15%	31.94 %	0.3449
About legal forms and establishment of the business	27.78%	31.39%	<u>p-value &lt; 0.01</u>
About doing business in abroad	26.23%	22.25%	0.2248
How to manage company and	24.38%	32.85 %	<u>p-value &lt; 0.01</u>

employees			
About business plan	23.77%	25.44 %	<u>0.001877</u>

We tried to count chi-square to know the dependence of sense the lack information between entrepreneurs and potential entrepreneurs to start a business. First, we see the differences between these two groups in Tab. 3, after taking chi-square ( $\chi^2 = 51,94 > 18,5 = \chi^2_{0,005}$  with 6 dgf.) we verify alternative H1 – there is the dependence which is statistically significant at 0.5% level of significance.

In the case of information about legal forms and establishment of the business, how to manage company and employees and about business plan, there are the biggest differences between young entrepreneurs and potential entrepreneurs (p-value > 0.05).

One of the aims of our research was to identify main barriers to start do business and also problems of young entrepreneurs. We found that following barriers of young entrepreneurs as the most important (Tab. 4):

- lack of financial resources 77.64%;
- lack of experience, knowledge and professional contacts 71.70 %.

These two barriers are the most important. However, they identify that mentoring is more important than financial resources, in this part, they indicate financial resources as the most important barriers. More to the point, behind them there is a lack of state grants 42.18 % a corruption 41.96%. We came to the conclusion that it is threatening number. Viewed in this light, the fifth biggest barrier was the fair of economy crisis 39.9% and high tax and insurance costs 36.56% and often law changes 36.01%.

Tab. 4 - Barriers of Young Potential Entrepreneurs – Answer on Question What Exactly To You Miss Start Own Business? Source: results of scientific research

<b>Answer</b>	<b>% share</b>
starting capital	78%
good business idea	41%
education and professional experiences	35%
ability to navigate in the laws	32%
better business environment	29%
willingness to take a risks	28%
merchant gift	14%
determination and perseverance	10%
ability to manage people	8%
support of family	8%
health	5%
nothing	3%

Nevertheless, men and women see as the biggest barrier of lack capital in terms of starting of business. Viewed in this light, women perceive law enforcement more positively than men, but are worried about the impact of the economic crisis and they think that young people are often prevented from lack of experience in business. According the education level there is the only difference in the perception of lack of contact that represents 10% of graduated, but only 15 % of respondents with primary education. In short, for majority young people is also

deficit of capital the biggest barrier in starting own business. On the other hand, 41 % of them miss a good business idea. They do not have education and professional experiences and they do not know to navigate in the laws of the country.

We identify the differences between entrepreneurs and young people. Moreover, entrepreneurs have some experiences, they have just started with business and so have more realistic view and know that missing capital is not only one big problem.

#### 4.2 Perceptions of business risks in Slovakia

Our research, in addition to other important information we examine how companies in Slovakia perceive business risks. First, we have been interested about differences between the selected regions. At the beginning, we assumed that firms in the Bratislava region at least suffer from the business risks, because they are located in the most developed region. The results are presented in Table 3. In addition to examining the percentage of firms that considered risks as a key, we investigated the statistical dependence between regions. P-value for all kinds of risks in addition to legal risk greater than 0.05 so do not reject the null hypothesis, respectively. Unfortunately, statistically relevant evidence that H2 is true, as the Pearson  $\chi^2$  is 12.3648 at 10 degrees of freedom, the overall P-value is 0.2614 > 0.05. Tab. 5 presents results in the perception of business risk.

Tab. 5 - Identification of business risks in Slovakia in 2013. Source: results of scientific research

<i>In your job you may experience with many risks. Which ones do you consider during current times as crucial? (Please indicate max. three answers.)</i>	2013 BA	2013 ZA	2013 TN	P-value
1. Market risk (lack of contracts) in% *average value of risk **	<b>80.39</b> 56.00	<b>80.49</b> 51.30	<b>82.86</b> 53.27	0.8672***
2. Financial risk (poor access to finance companies) in% average value **	<b>53.92</b> 31.94	<b>58.54</b> 32.95	<b>50.48</b> 30.01	0.4179
3. Operational risk (failure to manage processes) in% average value **	<b>20.59</b> 24.17	<b>22.56</b> 30.09	<b>14.29</b> 20.71	0.2408
4. Personnel risk (poor staff) in% average value **	<b>41.18</b> 31.04	<b>38.41</b> 30.89	<b>47.62</b> 30.77	0.3245
5. The legal risk in% average value **	<b>16.67</b> 37.5	<b>37.20</b> 28.76	<b>32.38</b> 32.01	<b><u>0.001574</u></b>
6. Safety risk (accidents, incidents etc.) in% average value **	<b>29.41</b> 20.28	<b>32.93</b> 24.73	<b>27.62</b> 28.76	0.63

Notes: \* Data are calculated as the number of respondents who replied with the answer given to the total number of firms;

\*\* Arithmetic mean of the values reported by businesses in different regions.

\*\*\* Using proportional test, we determined whether the individual types of risk occurs difference between regions. P-value, we determined for each risk separately.

As mentioned above, except for the legal risk, which is in the Bratislava region (16.67%) significantly lower than in Zilina (37.20%) and Trenčín (32.38%). We present P-value of 0.001574 < 0.05, that indicates the regions are statistically significant differences in other risk shows that differences between regions are not that big. For more detailed analysis, we find (Tab. 6) that between Bratislava and Zilina reaches P-value of 0.005872 < 0.05,  $\chi^2$  value Pearsonovho is 11.8162 at 1 degree of freedom. Similarly, we found a statistically significant

difference between the Bratislava and Trenčín, where P-value reaches  $0.0132 < 0.05$ . The difference can not be established between Zilina and Trenčín, where P-value reaches  $0.499 > 0.05$ .

The results show that, while alternative H2 can not be statistically verified, we managed to reject the null hypothesis in the case of legal. Statistically significant differences we found in the Bratislava region. Moreover, SMEs operating in it is statistically significant are less threatened by this risk as small entrepreneurs in Žilina and Trenčín.

Tab. 6 – P-value in law risk in 2013. Source: results of scientific research

Law Risk	2013 BA	2013 ZA	2013 TN	P-value BA:ZA	P- value ZA:TN	P- value BA:TN
Share in %	<b>16.67</b>	<b>37.20</b>	<b>32.38</b>	<b><u>0.0005</u></b>	0.499	<b><u>0.0132</u></b>

According to our estimation, we assumed that the average market risk in the Bratislava region is at least 40% and in other regions is even higher. Businesses were threatened by market risk in each region, the most intense in the Bratislava region, however, its average height 56 in Žilina 51.30 and 53.27 Trenčín region.

### 4.3 Financial risk management and ability to raise the funds

According to the H3 hypothesis: Enterprises in the Bratislava region can better manage financial risk and easier to obtain the necessary financial resources.

In the survey, we were interested in how businesses are able to manage financial risks to which they are exposed. On the other hand, when examining the differences between regions, we found differences between Bratislava and Zilina, which indicates that enterprises in the Bratislava region can better manage financial risk than those in Žilina (Tab. 7). Between Bratislava and Trenčín, Trenčín and Žilina statistically significant differences are not confirmed.

Tab. 7 – Ability to manage financial risk in 2013. Source: results of scientific research

<i>Do you think that you know to manage financial risks?</i>	2013 BA	2013 ZA	2013 TN	P-value BA:ZA	P- value ZA:TN	P-value BA:TN
<i>Yes in %</i>	40	23	32	<b><u>0.00486</u></b>	0.1599	0.2623
<i>To some extent %</i>	52	68	58	<b><u>0.0149</u></b>	0.1265	0.4924
<i>No, i can not judge %</i>	8	9	10	0.886	0.862	0.662

Furthermore, analysis of the results by using the Pearson chi-square and review P-values we tried to analyze business optimism by the method of decision trees.

As explained variable we selected question 20, which presented how our business will exist next 5 years. Numbers in the program were assessed by always zero, and zero is started as a negative response digit growth escalated until a clear yes.

Explanatory variables, we selected the answer to question 19 (Can you manage financial risks?), 22 (How changed your profitability?) And 13 (Do you know the criteria for assessing credit?).

Asked 20 companies responded as follows: a - do not survive to 5 years (5 responses), b = survive, but with great concern (28 replies), c = survive, but with some concerns (180 responses), d = definitely survive (158 responses).

In short, decision criterion was constructed as follows:

- Successful businesses (ot20 = 0) - If 19 = 1, 13 = 1, 22 = 1
- Failed (ot20 = 1 or 2) - where 19 = 3 or 4, if 19 = 22 = 3 and 3 = 3, and 13 or, in the 4 and 19 = 22 = 13 = 3 and 3

The resulting matrix provides the following actual placement of the undertakings:

a	b	c	d	
0	0	4	1	a = 0
0	0	22	6	b = 1
0	3	<u>101</u>	76	c = 2
0	2	57	<u>99</u>	d = 3

From the 180 companies, 101 firms have expressed some concern in response to question 20 c, we used the criteria where we were able to correctly identify 99 out of 158 companies which have expressed strong survive.

Software lined up explanatory variables by relevance, moreover according to the our results it appears that the question 19 was the most important explanatory variable and question 20, 22 and then the 13th as well.

Eight businesses answered that they can not manage financial risks (answer to question 19 zero). Only six of them (75%), in fact, answered for question 20 with answer 2 - i.e. they think they will survive with some concern, the other 25% think otherwise.

By contrast, 112 companies that responded that they think they can manage financial risks, only 71 (64%) answered on question 20 with response 3 - i. e. they think they definitely survive. The remaining 41 firms believe otherwise.

We came to the conclusion, it appears that firms that think that they can manage the financial risks are more cautious with response, and certainly survive up to 5 years. Only 64% of those who think that they can manage the financial risks they think and certainly survive up to 5 years.

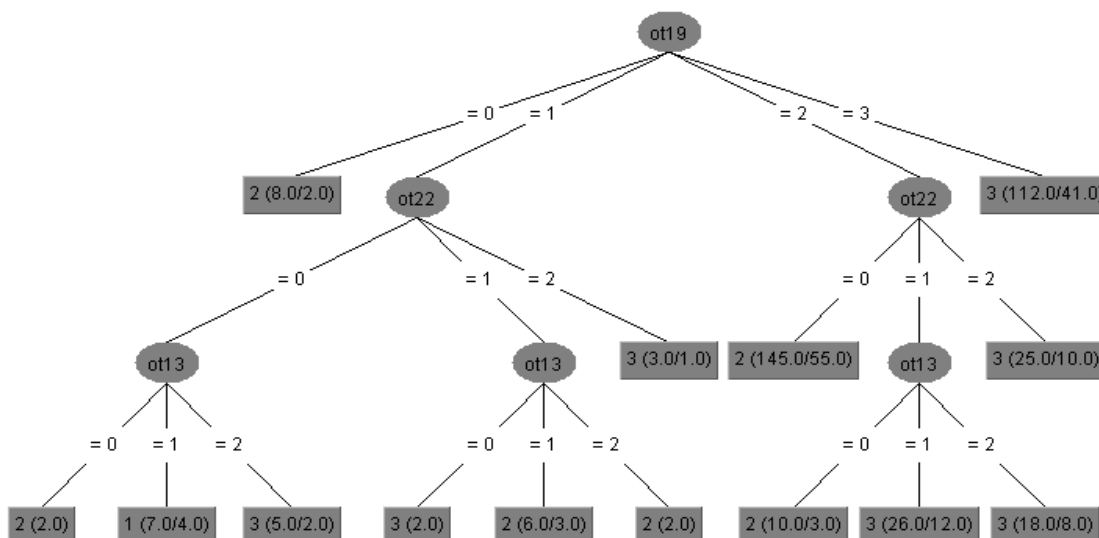

Fig. 1 - The decision tree as a result of question: do you think that your company will survive the next 5 years? Source: results of scientific research.

Up to 75% of companies that state that can not manage the financial risks they think will survive, but with some concern. In this context, it seems that even if you find companies that can not manage financial risks, their existence again is so black, with only some concerns about survival.

## 5 CONCLUSION

The aim of the paper was to outline the barriers which SMEs encounter in Slovakia and in terms of the financial risk further analyze the business risks of SMEs in Slovakia. We believe that we through closer interpretation of the results of the two presented surveys we fulfill this goal.

The question is: What are our specific findings? We have set three working hypotheses. The first working hypothesis examined that one of the biggest problems the entrepreneurs in Slovakia fighting, is to access to finance and lack of capital. This special issue came to the fore at young entrepreneurs. According to the results (Tab. 2 and 3), we found that indeed most entrepreneurs considered lack information on the funds and fund-raising as the biggest problem in business.

The second hypothesis examined the perceptions of business risks. We assumed that firms in the Bratislava region perceived risks less intensive than firms in other selected regions. The percentage of enterprises confirmed that, but the results are not statistically clearly interpretable. We were able to confirm only in the group of legal risk.

However, last working hypothesis was composed that companies in the Bratislava region can better manage financial risk and easier to obtain the necessary financial resources. We came to the conclusion that we can not generalize the argument that Bratislava firms are indeed the better. In short, we achieve statistically significant value when comparing the Bratislava and Žilina region. According to the results, we found that firms that think that they can manage the financial risks are more cautious in response and certainly survive up to 5 years. Only 64% of those who think that they can manage the financial risks they think and certainly survive up to 5 years.

Nonetheless, in the introduction we mentioned that one of the milestones of the paper is to propose the possibility that the business risk of the group of companies to reduce and facilitate their access to the necessary finance. How our suggestions make this situation better? We would like to bring some proposals, especially to make business easier to young entrepreneurs. In sum, it was too complicated in current times of crisis but they were prepared after constructive debate of authors of research. For the better understanding we composed a table with chosen problems and proposals of solution, all of them are specific for Slovak market.

Tab. 8 - Key barriers and proposals of solutions to support business in Slovakia.

## **CZECH REPUBLIC'S TAX POLICY AND ITS APPROACH TO TAXATION OF DONATIONS**

*Šárka Sobotovičová*

### **Abstract**

Donations in the Czech Republic were subject to the gift tax till the end of 2013. The gift tax ranks among property taxes. The approach to taxation of donations has basically changed since 2014 and gifts are newly identified as gratuitous income. This gratuitous income is incorporated into the income taxes. This article deals with the taxation of gifts and gift tax developments in the Czech Republic. It captures the dynamics of the gift tax since its introduction in 1993 until 2013. Due to the change in taxation of donations since 2014, an assessment of the impact of this change on the tax rate is provided.

*Keywords: gift tax, income tax, property taxes, tax revenues, wealth transfer tax*

JEL Classification:H20, H24

### **1 INTRODUCTION**

The gift taxes have generally come into existence as a supplement to the inheritance taxes. The reason is that the core of a property transfer by inheritance and donation is the same, since in both cases the property is transferred into the ownership of another person without charge. One of the reasons for the application of the gift tax is taxation of property which was donated while a donor is alive. Otherwise, taxpayers from countries, which apply inheritance tax, might optimize taxation of inheritance by donation of property while being alive.

The gift tax belonged to property taxes in the Czech Republic and referred to capital transfers tax. Progressive sliding tax rates were applied which differed according to family relationships. The gift tax was incorporated into the income taxes on January 1, 2014. A unified tax base is applied, which is different for both individual and legal entities.

### **2 THEORETICAL BASIS**

According to tax theory, the gift tax together with the inheritance tax ranks among the property taxes. It is capital transfer tax and relates to gratuitous transfers (Kubátová, 2010). As Široký states (2008), theory of property taxes can be generalized about as the theory of a wealth tax. Reasons for property taxation can be found both in the principle of utility and even the principle of ability to pay. In the case of taxation of donated property, a taxpayer may get the impression that they have not obtained the property for free, and therefore they will treat it with greater responsibility.

The argument for maintaining the transfer tax is based on its tendency to progressivity, which is related to tax fairness (Blechová, 2012). Where there is no tax exemption scheme for inheritance and gift taxes, there are progressive rates of taxation, which contribute to greater fairness of the tax system (Kubátová, 2010). To illustrate, a proponent of transfer taxes is Lumley (1998), who states that these taxes represent a stable income to a state budget. Jackson and Brown (2003) reported that the choice of transfer taxes is administratively less demanding and gift recipients consider the tax to be a smaller tax burden.

As Kubátová stated (2010), an important and often very frequent reason against taxation of property acquired through donation is that the subject of donation is always the property, which was, in most cases, acquired from already taxable income of a taxpayer (Joulfaian, 2003). It means that such property is therefore inherently taxed twice. The gift tax is considered to be a disincentive, which forces to “eat up” property, instead of accumulate it. The revenue from the gift tax is very low in the Czech Republic compared to the costs of this tax administration (Radvan, 2007).

Wealth transfers in the form of gifts between the livings are subject to the gift tax - inter vivos transfers (Joulfaian, 2004). In practice, taxing inter vivos transfers is difficult partly because it requires those concerned to report the taxable event. There are also many ways in which money can effectively be spent for the benefit of others without involving any direct transfer of money (Mirrlees, 2011). The reasons for donation may differ. It can be a transfer of wealth to the next generation among relatives or transfers motivated by altruism or by “joy of giving”. Therefore, some countries apply different tax rates and the tax exemption in connection with relationship between the transferor and the acquirer.

The taxation of gifts can occur in several forms in the European Union. Some countries tax the donations with a separate gift tax. However, it can also happen that the taxation of gifts is part of a more 'general tax' (e.g. income tax). Finally, it is possible that Member States do not tax gifts as such, but that donated real estate is nonetheless subject to a real estate transfer tax.

As reported by the European Commission (2014), the approach to the taxation of gifts in individual states of the European Union can be summarized as follows:

- Gifts (or the receipt of them) are taxed in 21 Member States.
- 16 countries make use of a specific tax.
- Denmark uses both a tax (relatives) and a provision in the personal income tax (third parties) for taxing gifts.
- Of the seven Member States without a gift tax in six, under conditions, donated real estate is subject to a real estate transfer tax.
- Only Estonia does not tax any gifts.

### **3 DEVELOPMENT OF THE GIFT TAX IN THE CZECH REPUBLIC**

The gift tax was introduced in the Czech Republic in 1993 by Act 357/1992 Coll. on inheritance tax, gift tax and real estate transfer tax. For the purposes of calculating the gift tax, taxpayers were divided into three groups based on kinship with the transferor:

- I. category was formed by first-degree relatives. It was bloodline both ascending and descending, so it means that it included both descendants as well as ancestors (sons, daughters, grandsons, great-grandsons, father, grandfather, great-grandfather, etc.) and husbands,
- II. category included collateral relatives - siblings, nephews, nieces, uncles and aunts, then children’s spouses, children and parents of spouses, spouses of parents and persons who lived with the donor for at least one year prior the transfer in a common household, and who therefore took care for the common household or were dependents on the transferor for their support,
- III. category featured other natural persons and legal entities.

A significant change occurred in the gift tax in 2008. It was a full exemption of gratuitous acquisition of property between persons of the I. and II. category. Gratuitous acquisition of financial means and movable assets for personal needs up to CZK20,000 realized between persons of the III. category are tax exempt.

The gratuitous acquisition of property is subject to the gift tax. The taxpayer was the acquirer who acquired the property free of charge if it was a donation in the homeland. In case of a donation into a foreign country, the taxpayer is a transferor. Taxable subjects were immovables, movables and other property benefits. The tax base was equal to the value of the acquired property reduced by the value of proven debts and other liabilities connected with the acquired property, customs duty paid if the acquired property was imported or exported. The value of gifts, which the acquirer has received from a single transferor within two years, was combined to prevent a purposeful reduction of taxes by dividing one donation to several smaller ones.

There were progressive sliding tax rates and differed according to family relationship. Tax rates for the taxpayers included in III. category are listed in the following table.

Tab. 1 – The gift tax rate for persons of III. category. Source: own processing according to Act 357/1992 Coll. on inheritance tax, gift tax and real estate transfer tax

<b>Tax base over CZK</b>	<b>Tax base to CZK</b>	<b>Tax rate</b>
-	1 000000	7%
1 000000	2 000000	CZK 70000 and 9 % from tax base exceeding CZK1 mil.
2 000000	5 000000	CZK 160 000 and 12 % from tax base exceeding CZK2 mil.
5 000 000	7 000 000	CZK 520 000 and 15 % from tax base exceeding CZK5 mil.
7 000 000	10 000 000	CZK 820 000 and 18 % from tax base exceeding CZK7 mil.
10 000 000	20 000 000	CZK 1 360 000 and 21 % from tax base exceeding CZK10 mil.
20 000 000	30 000 000	CZK 3 460 000 and 25 % from tax base exceeding CZK20 mil.
30 000 000	40 000 000	CZK 5 960 000 and 30 % from tax base exceeding CZK30 mil.
40 000 000	50 000 000	CZK 8 960 000 and 35 % from tax base exceeding CZK40 mil.
50 000 000	and more	CZK 12 460 000 and 40 % from tax base exceeding CZK50 mil.

The act on inheritance tax, gift tax and real estate transfer tax was repealed on January 1, 2014 and gratuitous income has become subject to the income tax imposed on legal entities and natural persons. Gratuitous property acquisition realized between persons of the I. and II. category remains tax exempt under the new Civil Code. Partial relief for persons included in the III. category with acquisition up to CZK20,000 was cancelled. However, occasional gratuitous income up to CZK15,000 is exempt.

#### **4 AIM AND METHODOLOGY**

The aim of this paper is to evaluate the approach to taxation of gifts in the Czech Republic. There is a description of developments in the gift tax in the Czech Republic based on the tax encashment and regulation following legislative changes. Due to the change in the approach

to taxation of gifts, a comparison and evaluation of the impact of this change on the tax rate is performed.

An important tool to study the dynamics of economic processes is time series analysis (Ramík, 2007). Simple rate time series dynamics allows us to characterize the basic features of their behavior. The basic features of time series dynamics include absolute increase.

The absolute increase (first order differential) can be calculated according to formula 1:  $y_t = y_t - y_{t-1}$ ,  $t = 2, 3, \dots, n$  (1)

wherein:

$y_t$  is the value of the gift tax revenues in the year  $t$ ,

$y_{t-1}$  is the value of the gift tax revenues in the year  $t-1$ .

Another used elementary characteristic is the growth rate, which indicates the percentage of increased value of time series at a certain point in time compared to the previous point in time. Growth rate in the year  $t$  is calculated according to formula 2:

$$k_t = \frac{y_t}{y_{t-1}}, t = 2, 3, \dots, n \quad (2)$$

wherein:

$y_t$  is the value of the gift tax collection in the year  $t$ ,

$y_{t-1}$  is the value of the gift tax collection in the year  $t-1$ .

Tax imposed represents the amount of tax as reported in tax returns and yield ( $Y$ ) is calculated according to formula 3:

$$Y = \frac{TR}{TI} * 100 \quad (3)$$

wherein:

TR is tax revenue,

TI is tax imposed.

When calculating the amount of the gift tax for progressive sliding tax rate, we proceed in accordance with Table 1. The tax base is rounded up to whole hundreds and tax rates are applied according to the zone in which the tax base is located.

When calculating the amount of income tax, we apply a unified tax rate and the tax is calculated according to formula:

$$T = TB * t_s \quad (4)$$

wherein:

TB is tax base TB (rounded down to CZK100),

$t_s$  is statutory tax rate.

In the article, the method of analysis was used to define, characterize, and classify the basic concepts and their impact in dealing with differences. The method of comparison was employed to a mutual comparison of tax burden. Acquired knowledge was evaluated by the synthesis method at the end of the article.

## 5 RESULTS

Development of the gift tax revenues in the Czech Republic in the years 1993-2013, including the absolute difference of the first order and the growth rate, is given in the following table. It also states the tax imposed since 1995 (earlier data are not available) and yield for individual years is calculated. The gift tax revenues were mainly influenced by changes in the legislation within individual years. Due to progressively introduced extensive exemptions, revenues of this tax in 2013 fell below the level of 1993, when the tax was introduced. The total gift tax collection in 2013 was CZK48 mil. lower than in 1993.

2011	4279	4141	31.007	4269	100.234
2012	3368	-911	0.787	3359	100.268
2013	108	-3260	0.032	93	116.129

\* Yield cannot be determined because the value of tax obligation is negative.

Gift tax revenue developments were affected by the amendment in 1996, which broadened the range of gift tax exemptions and changed the taxation regime for consideration and gratuitous transfers of real estate.

There was an increase by CZK47 mil. in tax revenues in 2003 compared with 2002, which is reflected in tax revenues in the performance of the budgeted amount to 95.3 %. Relatively extensive exemptions on gratuitous property acquisition are guaranteed in the gift tax; especially for financing public benefit activities, including property acquisition by foundations and endowment funds, state-registered churches and religious societies, charitable societies, and political parties. Despite this fact, the gift tax revenue indicated an upward trend. The gift tax revenue growth, compared to the previous period, was caused not only due to the increase in the number and value of the property gratuitously transferred, but

also due to increased effectiveness of recovery of tax claims. The main particularity of this year is a negative tax obligation, which has been introduced due to depreciation of arrears for impregnability of CZK723.9 mil. The reason for the depreciation of claim resulted from the bankruptcy proceedings and was based on a qualified estimate of the bankruptcy yield.

The gift tax revenue has increased by CZK170 mil. in 2004 compared to 2003. In total, the gift tax collection amounted to CZK818 mil. in 2004, representing an increase of CZK662 mil. in comparison with 1993. The total revenue of the gift tax in 2005 amounted to CZK510 mil. which represents only 63.8 % of the budgeted amount and CZK308 mil. less than in 2004. Revenues developments were affected by a larger number of exempt transfers of property rights to housing from the cooperative ownership to personal property. The gift tax revenue is influenced both by a decrease in the value of donated property and a quite extensive relief, when acquisition of movable personal belongings up to CZK1 mil. and up to the same amount of the acquisition of funds in the homeland is exempt. The gratuitous acquisition of property for financing research and development was newly exempt with legal entities in 2005.

The total gift tax revenue reached the amount of CZK345 mil. in 2008 and compared to 2007, there was a decline by CZK347 mil. The decrease in tax revenues was caused mainly by extending the exemption of gratuitous property acquisition between persons from the I. and II. category of taxpayers from January 1, 2008. This new legislation also affected the decrease in the amount of the gift tax collection between the years 2009 and 2010.

The gift tax revenue in 2011 and 2012 differs significantly from other years. It is influenced by legislative changes, which burden gratuitous acquisition of greenhouse gas emissions allowances for electricity generation with the gift tax in these two years. The gift tax rate in these cases represented 32 % of the tax base.

The total gift tax revenue amounted to CZK4.279 mil. in 2011. The increase of the gift tax due to the introduction of the gift tax on the emission allowances should be CZK4.800 mil. Taxpayers were obliged to file the gift tax returns to the local office by March 31 of the calendar year. For this reason, most of the gift tax was already collected during the first half of 2011. Due to the fact that in several cases it was found that the tax exemption applies to taxpayers to a greater extent than was originally assumed, the amount did not completely meet the budget.

Based on the above mentioned legislative changes, the gift tax collection was high in 2012 compared to the year before the amendment and amounted to CZK3.368 mil. However, it was lower by CZK911 mil. (21.3 %) in comparison with 2011 due to the lower average market value of greenhouse gas emissions allowances, which the tax base is calculated from.

The reason for a significant decrease in the gift tax collections in 2013 is mainly a termination of the temporarily introduced gift tax for operators of equipments for electricity production using gratuitous acquisition of greenhouse gas emissions allowances.

The gift tax revenue depends on the number and values of gratuitous property transfers and is affected by low tax rates and widespread exemptions. The collection amount is also affected by the persistent overall economic situation with a direct link to the decreasing solvency of donors.

Fig. 1 – Comparison of the gift tax collection and tax regulation between 1993-2013. Source: <http://www.financnisprava.cz/cs/dane-a-pojistne/analyzy-a-statistiky/udaje-z-vyberu-dani>

As summarized in the graph above, the gift tax revenue has been stable over time and began to decrease in 2008. This trend also continued in 2009 in connection with the amendment which introduced full exemption from the gift tax on January 1, 2008 for persons of the I. and II. categories. More significant changes in the gift tax revenue may be recorded in 2011 and 2012, when gratuitous acquisition of greenhouse gas emissions allowances was subject to the gift tax. The gift tax regulation represents the tax amount as indicated in tax returns. The tax regulation is lower than the tax collection in most of the reference years (11 out of 19, since data for the years 1993 and 1994 are not available). The tax regulation from 2003 is nonstandard and is influenced by depreciation of arrears for impregnability as mentioned above.

The approach to taxation of gifts has changed in the Czech Republic since January 1, 2014. The gift tax was abolished and gifts, which are now being referred to as gratuitous income and are subject to the income tax. Following this change, the algorithm of tax calculation has completely changed. Progressive sliding rate taxes were at the same rate for both individuals and legal entities at the end of 2013 and partial exemption was applied. A unified tax rate has been applied since 2014, which is 15 % for natural persons and 19 % for legal entities (Janoušková, 2012).

Prerequisite for the calculations: immovables and movables, both things and money and claimed exemption are in amount of  $2 * 20.000$  CZK according to the wording of the law in force in 2013. The calculation for natural person is performed in two variants. Firstly, it is a variant for those with no income, where natural person may use a tax relief in the amount of CZK24.840. Secondly, for those with income where other incomes at the minimum amount of CZK165.600 are assumed and therefore, a tax relief does not reflect in the amount of the gift tax. A transferor and acquirer are included into the III. category.

Tab. 3 – Model calculation of tax burden for individuals. Source: own calculations

Property	Gift tax in 2013	Tax from donations in 2014 natural person without income		Tax from donations in 2014 natural person with income	
	Tax	Tax	Difference	Tax	Difference
165600	8 792	24 840	16048	0	-8792
1 000 000	67 200	150 000	82800	125160	57960
2 000 000	156 400	300000	143600	275160	118760
5 000 000	515 200	750000	234800	725160	209960
7 000 000	814 000	1 050000	236000	1 025160	211160
10 000 000	1 352 800	1 500000	147200	1 475160	122360
20 000 000	3 451 600	3 000000	-451600	2 975160	-476440
30 000 000	5 950 000	4 500000	-1 450000	4 475160	-1 474840
40 000 000	8 948 000	6 000000	-2 948000	5 975160	-2 972840
50 000 000	12 446 000	7 500000	-4 946000	7 475160	-4 970840
60 000 000	16 444 000	9 000000	-7 444000	8 975160	-7 468840

Based on the above calculations, it is clear that the new system of taxation for most natural persons is disadvantageous and the calculated tax is higher. Taxation of donations with a value higher, than about CZK12.3 mil., would be more advantageous because an impact of progressive sliding rate taxes becomes evident. The average tax rate is higher than the actual income tax rate for individuals, which is 15 %.

There is an advantage for some taxpayers who, besides gratuitous incomes, do not have additional incomes, or their other incomes are low. Then, they can take advantage of tax allowances, which reduces the tax base, and tax reliefs which reduce the already calculated tax (Janoušková&Sobotovičová, 2013).

Tab. 4 – Model calculation of tax burden for legal entities. Source: own calculations

Property	Gift tax in 2013	Tax from donations in 2014	
	Tax	Tax	Difference
165600	8 792	31 464	22 672
1 000 000	67 200	190 000	122 800
2 000 000	156 400	380 000	223 600
5 000 000	515 200	950 000	434 800
7 000 000	814 000	1 330 000	516 000
10 000 000	1 352 800	1 900 000	547 200
20 000 000	3 451 600	3 800 000	348 400
30 000 000	5 950 000	5 700 000	-250 000
40 000 000	8 948 000	7 600 000	-1 348 000
50 000 000	12 446 000	9 500 000	-2 946 000
60 000 000	16 444 000	11 400 000	-5 044 000

Based on the above calculations, it is clear that the new system of taxation for majority of legal entities is even more disadvantageous than for natural persons. This is because the tax rate for legal entities is higher, namely by 19 %. The taxation of donations would be more

advantageous for donations over CZK37 mil. In such cases, the impact of progressive sliding rate tax becomes evident so that the average tax rate is higher than the actual income tax rate for legal entities.

## **6 DISCUSSION**

The gift tax is a one-off tax which has a different method of assessment. In the tax return, a taxpayer indicates only the data needed for tax determination. The actual tax for the taxpayer is assessed by a tax office and they are informed about it through the tax assessment. Therefore, tax maturity is based on delivery of tax assessment and its due date is not tied to the year when the property transfer occurred. Especially in the early years, the tax assessment takes longer delays, such as up to two years after receiving a gift.

Revenues of the gift tax amounted to CZK15.541 mil. and the tax imposed amounted to CZK14.848 mil. over the entire period of the gift tax in force. The difference between the gift tax revenues and tax imposed is mainly influenced by the time discrepancy between the tax collection and its assessment, and also between paid interest and penalties. The gift tax revenue growth, compared to the previous period, was caused not only due to the increase in the number and value of the property gratuitously transferred, but also due to increased effectiveness of enforcement activities of tax administrators. Reducing collection and tax regulations occurred mainly in the context of adopted legislative amendments, especially in connection with extending the exemption.

The highest absolute increase was achieved in 2011, when gratuitous acquisition of greenhouse gas emissions allowances began to be subject to the gift tax. Such an increase in tax revenues is debatable, as it was affected by specific legislative arrangements with limited validity. The issue of taxation of emission allowances within the gift tax in the Czech Republic is different from procedures in other EU Member States. This method of taxation allowances for greenhouse gas emissions is still the subject of litigation and is not binding resolved. The Supreme Administrative Court addressed the question of whether the Czech legislation is not in contrary to Article 10 of the European Parliament and Council Directive 87/2003/EC of October 13, 2003 establishing a scheme for greenhouse gas emission allowance trading within the Community. The Advocate General of the Court of Justice of the European Union Juliane Kokott has stated that the gift tax which the Czech government has imposed on emission allowances is not in conformity with European Union law. Although the findings of the Court are not binding, it can be assumed that the parties concerned will apply for a refund of the paid tax.

There were progressive sliding rate taxes in the Czech Republic till the end of 2013. The Explanatory Memorandum (2013) states, that the tax calculation is unnecessarily complicated with regard to the yield of this tax. In comparison with other EU states, the legislation of the gift tax in the Czech Republic was one of the simplest and most transparent, and property taxes were relatively low.

Based on the calculation, it is clear that there is an increase in the taxation of gifts for both natural persons and legal entities. Only very expensive gifts are burdened by lower taxes under the new legislation. This is because the flat tax rate applied to income is lower than progressive sliding rate of the gift tax only at a high tax base. There are exceptions to individuals who have no other incomes apart from donations or their incomes are low and can take advantage of tax reliefs or tax allowances.

Regarding legal entities, donations to public beneficial taxpayers are still exempt, if they are for purposes defined by law or a capital contribution for the taxpayer.

## **7 CONCLUSION**

Based on the analysis of developments in the gift tax revenues, it was found that the tax collection ranged from CZK108 mil. to CZK818 mil. between the years 1993-2013. The tax collection was significantly higher in the years 2011 and 2012, when gratuitous acquisition of greenhouse gas emissions allowances began to be subject to the gift tax according to legislative changes. The question is, however, the relevance of such an increase in revenues, which is influenced by specific legislative arrangements with limited relevance in relation to other time periods.

The gift tax revenues were low in comparison with other taxes. The Civic Democratic Party came up with a proposal in 2003 to repeal the gift tax arguing that the collection costs are high, both on the part of the state and the taxpayers' one. Several EU member states have already abolished capital transfers taxes. This is also in accordance with a global trend of shifting the tax burden from direct taxes to indirect taxes.

Taxation of donations was included into the income tax in 2014 and thereby the tax rate has also changed. Most gifts between taxpayers of the I. and II. category remains tax exempt. The tax from gratuitous performance has increased for most taxpayers included in the III. category. The only exceptions are some individuals for whom taxation under the income tax base is more profitable (making use of tax reliefs or tax base to compensate for loss of business or lease). In case of a more valuable gift, when taxation is higher, it may be better to use other legal provisions, to time donation appropriately, or even handle the transaction as a pecuniary matter. The benefit of the new legislation should consist in simplicity and administrative savings associated with the inclusion of gifts under the income tax regime.

Moreover, gratuitous income is stated in the income tax return since 2014. Therefore, the tax is paid automatically without assessment. Previously, there was not an exception for gifts. There was a long time gap between assessment of the gift tax and filing the tax return. The tax was paid only on the basis of the received payment assessment.

## **ATTITUDE OF CZECH FIRMS TO INVESTMENT IN DESIGN**

*Pavla Staňková, Jan Kramoliš*

### **Abstract**

Currently, product design and company design are becoming important tools which influence the final decisions of customers. For this reason, firms are aware of the importance of design for the success of a product in the market. However, the question is whether they tailor their investment to design adequately. The return on investment in design is a key question when making decisions; it is also a tool for competitiveness and performance. The aim of this article is to present the attitudes of Czech firms to investment in design, whether they have a design budget set out, what impact they expect that design will have on the company's economic results and how they perceive the return on investment in design.

*Keywords: Design, investment, profitability, competitiveness, performance*

JEL Classification: M1, O32, M31

### **1 INTRODUCTION**

Bruce and Bessant, J. (2002) define design as the application of human creativity to a purpose – to create products, services, buildings, organizations and environments which meet people's needs. It is the systematic transformation of ideas into reality, and it is something which has been happening since the earliest days of human ingenuity.

Stamm (2008) specifies three interpretations of the term design:

- Design is a tangible outcome.
- Design is a creative activity.
- Design is a process by which information is transformed into a tangible outcome.

According to Fairhead (1988), we can define four different levels of the understanding of design given, see Figure 1:

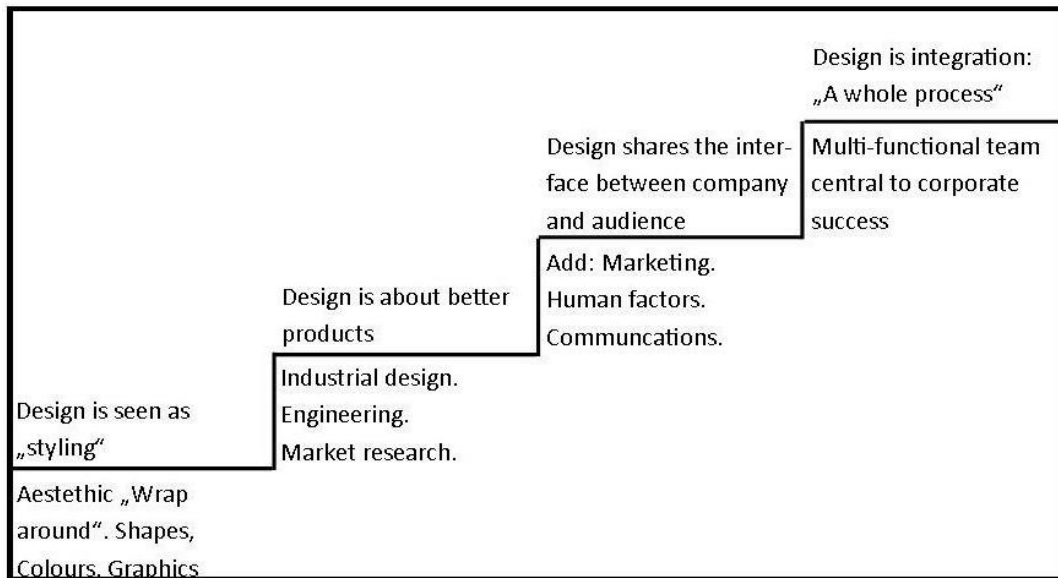

Fig. 1 – The growing world of the design. Source: FAIRHEAD, J. (1988)

Design management is a term for which there is no clear-cut definition. However, it is evident that this term represents the connection of two fields – design and management. According to Kathryn Best (2006), a wide variety of perspectives exist that reflect the rich array of individuals, professions and context involved in the area of design management. Hollins (2002) defines design management as the organisation of processes for developing new products and services.

Bruce, M. and Bessant, J. (2002) identify the following fundamental issues of design management:

- a) How do particular perspectives fit into the design process and what can they bring?
- b) How can design professionals support these different contributions?
- c) How tolls/techniques are made available to help make this contribution?
- d) How can the effectiveness of the design process be measured?
- e) How can the process be improved?

According to the Design Management Institute in Boston (2014) the definition of Design management encompasses the ongoing processes, business decisions and strategies that enable innovation and create effectively-designed products, services, communications, environments and brands that enhance our quality of life and provide organizational success. On a deeper level, design management seeks to link design, innovation, technology, management and customers to provide a competitive advantage across the triple bottom line: economic, social/cultural and environmental factors. It is the art and science of empowering design to enhance the collaboration and synergy between "design" and "business" to improve design effectivity. The scope of design management ranges from the tactical management of corporate design functions and design agencies, including design operations, staff, methods and processes—to the strategic advocacy of design across an organization as a key

differentiator and a driver of organizational success. It includes the use of design thinking—or using design processes to solve general business problems.

## 2 THEORETICAL BACKGROUND

Investment in design has traditionally been linked to company performance (Bloch, 1995; Gemser and Leenders, 2001; Potter et al., 1991; Ulrich and Pearson, 1998). According to Chiva and Alegre (2009) design investment on its own seems to be rather ineffective in providing a basis for sustainable competitive advantages because it can be easily duplicated. The benefits from a growing investment in design can be more readily defended if the company employs these resources through effective skills. A company that invests in design and develops the right skills to obtain efficient designs may have better results than others that do not have these skills. Gemser and Leenders (2001) suggest that it is very likely that the impact of design on company performance will vary depending on the skills and talents of the people involved in the design process.

Table 1 provides some examples of the studies of different firms, sectors and countries that share the common topic – design and performance.

Tab. 1 – Studies focused on design and its impact of performance and competitiveness.  
Source: own

<b>Author</b>	<b>Topics</b>	<b>Main focus</b>
Robin Roy and Stephen Potter (1993)	The commercial impacts of investment in design	Impact of investment in design in small and medium-sized UK manufacturers
Ricardo Chiva and Joaquín Alegre (2009)	Investment in Design and Firm Performance: The Mediating Role of Design Management	The analyse the effect of design investment on company performance and how this relationship is mediated by design management skills
Robin Roy and Johann Riedel (1997)	Design and innovation in successful product competition	Conceptual analysis of the role of design and innovation in product competition.
Margaret Bruce and Rachel Cooper (1999)	Effective design management for small businesses	The research documented the ways in which small manufacturing and service companies use professional design skills and their approaches to managing product, engineering and graphic design.

All studies confirm a positive influence on performance and competitiveness. For example, the research study by Roy and Porter (1993): A survey of 221 small and medium-sized UK manufacturers which received a government subsidy to employ a professional design consultant to help develop new or improved products or graphics showed that 60% of all projects and 90% of the implemented ones were commercially successful. Other benefits

included the firms gaining design management skills and some impact on the UK trade balance.

This research study confirms the above-mentioned findings that graphic design projects are significantly more likely to be profitable (chisquare  $p < 0,03$ ) than projects involving product design expertise or projects involving engineering or engineering plus industrial design. However, as Figure 2 shows, once the projects are put into production, the likelihood of product or engineering projects being profitable is almost as great as that for graphics projects.

Fig. 2 – Profitable and low making projects in relation to design input, implemented projects.  
Source: ROY, R. and POTTER, S. (1993)

The main difference, as Figure 3 shows, is in the payback period, with graphics projects on average returning investment somewhat faster than product or engineering projects.

Fig. 3 – Payback period on profitable, implemented projects according to design input.  
Source: ROY, R. and POTTER, S. (1993)

Overall, in the quantitative sample, 69% of all the projects and those that were implemented returned their total investment (i.e were profitable) with a mean payback period of 14.5 months.

These figures present a very good case for investing in design projects. Graphics design projects appear to involve little technical uncertainty or financial risk. Although there is a relatively high risk of failure at the start of a product or engineering project, because most of the failed projects involved exploring ideas that were abandoned before being put into production, the financial loss (except for engineering projects requiring expensive feasibility studies) is likely to be quite small. And once a project has been implemented, the prospect of a rapid return on investment becomes very good, and the risk of financial loss is low, for all types of design.

The study by Chiva and Alegre (2009) presents the results of an analysis into the effect of design investment on company performance and how this relationship is mediated by design management skills. Chiva's and Alegre's partial mediation model (See Figure 4) reveals a positive and significant, although moderate, relationship between design investment and design management, and between design management and firm performance, thereby supporting it. Finally, the direct relationship between design investment and firm performance indicated in the direct effect model is almost cancelled out and becomes nonsignificant in the partial mediation model. This means that the positive and significant impact of design investment on firm performance evidenced in the direct effect model is due to a concept not taken into account in this model: design management. This in turn means that design management plays a substantial role in translating design investment into performance.

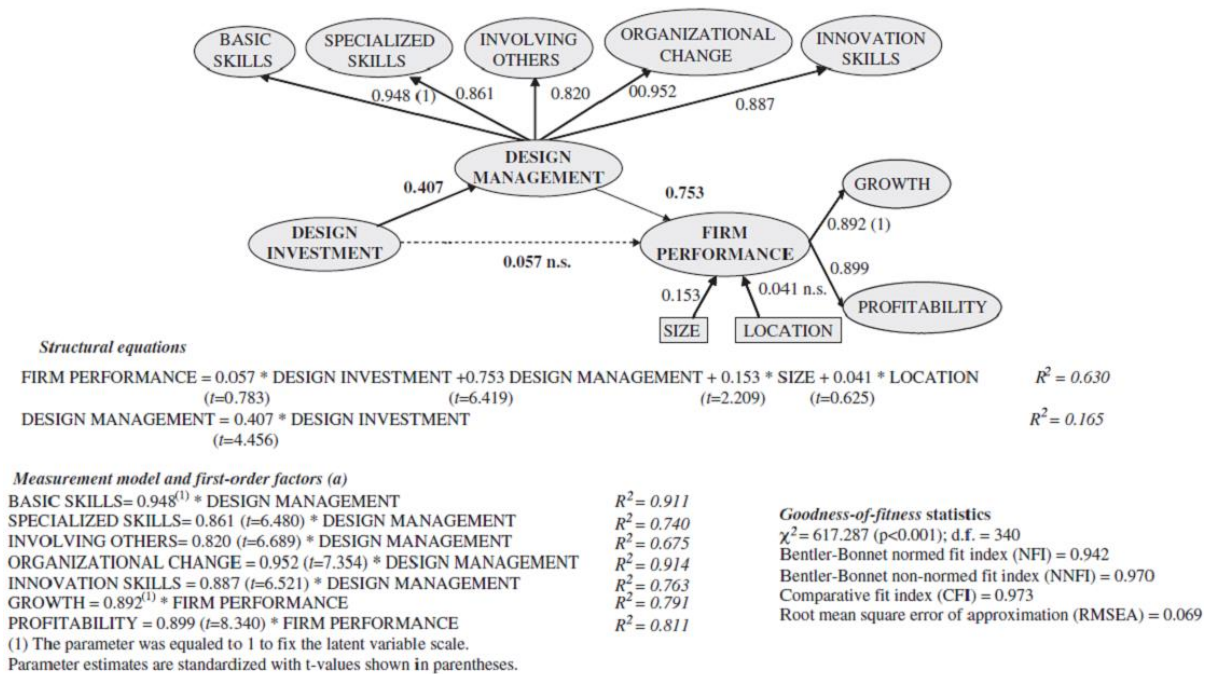

Fig. 4 – Payback period on profitable, implemented projects according to design input.  
Source: ROY, R. and POTTER, S. (1993)

Bruce, M. and Bessant, J. (2002) summarized the key benefits from design investment:

- Increased profit due to increasing sales or due to decreasing manufacturing costs.
- Increased market share.
- Gaining a competitive advantage.
- Revamping mature and failing products.
- Providing a strategy for growth.
- Design is a way of launching a new product or service.

The benefits from design investment were also highlighted in research conducted by the UK Design Council which focused on the contribution made by design and presents mail responses (1999, in Bruce, M. and Bessant, J., 2002):

- 91 per cent felt it improved the image of their company.
- 90 per cent felt it improved quality of their products.
- 88 per cent felt it helped them communicate more effectively with their customers.
- 84 per cent felt it helped increase profit.
- 80 per cent felt it helped break into new markets.
- 70 per cent felt it reduced costs.

### **3 MATERIALS AND METHODS**

The aim of the research conducted at the Faculty of Management and Economics of the Tomas Bata University in Zlín was to find what attitudes Czech firms have to investment in design, whether they have a set design budget, what impact they expect that design will have on the company's economic results and how they perceive the return on investment in design.

The research process consists of two main parts. In the first part of the research, undertaken from January to March 2014, a method of smart internet questionnaires was used. It was designed by the authors of this paper and based on the experience gained from their previous research.

The primary aim was to investigate company concern for design in relation to other factors. This was done by asking specific questions. The secondary aim was to investigate company concern for the importance of design itself.

In the second part of research process, the results were analysed using quantification and by means of seeking a mutual dependence. The questionnaire form contains 16 questions. The responses were divided into several categories with common features. In total 166 entries collected from 305 addressed respondents were analysed in the research.

Hypotheses were tested on the level of significance of  $\alpha = 0.05$ . The H1 hypothesis was subjected to the Pearson's chi-squared  $\chi^2$  test of independence for a contingent table, using IBM SPSS Statistics software. P-value and Excel XLStatistics5 programme were used for a statistical evaluation of the H2 hypothesis.

The questionnaire survey was processed by methods of descriptive statistics and the Pearson's chi-square test. The Excel XLStatistics5 programme was used to verify our hypotheses.

$$\chi^2 = \sum_{i=1}^r \sum_{j=1}^c \frac{O_{ij} E_{ij}}{E_{ij}} \quad (1)$$

where:

$\chi^2$  = Pearson's cumulative test statistic;

$O_i$  = an observed frequency in a given contingency table;

$E_i$  = an expected (theoretical) frequency, asserted by the null hypothesis;

$r$  and  $c$  are the number of rows and columns in the table, respectively. (McDonald, 2008)

The dependence of variables was tested by means of the Pearson's chi-square test with significance level  $\alpha = 0,05$ .

Some fields were verified by means of descriptive statistics indicators. The percentage calculations and weighted averages were used.

The results of the research were consulted with experts in design, design management and innovation.

The table below shows the occupational structure of the respondents who participated in the e-research.

Tab. 2 – Target group characteristics. Source: own.

	relative (%)	market orientation
Subcontractor	26.8	<b>B2B</b>  <b>49.8 %</b>
Producer	30.1	
Service provider	29.4	
Merchant	13.7	

	relative (%)	market orientation
Subcontractor	9.7	<b>B2C</b>  <b>50.2 %</b>
Producer	33.8	
Service provider	35.3	
Merchant	21.1	

The table above indicates that B2B and B2C were almost equally represented (49.8 % and 50.2 %) in the investigated area. The zero share in the respondent structure is represented by B2G business. This means that just the B2C and B2B sectors should have major share. Firstly, a list of selected suitable subjects was compiled. Then, this list was sent out to be filled in through the internet research questionnaires.

Tab. 3 – Target group characteristics: Business size distribution - Number of employees.  
Source: own.

Number of employees	B2B only	B2C only	B2C and B2B (both only)	Relative (%)
1- 10 (Micro)	9	18	1	16%
11-50 (Small)	10	11	8	17%
51-200 (Medium-sized)	15	15	6	22%
200 + (Big)	31	22	22	45%

## 4 RESULTS AND DISCUSSION

The current attitude to investment in design in business concepts of Czech companies in the subjects examined in the Czech market is characterized by the following queries. In cases of a majority consensus, the data are quantified by a relative indicator and supplemented by

important findings in the form of a comment. In cases of a fragmentation of answers, only the most important findings in the surveyed area are listed.

The following hypotheses were set:

H1<sub>0</sub>: There is no correlation between the expected time of a design investment return and firms operating in the B2B and B2C sectors

H1<sub>1</sub>: There is a correlation between the expected time of a design investment return and firms operating in the B2B and B2C sectors

H2<sub>0</sub>: There is no correlation between the expected time of a design investment return and the size of the firm.

H2<sub>1</sub>: There is a correlation between the expected time of a design investment return and the size of the firm.

#### **4.1 The expected contributions of Investment in Design**

The aim of this research question was to find out what are the expectations of what impact design will have on the economic result, see Tab. 4.

Tab. 4 – Expected results. Source: own.

<b>Business Expected results from investing in design (%)</b>	
Very strong	11 %
Strong	30 %
Average	43 %
Weak	13 %
None	3 %

According to the research result, 43% of firms expect that design will have an average impact on their economic result. Another 30% are optimistic and state that the impact will be strong. Similarly, 11% of firms think that the impact will be very strong. On the other hand, some of the respondents have different opinions; 13% of respondents stated that the impact of design on the economic result will be weak and 3% of respondents even stated that there will be no impact.

A possible interpretation of these results is that the managers of Czech firms are, as a majority, aware of the importance of design and they acknowledge this importance for further development of their firm in a given business field. Thus, design as an entity has to be accounted for and included in planning.

#### **4.2 Budget set for design**

The next question investigated was whether firms have a financial amount set out specifically for design in their budgets. The pie chart below shows cumulative results in relative indicators.

Fig. 5 – Pie chart – has a financial amount set out specifically for design? Source: own.

From Fig. 5 above it is evident that most of the firms do not have a financial amount set out specifically for design in their budget. When looking into this segment in more detail and from the firm size point of view, the answers to the questions are distributed almost evenly. From the research point of view, the answer “YES” is more interesting; nearly one third of medium and big-size firms set out a certain amount for design in their budgets. Under closer observation we can see that a design budget mostly occurs in medium-sized firms (29.7%). In small firms it occurs in 13.8% and in micro firms in only 7.4%. This fact confirms the statement that the bigger the firm is the bigger the chance that it has a set design budget. On the other hand, we have to take into consideration the target group characteristics, as the big firms have the largest representation (nearly one half of the total amount) in the research conducted.

To generalize the result, it can be said that the managers of Czech firms recognize design as an important entity which can influence the prosperity, but they do not account for design and the investment into it in their company. Such a conclusion probably best describes the current situation concerning design in Czech firms.

#### **4.3 Return on design investment**

The question investigated the opinion of firms on a return on investment in design from a time point of view. The subject of this research question was to investigate whether Czech firms

expect that money invested into design today will return a profit. There were four categories to be chosen from with suggested time intervals:

- Short term return – within 1 year
- Medium term return (I.) – 1 to 2 years
- Medium term return (II.) – 3 to 5 years
- Long term return– more than 5 years

Tab. 5 – Estimated time of return on design investment. Source: own

<b>Estimated time of return on design investment</b>		
Within one year (short term)	17.5 %	57.9 %
1 - 2 years	40.4 %	
3 - 5 years	28.3 %	
More than 5 years (long term)	13.8 %	

In an expert's opinion, this research result tells us that managers often perceive the return on design investment unrealistically. As a sum, nearly 58% of respondents expect a return on the investment within two years. According to a design expert, the process of creation, the development and introduction of a new design in a production firm is a long-term process in which a number of people of various professions take part. Such a process is accompanied by many technical and technological restrictions. Testing is often undertaken but then, the product is produced for many years to come. The return on investment is within about three to five years depending on the type of business and the product characteristics.

However, it is important to highlight that in the event of a design change which is part of a rebranding of the firm itself the time of return is generally shorter.

#### **4.4 Hypothesis verification**

The verification of the set hypotheses is presented below.

H1<sub>0</sub>: There is no correlation between the expected time of return on design investment and the firms operating in the B2B and B2C sectors

H1<sub>1</sub>: There is a correlation between the expected time of return on design investment and the firms operating in the B2B and B2C sectors

	A	B	C	D	E	F	G	H	I
1	Data			Descriptives					
2	Expected on investment in design	Business category							
3	1 – 2 years	B2C		Category Labels and Counts (Frequencies)					
4	Less than one year	B2C		Business category					
5	1 – 2 years	B2B		All B2C B2B B2B, B2C					
6	Less than one year	B2C	Expected on investment in design	All	166	59	68	39	
7	More than five years	B2B		1 – 2 years	67	26	26	15	
8	3 – 5 years	B2C		Less than one year	29	12	12	5	
9	1 – 2 years	B2B		More than five years	23	6	11	6	
10	1 – 2 years	B2B		3 – 5 years	47	15	19	13	

Fig. 6 – Screenshot of testing hypothesis H1 (XLstatistics). Source: own.

	A	B	C	D	E	F	G	H	I	J
1	Analysis of r x c tables									
2										
3	(Pearson) Chi-square Test									
4	(For independence of Expected on investment in design and Business category)									
5	H <sub>0</sub> : Variables are independent (no interaction between variables)									
6	H <sub>1</sub> : Variables are dependent (interaction between variables)									
7	Chi-square	2,506841								
8	DF	6								
9	p-value =	0,867701								

Fig. 7 – Screenshot of hypothesis H1 verification (XLstatistics). Source: own.

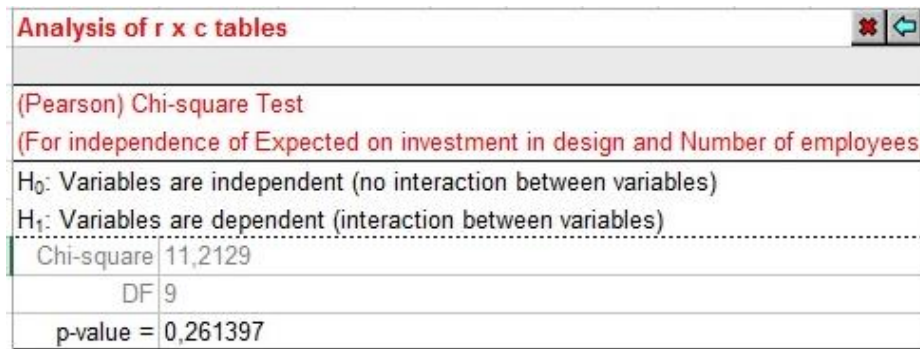

According to the results, with p-value of 0.867701 (the standard risk value was 0.05), the H<sub>0</sub> hypotheses is rejected, which means that it cannot be stated that there is a difference between the firms operating in the B2B or B2C sectors in relation to their expected return on investment in design.

H<sub>20</sub>: There is no correlation between the expected time of a design investment return and the size of the firm.

H<sub>21</sub>: There is a correlation between the expected time of a design investment return and the size of the firm. (See Figure 8 and 9)

	A	B	C	D	E	F	G	H	I	J
1	Data			Descriptives						
2	Expected on investment in design	Number of employees								
3	Less than one year	1 - 10		Category Labels and Counts (Frequencies)						
4	1 – 2 years	1 - 10		Number of employees						
5	1 – 2 years	1 - 10		All 1 - 10 11 - 50 51 - 200 201 and more						
6	3 – 5 years	1 - 10	Expected on investment in design	All	130	26	29	1	74	
7	More than five years	1 - 10		Less than one year	23	6	6	1	10	
8	Less than one year	1 - 10		1 – 2 years	53	14	15	0	24	
9	1 – 2 years	1 - 10		3 – 5 years	37	5	5	0	27	
10	1 – 2 years	1 - 10		More than five years	17	1	3	0	13	

Fig. 8 – Screenshot of testing hypothesis H2 (XLstatistics). Source: own.

Analysis of r x c tables	
(Pearson) Chi-square Test	
(For independence of Expected on investment in design and Number of employees)	
H <sub>0</sub> : Variables are independent (no interaction between variables)	
H <sub>1</sub> : Variables are dependent (interaction between variables)	
Chi-square	11,2129
DF	9
p-value =	0,261397

Fig. 9 – Screenshot of hypothesis H2 verification (XLstatistics). Source: own.

According to the results, with p-value of 0.867701 (the standard risk value was 0.05), the H<sub>0</sub> hypotheses is rejected, which means that it cannot be stated that there is a difference between the firms in relation to the number of employees and the expected return on investment in design.

## 5 CONCLUSION

Within the Czech Republic, design is, generally, a popular subject which we encounter on a daily basis everywhere we go. Inspired by international examples, Czech managers acknowledge design as an entity which can have a positive impact on the development of a firm, its position in the market and its ability to compete with others. However, from respecting and recognizing design there is still a long journey to real action in one's own company. An analysis of what a high-quality strategically-planned design can do to a given firm is generally missing.

Surely, this is connected to the fact that creating and developing a new design is a long-term process which presumes the coordination of people from many professions and the result does not come immediately or within one year. Firms would rather concentrate on solving ad hoc problems and their primary aim is to sell right away.

Through the research conducted at the Faculty of Management and Economics of the Tomas Bata University in Zlín it was found that nearly half of the firms (43%) anticipate a strong impact from design on the company's economic result. Such a finding is in line with the results of international studies in which firms are even more optimistic as is apparent from the UK Design Council research (1999, in Bruce, M. and Bessant, J., 2002) according to which 84% of firms felt that it helped increase profit.

The research also confirmed an assumption that even though firms are aware of the role of design as a competitive tool, finances for design are often difficult to find and only 23% of the firms researched have a financial amount set out specifically for design in their budgets.

If we compare the results of the research conducted with the results of research published by international authors, we can see that interesting results were found concerning the expected time of return on investment. 57% of the firms researched expect a return on investment in design within 2 years, which is, according a Czech design specialist, unrealistic. However, such results were also confirmed by research by Roy, R. and Potter, S. (1993), during which the return on investment in a product design was observed though the implementation of specific projects. The return on investment in a product design was found to be within 16 months and the return on investment in a graphic design or packaging design in about 12 months.

The research also confirmed an assumption that the expectations of firms in the field of design and investment also depend on the type of business (e.g. business in the B2B market or B2C market) and also on the size of a firm.

The limitations of this research are mainly represented by the number of investigated selected companies and businesses in the Czech Republic. The research can be considered not to involve tens of other companies and businesses that are non-existent in the market anymore. Another fact is, that some companies would like to present themselves within the questionnaire claiming they would like to use the "investment in design" even though they are not economically fit to be able to afford it can become another problem. However, a likely situation may be that a company's representative, who filled in the questionnaire, overestimated this fact and the company actually does not possess sufficient funds for using and applying for this purpose. The research that was carried out did not investigate the time factor in regard of a demanding interpretation of the questionnaire question with the respondents.

## **EFFICIENCY OF NETWORKING REGIONAL HOSPITALS IN THE CZECH REPUBLIC – CASE STUDY OF PLZEŇ REGION**

*Pavla Staňková, Šárka Papadaki, Petr Klímek*

### **Abstract**

Integration of hospitals for increasing their efficiency is the current trend in healthcare. Integration can be either vertical, which leads to the integration of health organizations in various complementary or related activities; or horizontal, when associated healthcare organization offer similar services. Except the integration of private hospitals (e.g. Agel, the private hospital chain) the current trend in the Czech Republic is to integrate hospitals managed by the county. The first integration of regional hospitals took place in 2004 (Health Holding Královehradecký region) and the latest integration was on January 1, 2015 (Hospital of Pardubice region). Drawing from an example of Health Holding of Plzeň Region, the aim of this article is to answer the research question whether the horizontal integration of regional hospitals leads to their greater efficiency.

*Keywords: Performance, Hospital, Regional hospital, Integration, Vertical integration, Horizontal integration*

JEL Classification: I11, L14, M21

### **1 INTRODUCTION**

In 2013, hospitals in the Czech Republic consumed 131.3 billion CZK from the total of 290.9 billion CZK issued to the resort of health care. This amount represents approximately 7.12% of GDP (UZIS 2014). Due to the fact that health care expenditures have an increasing tendency, it is necessary to find ways to keep them at an acceptable level. One of the ways of doing so is different modes of integration – the connection of various institutions in one unit. These tendencies are described in many scientific articles, e.g. by Bazzoli (2004), Baker (2001), Clement (1997), Lake (2003), Ackerman (1992) etc., with an emphasis on the positive benefits of this merger.

In general, the integration of services offers (1) more access to capital to improve facilities and (2) economies of scale to improve technical services. On the other hand, the institution staff, physicians and community lose considerable autonomy in integrated services (Shortell 1988).

Integration can be either horizontal or vertical. Horizontal integration is defined as the coordination of activities across operating units that are at the same stage in the process of delivering services. Horizontal integration involves grouping organizations that provide a similar level of care under one management umbrella. Vertical integration is defined as the coordination of services among operating units that are in different stages of the process of delivery patient services (Pan American Health Organization 2008).

The various advantages and disadvantages of the types of integration arising for the institutions can be summarized in the following points see Table 1 (Schulz 2003).

Tab. 1 The advantages and disadvantages of the types of integration. Source: Schulz 2003.

Type of integration	Institution	
	Advantage	Disadvantage
<b>Horizontal, e.g., multihospital system</b>	Access to capital Economies of scale Management resources Improved recruitment More political power Hospital survival	Loss of autonomy
<b>Vertical systems, e.g., HMO, clinic and hospital</b>	Offer full range of services More competitive Economies of scale Articulation of services More political power	Loss of autonomy
<b>Investor-owned</b>	Access to capital More freedom to serve organization goals	Stock holder and corporate control

We can observe the trend of integration not only in the industry but also in services such as the hospital industry. In the USA, the number of hospital integrations dramatically increased integration in past 20 years (Huckman 2006; Gaynor and Wilson, 1999). Integration in the USA typically refers to horizontal integration of hospitals or physicians and vertical integration of hospitals and physicians (Bazzoli 2004). A similar trend has been observed in the Czech Republic during the past decades. When focusing on horizontal integration two primary benefits can be seen: (1) increased market power and (2) greater efficiency (Huckman 2006; Lake 2003). A number of foreign authors describe the benefits and risks of jointing, e.g. Bazzoli (2004), Baker (2001), Clement (1997), Lake (2003), Ackerman (1992), etc. The authors state the following positive points:

- Access to better resources due to the collective purchase
- Greater negotiating power
- Costs reduction and improvement of medical technology through information exchange
- Elimination of service duplication
- Providing complex services
- Allocation of risk between multiple organizations
- Enhanced relationships with customers
- Improved quality of care

On the other hand, several authors such as Halverson (1997) or Zuckerman (2006) state the disadvantages of integration. Among others they list the following:

- New costs from inter-organizational cooperation
- Loss of autonomy and control

For the overview of studies and articles focusing on hospital integration see Table 2.

Tab. 2 Studies focused on healthcare and hospital integration. Source: own work

<b>Author</b>	<b>Topics</b>	<b>Main focus</b>
<b>Stephen L. Walston, John R. Kimberly and Lawton R. Burns (1996)</b>	Owned vertical integration and health care: Promise and performance	Benefits and actual outcomes of vertical integration in health sector and comparison to the other sectors of the economy
<b>Martin Gaynor (2006)</b>	Is vertical integration anticompetitive? Definitely maybe (but that's not final)	Competitive and anticompetitive effects of vertical integration
<b>Robert S. Huckman (2006)</b>	Hospital integration and vertical consolidation: An analysis of acquisitions in New York State	The study examines the effect of hospital acquisitions in New York State on the distribution of market share for major cardiac procedures across providers in target markets
<b>Alison Evans Cuellar and Paul J. Gertler (2006)</b>	Strategic integration of hospitals and physicians	The study finds out that integration has little effect on efficiency; however, it is associated with an increase in prices, especially when the integrated organization is exclusive and occurs in less competitive markets.

Walston, Kimberly and Burns (1996) summarize benefits of vertical integration in health care as follows:

- Lowering costs and eliminating unneeded services – confirmed by the studies of Findlay (1993), Coddington (1994), Shortell (1988), Peters (1991), Ackerman (1992), Gillies (1993), Conrad (1993), Wheeler (1986), Johnson (1993), Conrad and Dowling (1990), Brown and McCool (1986)
- Economics of scale – confirmed by the studies of Findlay (1993), Peters (1991), Ackerman (1992), Brown and McCool (1986)
- Increased market and negotiating power – confirmed by the studies of Findlay (1993), Shortell (1989), Peters (1991), Fox (1989), Johnson (1993), Conrad and Dowling (1990)
- Profit and market share gains – confirmed by the studies of Coddington (1994), Wheeler (1986), Brown and McCool (1986)
- Better recruitment and retention – confirmed by the studies of Coddington (1994) and Peters (1991)
- Environmental acceptance – confirmed by the study of Zuckerman and D'Aunno (1990)

All studies agree on benefits of vertical integration.

Most researchers, such as L.R. Burns et al. (1990; 1998), S.M. Shortell et al. (1996) and G.J. Bazzoli et al. (1999) presume that horizontal and vertical integration do not have influence on revenue increase. They insist that integration has some influence on profit increases through reducing expenses. In addition, this result differs from the results of J.P. Clement et al. (1997), who claim that horizontal integration has influence on revenue increases. Yang (2004) in his study shows that the hospitals with only functional integration are more profitable than the hospital with clinical and functional integration.

## **2 SYSTEM OF HEALTH CARE IN CZECH REPUBLIC**

The fundamental milestone for the networking of hospitals in the Czech Republic was the year 1992 and the emergence of Act no. 160/1992 Coll., on health care provided in private medical facilities, which gave legal framework for the privatization of health care and the emergence of private health care. As seen from Fig. 1 and 2, which describe the progress of medical facilities in the Czech Republic from 1992 to 2013 and the growing number of hospitals in the Czech Republic from 1992 to 2013, the period of privatization led to a rapid increase of the number of medical facilities. Especially the leap from number 3 956 in 1992 to 17 176 by the end of 1993 is obvious, as well as an increase from 157 hospitals (1993) to 199 (1994).

Fig. 1 - Trends in the number of medical facilities in the Czech Republic 1992 – 2013.  
Source: own work according to UZIS ©2010-2014a.

Fig. 2 - Trends in the number of hospitals in the Czech Republic 1992 – 2013. Source: own work according to UZIS ©2010-2014a.

Changes occurred not only in the number of health care facilities, but also in the legal form of individual hospitals. The Act no. 290/2002 Coll., On the transfer of certain other assets, rights and obligations of the Czech Republic to regions and municipalities, under which 82 district hospitals passed into the competence of the regions, came into force on January 1, 2003. These hospitals were gradually converted into joint-stock companies. In 2009, the total of 52 such hospitals existed in the Czech Republic.

From the perspective of the founder hospitals can be divided into hospitals established by the Ministry of Health, regions, towns, municipalities, churches and other central institutions and other legal entities. According to the information from the Institute of Health Information and Statistics of the Czech Republic (UZIS 2012) 120 hospitals established by a legal entity existed in the Czech Republic on June 30, 2012. These hospitals constitute 64% of all hospitals, 40 of them being hospitals established by the county, city or municipality (21 %), 19 hospitals established by the Ministry of Health (10%), 5 hospitals established by other central organs (3%), 3 of the hospitals established by Ministry of Defence, 2 by Ministry of Justice, and 3 hospitals founded by the Church (2%), see Figure 3.

Fig. 3 - The percentage of hospitals in the Czech Republic according to founder on June 30, 2012. Source: own work according to UZIS ©2012 and UZIS ©2010-2014a.

As is clear from the Act no. 372/2011 Coll., On health services and terms and conditions for providing such services (UZIS 2012) faculty hospitals are established by the Ministry, of which 9 hospitals are established by the Ministry of Health and 1 hospital by the Ministry of Defence. Another legal entity establishes 67% of these (i.e., 98 in the absolute number); a county, city or municipality establish 22% acute care hospitals , (i.e., 33 in the absolute number); Ministry of Health establishes 7% acute care hospitals (i.e., 10 in the absolute number); other central institutions establish 3% acute care hospitals (i.e., 4 in the absolute number); and church establishes 1% acute care hospitals (i.e., 1 in the absolute number). Other legal entity is the founder of the largest number of 22 hospitals (73%) of the hospital aftercare, followed by 7 hospitals follow-up care (21%) established by the regions, cities or municipalities and 2 hospitals aftercare (6%) established by the church, see Table 3.

Tab. 3 - The percentage of hospitals in the Czech Republic according to founder on June 30, 2012. Source: own work according to UZIS ©2012 and UZIS ©2010-2014a.

	University hospitals	Othe hospitals	Hospitals with chronic beds	Total
Ministry of Health	9	10		19
Regional, city or municipal administration		33	7	40
Church		1	2	3
Other legal body		98	22	120
Other central organs	1	4		5
Total	10	146	31	187

The concepts **founder** and **owner** should be distinguished when discussing hospitals. . The category of **founder** reflects the legal form of hospitals, i.e., the hospital as a legal entity or the hospital as a contributory institution. Legal entity operates under the Commercial Code and contributory organization is founded by a government department or territorial self-governing units.

The category of **owner** reflects owning the hospital, which in practice of hospitals means that a legal entity may be owned by local government units.

The actual situation in terms of owners of the hospitals in the Czech Republic is that 51% of all hospitals in the Czech Republic are owned by the county, town or municipality (95 hospitals), of which 29% are owned by region through the ownership of legal entities (joint-stock company, a limited liability company, a public company) and 22% are directly founded by the region. 34% of hospitals are owned by another legal entity (65 hospitals); 10% still remain the property of the Ministry of Health (19 hospitals); 2% are owned by the Church (3 hospitals) and 3% are owned by the Ministry of Defense and Ministry of Justice (5 hospitals). Based on the calculation, it is then possible to obtain redistribution of hospitals according to ownership, see Figure 4.

Fig. 4 - The number of hospitals in the Czech Republic, according to property on June 30, 2012. Source: own work according to UZIS ©2012 and UZIS ©2010-2014a.

### **Ratings of the economic situation of hospitals**

Indicators of costs, revenues and profits are the most widely used scales of economic situation in hospitals. Although these indicators are often presented in comparative statistics, according to Staňková (2013) rating through the profit is very problematic for several reasons:

- a) Most companies with commercial character cease to use profit as a basic indicator of the economic situation and increasingly use cash-flow indicators, i.e., indicators that monitor cash flows as a comparison between revenues and expenditures.
- b) Profit can be expressed in various forms, such as net profit, profit before tax, earnings before interest and taxes, earnings before interest, tax and depreciation (Knápková, Pavelková and Chodúr 2011, 20). When comparing the economic situation in hospitals it is necessary to carefully consider which indicator will be used and compared.
- c) To assess the profit of hospitals their legal form of business is also important. Nonprofit hospitals, i.e., hospitals operating as contributory organizations, are not primarily founded for profit and their aim is balanced economy. It may also happen that in the event of loss of non-profit organizations that loss is covered from other resources of the founder, therefore, the economic situation of hospitals is distorted. Conversely, hospital business as a legal entity is an organization founded for the purpose of making profit.
- d) In assessing the economic situation of hospitals the problem of ethics may occur. In a present-day society an opinion prevails that provision of health services is a mission, an activity that is socially beneficial, necessary and should not be tied to economic indicators. Unfortunately, this opinion makes it difficult to provide financial management of hospitals because the hospitals themselves get into a difficult financial situation as they must provide services for which they do not get paid. On the other hand, the question arises whether it is ethical to refuse this service to a person who needs it and whose life depends on it.

Although pitfalls of economic situation of hospitals were mentioned, this field of hospital management cannot be ignored. Hospital may have good quality care, enough patients, top doctors, but if this is concurrently not reflected in the economic situation of the hospital management, the management is wrong.

According to the information from the Institute of Health Studies and Statistics of the Czech Republic (UZIS 2014b), the total hospital costs (information collected from 163 hospitals) by December 31, 2013 attained the amount of 131 316 mil. CZK and compared to 2012 it increased by 0,4%. Total revenues of hospitals by December 31, 2013 amounted 129 438 mil. CZK and compared to 2012 they decrease by 1.3%. The profit of all 163 hospitals was the loss of 1 878 mil. CZK. In terms of the founder (see Table 4), all types of hospitals managed with a loss, with the exception of hospitals owned by other central organs.

Tab. 4 - Overview of costs, revenues and profit of hospitals according to founder by December 31, 2013 in mil. CZK. Source: own work according to UZIS 2014b; N=163.

	<b>Costs total</b>	<b>Revenues total</b>	<b>Economic outcome</b>
Ministry of Health	61 590	60 707	-883
Regional, city or municipal administration	18065	17905	-160
Other legal body and church	48466	47630	-836
Other central organs	3 195	3 196	1
<b>Total</b>	<b>131316</b>	<b>129438</b>	<b>-1878</b>

If the categorisation of hospitals by the owner is to be respected, i.e., hospitals running business as legal persons under the ownership of municipalities, cities and counties are included in the category of municipality, city and region, the overall loss of hospitals increases from 160 mil. to 1308 mil. CZK. This points out the inefficient economy of hospitals owned by regions, see Tab 5.

Tab. 5 - Overview of costs, revenues and profit of hospitals according to owner by December 31, 2013 in mil. CZK. Source: own work according to UZIS ©2010-2014b; N=163.

	<b>Costs total</b>	<b>Revenues total</b>	<b>Economic outcome</b>
Ministry of Health	61 590	60 707	-883
Regional, city or municipal administration	52044	50736	-1308
Other legal body and church	14487	14799	312
Other central organs	3 195	3 196	1
<b>Total</b>	<b>131316</b>	<b>129438</b>	<b>-1878</b>

### **3 RESEARCH OF EVALUATING THE PERFORMANCE OF NETWORKING REGIONAL HOSPITALS IN THE CZECH REPUBLIC**

The aim of the research conducted at the Faculty of Management and Economics, Tomas Bata University in Zlín, was to find answer to the following research question:

Does networking of regional hospitals lead to improving performance of hospitals?

The main file consisted of 188 hospitals operating by June 30, 2013, in the Czech Republic, of which 97 hospitals are owned by the county, municipality or town. The research found that

28% of hospitals owned by the county, municipality or town in the Czech Republic (i.e., 27 hospitals) have formed an association aimed at improvement of the economy, better patient care, greater possibilities of use and career growth for employees. It is also based on the principle of solidarity, when the health regulations do not favour small hospitals, and placement of acute health care is provided throughout the region.

The trend of association of hospitals owned by regions began in 2004, when the first association of hospitals was created. This trend continues into the present. Currently (by January 1, 2015), 5 associations of hospitals owned by the regions exist in the Czech Republic.

*a) Health holding Královéhradecký region*

One of the oldest associations of hospitals owned by the region in the Czech Republic. Founded in 2004, it originally associated five of the following hospitals:

- City Hospital Dvůr Králové nad Labem, Regional Hospital Jičín, Regional Hospital Náchod, Regional Hospital Rychnov nad Kněžnou, Regional Hospital Trutnov

In 2013 Regional Hospital Rychnov nad Kněžnou became a part of Regional Hospital Náchod, therefore 4 hospitals are currently part of the association.

*b) Hospital of Ústecký region*

Hospital of Ústí nad Labem region was founded on September 1, 2007, and currently it comprises 5 hospitals:

- Děčín Hospital, Chomutov Hospital, Most Hospital, Teplice Hospital, Masaryk Hospital in Ústí nad Labem

*c) Hospital holding of Středočeský region*

Hospital holding of Středočeský region was founded on September 18, 2009, and its original members were 5 hospitals:

- Hospital of Rudolf and Stefanie Benešov, Regional Hospital Kladno, Regional Hospital Kolín, Regional Hospital Mladá Boleslav, Regional Hospital Příbram.

Hospital Kutná Hora became a part of the association on January 1, 2010, but insolvency proceedings were initiated in February 2010.

*d) Health holding of Plzeň region*

Health holding of Plzeň region was formed on June 30, 2010. The members of the holding company are the following hospitals:

- Domažlice Hospital, Klatovy Hospital, Rokycanská Hospital, Stod Hospital, Hospitals of subsequent care Horažďovice, Hospitals of subsequent care Svatá Anna

*e) Hospitals of Pardubický region*

Hospitals of Pardubický region is the youngest association that was established on January 1, 2015. It links the following hospitals:

- Hospitals of Pardubický region - Pardubice Hospital, Chrudim Hospital, Svitavy Hospital, Litomyšl Hospital, Ústí nad Orlicí Hospital

The first part of the research tried to verify the hypothesis on a case study of Health holding of Plzeň region. For further research were selected only Health holding of Plzeň region. Only for this hospitals we have economic and noneconomic information before and after the

integration. In the secondary research the team focused on the following indicators for the year 2005 - 2013:

- Economic outcome
- Bed occupancy
- Receivables after maturity date
- Payables after maturity date
- Current Ratio

The following hypotheses were set:

*H1<sub>0</sub>: There is no difference between the hospital economic results before and after the horizontal integration.*

*H1<sub>1</sub>: There is a difference between the hospital economic results before and after the horizontal integration.*

*H2<sub>0</sub>: There is no difference between the bed occupancy before and after the horizontal integration.*

*H2<sub>1</sub>: There is a difference between the bed occupancy before and after the horizontal integration.*

*H3<sub>0</sub>: There is no difference between the receivables after maturity date before and after the horizontal integration.*

*H3<sub>1</sub>: There is a difference between the receivables after maturity date before and after the horizontal integration.*

*H4<sub>0</sub>: There is no difference between the payables after maturity date before and after the horizontal integration.*

*H4<sub>1</sub>: There is a difference between the payables after maturity date before and after the horizontal integration.*

*H5<sub>0</sub>: There is no difference between the current ratio before and after the horizontal integration.*

*H5<sub>1</sub>: There is a difference between the current ratio before and after the horizontal integration.*

Hypotheses were tested on the level of significance of  $\alpha = 0.05$ . The H1 hypothesis was subjected to **Mann-Whitney Test**. This test is useful in cases where the assumption of normality is questionable and no suitable transformation of the data can be found, and in cases where one or more observations are suspected to be outliers. To perform the test, the two samples are combined and ranked from smallest to largest (from rank 1 to rank  $n_1+n_2$ ), with any tied observations being given the average rank for the values in the tied group.  $X_1, X_2, \dots, X_m$  and  $Y_1, Y_2, \dots, Y_n$  are two **independent samples** (unpaired). We want to test the null hypothesis that its distribution functions are the same. We sort **all** values of  $X_1, X_2, \dots, X_m$  and  $Y_1, Y_2, \dots, Y_n$  into the growing row. We count the sum of rank for  $X_1, X_2, \dots, X_m$  ( $T_1$ ). Similarly  $T_2$  is the sum of rank for  $Y_1, Y_2, \dots, Y_n$ .

Then we can calculate  $U_1$  and  $U_2$  by using the formulas:

$$U_1 = mn + \frac{m(m+1)}{2} - T_1, \quad U_2 = mn + \frac{n(n+1)}{2} - T_2.$$

**Decision rule:**

If number  $\min(U_1, U_2)$  is smaller or equal than the value from special tables, we reject the null hypothesis. The small p-value (smaller than 0.05) in the calculated results indicates that the samples come from populations with significantly different medians.

Table 6 presents results of Mann-Whitney Test of hypotheses that were set up for research differences in chosen indicators between before and after the horizontal integration.

Tab. 6 Results of Mann-Whitney Test of hypotheses. Source: own work.

P-value	Economics Results	Bed occupancy	Receivables after maturity date	Payables after maturity date	Current ratio
Hospital Domažlice	0,415585	0,025022	0,403248	0,5	0.016503
Hospital Klatovy	0,044041	x	0,110336	0,00715	0.196884
Hospital Rokycany	0,009508	0,018668	0,009508	0,00526	0.009508
Hospital Stod	0,044041	x	0,110336	0,00715	0.044041
Hospitals of subsequent care Horažďovice	0,005258	0,012591	x	x	0.009508
Hospitals of subsequent care Svatá Anna	0,016503	x	x	x	0.334908

The difference was not proved as statistically significant
The difference was proved as statistically significant Economic result is significantly higher before the horizontal integration. Bed occupancy is significantly higher before the horizontal integration. Payables after maturity date are significantly lower before the horizontal integration. Current liquidity is significantly higher before the horizontal integration.
The difference was proved as statistically significant Economic result is significantly lower before the horizontal integration. Bed occupancy is significantly higher before the horizontal integration. Receivables after maturity date are significantly higher before the horizontal integration. Payables after maturity date are significantly higher before the horizontal integration. Current liquidity is significantly lower before the horizontal integration.

The research results did not confirm the significant effect of horizontal integration on selected indicators of the effectiveness of health care organizations. The worst results were in the field of bed occupancy indicators. All hospitals with available data had worse bed occupancy after integration. This may be caused by other factors, especially changes in hospital funding. The goal of many hospitals was to reduce patient time of hospitalization.

The best results were achieved in the indicator of receivables after maturity date. There is a decrease in overall receivables after maturity date after the horizontal integration. The research has not clearly demonstrated the positive impact of integration on economic results. Three hospitals have achieved better results after horizontal integration, two hospitals have achieved worse results and one hospital did not show any statistically significant difference before and after the horizontal integration.

There has been no confirmation of the hypotheses. Hypothesis H1 - by three hospitals has shown that economic result is significantly lower before the horizontal integration. Hypothesis H2 – in all hospitals is bed occupancy significantly higher before the horizontal integration. Hypothesis H3 – the difference before and after integration was not proved as statistically significant. H4 - There is no difference between the payables after maturity date before and after the horizontal integration. H5 – in three hospitals are current liquidity is significantly lower before the horizontal integration.

#### **4 CONCLUSION**

Using the Mann-Whitney Test and trend analysis, the research realized at the Faculty of Management and Economics, Tomáš Baťa University in Zlín, on an example of Health Holding of Plzeň Region has not clearly confirmed the premise that the horizontal integration of hospitals leads to greater efficiency. This research, however, partly confirms Cuellar and Gentler (2006) that the integration has little effect on efficiency. Nevertheless, it is clear that the benefits may be non-economic as well as economic. In addition, it is necessary to consider other circumstances that may affect the restrictions evaluation, e.g., a relatively short period of existence of integration, political influences, the absence of a national health strategy, unclear and unstable conditions for the financing and provision of health care, etc.

According to Suchý (2014) a integration of joint activities in a holding is highly problematic, because it is a challenging process in which subjects must change their processes, procedures, agendas and information systems. The complexity of these processes and failure to prove the immediate effectiveness should not be the reason for the negative understanding of integration. Hospitals in the long term can expect that the integration will bring along savings mainly due to the reduction of duplicate operations and functions, higher revenues through joint agreements with insurance companies or joint marketing and PR policy. It may also bring an increase in the quality of healthcare by defining common practices in the provision of health care, utilization of comparisons and benchmarking in the evaluation of health services.

## **SUCCESS FACTORS OF RURAL SMEs: A CASE STUDY OF POLISH MICRO ENTERPRISES**

*Wadim Strielkowski, Evgeny Lisin, Jan Herget*

### **Abstract**

Our paper tackles the nature of Polish micro enterprises, in particular factors that influence their success. Rural micro-enterprises represent a key factor in sustainable rural development and through creating the employment opportunities, contributing to the local budgets and helping to conserve environment they play the decisive role in transformation processes. Moreover, some of the SMEs in question contribute to the production of renewable energy and therefore foster the sustainable regional development.

The research design was based on a questionnaire survey of 300 rural micro-enterprises in Mazowieckie and Warmia-Mazury provinces of Poland. The undertaken survey provides a rich profile of Polish rural micro-enterprise. Statistical and econometric analyses are conducted in order to indicate those factors that influence the success of Polish rural enterprises. A number of factors that are found to be significant include owner/manager characteristics and enterprise characteristics. The owner/manager characteristics include: owner/manager age (positive impact), owner/manager age squared (negative impact), need of cash as the main motive for establishing an enterprise (negative impact), risk-taking as the main motive for establishing an enterprise (positive impact) and owner/manager education (positive impact). The enterprise characteristics include enterprise location within a region with competitive situation (positive impact), enterprise legal status (negative impact), Broadband Internet connection in enterprise (positive impact) and the fact whether enterprise has any certificates for its products (positive impact). The results have significant implications for the researches and policy-makers and can become a basis for preparing relevant enterprise support policies in Poland.

## **1 INTRODUCTION**

One can hardly doubt the importance of micro-enterprises as the key factor in sustainable urban development. The success of European micro-enterprises (which are the largest part of all European SMEs) is embedded in the Lisbon strategy, constituting one of its main pillars.

There has been some research in international and Polish literature into the factors that influence enterprise success (Storey, 1994; Barkham et al., 1996; Grabowski and Kulawczyk, 1992; or Polish Agency for Enterprise Development, 2004;) and micro-enterprise success in particular (Zienkowski, 1992; or Zolnierski, 2005). There has also been some research done about rural enterprises (North and Smallbone, 1996; Zahrai, 2000; Skowronek-Mielczarek, 2002; or Strielkowski, 2012). However, these studies have never undertaken an analysis of rural micro-enterprises, nor have they

ever specifically concentrated on rural micro-enterprises in the selected sector of the economy (i.e. food-processing or farm enterprises).

Therefore, the purpose of this paper is to identify factors influencing Polish rural food-processing micro-enterprise success (measured by profits per employee). The extensive fieldwork that has been undertaken in the Mazowieckie and Warmia-Mazury provinces of Poland provides a rich profile of rural micro-enterprises in the food-processing sector.

## **2 MICRO-ENTERPRISES AND RURAL DEVELOPMENT**

The basic feature of a rural enterprise that distinguishes it from the whole class of enterprises in general is its spatial context: a rural enterprise is a micro, small or medium enterprise involved in non-agricultural activities in rural areas. According to some, rural enterprises have several specific characteristics which differentiate them from the rest of SMEs (urban SMEs). North and Smallbone (1996) conducted a study of mature rural SMEs in remote rural areas of the United Kingdom, identifying the four most important characteristics of rural enterprises. They found that the majority of rural enterprises aim to achieve sustainability and a good living in a rural environment, rather than to make profits. The second characteristic of rural enterprises is that they have a higher survival rate. Some other studies (see for example Zahrai, 2000) highlight other basic traits which are characteristic of rural enterprises, including scale, labour and capital intensiveness, access to capital, market orientation and flexibility.

### **2.1 The role of SMEs and micro-enterprises in rural development**

The specifics of SMEs in rural areas make them among the most crucial factors in sustainable rural development (Noteboom, 1992). Special stress is put on their reinforcement in the traditionally agricultural regions usually characterized by a high rate of unemployment, where the definite possibility of mass job creation exists through employing workers to fulfill simple tasks at relatively low financial costs.

According to some authors (e.g. Zahrai, 2000), the creation of micro-enterprises in rural areas is closely connected with generating new job opportunities. In this way unemployment is reduced, a new class of small owners is formed and, as a result, a change in the social and professional structure of those regions is achieved. By increasing employment levels in rural areas, micro-enterprises can ease the social tensions and contribute to the reduction of high social costs of transformation (such as mass firing due to restructuring in the industrial and agricultural sectors). Rural enterprises are different from their counterparts in urban locations; these differences range from their approach to the environment to the production processes used.

## **3 RURAL ENTERPRISES IN POLAND**

This account of Polish micro-enterprises should start from the story of the Polish SME sector in general, since micro-enterprises constitute about 95% of all SMEs in Poland. Hereinafter in this sub-section, SMEs are used as a proxy for micro-enterprises in Poland.

The total number of Polish private SMEs increased from 1,205 thousand in 1990 to 3,495 thousand in 2002 due to the transitional changes in the Polish economy (Polish Central Statistical Office, 2005). The prevailing enterprises were sole-traders. At the

end of 2003 there were 3,581.6 thousand SMEs in total, which is a 3.2% increase (Polish Central Statistical Office, 2005). The rapid growth in the number of small and medium enterprises – and especially micro-enterprises – was the Polish economy's distinguishing feature (Fig. 1).

Fig. 1 –Polish SMEs in 1993-2002 (thousands). Source: Polish Agency for Enterprises Development (2004)

The dominant role among Polish SMEs is played by micro-enterprises (employing up to 9 people), which constitute 95.2% of all enterprises operating on the Polish market. Small enterprises constitute 3.8%, medium enterprises 0.8%, and the rest are large enterprises, with 0.2% (Ministry of Economy of the Republic of Poland, 2004). The most dominant group of enterprises in the 1990s was sole-traders. They constituted more than 80% of all registered SMEs.

There are still many obstacles to establishing an enterprise in Poland. According to Porter, (2001) Poland occupied the 24<sup>th</sup> position in the ranking of the number of procedures necessary to start an enterprise, 19<sup>th</sup> place according to the time required (31 days), and 26<sup>th</sup> place according to the costs of establishing a firm among the 29 OECD Member States (Porter, 2001).

#### **4 DATA COLLECTION AND ANALYSIS**

The starting point for the sample selection for this paper was not a probabilistic form. The geographical areas from which the rural micro-enterprises have been drawn were selected based on the considerations of accessibility and budgetary economy. However, it would be true to say that both regions selected – Warmia-Mazury and Mazowieckie provinces represent high level of unemployment and low density of small business in one case and the highest employment in the country together with the widest network of micro-enterprises in the other. It would be too straightforward to suggest that the sampling procedure was ideal from the standpoint of statistical theory, though it is assumed that the sample obtained can be regarded as quasi-random.

At the first stage a list of parishes in both provinces was obtained from the Polish Central Statistical Office. Using the database of parishes 28 parishes were randomly chosen from the list of 56. At the second stage of the sampling process four rural communities were randomly selected within each parish. The 112 communities

obtained then were cross-checked using the community database from the Polish Central Statistical Office. At the third stage of sampling process communities representatives were contacted for survey implementation. Seventy-nine community representatives agreed to help with the research (representatives of 43 communities of Warmia-Mazury province and 36 communities in Mazowieckie province).

At the fourth stage of sampling process enterprises within selected communities were contacted (face-to-face semi-structured interviews).

## **5 THE MODEL OF THE SUCCESS OF POLISH RURAL FOOD-PROCESSING MICRO-ENTERPRISE AND ITS ESTIMATION**

The econometric techniques employed in this paper are fixed and random effects models. Various tests (i.e. Breusch and Pagan test) are run in order to test for random effects and the Hausman (1978) procedure is used to obtain the most appropriate model.

The results of all econometric models: those restricted and unrestricted models comparing all enterprises within the sample are presented and compared. In the conclusions the discussion on the major differences and similarities of both provinces – the poor province and the rich province – is done and major implications are highlighted.

### **5.1 Variables used in the econometric analysis**

Based on economic theory and previous empirical work, the generalized model of enterprise success used here anticipates that the success of small enterprise is influenced by combination of factors internal to the firm and external to the firm. Success of the enterprise is measured as the profit per employee in 2004. Overall, there are 29 hypotheses to be tested. Due to the fact that the explanatory variables used in this model might have many levels (usually expressed by dummies), the number of variables that goes into estimating the model is equal to 7 for the small model, 20 for the intermediate model and 29 for the large model..

The small model of enterprise success uses only truly exogenous variables, the intermediate model of enterprise success uses an extended list of variables (purely exogenous variables and arguably exogenous variables), the large model of enterprise success uses all variables from the small and intermediate models and, in addition, adds subjective variables. The complete overview of the research variables is listed in Appendix 1.

### **5.2 Econometric techniques employed for the estimation of the model of rural enterprise success**

The general econometric model for estimation has the following form:

$$Y_i = \sum_{k=1}^k \beta_k X_{ki} + \sum_{m=1}^m \beta_m Z_{mi} + \sum_{l=1}^l \beta_l W_{li} + u_c + e_i \quad (1)$$

where X are the exogenous variables of the small model, Z the extra objective variables of the intermediate model and W the extra subjective variables added to make the large model.  $u_c$  is a community identifier.

The full list of econometric techniques used includes Breusch and Pagan test for the presence of individual community effects, Hausman test for individual location effects, general least squares (GLS) for the estimation of fixed effects and random effects models as well as ordinary least square (OLS) estimations with robust standard errors.

### 5.3 Model estimation

The small model (Tab. 1) was computed for all 300 valid enterprise cases of truly exogenous variables. Overall, it seems that coefficient of determination (R-squared) are quite small in all three cases indicating the weak explanatory power of the model. Small coefficients of determination are reported quite often in similar studies (see for example study on barriers to entry by Xhillari and Telhaj (2003)). Small coefficients of determination mean that a good deal of variance in the model still remains unexplained. However, the results of the model can still be used to study factors that are significant for enterprise success. There are three variables that have come through as significant in the whole sample model: owner/manager age, owner/manager age squared and a provincial dummy.

## 6 MAIN CONCLUSIONS

Summarizing the findings from the three econometric models which are using the data for all enterprises it can be seen that both owner/manager age and enterprises location play the key role in enterprise success. This suggests that those two factors should be attributed some special attention when the success or influencing the success of Polish rural micro-enterprises are concerned. The results also show that enterprises in Mazowieckie province are more successful than those in Warmia-Mazury province.

Enterprise size and enterprise legal status are negatively impacting enterprise success; those factors have emerged in two models. The result about the legal form suggests that enterprises that are created as family enterprises and limited companies are generally less successful (earn less profit per employee) than sole-trader companies. The result about enterprise size can be regarded is a technical issue – it is a matter of the measure of enterprise success that has been selected for this work. When different

measures of success are used for testing, it becomes insignificant. Thus, this result does not mean that rural enterprises should not employ more people providing they want to be successful.

Factors such as Broadband Internet connection in enterprise, cash motivation of owner/manager and certificates obtained by the enterprise are also of considerable importance for enterprise success.

Our results confirm related findings of Kadocsa and Francsovcics (2011), Strielkowski (2012), or Janda et al. (2013) who show that small enterprises in the CEECs did not perceive any major impacts of EU accession. The Hungarians small businesses did not capitalize on the opportunities offered by the EU, did not make effort to apply for EU grants and funds and did not attempt to penetrate new markets.

Our analysis shows that the success of the rural food processing microenterprise in Eastern Europe is most related to its owner-manager. Surprisingly, the characteristic of the owner - manager which matters the most is not his education or his experience with food processing but his age. The major policy recommendation for government authorities dealing with support policies is therefore not to look so much on enterprise characteristics but to concentrate on the characteristics of the entrepreneur. Our analysis also confirms that the profitability of rural food processing microenterprises is positively correlated with favorable micro and macroeconomic conditions differentiating between rich and poor areas.

## **TRENDS IN PERFORMANCE MANAGEMENT: COMPARISON AND SUMMARY OF SURVEYS**

*Michaela Striteska, Lucie Jelinkova*

### **Abstract**

This paper deals with development and trends in performance measurement and management. Based on the comparison and summary of three surveys, carried out in the years 2011 - 2013 in the Czech manufacturing and non-manufacturing companies, are identified three key research areas. First area deals with models or frameworks that businesses currently use for performance management, second discusses the specific performance measurement areas and indicators that are used and in the third area are identified key elements of successful performance management that need to be fulfilled. Through these research areas is mapped current form of performance management process in the Czech companies and are also identified characteristics which should be met in the future to create effective performance management system. The findings of this summary and comparison are evaluated within the context of theoretical assumptions and results of similar research studies. The paper was created on the basis of literature review and 46 case studies analysis. The case studies were worked out by analyzing internal company materials and by conducting semi-structured interviews with the top management.

*Keywords: performance measurement, performance management, framework, measures, comparison*

## **1 INTRODUCTION**

In today's business environment, companies are confronted with the continual and quickly ongoing changes. The dynamic development of the business environment has a major influence to the development of approaches to performance measurement and management "Within the next five years, every company will have to redesign how to measure its business performance" (Eccles, 1991). To be able to do this change, managers need a comprehensive understanding of trends and deeper knowledge of new approaches in performance management and measurement. The main aim of this paper is to contribute toward building such an understanding and knowledge.

Specifically, we investigate the models and frameworks that are currently used to measure and manage company performance. In the past two decades, a wide variety of performance measurements systems have been developed and implemented to overcome the limitations of traditional financial measures. All, in different ways, are designed to provide a "balance" overview of the company's performance. Therefore, we further explore which particular areas and measures are used to monitor performance. As stated Stivers et al. (1998) although much is being written about nonfinancial performance measures, very little is known about actual current practices. Another equally important study objective is to determine the key elements that have to be met by companies to design effective PMS having regard to the global trends.

The performance management system could be examined according to Neely et al. (1995) at three different levels: at the level of particular performance measures, at the level as an entity (multi-dimensional measures, measures at the operational level, the integration of measures

across the organization's functions and through its hierarchy, inclusion of cause-effect linkages), at the level of relationship between the PMS and environment within which it operates (strategy re-formulation, the consistency with the existing recognition and reward structure). Within this paper the performance management systems of selected Czech companies at the level as an entity is examined.

## **2 PERFORMANCE MEASUREMENT AND MANAGEMENT FRAMEWORKS: LITERATURE REVIEW**

### **2.1 Characteristics of effectively created management frameworks**

For successful performance management in companies are used systems, which can be understood as a comprehensive and universal set of activities and methods of measurement (Wagner, 2009), so called performance measurement system (PMS). These systems are the heart of the process of performance management, support its philosophy and are necessary for the effective and efficient functioning (Lebas, 1995). For companies that use PMS as the basis for their activities and development, the health of the companies depends on the effectiveness of the PMS (Najmi et al., 2005).

Therefore, in order to consider a performance measurement system as effective must fulfill specific roles. For example Lima et al. (2010) identified these roles based on interviews with experts and with the help of the Delphi Method. The most frequently cited PMS roles in the literature are: strategy implementation and revision, providing connections, performance measurement and evaluation, monitoring progress and be a tool for internal communication and motivation. (Gimbert et al., 2010; Micheli, Manzoni, 2010) In the last two decades the attention was paid especially to the role - implementation and revision of the strategy. Most surveys have focused on the area of transforming strategy into action, thus confirming that the PMS is a useful tool in this regard. (Kaplan, Norton, 1996; Simons, 2000)

The basis for the creation of an effective performance management framework is to create an effective performance measurement system. Neely et al. (2007) identify six following key characteristics of chosen PMSs listed before 2002:

- The set of performance measures used by the company must provide a "balanced" company image.
- The use of a PMS should provide a brief overview of the company's performance.
- The need for companies to establish a set of performance measures which are multi-dimensional.
- A measurement and performance management system will provide a comprehensive view of the entire company.
- Performance measurements should be integrated into all activities of the organisation through its hierarchy.
- A PMS should help to understand how the results are affected by different determinants.

Moreover Gomes et al. (2011) created from available literature on performance measurement in the last two decades following summary of relevant features and characteristics of performance measures and PMSs:

- Must reflect relevant non-financial information, based on key success factors of each organization.
- Should be implemented as means of articulating strategy and monitoring organization results.

- Should be based on organizational objectives, critical success factors and customer needs and monitoring both financial and non-financial aspects.
- Must accordingly change dynamically with the strategy.
- Must meet the needs of specific situations in relevant manufacturing operations, and should be long-term oriented, as well as simple to understand and implement.
- Must make a link to the reward systems.
- Financial and non-financial measures must be aligned, and used within a strategic framework.
- Should stimulate the continuous improvement processes.
- Must be easy to understand and to use.
- Must be clearly defined and have a very explicit purpose.
- Should allow a fast and rigorous response to changes in the organizational environment.

## **2.2 Development and trends in performance measurement and management**

The development of an approach to companies' performance management is dependent on the development of the economic environment. This development can be seen in all components of PMSs, and is especially noticeable in defining performance measurements and in establishing the methods of measurement (Wagner, 2009). According to opinion of Dluhosova (2007) depends the success of performance measurement and management, above all, on the choice of correct performance measures and of an instrument to measure as well as on the possible use in corporate management. The main determinants of this development can be identified as: technical-economic model of the economy, globalisation trends, the development of modern technologies, the impact of intellectual assets, the degree of knowledge of economic systems etc. (Dluhosova, 2007). Huyett and Viguerie (2005) defined another determinants: the combined pressure of global competition, technological advancements, interconnectivity and economic liberalization.

The history of performance measurement dates back to the early 19th century, when the increasing industrialization led to the measurement of the productivity performance management (Bititci et al., 2012). Performance measurement was based on Accounting Standards and Cost Accounting. Since 1920, financial ratio indicators (ROI, ROE, ROCE) have been particularly used for measuring performance, and are still widely used as a diagnostic tool for measuring the financial health of a company.

Due to the fact that the product manufacturers and service providers can be consider as service operations; so traditional accounting measures and the static view of costs are no longer appropriate in modern business environment. (Quinn et al., 1990) Based on the findings that traditional financial measures are no longer sufficient for understanding performance in a dynamic business environment because they promote short-termism leading to a lack of strategic focus and failure to provide data on quality (Dixon et al., 1990, Bititci, 1994, Kagioglou et al., 2001, Robinson et al., 2005, Wagner, 2009) were developed and implemented wide variety of performance measurement systems – eg. Performance Measurement Matrix (PMM) (Keegan et al., 1989), the results and determinants framework (Fitzgerald et al., 1991), Economic value add (Stewart, 1991), SMART Performance Pyramid (Lynch, Cross, 1991; Tangen, 2004), Economic value add (Stewart, 1991), Balanced Scorecard (Kaplan and Norton, 1992), EFQM Business Excellence Model (EFQM, 2003), Dynamic performance measurement system (Bititci et al., 2000), Integrated performance measurement framework (Medori and Steeple, 2000).

The SMART model (Lynch, Cross, 1991) developed in 1988 represents a significant change in the approach to performance measurement. It is the first time when attention was focused on linking strategy to operations, the use of external and internal performance measurements and modelling of the company as an integrated system. At the beginning of 1990, the MVA model (Stewart, 1991) introduced a completely new approach that viewed performance measurement exclusively from a market perspective. This was followed by the BSC model (Kaplan and Norton, 1992), which includes both financial and nonfinancial performance measurements. This has gained great attention over the last fifteen years and has been successfully applied in many sectors. Several years later the EFQM model (EFQM, 2003) was developed for the needs of European companies.

Sureshchandar and Leisten (2004) argue that BSC framework do not take account of many other important stakeholders. Also, Neely et al. (2001) claim that organizations have strategy to bring value to a set of stakeholders. On the basis of this criticism was created Performance prism. This framework integrates stakeholder perspective under five facets - stakeholder satisfaction, stakeholder contribution, strategies, capabilities and processes.

Figge et al. (2002) argue that many organizations begin to integrate social and environmental perspective into their systems of performance measurement and management along with the traditional perspective. The era post 2000 generates a lot of frameworks updating the BSC approach – eg. Kanjis business scorecard, argues that BSC approach should be consistent with business excellence and TQM (Kanji and Sá, 2002); Total performance scorecard, integrated personal and organizational scorecard with PDCA cycle (Rampersad, 2005); Dynamic multi-dimensional performance Framework, which is composed of five performance dimensions – financial performance, customer, process, people and future (Maltz et al., 2003). The other recent development brings – eg. the flexible strategy game-card that highlights the dual perspectives of performance - enterprise perspective and customer perspective (Sushil, 2010); System dynamics based balanced scorecard – connecting traditional BSC and system dynamics principles (Barnabe, 2011); Sustainability performance measurement system, which describes phases of evolution of corporate sustainable PMS. (Searcy, 2011) Current systems of performance measurement and management are based on system dynamics, sustainability and simulation view of performance. (Yadav et al., 2013)

### **3 OBJECTIVES AND METHODOLOGY OF THE INVESTIGATION**

In the years 2011 – 2013, three research surveys were carried out, each time lasting a period of 3 months (October to December). In general, everything was focused on mapping the current form of PMSs in Czech companies and identifying the characteristics that an effective performance management system should meet. Even though each survey had its specific objective, each one specifically investigated three consistent areas:

- 1. Models or frameworks that businesses currently use for performance management,*
- 2. The specific performance measurement areas and indicators that are used,*
- 3. Key elements of successful performance management that need to be fulfilled.*

To fulfil the objectives of the research investigation, the method of analysing case studies was selected, as it was necessary to obtain a large amount of data from specific companies. In total, 46 companies were examined, of which there were 35 manufacturing and 11 providing services. The criterion for selection was the size of the company by number of employees and turnover, and previous experience with measurement and performance management, which were determined using previously conducted secondary analyses. Medium and large

businesses were included in the research investigation, among which the assumption was established that a systematic approach to performance management was used.

The case studies were worked out by analyzing internal company materials relating to the area studied and by conducting semi-structured interviews. The data collection phase of the study began with a general examination of relevant literature and research studies, to provide the researchers with sufficient theoretical background. After that the characteristics of basic information about company, vision, values and strategy, performance management and measurement system in selected companies was performed on the basis of all available internal documents. Interviewing was the second technique used for data collection.

The semi-structured interview was conducted based on the methodology and rules presented by Allhoff (2008) and Scharlau (2010). A total of 60 interviews were conducted with mid-level managers (quality manager, HR manager, manager for strategic development) and top level management (general director, financial and sales director) of selected companies. Content analysis was used to process the data.

More detailed characterisation of individual research investigations:

*1. Key features of Strategic Performance Management Systems - year 2011*

The main goal of this research study was to investigate the features of PMS in Czech large size manufacturing companies from two points of view. First was to identify and analyze the current form (models, features, roles, strengths and weaknesses) of PMS in selected manufacturing companies. Second was to determine the requirements that have to be met in the future to design effective PMS. The attention was also paid to factors that affect performance of the manufacturing enterprises and to aspects (characteristics, components, crucial elements) of successful performance management. Totally six large manufactures (automotive, electrical, glass and chemical industry) were analysed by the method of semi-structured interviews with the usage of the 10 open questions (Striteska, 2012).

*2. Current Performance Management Systems and Factors affecting their Quality - year 2012*

The aim of the investigation was to determine the form of current performance measurement systems in selected Czech manufacturing companies (the level at which it operates, the significance of specific financial and nonfinancial indicators for decision-making, and satisfaction with the information provided). A great deal of attention was also paid to identifying the key factors that affect the quality of the process of performance management.

Interviews and analysis were conducted in eleven middle and nine large-size manufacturing companies (metal working industry, plastic processing, manufacturing of packaging, food processing industry, electrical engineering, the energy, the petrochemical and tobacco industry). The interviews covered 10 open questions (Jelinkova, Striteska, 2014; Striteska et al., 2014).

*3. Strategic performance management with Focus on Customer – year 2013*

The main objective of the investigation was to determine whether the companies surveyed had set a long-term strategic concept including objectives and processes focused on the customer and whether the strategy was implemented by means of the strategic performance measures. Partial objectives of this investigation were also to identify the attitude of the companies to monitoring and measuring customer satisfaction, the use of customer satisfaction measurement as an input in the process of continuous improvement and identifying the ways in which the companies determine their competitive position. Consequently, an analysis was made of how the information gathered is used in the company.

The final sample for interviewing included a total of 20 managers, 11 of which were at the highest management level and 9 were at mid-level management of the companies, the activities of which were manufacturing, process manufacturing, chemical processing, energy, automotive, information technology, transportation, health, banking, insurance and other services. The selected companies can be divided into 9 large companies and 11 medium companies (Striteska, Jelinkova, 2014).

## **4 FINDINGS AND DISCUSSION**

### **4.1 Approach, model or framework used for performance measurement**

After more detailed analysis, the individual models or methods for measuring performance can be divided into separate groups, which are: comprehensive approaches, a set of Key Performance Indicators (KPI) and performance measurement based on financial indicators. As comprehensive approaches are considered the Balanced Scorecard model and EFQM, which are instruments for measurement and evaluation as well as performance management.

The following table (Tab. 1) shows the frequency (in %) of the use of the different models/methods for measuring the performance of the companies surveyed in 2011-2013.

Tab. 1 – The frequency of the use of models/methods. Source: own processing

Set of models	The frequency of the use of models in the year		
	2011	2012	2013
Comprehensive approaches	33%	15%	10%
Set of KPI	50%	40%	50%
Financial indicators	17%	45%	40%

The table above clearly shows that there is still a large percentage of Czech companies using primarily financial indicators to measure performance, supplemented at most by monitoring customer satisfaction. In the first year of the survey, this percentage was the lowest, as only large manufacturing companies were examined, based on the assumption that at the beginning (1991-2000) the main development of performance measurement systems related to manufacturing operations (Sushil, Sagar, 2013) . At the same time, there is here the highest percentage of the use of comprehensive approaches, namely the BSC methods.

In further investigations, at least half of the companies have always been medium-sized businesses, and this is reflected in the given results. A somewhat surprising finding is little use of comprehensive approaches to performance measurement. Of all the companies surveyed, only one uses an EFQM model to measure performance, the other approach based on the BSC method.

Companies that were included in the group measuring performance based on a KPI set were subjected to a detailed analysis. The areas investigated were those in which the individual KPIs were defined. Overall it could be stated that two-thirds of them have measures set in all the main perspectives of the BSC method (finance, customers, processes and employees). So far, one-third consistently omits measuring the performance of employees.

Although many research studies have confirmed the strong relationship between human resources management and the attitude of the employees on the one hand and the performance of the organization on the other hand Armstrong (2007) provides a number of relevant

research surveys, HRM indicators are not yet the norm in examining the effectiveness of human resources management and its impact on company results (Guryn, 2006).

Very often, however, these companies apply specific tools which will also contribute to improving performance such as Lean Management, process analysis and benchmarking.

If we summarise the results obtained, it can be stated that comprehensive approaches are still little used in Czech companies. Trunecek et al. (2005) conducted a survey in 2005 among 139 Czech companies and found that only 11% of them fully utilise the BSC model and 40% do not even know it. For more than five years, our results are similar; a higher percentage of the use of BSC is only among large manufacturing companies. An interesting finding is that the companies surveyed, with one exception, do not even use an EFQM model that was created for the needs of European businesses and is often used in Western Europe.

Nevertheless, we can identify an ever-growing trend in the use of a KPI set, which seeks to provide a “balanced” view of a company’s performance evaluation. Performance management solely on the basis of financial indicators is now declining and less than 40% of the companies surveyed use it. Compared to the previously conducted studies (Fibirova (2007), Horova a Hrdy (2007), Kral et al. (2007) or Skodakova (2009), where management on the basis of financial indicators still predominated in the practices of Czech companies, among the companies we surveyed performance measurement prevails based on a set of KPIs.

#### **4.2 Specific areas of measurement and types of performance indicators**

The survey of Stivers et al. (1998) conducted in U.S. Fortune 500 companies and in Canadian Post 300 companies examined the degree to which executives identify particular nonfinancial performance measures as important and whether the companies are measuring them. They revealed that customer service factors are perceived to be the most important measures. On the other hand, factors in the innovation and employee involvement categories were perceived to be less important in goal setting. Chow and Van der Stede (2006) stated that in a study carried by Wm. Schiemann & Associates, the executives widely acknowledged the limitation of traditional financial measures. Nevertheless, they still favored them over nonfinancial measures because they saw them as being generally less ambiguous. The ever increasing application of nonfinancial measurements closely related to areas in which performance is measured using them. In the context of these research studies, it was interesting to take a closer look at the areas and performance measures used by surveyed companies.

Tab. 2 – Specific performance measures and frequency of their use. Source: own processing

<b>Performance measurement area</b>	<b>2011</b>	<b>2012</b>	<b>2013</b>
<i>Financial performance</i>			
Traditional financial indicators	100%	100%	100%
Value based indicators (EVA, MVA, CFROI)	33%	15%	10%
<i>Customer performance</i>			
Complaints	100%	90%	75%
Customer satisfaction	100%	75%	95%
Customer retention	33%	35%	20%
<i>Internal process</i>			
Innovation process	33%	20%	40%
Operating process (quality, time, costs)	100%	100%	100%

<i>Employee performance</i>			
Employee satisfaction	50%	35%	30%
Labor productivity	83%	70%	60%
Employee retention	17%	20%	25%
Employee Skills	33%	35%	25%
Employee engagement	17%	10%	25%

The above mentioned results in many aspects still correspond with the survey of Lingle and Scheemann from 1996, who found that financial performance measures are included in regular management review in 98% of surveyed companies, operating efficiency in 82%, customer satisfaction in 76% and employee performance in 57%.

Strong critique of traditional performance measurement systems and confidence of managers in financial indicators have led to place greater emphasis on „modern“ financial indicators based on value management. However as stated (Venanzi, 2012), more than 10 years later, this scenario seems to have changed only a little, paradoxically. International evidence as well as our survey indicates that managers remain anchored to traditional financial metrics and other metrics like EVA are used rarely (Graham et al., 2005). The unchanged behaviour in financial performance measurement confirmed also recent study conducted by the U.S. National Association of Corporate Directors boardrooms which investigated that only 16% use economic value measure as financial metric in compensation plans (Daly 2011).

Yadav et al. (2013) stated that in the era post 2000 can be seen some new performance measures, such as leadership, training, education, innovation, capabilities, knowledge, personal improvement, etc. Unfortunately all of these measures are rarely seen in the PMSs of monitored companies.

#### **4.3 Key requirements that have to be met in the future to design successful performance management system**

At the end of interviews, managers always got room for expressing their own opinion, how effective PMSs that respond to global trends and changing roles of business should be developed or enhanced. In the discussion it was often found that managers are not fully aware of all the components that should modern performance measurement system include, as stated the literature. It was quite complicated for managers to finding answers to this question. Despite their opinions regarding key characteristics of effectively created performance management system could be summarized to following points:

- simple and clear performance system that strengthen the monitoring of all strategic goals,
- engagement of all hierarchical levels, measures should be integrated through its hierarchy,
- interconnection with the remuneration policy – instrument for employee motivation,
- It systems that enable the collection, analysis and reporting of requested data,
- well trained employee.

On the other hand surprisingly not once has been mentioned the establishment and checking the validity of linkages (cause and effect relationships) among particular strategic performance measures. In the companies that do not use comprehensive performance management approaches no relationship is revealed between the skills and motivations of

employees or key processes and the development of customer satisfaction. And if these relations are examined in a company, they usually remain at the level of apparent hypotheses. This fact is closely related to the finding that the indicators mapping the human resources are not yet the norm in examining the effectiveness of human resource management and its impact on corporate results (Guryn, 2006).

Another important characteristic of effective PMS which was not mentioned is that measures should be conceived as part of fast feedback management systems and should be designed for stimulating continuous improvement capability rather than simply monitor operations strategy (Maskell, 1991). The PMS should be regularly reviewed and updated in order to remain flexible. The latest trends stated in the current literature, which are system dynamics, modelling and simulation, were mentioned within the interviews only once.

## **5 CONCLUSION**

In the Work of Yadav et al. (2013) that deals with the research trends of the last two decades of the performance measurement and management frameworks, the writers came to the conclusion that industrial economies have experienced structural changes and so as the changes have been experienced in PMS research. As a key transformation in the period 1991 - 2000 can be considered the development of an integrated and balanced system of performance measurement and management. For the second decade 2001 - 2011 is typical integration of multi-stakeholder perspective and dynamism of system. Current literature mainly focuses on flexible strategy game-card usage and integration of sustainability in company performance management system.

Compared to the previously conducted research studies our surveys revealed continuously increasing trend in the use of set of KPI, which seeks to provide a “balanced” view of a company’s performance evaluation. Unfortunately, comprehensive approaches to performance management are still not frequently used in surveyed companies. Therefore, the focus of companies should be redirected from performance measurement to performance management.

It is not surprising finding that all monitored companies use traditional financial measures, however surprising is that modern financial indicators base on value management are still used rarely. In customer area measures such as complaints and customer satisfaction are already used routinely, on the contrary customer retention, which for example Nenadal (2004) identify as advance degree of excellence of performance measurement in relation to customer, monitor less than a third of surveyed companies. The same situation occurs in the area of internal processes where all companies measure operational processes but approximately only third of them define measures in innovation processes. In employee performance area three quarters of companies monitor labor productivity, but measures like employee satisfaction, employee retention or employee skills are disproportionately less used. In general measures aimed at improving of performance (lead measures) like employee engagement and innovation process are currently used rarely.

According to Gomes et al. (2011) the recent dramatic environmental and market changes have fundamental influence to the performance measurement literature. The most recent literature highlight, that is necessary to approach to performance management from a more open systems perspective. Some of the relevant issues raised in the literature recently are introduced below:

- Should capture the dynamic nature of the market and environment and include it in the PMS.

- The organizational focus should be redirected from performance measurement to performance management.
- Should be changed from an internal/closed to an external/open perspective, measuring across supply chain and networks.
- Information systems and technology should be facilitators of the performance measurement and management process.
- New processes, initially developed for large organizations, should be found to implement PMS in small and medium enterprises.
- A stakeholder oriented approach should be created, balanced in its perspective.
- PMS should take in consideration the human factor, including new and innovative incentive/reward systems, and their links to performance measurement in order to involve employees in the performance measurement process.

The disappointing for the authors of the survey is that some of the main trends identified in the current literature are not recognized by the Czech managers. Notably the dynamics and flexibility of PMS, which should stimulate continuous improvement of company performance as well as focus on sustainability and all stakeholders are missing. In the surveyed companies (large manufacturing companies) we revealed only performance measures relating to the environment. In other words, still there a wide gap exists between what is used in practice and what is considered as effective in research.

Based on the analysis results further research will be conducted. The main aim will be investigate dependence of using the models on some other company activity.

## **USAGE OF INTERNATIONAL FINANCIAL REPORTING STANDARDS (IFRS) IN CZECH SMALL AND MEDIUM ENTITIES (SMES) – IS IT REALLY SO RARE?**

*Kateřina Struhařov*

### **Abstract**

In this paper the usage of International financial reporting standards (IFRS) in Czech Small and medium entities (SMEs) is analyzed. Despite the past studies from the Czech Republic, the paper aims to show that there are some Czech SMEs that may benefit from usage of IFRS. Furthermore the cost/barriers and benefits of IFRS are analyzed, as well the reasons why selected companies do not plan to adopt IFRS as primary accounting system. IFRS for SMEs is also mentioned as possible way how to widespread IFRS in the Czech Republic.

*Keywords: IFRS, SMEs, Czech Republic*

JEL Classification: M41 Accounting

### **1 INTRODUCTION**

Based on the previous studies from the Czech Republic (Bohuřov & Blařkov, 2012, Mllerov, Pasekov, & Hblov, 2010, Bohuřov & Nerudov, 2008, Bartnkov, 2012, Pasekov, Crhov, Strouhal, & Řezankov, 2014) the usage of IFRS in Czech SMEs is really rare due to many factors, mainly due to the cost connected with IFRS adoption that are overwhelming the pros of such adoption. Also Czech tax legislation is not helping to the widespread of IFRS as CZ GAAP profit or loss is needed for the calculation of corporate income tax and thus the companies need to have two accounting systems or some kind of bridge between them.

On the other hand when you check the vacant positions for accountants, IFRS knowledge is no more benefit, but it is common request for applicants. As at 22 Jan 2015 there were 79 out of 470 accountancy job offers on jobs.cz (Czech jobs server) requesting IFRS knowledge.

There are also some indications that Agrofert Group (a group of more than 200 companies which are active in food production, agriculture, chemistry, ground machinery, forestry, timber harvesting, woodworking, renewable resources and biofuels) have in 2013 started to adopt IFRS to be able to present IFRS financial statements for 2015.

In this paper I am presenting the results of my research held during my PhD. studies and resulting in my dissertation thesis with the title Usage of IFRS in Czech SMEs.

### **2 LITERATURE BACKGROUND**

#### **2.1 General IFRS information**

As defined by International Accounting Standards Board (IASB): “International Financial Reporting Standards (IFRS) is a single set of accounting standards, developed and maintained by the IASB with the intention of those standards being capable of being applied on a globally consistent basis—by developed, emerging and developing economies—thus providing investors and other users of financial statements with the ability to compare the financial

performance of publicly listed companies on a like-for-like basis with their international peers.”

“Up to 2000, IFRS were only supported by the international accounting standards Committee (IASB). In 2000, the European Commission announced a plan to adopt IFRS as a regulatory tool for the European accounting. Immediately after this decision in 2000, a number of countries, such as the Netherlands and Austria, allowed companies to use IFRS as an alternative for the local standards in order to smoothen the changeover to IFRS in 2005. Some other countries, such as France, Belgium, Germany and Italy, already permitted listed companies to follow IFRS before the decision by the EC in 2000. As a result, a number of European companies were already using IFRS before it became mandatory in 2005. These companies are called ‘early adopters’.” (Renders, A., & Gaeremynck, A., 2007, p.49-50). Since 1 January 2005 all companies listed on a regulated market in the Member States of the European Union, are required to prepare their consolidated financial statements under IFRS.

As at April 2014 IFRS was adopted in 105 jurisdictions, around 60 per cent of the 105 jurisdictions that require IFRS for all or most domestic publicly traded companies also require IFRS for some domestic companies whose securities are not publicly traded, generally financial institutions and large unlisted companies. Over 90 per cent of the 105 jurisdictions that require IFRS for all or most domestic publicly traded companies also require or permit IFRS for all or most non-publicly traded companies. (IASB, 2014). In 2008 IFRS were allowed to be used in the United States.

In the Czech Republic, no specific plan for the harmonization of financial reporting (PricewaterhouseCoopers, 2010) has been announced. The European Union's requirements were integrated into Czech accounting legislation.

As at April 2014 the IFRS consisted of Conceptual Framework, individual standards (28 IAS and 14 IFRS) and interpretations (8 SIC and 18 IFRIC).

## **2.2 IFRS for SMEs**

Since July 2009 IFRS for SMEs is available as alternative for small and medium entities (defined as entities with no public accountability and that publish general purpose financial statements for external users). IFRS for SMEs is based on the same principles as full IFRS. However, these principles were in many cases simplified to meet the needs of SMEs as well as to make the costs for the preparation of the financial statements reasonable (IASB, 2010, PwC, 2009, KPMG, 2010).

The publication of IFRS for SMEs was connected with great expectations in many countries. However it has shown, that IFRS for SMEs did not have so big success as planned by IASB and other supporters. It has been adopted by many countries with lower economic performance and weak accounting systems. On the other hand in countries that are economically strong and have a relatively high quality financial reporting system the IFRS for SMEs adoption has been associated with certain distrust. (Bohušová & Blašková, 2011).

Unlikely the adoption of full IFRS, the adoption of the IFRS for SMEs at EU level was rejected in new accounting Directive in June 2013 as it was concluded that introducing the IFRS for SMEs would not appropriately serve the objectives of simplification and reduction of administrative burden (For instance, the Directive does not require preparation of a cash flow statement, whereas this is mandatory under the IFRS for SMEs.). Nevertheless, Member States are able to permit or require the IFRS for SMEs as their accounting standard for all or some of their unlisted companies provided that the Directive is fully implemented and the standard is modified to comply with any accounting requirement of the Directive that departs

from the IFRS for SMEs. In order to comply with the simpler regime introduced by this Directive, IFRS for SMEs may be available only as a voluntary option for small companies in jurisdictions where the standard is used. (EU, 2013).

The Czech Republic has not adopted the IFRS for SMEs and the adoption is not under consideration in the nearby future (IFRS, 2013).

### **2.3 Differences between CZ GAAP and IFRS, IFRS for SMEs**

Contrary to IFRS, CZ GAAP is a national, rule-based accounting system and this is one of the reasons for differences between these two accounting systems (in IFRS the transaction is booked based on the substance over form principle, in CZ GAAP it has to be booked based on the documents that relate to the transaction). The other reasons for differences to be mentioned is the lack of conceptual framework in CZ GAAP (to define basic elements of financial statements as well to serve the users of financial statements to understand main assumptions of accounting system) and linkage of CZ GAAP to Czech tax legislation. In Appendix 1 list of typical differences between CZ GAAP and IFRS can be found.

Nerudová (2009) analyzed the linkage between tax and accounting. Using categories defined by Lamb, Nobes, and Roberts (1998) she analyzed individual elements of financial statements and accounting principles. From her analysis tax leads or dominates in Depreciation for majority of SMEs (accounting depreciation = tax depreciation), in Lease classification (one of the most significant difference between CZ GAAP and IFRS) and in Research and Development cost. Also the financial information presented by majority of Czech SMEs are mainly prepared for tax offices, not for other users of financial statements like investors, shareholders and other stakeholders.

Strouhal, Paseková, and Müllerová (2011) discussed the compatibility levels between IFRS, IFRS for SMEs and CZ GAAP. The results of Similarity and Dissimilarity Analysis (using Jaccard's, Roger-Tanimoto and Lance-Williams coefficient) proof the close linkage between big set of IFRS with separate standard IFRS for SMEs (JC 0,8621). Czech accounting system is slightly closer to IFRS for SMEs (JC 0,5667) than to full IFRS (JC 0,5455).

Hinke and Hrdý (2012) discussed using answers of 116 companies from Czech Republic the possible improvement of the quality of financial statements if IFRS or IFRS for SMEs rules would have been implemented in the Czech Republic. Based on their research they have concluded, that implementation of IFRS rules would improve the fair and true view of financial statements prepared by Czech companies as well as results of financial analysis. They also stated that it would be better to prepare financial analysis from high-quality data than to use financial statements prepared under CZ GAAP and make additional corrections to eliminate wrong accounting principles.

One more drawback of Czech accounting regulation that has to be mentioned is the lack of separation the ongoing major activity from the other operations. Effect from discontinued operations that do not constitute a future potential shall be reported apart from other effects Halíř (2010).

### **2.4 Voluntary IFRS adoption**

Proponents of accounting harmonization consider there are many potential benefits to using a common set of accounting standards throughout the world. They include improved transparency, comparability, and quality in financial reporting, leading to lower preparation costs, more efficient investment decisions and cheaper cost of capital for companies (EU 1606/2002). Prior to the mandatory adoption of IFRS, European company executives

provided several reasons why companies would change from national standards to IAS or U.S. GAAP (KPMG, 2000). They are (in order of importance):

1. the possibility of increasing the availability of capital;
2. the quality of the standards;
3. the preferences of institutional investors;
4. the possibility of lowering the cost of capital; and
5. the preferences of analysts.

Studies of voluntary adopters have found mixed evidence as to whether these benefits have been realized (Al-Basteki, 1995, Dumontier & Raffournier, 1998, El-Gazzar, Finn, & Jacob 1999, Murphy, 1999, Garc'ia & Zorio, 2002, Tagesson, Dahlgren, Gamlen, & Hakansson, 2003, MS Guerreiro, Rodrigues, & Craig, 2008, Tarca, Morris, & Moy, 2013).

## **2.5 Benefits/cost of reporting under IFRS**

Benefits of reporting under IFRS were already mentioned - IFRS as a global standard has had a tremendously beneficial impact for global investors, who lacked all comparability in the pre-IFRS days. Several academic studies have shown that the introduction of IFRS has contributed to lowering the cost of capital (Daske, Hall, & Leuz, 2008 among others) while other authors describe the institutional reasons for the IFRS adoption worldwide (Judge, Li & Pisker, 2010, Lasmin, 2011). Companies that have high levels of international activities are among the group that would benefit from a switch to IFRS. Companies that are involved in foreign activities and investing benefit from the switch due to the increased comparability of a set accounting standard (Thomas, 2009, Bradshaw et al., 2010).

Mládek (2010) summarized the potential benefits of IFRS for Czech companies. The primary benefit is that IFRS opens the door to capital market. Also the ability to prepare IFRS financial statements can help the companies to gain better loan conditions mainly from foreign banks. IFRS also increases reputation of the company, this can be beneficial in business deals or in the situation when the company is looking for foreign investors. Some financial managers prefer IFRS data for budgeting, investment decision and for better illustration of financial aspects of the company. They also prefer to book the transaction based on their substance and not based on the tax rules and regulation that sometimes doesn't fit to the company's business.

Application of IFRS requires a high level of professional knowledge by the accounting staff of any entity trying to apply these standards (Mechelli, 2009). To find accounting experts, is still quite a big problem in Europe. Neither the crisis has changed the situation; a company will always need a skillful and experienced accountant. The research conducted by Robert Half International under the title Global Financial Employment Monitor of May 2009 showed that 51% of companies in the Czech Republic and up to 60% of companies in Europe have difficulties finding experts in this field (Robert Half International, 2009). This was confirmed by research performed by Hinke and Hrdý (2012) when 54% of respondents have heard about IFRS but were not able to define the main differences between IFRS and CZ GAAP, only 16% of respondents have participated on IFRS trainings. The IFRS knowledge in companies that responded to their survey have among the financial managers and accountants also controllers, who are responsible to perform business analyses in the companies and declared the usage of IFRS.

Beyond the problem of the IFRS education, the companies willing to adopt IFRS have to face significant implementation costs (IT costs, costs for renegotiating contracts, etc.). According

to Jermakowicz and Gornik-Tomasyewsky (2005) implementation of IFRS brings not only a change in format of financial statements, accounting policies, and much more detailed reporting information, but also great changes in company that IFRS implements. These changes require financial costs and the human resources and they may take up to 24 months before implementation is ready and mostly it requires the creation of a new accounting system besides an existing accounts used for the statutory purposes. Mládek (2010) commented the need to keep double bookkeeping, from his point of view, when companies use sophisticated IT systems for bookkeeping, the attributes of individual records can be set in order to enable the company to report under CZ GAAP as well as under IFRS.

## **2.6 Benefits/cost of reporting under IFRS for SMEs**

After the issuance of IFRS for SMEs there were also some studies regarding this new standard performed (e.g. Ikäheimo, 2010, Haller & Löffelmann, 2008, Müllerová, Paseková, & Hýblová, 2010, Bohušová & Blašková, 2012, Albu et al., 2013, Bartůňková, 2012). Majority of these studies have concluded that the cost of IFRS for SMEs adoption would exceed the benefits, and that SMEs are not very interested in giving fair and true view of their finance, the tight linkage of accounting and the tax was confirmed.

Ikäheimo (2010) in his study proposed a classification of finish SMEs. Majority of them are defined as the “looser firms” which are and will be local in the future and have no intention to growth. For these “looser firms” the IFRS adoption has no sense and the cost will greatly exceed the benefits. He has also defined the “born to be global firms” represented by the businesses that are international or tent to be international. For this group of companies can the implementation of the IFRS for SMEs be very beneficial. Even if these companies are not the majority of companies in Finland they are likely to have an important role in the economy.

## **3 RESEARCH QUESTIONS AND METHODOLOGY**

Based on the literature background and my own experience I have decided to follow the Ikäheimo classification and will focus on usage of IFRS only in Czech SMEs where it can be expected that it is beneficial for them (so called “born-to-be global firms”). In this category the majority of companies are those, who are international or who tend to be international. As the data about the company’s strategy are not publicly available I have decided to make the assumption that companies with more than 50% of foreign ownership can be considered as part of “born-to-be-global firms”, in these companies also the institutional reason for IFRS adoption can be expected. As at September 2013 there were 4 335 active Czech SMEs meeting the criteria of foreign ownership (based on the data from SW Albertina). 48% of these entities are based in Prague, the capital city, rest is spread over the Czech Republic. 50% of these companies are within the category of micro entities, 29% are medium and 21% are small entities with employees more than 50 and less than 250 employees. According to category of their business, 1368 firms were representing wholesale and trade, 1 255 other services and 1 056 industry.

On this group of companies I have tried to answer following research questions:

1. The usage of IFRS in Czech SMEs is low not only due to the tax barriers, lack of resources and IFRS knowledge (as already confirmed by previous studies), but also due to inaccurate estimation of costs/benefits of IFRS usage.
2. The tax obstacles is still the most important barrier for the widespread of IFRS in Czech SMEs.
3. There are Czech companies that do benefit from usage of IFRS.

4. IFRS for SMEs as an easier alternative to full IFRS can be the way for Czech SMEs to adopt IFRS.

For answering the research questions logical, empirical as well as statistical methods were used. The data were gathered from the SW Albertina, survey with on-line questionnaire and available companies' financial statements and notes on justice.cz.

### 3.1 The sample and survey

From the population of 4 335 entities there were 2 557 entities with contact information available. These were selected as entities to be contacted to answer the questionnaire. The questionnaire was on-line and there were 3 e-mails in period September 2013 to March 2014 circulated to sample companies.

There were 70 responses to the questionnaire obtained, out of these responses were 57 complete and these were used for the evaluation and qualitative research.

The respondents were representing all sectors of economy, 82% out of 57 companies were respondents from industry, wholesale and services, the three sectors that are the most important among Czech SMEs.

Regarding the size of respondents, there were 7 micro, 38 small and 12 medium entities.

28 respondents were using IFRS (mainly in the form of IFRS reporting), 29 had no experience with IFRS at all. Those who were using IFRS were doing it mainly because it was required by the owner, lenders of finance or due to legislation needs (all can be seen as institutional reasons for IFRS reporting), some mentioned also decision of management. 29 respondents did not use IFRS.

## 4 EVALUATION OF RESEARCH DATA AND DISCUSSION

To answer research question 1 - *The usage of IFRS in Czech SMEs is low not only due to tax barriers, the lack of resources and IFRS knowledge (as already confirmed by previous studies), but also due to inaccurate estimation of cost/benefits of IFRS usage* – the major cost or barriers and benefits of IFRS were analyzed. Firstly, the respondents were asked to mark important costs or barriers and benefits of IFRS, see in Tab.1. There were 3 benefits and 5 costs marked by more than 50% respondents as important. The important cost/barriers and benefits are in line with the literature with the exemption of the ability to get finance.

Tab. 1: Summary of benefits and cost/barrier marked by respondents as important. Source: prepared by author.

<b>Benefits</b>	Nr. of respondents who marked as important (out of 57)
Better ability to compare financial data	39
Easier reporting within group	38
Better usage of financial data in the company	28
Increased prestige for business partners	23
Increased attractiveness of company	20
Needed if IPO planned	15
Increased possibility to get external finance	10
Helps to increase equity	6
<b>Costs/barriers</b>	

Administrative burden connected to IFRS	36
Change of processes and IT that is needed to implement IFRS	36
Lack of IFRS knowledge	30
Cost of IFRS adoption	30
Difference between statutory and IFRS profits or losses	29
The need to be informed about new IFRSs	28
Complexity of requirements for IFRS notes	25
Fair value concept used in IFRS	21

Afterwards, using Chi-square test for 2x2 tables, it was analyzed if the assessment of importance of each listed cost/barriers and benefits differs for respondents already using IFRS and those who have no experience with IFRS.

For  $\alpha = 5\%$  the  $H_0$ : *The expectation of costs/barriers do not differ for respondents already using IFRS and for those not using IFRS* can be rejected for the Cost of IFRS adoption and for the Administrative burden connected to IFRS, where these barriers/costs are assumed to be much more important by companies not using IFRS than those who already have implemented IFRS.

It shall be also mentioned that only for barrier Lack of the IFRS knowledge importance for IFRS users was higher than importance for non-users, who see this barrier as the least important from all barriers evaluated. See Tab.2 for more details.

Tab. 2: Costs/barriers of IFRS. Source: prepared by author using XLS Statistics.

% of respondents	Do use IFRS and assume it is important	Do not use IFRS and assume it is important	P-value of Chi-quadrat test (2x2tables)
Lack of IFRS knowledge	69%	46%	0,092152545
Cost of IFRS adoption	42%	86%	0,001681297
Administrative burden connected to IFRS	56%	84%	0,026388661
Change of processes and IT that is needed to implement IFRS	63%	76%	0,308818942
Difference between statutory and IFRS profits or losses	48%	67%	0,182593912
The need to be informed about new IFRSs	52%	54%	0,884399297
Fair value concept used in IFRS	48%	53%	0,756548888
Complexity of requirements for IFRS notes	50%	52%	0,879249972

For  $\alpha = 5\%$  the  $H_0$ : *The expectation of benefits do not differ for respondents already using IFRS and for those not using IFRS* can be rejected for Increased possibility to get external finance, Increased prestige for business partners, Easier position when gaining EU grants.

However the detailed analysis has shown that the benefits expectation of IFRS non-users are much more optimistic than of those who IFRS already use. The IFRS users see as most important benefit Easier reporting within group, Better ability to compare financial data and Better usage of financial data in the company. See Tab.3 for more details.

Tab. 3: Benefits of IFRS. Source: prepared by author using XLS Statistics.

% of respondents	Do use IFRS and assume it is important benefit	Do not use IFRS and assume it is important benefit	P-value of Chi-quadrat test (2x2tables)
Helps to increase equity	11%	16%	0,642718259
Increased possibility to get external finance	8%	33%	0,023540058
Easier reporting within group	73%	76%	0,810755084
Increased prestige for business partners	33%	71%	0,015677648
Increased attractiveness of company	41%	59%	0,267046906
Better usage of financial data in the company	62%	46%	0,265838464
Easier position when gaining EU grants	0%	43%	0,000164118 (Fisher's exact test P-value = 0,000278435)
Better ability to compare financial data	77%	79%	0,848263944
Needed if IPO planned	32%	30%	0,906958047

The inaccurate expectation was confirmed for 2 significant barriers/costs of IFRS. In the case of benefits the test has shown the different expectations as well, when non users have seen more benefits than IFRS users. Even if the benefits of IFRS are being seen as more positive by IFRS non-users, the inaccurate expectation of cost by this group of respondents leads to the negative attitude to the IFRS adoption. The attitude to costs/barriers is in line with previous studies, the attitude to benefits and overall not willingness to adopt IFRS shall be further analyzed in the future.

To answer research question 2 - *The tax obstacles is still the most important barrier for the widespread of IFRS in Czech SMEs* the respondents were asked about the possibility to adopt IFRS as allowed by Czech accounting legislation if they are part of group preparing consolidated IFRS statements, this possibility was applicable for 42 respondents. The tax obstacles were mentioned by 16 respondents, however 19 respondents mentioned complexity of IFRS as the reason for not adopting IFRS as primary accounting system, therefore the  $H_0: f_{Tax\ obstacles} > f_{Other}$ , where  $f$  is frequency, shall be rejected, see Tab.4 for more details. This conclusion is not in line with previous studies and shows that even the tax is quite big problem for some respondents, others mentioned the complexity of IFRS as the reason for not planning to adopt IFRS.

Tab.4: IFRS usage evaluation. Source: prepared by author.

	Do use IFRS	Do not use IFRS
Used this possibility or will use in nearly future	4	1
Would use if there is no need to transform financial results to CZ GAAP for the purposes of CIT	11	5
Do not plan at all due to complexity and more strict rules for IFRS financial statements mainly notes	9	10
Other	1	1

To answer research question 3 - *There are Czech companies that do benefit from usage of IFRS* - the evaluation of IFRS usage of those 28 respondents who has experience with IFRS was done.

Out of 28 respondents using IFRS only one evaluated the usage of IFRS as negative, 10 had positive experience and 17 was neutral in the evaluation, the major reasons for the evaluation of usage IFRS are stated in Tab.5.

Tab.5: The possibility to adopt IFRS as primary accounting system as allowed by Czech accounting legislation. Source: prepared by author.

Negative	1	IFRS information are used only by the owner who is listed, the administrative burden connected to IFRS reporting is high and there is a high percentage of making errors.
Neutral	17	IFRS information are used only by the mother company, we do not need them at all. It is the requirement of our owner and we have used to it. Reporting system was already set up and it is not such administrative work to be performed in addition to our normal processes during closing.
Positive	10	Lower cost for the preparation of consolidated accounts. Increase of prestige of the company. Better financial information. Better management evaluation of entities in the group based on same reporting system.

Based on the information from respondents the  $H_0: f_{Positive} > 0$ , where  $f$  is frequency, can be accepted and it can be confirmed, that there are some companies, who may benefit from usage of IFRS. These companies meet the definition of born-to-be global by Ikäheimo. One of typical feature of these companies is that they or their ultimate mother prepare consolidated financial data, that IFRS is used for management evaluation and that they found IFRS to help them to increase prestige of the company outside Czech Republic. Also the respondents with positive evaluation of IFRS confirmed that IFRS provides better financial information which is in line with study of Hinke and Hrdý.

To answer research question 4 - *IFRS for SMEs as an easier alternative to full IFRS can be the way for Czech SMEs to adopt IFRS* – the respondents were asked if they know IFRS for SMEs and if they think it is an easier alternative to full IFRS and can be the way for Czech SMEs to adopt IFRS. Only 9 respondents out of 57 were aware of IFRS for SMEs. Out of all respondents 7 agreed with the statement, 3 disagreed, the rest had no idea. Therefore the  $H_0: f/n \text{ Agree} > 50\%$ , where  $f/n$  is relative frequency shall be rejected. As the IFRS for SMEs was not supported by EU, the literature did not find the IFRS for SMEs meeting SMEs needs and also the research has shown low awareness of IFRS for SMEs, IFRS for SMEs will not be for future research considered as the possibility for Czech SMEs.

## 5 CONCLUSION

In this paper the IFRS usage in Czech SMEs was discussed. As it was indicated by the research, there are some companies that may benefit from the usage of IFRS. It was also shown that there are Czech small and medium sized companies using IFRS for reporting purposes. To adopt IFRS as primary accounting system is however not planned by majority of respondents, not only due to tax barriers but also due to complexity of IFRS and the higher requests for financial statements and notes preparation. As part of my research the expected cost/barriers and benefits of IFRS were studied, except of easier ability to gain additional finance (in form of loan as well as capital increase) all other cost/barriers and benefits mentioned in literature were assessed as important by respondents. The different attitude to assessment of cost/barriers and benefits by IFRS users and non-users were confirmed for some of them. What is surprising is that the IFRS non-users see the benefits of IFRS more positively than IFRS users, but still the costs are more important for them and therefore are not willing to adopt IFRS, this has to be further analyzed in the future. Regarding IFRS for SMEs this study has shown that there is low awareness about this standard and that IFRS for SMEs shall not be further seen as the way to widespread IFRS in Czech SMEs.

## **Appendix 1**

List of typical differences between CZ GAAP and IFRS:

- Content of a full set of financial statements – in CZ GAAP only statement of financial position (balance sheet), income statement and Notes are mandatory for all accounting entities. In IFRS, entities shall present (other than statement of financial position, income statement and Notes) also statement of comprehensive income, statement of changes in equity and cash flow statement.
- Fair value – in CZ GAAP only some specific assets shall be revaluated using fair value (financial instruments or by company transformations). In full IFRS intangible assets, property, plant and equipment and investment property may be revalued. Derivatives, selected biological assets and most securities must be revalued. Fair value remeasurement is required on the initial measurement of all financial instruments and for business combinations except for formations of JVs and business combinations under common control. In IFRS for SMEs revaluation of intangible assets and property, plant and equipment is forbidden, other usage of fair value depends on the availability of fair value, if cost and effort to assess fair value are significant the cost method has to be used.
- Revenue recognition – in CZ GAAP legal form prevails, in IFRS the substance of the transaction is relevant. The recognition criteria have to be met in IFRS and there is a possibility to use the percentage of completion method for booking revenues from long-term projects.
- Borrowing costs – in CZ GAAP the entity can decide if borrowing costs will be expensed or capitalized. In full IFRS the borrowing costs shall be capitalized, in IFRS for SMEs all borrowing cost shall be expensed.
- Intangible assets – in IFRS recognition criteria has to be followed, in CZ GAAP the useful life of the asset shall be over one year and the purchase value of asset shall be over the stated limit to recognize the asset.
- Research and development cost – in full IFRS research costs are expensed as they are incurred. Development costs are capitalized and amortized only if stringent recognition criteria are met. In IFRS for SMEs research and development cost are expensed as they occur. In CZ GAAP research and development costs can be capitalized only if the asset is generated to be sold.
- Fixed assets valuation – in IFRS unlike in CZ GAAP demolition and dismantling cost shall be part of the value of the fixed asset.
- Recognition criteria for long-term assets – in IFRS criteria based on the economic benefits have to be met (resource controlled by the entity as a result of past events and from which future economic benefits are expected to flow to the entity), in CZ GAAP the useful life of the asset shall be over one year and the purchase value of the asset shall be over the stated limit to recognize the asset.
- Assets held for sale – specific category in IFRS, which is included in inventories, in CZ GAAP assets held for sale are not defined and until they are sold, are included in long-term assets.
- Amortization of goodwill – in CZ GAAP goodwill is amortized over 5 or 15 years, in IFRS for SMEs goodwill shall be amortized over 10 years, in full IFRS goodwill is not amortized but tested annually for impairment.

- Financial lease – in CZ GAAP the assets acquired under finance lease are not presented in the financial statements. In IFRS the leased assets are included in the financial statements as well as the liabilities and financial costs connected.
- Investment property - as defined by IFRS as property held by owner to earn rentals or for capital appreciation but not in the ordinary course of business. It shall be measured at depreciated cost less accumulated amortization or fair value. In CZ GAAP there is no specific guidance. Investment properties are presented within property, plant and equipment.
- Grants accounting – in full IFRS and CZ GAAP the grants for the purchase of assets lower their purchase value, in IFRS for SMEs grants are included in revenues.
- Provisions recognition – in IFRS certain criteria have to be met to recognize the provisions (present obligation exists, it is probable that the entity will be required to transfer economic benefits in settlement and the amount of the obligation can be estimated reliably), in CZ GAAP there are some provisions that do not meet these criteria.
- Extraordinary items – extraordinary items are prohibited in IFRS. In case of changes in the accounting policies IFRS restates comparatives and prior-year opening retained earnings. In CZ GAAP unusual operations with regard to the normal activities of an entity and cases of random events, changes in accounting methodology and corrections of material prior-period errors are included in extraordinary items.
- Impairment rules – in IFRS a detailed guidance for the calculation of impairment is provided, in full IFRS impairment shall be assessed regularly at each reporting date, in IFRS for SMEs only if there are any indications of impairment. In CZ GAAP no such guidance is available.
- Reclassification – some items in the Financial Statements have to be classified in different categories in IFRS than in CZ GAAP, e.g. activation, changes in inventory, foreign exchange differences, corporate income tax receivable or payable etc.

## **AFFILIATES OF LARGEST ENTERPRISES IN THE CZECH REPUBLIC: A SPATIAL PERSPECTIVE**

*Jan Suchacek*

### **Abstract**

The significance of large enterprises can be barely denied. Contrary to the enterprise headquarters, branches of individual enterprises attract considerably smaller attention. Geographies of enterprises largely comply with existing settlement systems on the one hand and mirror socioeconomically differentiated landscape on the other. The main objective of this article consists in the analysis and interpretation of location factors determining the collocation of the first-tier affiliates of one hundred largest Czech enterprises. Size of the enterprise is measured by its turnover. First-tier affiliates are understood as those following immediately after headquarters in the framework of enterprise hierarchy. The whole issue will be assessed predominantly from qualitative perspective. While spatially-orientated studies usually tend to the focus on head offices, branches of individual enterprises are typically neglected or even omitted. It should be taken into consideration that overall qualities and performances of enterprises are derived not only from their head offices but also from their affiliates.

*Keywords: location factors, geographies of enterprises, affiliates, headquarters, regions, Czech Republic, Czech companies, foreign companies*

JEL Classification: R10, R19, R30, L20, L29

### **1 INTRODUCTION**

Location decision-making substantially co-forms not only contemporary but also future socioeconomic landscape. Basically, we deal with two perspectives: first, there is a specific demand side represented by enterprises and investors. These entities demand certain characteristics and qualities of territories. Second, location conditions of individual territories constitute a specific supply side. Final collocation of investments naturally displays plentiful interplays between above mentioned supply and demand sides. Contrary to general economic categories, supply and demand we focus on bear a distinct spatial dimension.

In practice, location decision-making is rather uneasy process as it is dependent on particular spatio-temporal context. Any larger generalizations are not desirable just for the sake of different nature of utilized methods, differentiated quality of data, specific features of individual economic branches etc. (see also Aksoy & Marshall, 1992, Bevan, Estrin & Meyer, 2004, Corbridge, Martin & Thrift et al, 1994, Shephard & Barnes et al, 2003, Suchacek, 2013 or Johnston, Gregory & Smith et al, 1994).

This article aims at the analysis and interpretation of location factors delimitating the collocation of the first-tier affiliates of one hundred largest Czech enterprises. Sizes of individual enterprises are measured via their turnover. First-tier branches are perceived as those following immediately after headquarters in the framework of enterprise organizational hierarchy. The whole problem will be grasped primarily from qualitative point of view. In recent years, head offices of large enterprises attracted intense, albeit yet insufficient attention (see Lyons, 1994, Meyer & Sinani, 2009 or Suchacek & Baranek, 2011). However, local and regional studies are usually devoid of branches of individual enterprises. Put succinctly,

organizational structures of largest enterprises do matter and individual affiliates represent an indispensable part of these structures.

## **2 SOME THEORETICAL ASPECTS OF THE GEOGRAPHY OF ENTERPRISE**

No enterprise is located in the vacuum; on the contrary, there are numerous place-specific attributes and interrelations with enterprise surroundings. This includes suppliers, customers, local, regional and state institutions, legal system, quality of environment, quality of the labor, investment incentives and many others.

As mentioned by Maier and Tödting (1997), relations of enterprises to their milieu are considerably determined by spatial differentiation of input factors including land, labor, capital, natural resources, know-how or technologies. And the same hold true for output side, which involves geographically differentiated approach to the markets and customers. Enterprise outputs are naturally often dependent on existing settlement structure. Both input and output sides are also affected by increasingly popular soft factors (see Suchacek, Seda, Friedrich & Koutsky, 2014).

Not surprisingly, location decision-making is rather complex and quasi-irreversible process. This fact applies to large enterprises with even higher intensity. There are only little doubts that large enterprises are of great importance in relation to local and regional economies and development. This fact is frequently accentuated by both economists and geographers (see for instance Massey, 1995, Holland, 1976, Markusen, 1985, van Dijk & Pellenbarg, 1999, Vanhove & Klaasen, 1987, Frobel, Heinrichs and Kreye, 1980 or Dunning & Lundan, 1994).

Massey (1995) brought the conception of spatial division of labor. She claims that place's character is the result of specific combination of past layers of socioeconomic events occurring there. That is why it is important to regard wider socioeconomic context. According to that concept, space is relative rather than absolute category and is penetrated by socioeconomic hierarchical relations. Massey (1995) shows that management and R&D functions tend to locate in large cities and metropolitan territories, while the other – mainly old industrial or underdeveloped areas – are 'entrusted' to perform other, mostly manufacturing functions.

Maier and Tödting (1997) point out that geography of enterprise or the spatial distribution of enterprise's structures and functions becomes increasingly important as there exist systematic relations between the regional hierarchy and the hierarchy of particular branches within large enterprises. Not surprisingly, territories, in which headquarters functions are concentrated, occupy the best position on the socioeconomic ladder. On the contrary, the position of individual branches is describable as sensitive one and this basically concerns affiliates of all tiers.

Moreover, Massey (1995) or Fothergill and Guy (1990) found that the closure of enterprise branch is quite frequently based on its position within enterprise organizational hierarchy rather than on its productivity. Naturally, manufacturing branches are the most vulnerable ones. Massey (1995) suggests that manufacturing within the enterprise should not be divided from headquarters and R&D functions. Moreover, the whole hierarchy of working positions should be kept in one region as management decisions that concern affiliates in geographically or functionally distant regions typically do not take into account spatially specific circumstances. Economies of numerous regions are thus actually controlled externally. Indeed, the problem of 'external control' became rather relevant mainly in recent

years. The development of many localities and regions is not under exclusive control of respective territorial managements any longer.

Very often, affiliates represent so-called 'Cathedrals in the Desert'. These branches are labeled as 'Cathedrals' because they use much more advanced technologies than the rest of the enterprises in the analyzed peripheral region. And these cathedrals lie in the desert as they are fully subordinated to the headquarters collocated typically in rather distant leading regions and are to a large degree isolated from the other firms in peripheral region. Thus, peripheral regions enjoy only limited benefits from the presence of these affiliates.

As a consequence of previously depicted tendencies, we are increasingly entitled to use the notion of mesoeconomics, which is created primarily by large multinational corporations and their organizational hierarchies. Mesoeconomics describes the economic arrangements, which are based neither on the microeconomics of buying and selling and supply and demand, nor on the macroeconomic aggregate indicators. In other words, strict division of economics into macroeconomics and microeconomics is often a figment. Taking into account their economic-political power, large enterprises in a way formed a new category within economics (see also Holland, 1976).

### **3 MATERIALS AND METHODS**

The pivotal objective of the survey was the analysis and interpretation of factors influencing enterprise first-tier affiliates location. Our survey has been accomplished through exploratory research in 2011. The whole research was of qualitative character and data were gathered by means of electronic and telephone questioning.

Basic sample for qualitative part of this research consisted of 190 companies. This was caused by their iterative occurrence in top 100 databases as well as by liquidation of some of them. Altogether 53 valid questionnaires returned to the research team, which means that rate of return reached roughly 28 %. The questionnaire first reached top managers of individual enterprises via e-mail. In case, the manager of enterprise did not respond, he or she was contacted through telephone call and after an explanation of the research purpose he or she received questionnaire via e-mail again.

The survey itself was accomplished by means of structured questionnaire. Likert scale ranging from -3 to +3 proved to be the most pertinent one for such kind of research. The higher number means the higher intensity of the phenomenon concerned. Thus, for instance -3 denotes full disagreement, while +3 full agreement and 0 is a mediocre value. This scale was used in the majority of questions. The obtained results were subsequently transformed to the percentage, which proved to be useful for further comparisons and interpretations. Some of the questions in the framework of structured questionnaire were formulated as open, which facilitated obtaining certain specific information. It should be mentioned that utilized methods as well as rate of return affect the results of this research.

### **4 RESULTS AND DISCUSSION**

Our research brought several interesting results. While 76 % of the questioned largest enterprises had foreign owners, remaining 24 % were kept by their Czech counterparts. And it turned out that just ownership matters as evaluation of decisive factors influencing the location of first-tier affiliates perceptibly differs in view of Czech and foreign enterprises.

This concern factors such as ‘proximity to suppliers’ preferred by Czech enterprises and ‘proximity to customers’ stressed on the contrary by foreign owners. This reveals different motivations for the location of these companies.

Tab. 1: Decisive factors influencing the location of affiliates. Source: author

Average % evaluation and rank according to Czech companies		Factors influencing affiliates' location according to Czech and foreign companies	Average % evaluation and rank according to foreign companies	
1.	88.3	<b>Infrastructure</b>	86.8	2.
2.	86.6	<b>Geographical location</b>	87.3	1.
3.	76.6	<b>Proximity of suppliers</b>	78.5	6.
4.	76.0	<b>Agglomeration economies/advantages</b>	79.0	5.
5.	75.0	<b>Quality of entrepreneurial milieu</b>	77.5	7.
6.	73.3	<b>Proximity of customers</b>	80.3	3.
7.	71.6	<b>Availability of raw materials</b>	75.5	10.
	71.6	<b>Availability/quantity of work force</b>	76.5	8.
	71.6	<b>Low wage demand</b>	76.0	9.
8.	70.0	<b>Local work force quality</b>	79.8	4.
9.	68.3	<b>Closeness/concentration of related industries</b>	71.5	11.
	68.3	<b>Proximity of competitors</b>	71.5	
	68.3	<b>Price of land</b>	69.2	14.
10.	66.6	<b>Image/prestige of the place</b>	69.6	13.
11.	61.6	<b>Willingness of managers to move</b>	71.0	12.
12.	61.2	<b>National policies</b>	68.2	15.
13.	60.0	<b>Nearness of decisive authorities</b>	69.2	14.
14.	56.6	<b>Public administration system</b>	69.2	
15.	55.0	<b>Quality of environment</b>	55.0	17.
16.	46.6	<b>Determined historically</b>	60.3	16.
17.	43.3	<b>Cultural facilities</b>	45.2	18.
18.	38.3	<b>Sport facilities</b>	44.2	19.

It is worth noticing also ‘local work force quality’ factor, which is one of the most important from the standpoint of foreign companies, while according to Czech companies the factor proved to bear only medium relevance. This has much to do with more progressive or

sophisticated branches of the economy, on which foreign enterprises focus. This is indirectly confirmed by relatively higher importance of the factor named as ‘availability of raw materials’ in view of Czech companies. It cannot be omitted that average assessment of factors according to foreign enterprises is generally higher than that in case of Czech ones. Apparently, the qualitative distinction tends to follow the axis Czech – foreign companies.

As for the course of the location of the first-tier affiliates, calculations turned out decisive in 92 % of all cases. Intuition plays only a minor role and concerns to a smaller or larger degree only 8 % of all decision-makings related to the first-tier branches. This in a way complies with multitude informational layers covering the landscape we live in. At the same time, one cannot underestimate the role of managerial as well as other routines in the process of location decision-making.

Fig. 1 – Course of the location of the first-tier affiliates. Source: author

Next interesting domain is represented by expectations and experiences categories, i.e. to what extent initial expectations during the establishing and further running of the enterprise meet the reality. In 6 %, approximately the half of all matters turned out to be in accordance with initial expectations. Majority of matters ran in compliance with expectations in 92 % of cases and just according to 2 % of respondents everything proved to be entirely ok. When evaluating these results, one should bear in mind that enterprise managements may partly tend to the overestimation of their own capabilities.

Next question was related to the difference in the affinity with territories where headquarters and branches are collocated. Generally speaking, largest companies confirmed higher affinity with territories, where their head offices are located and the value reached 74.2 %. In case of the territories, where first-tier affiliates can be found, the respective value was 73 %. This difference can be described as not high yet perceptible.

Previous researches (see for instance Suchacek & Baranek, 2011) showed that capital city is by far the most attractive place for the location of headquarters, while other territories are literally ‘sentenced’ to act as hosts for the affiliates. The main disadvantages of territories out of the capital city were as follows: low purchasing power (67 %) and insufficient infrastructure (33 %).

Fig. 2 – Locational expectations and experience. Source: author

As for the promising places out of the capital city, Brno, which is the second largest town as to the population size, turned out the most perspective town for possible location of head office for 31.2% of questioned. Ostrava, Czech Republic’s No. 3 town from the population point of view, reached the value 23.5%. Next position is occupied by Hradec Králové that reached 17.6% and Olomouc, which was treated as a suitable place for performing central functions by 11.8 % of these enterprises. Surprisingly, Plzeň as the fourth most populous town in the country reached mere 5.9%, which was accounted for by town’s non-central geographical location.

## 5 CONCLUSIONS

There are many factors, which affect the location of affiliates of largest enterprises in the Czech Republic. Not surprisingly, infrastructure and geographical location turned out to be the most important ones, which is in consonance with previous researches. However, the list of location factors, which are considered relevant by foreign companies differ from that of their Czech counterparts. When establishing affiliates, location decision-making of largest companies goes upon calculations, the role of intuition-based activities is not so important. And not surprisingly, largest companies are less congruous with territories, where their affiliates are located. Last but not least, there is undoubted challenge related to the future

research on location factors driving the collocation of both headquarters and affiliates as the development of the economy is increasingly a turbulent one.

## **MANAGERIAL ACCOUNTING TOOLS AND CLUSTERS FROM THE COMPANIES ACCORDING TO THE USED INSTRUMENTS**

*Libuše Svobodová*

### **Abstract**

The presented article is based on the questionnaire survey, which was conducted in 2014 in the Czech Republic. There were involved 295 Czech enterprises in the study. Questionnaire investigation was focused on the tools used in managerial accounting in the interviewed enterprises. Specifically, there were questions involved on the monitoring of costs, the creation and usage of calculations, plans and budgets, capacity utilization and efficiency, efficiency evaluation and monitoring of economic results and evaluation of financial analysis. The last part was dedicated to identification data.

In the evaluation there were involved physical persons and also small, medium and large legal entities. It is expected that SMEs use less tools of managerial accounting than large companies. It is also expected that it is possible to divide companies according to used instruments to representative clusters.

A detailed research together with the analysis and critical assessment of accessible materials will enable to identify the main objectives in the field of study. The analysis of the initial state will consequently enable to identify the key factors and knowledge.

*Keywords: Efficiency, Evaluation, Identification, Managerial Accounting, Survey, Utilization*

JEL Classification: L25, M21, M40

## **1 INTRODUCTION**

Managerial accounting is an integral part of the enterprises. Managerial accounting information include: information on the costs of an organization's products and services, calculations, budgets, performance reports and other information which assist managers in their planning and control activities.

Managerial accounting should be also defined as management accounting or in the strict sense as cost accounting.

A fundamental purpose of managerial accounting is to enhance firm value by ensuring the effective and efficient use of scarce resources. Thus, managerial accounting systems should provide information that improves employees' abilities to make organizationally desirable decisions, thereby enabling employees to achieve the organization's goals and objectives (Caplan, 1988; Horngren et al., 2000). Additionally, managerial accounting systems should provide information that helps align the interests of employees with owners by directing employee effort and attention to activities that benefit the organization (Atkinson et al., 1997; Lambert, 2001). Viewed in this light, the information produced by a managerial accounting system serves two important roles in an organization: to provide some of the necessary information for planning and decision-making, and to motivate individuals (Zimmerman, 2000).

## **2 THEORETICAL BACKGROUND**

Lazar and Matuskova (2012) focused on the variable and fixed costs. Kupkovic and Toth (2004) focused in their article on Activity Based Costing as on new managerial method of costing, budgeting and accounting system, practice and technic, which represent causal relationship between creation of outputs and activities that would consume enterprise sources. Tapura et al. (2015) focused on Cost-based calculations, Balanced Scorecard approach, Payback methods and other management accounting methods for safety-related decision-making.

Knapkova et al. (2014a) focused on the utilization of balanced scorecard and the effect of its use on the financial performance of companies in the Czech Republic. An extensive questionnaire survey carried out by the Faculty of Management and Economics of TBU in Zlin (a total of 350 enterprises in the Czech Republic) revealed that the BSC is used by approximately 13% of enterprises. A company's size affects the use of BSC, which was confirmed by chi-square, and therefore we can state that the use of BSC grows with a company's size.

Knapkova et al. (2014b) found in the same study that the use of benchmarking in the Czech Republic is still relatively low and there are not differences among companies with different specialization and different age and their use of benchmarking. It was proved that larger companies use benchmarking to a greater extent than smaller companies.

On Balanced Scorecard focused also Gavurova (2011, 2012).

Janecek and Hynek (2007) firstly focus on the efficiency of firms in a knowledge economy. They continue with next article (Janecek and Hynek, 2010) focused on the using of indicators counted for various groups of businesses as return on assets, return on sales, level of leverage factor, intensity of capital turnover and mainly return on equity. Authors compared efficiency of users and non-users Economic Value Added (EVA) concept. Camska and Scholleova (2014) concentrate on valuation of entities. Stamfestova (2014) focused in the article on business performance management in manufacturing companies in the Czech Republic. Mohelska, Sokolova (2011) focused on the competence and roles of territorial administration. Seidler (2011) wrote about responsible management of the correct way to prosperity companies. Suchanek et al. (2013) presented the article focused on the influence of Quality management on corporate performance. Siska (2009) wrote How to evaluate economic successfulness of an enterprise.

Scorte et.al. (2013) done the research in the hospitality industry. 65.93% of the managers surveyed believe that the accounting information provided by the managerial accounting are very useful in decision making; between the managers' profession and experience and their perception of the importance and usefulness of the accounting information there is a correlation that is to be understood differently, in our opinion, in relation to the nature of the information provided by the financial accounting and that provided by the management accounting; in 68% of the firms in the sample there is a management accounting system; at the level of the sample there is a more or less intense correlation between the firm's size measured by turnover and the frequency of use of accounting information by categories, but this assertion cannot be extended to the total population; with a probability of 95%, it is verified the fact that between the size of the firms, measured by total assets and the frequency of use of accounting information on costs there is also a correlation at the level of all firms in the total population; in a proportion of 95%, the managers that consider important and useful the information provided by the management accounting are open and have a positive attitude regarding the implementation of a cost accounting information system.

Abdel-Kader and Luther (2006) done in the research in British food and drinks industry. Direct costing is widely practised and important, by contrast with activity-based costing and full absorption costing. The balanced scorecard and other non-financial performance measures are perceived to be important but never or rarely used by 40 per cent of companies. It will be important to compare the results from Great Britain with the results from the Czech Republic in 2014.

Molina et. al. (2014) focused on the balanced scorecard in the connection with the levels of organizational climate, employees' commitment, job satisfaction and job dedication. The results indicate a clear relationship with the satisfaction of employees within the organization; it shows that the BSC implementation is significantly related to positive employees' affective reactions.

Study from Akinyomi (2014) examines the relationship between firm size and activity-based costing system implementation in Nigerian manufacturing sector. From the review of literature and data analysis, it becomes glaring that a positive relationship exists between firm size and activity-based costing system implementation in the Nigerian manufacturing sector. Large size firms tend to be favorably disposed to activity-based costing system implementation.

In the presented paper there will be not done the detailed description and review of the managerial tools used in the companies. It is not the goal of the article. The detailed review done for example Langfield-Smith (1997) or Sprinkle (2003). Coman et al. (2012) focused on managerial accounting as a source of information for an efficient management in SME.

### **3 GOALS AND USED METHODS**

The article is based on primary and secondary sources. The primary sources are represented more. They are represented by the results from the conducted questionnaire investigation and by ideas of the author. The secondary sources comprise professional literature, information collected from professional press, legal regulations, websites, discussions or previous participations in professional seminars and conferences relating to the chosen subject. Then it was necessary to select, classify and update accessible relevant information from the numerous published materials that would provide the basic knowledge of the selected topic.

The goal of the paper is to present selected results from the questionnaire investigation done by the author of this paper. The sub goal is aimed to confirm or refute two hypothesizes. It is expected that SMEs use less tools of managerial accounting than large companies. It is also expected that it is possible to divide companies thanks to used tools to representative clusters.

## **4 RESULTS FROM THE QUESTIONNAIRE INVESTIGATION**

### **4.1 Description of the project**

In 2014, a survey was conducted among nearly 300 businesses. Firstly was conducted pilot testing of questionnaires in early spring 2014. Secondly was done the current survey. Concretely were gained 295 questionnaires together. Three of them were not possible to use for next evaluation. The partial results will be presented in the presented article. The survey involved 77% of SMEs and 23% of large enterprises from all regions of the Czech Republic. The second question of the questionnaire was focused on the tools that are used in the managerial accounting by the Czech enterprises. Next questions were involved on the monitoring of costs, the creation and utilization of calculations, plans and budgets, capacity utilization and efficiency, efficiency evaluation and monitoring of economic results and

evaluation of financial analysis. The last question was aimed on the utilization of the technologies in the connection with managerial accounting. For example were named accounting software, specialized software, MS Office or other software used for processing of the managerial accounting.

#### **4.2 Results from the questionnaire**

In the graphs below there are presented the results from the question aimed on the tools of managerial accounting and its utilization in the Czech companies. The results are divided on the small and medium enterprises, on the large ones and together.

Into evaluation there were involved:

- Direct costs
- Indirect costs
- Type calculation formula
- Calculation (full costs)
- Calculation (variable costs)
- Activity Based Costing
- Controlling
- Benchmarking
- Balanced Scorecard
- Economic Value Added, Market Value Added
- Quality Management
- Just in Time
- Others

The presented graphs are divided on the monitoring of costs and utilization of the calculations and the second one on the tools of strategic management used in the involved companies. Both graphs clearly illustrate and confirm the first hypothesis. The small and medium-sized enterprises use less tools of managerial accounting than large ones. The only one tool that small and medium-sized companies use more than large companies is monitoring of direct costs. On the other hand it is possible to expect that large companies use other identification of the costs that they use for next processing.

The results from calculations show that businesses mainly used for determination of the calculation simpler and less complicated methods. When we focus on the calculation in more detail, 37% of large companies used calculation of full costs. On the other hand SME used mostly the type calculation formula. Totally is mostly used the calculation of full costs. It is possible to state that it is mostly the easiest type of calculation in the companies. The calculation of variable costs is used only by 10% respondents. Concretely is it 8% of SME and 18% of large ones. The less used calculation method in both groups and also overall is Activity Based Costing. Furthermore, it may be noted that Activity Based Costing uses only 4% SME, for large it is 21%. A smaller percentage of utilization of mentioned tools by SME can be explained by the complexity of the methods for some businesses and also lack of personnel.

Fig. 1 – Used costs and calculations in SME, large companies and total. Source: own elaboration

The following chart is dedicated to strategic management and its tools. It was expected that SMEs companies will use less the tools of managerial accounting such as Controlling, Benchmarking, Balanced Scorecard, Economic Value Added or Market Value Added, Quality Management or Just in Time than large companies. Balanced Scorecard is the less used managerial tool by the respondents. The reason should be the sophistication of this method. The managers need to classify 4 perspectives. The first one is financial situation of the company, customer perception, internal business processes and learning and growth of the company. Only 1% of SME uses this method and 15% of the large companies. Concretely it were 2 SME and 10 large businesses. The biggest difference in the results is in the controlling, 39%. Large companies have mostly the specialists and departments that are focused on this field. On the other hand 28% of the SME use controlling as managerial function like planning, organizing, staffing and directing when control in management means setting standards, measuring actual performance and taking corrective action. The number of companies dealing with controlling is represented by 107 respondents. 62 of them are SME and 42 large companies. The same can be noted for benchmarking. 8 SME uses those method and 20 large ones. Benchmarking is totally represented by 28 companies. It was not expected that SME will calculate the Economic Value Added. It is due the necessity of information from the financial accounting. The companies that use tax records instead double-entry bookkeeping can not calculate it. The reason is that Economic Value Added is based on financial accounting statements such as balance sheet and income statement. The tax record use other statements based on different data such as income and expenses and not revenues and costs. The calculation of Economic Value Added is not easy due the opportunity costs that are not easy to quantify for a lot of accountants. Positive answer was from 12 SME that they calculate it and 16 large companies. Totally are by utilization of EVA or MVA again 28 companies such as by Benchmarking. Last two methods were Quality Management and Just in Time. Quality Management is used in 47 SMEs and 30 large enterprises. Just in Time and its benefits uses only 18 SMEs and 15 large enterprises.

Fig. 2 – Used tools from Strategic Management in SME, large companies and total. Source: own elaboration

Other issue that should be solved can be the clusters of the companies on the basis of the utilization of the managerial tools mentioned above. It is expected that some SME will have one cluster and next clusters will be composed of all types of companies. After detailed statistic processing it is possible to present that there are three clusters of the companies. The second one is compounded mostly from small enterprises. Second two are comprised from all types of the companies.

Fig. 3 – Clusters of the companies and used tools. Source: own elaboration

Distribution of clusters is supported by the number of enterprises in the poison. The first cluster is comprised from 101 companies, second from 90 and the last one from 104 businesses. This division is satisfactory for any further statistical processing.

Fig. 4 – Numbers of companies in clusters. Source: own elaboration

The composition of clusters and used tools is presented in the next table.

Tab. 1 – Composition of clusters and used tools. Source: own elaboration

	Cluster 1	Cluster 2	Cluster 3
Direct costs	27%	100%	100%
Indirect costs	8%	53%	96%
Type calculation formula	19%	12%	31%
Calculation (full costs)	25%	0%	46%
Calculation (variable costs)	6%	0%	23%
Activity Based Costing	9%	4%	11%
Controlling	38%	0%	69%
Benchmarking	7%	1%	21%
Balanced Scorecard	2%	0%	10%
EVA, MVA	10%	2%	16%
Quality Management	32%	0%	48%
Just in Time	12%	0%	24%
Others	4%	0%	4%

In the cluster 1 it is possible to expect that companies uses other classification of costs than direct or indirect. There were some large and also medium companies that give no positive answer on the monitoring of the direct and indirect costs. Or it is possible to deduce that businesses understood the question differently. In this group are controlling, Quality management, calculation of full costs, direct costs and type calculation formula the highest utilization. The second cluster is composed primarily of small companies that uses direct and indirect cost, 12% type calculation formula, 4% Activity Based Costing, 2% EVA or MVA and 1% Benchmarking. The last cluster is composed from the companies that use the most tools from the managerial accounting. 100% companies use direct costs and 96% indirect costs. Next high value is dedicated to controlling. Almost 50% are used Quality Management

and calculation (full costs). 31% use type calculation formula, 24 Just in Time a 23 calculate by variable costing, 21% has benchmarking. Next methods are EVA, MVA, Activity Based Costing, Balanced Scorecard or others.

## **5 DISCUSSION**

The results were mostly expected. With entrepreneurs we could discuss more about the classification of costs, which was mentioned earlier.

The next step might be to analyze the results of further questions in the investigation. Enterprises can be again divided into SME and large or as the clusters according to business entities that have been proposed in the article.

The question can also be if businesses do not use the tools of managerial accounting due to insufficient resources, capacity, complexity or because of indifference or ignorance of this area.

## **6 CONCLUSION**

The results of the survey confirmed both hypotheses. The presented graphs in figure 1 and 2 clearly illustrates and confirms the hypothesis that small and medium-sized enterprises use tools of managerial accounting less than large enterprises. The only one tool that small and medium-sized companies use more than large businesses is monitoring of the direct costs. Insufficient use of instruments of managerial accounting may be a lack of capacity, lack of data and difficulties in needed monitoring and processing data. Small businesses in the Czech Republic use managerial accounting tools, but they may not fully realize it.

The figure 3 and 4 and table 1 are dedicated to the results of the second hypothesis. The second hypothesis was focused on the clusters of the companies on the basis of the used or unused managerial tools. The results allowed us to create three clusters. One is comprised from the small companies. The second two are composed from all three types of companies, small, medium and large ones. The distribution is statistics significant due to the numerical distribution in all three clusters.

If we compare the results with the studies referred to in the second part of this article, we will get not quite the same results. Abdel Kader and Luther (2006) reported that up to 40% of the companies in the analysis of the sample in Great Britain used the Balanced Scorecard. In the Czech Republic is an average of 4% during the analysis of the sample. Knapkova et. al. (2014a) presented in their study that almost 13 % of the companies use this tool. In the comparison to studies with Akinyomi (2014) can be confirmed that even in the Czech Republic large size firms tend to be favorably disposed to activity-based costing system implementation. Knapkova et. al. (2014) presented that it was proved that larger companies use benchmarking to a greater extent than smaller companies. Benchmarking use 4 % of SME and 30 % of large companies based on the results of the questionnaire investigation done at Faculty of Informatics and Management so we should confirm the same trend.

## **PREDICTABILITY OF INDIVIDUAL FACTORS WITHIN AN ENTERPRISE BUDGETING AND PLANNING SYSTEM – PRESENTATION OF SURVEY RESULTS**

*Vendula Šocová, Boris Popesko*

### **Abstract**

This paper presents the initial results of a questionnaire focused on the ability of enterprises to forecast the behavior of the external environment and its influence on their budgeting processes. Traditional budgeting and planning systems have often been criticized for their inability to accurately predict the behavior of revenue streams, costs, profits, sales volumes and other indicators often affected by the behavior of the external environment. These budgets, based on annual accounting periods, frequently clash with a rapidly moving business environment and frequent changes in the market. The objective of the study presented herein was to obtain empirical evidence on the capability of Czech enterprises to predict the behavior of primary budgetary elements, such as profits or sales volumes. The results of the study are based on a survey of 145 medium- and large-sized enterprises in the Czech Republic. The findings are compared with those of a similar study performed in the USA and Canada in 2009.

*Keywords: Budgeting, planning, forecast.*

JEL Classification: M1, M41

### **1 INTRODUCTION**

Budgeting and planning represent fundamental management accounting tools used worldwide by different types of organization. The traditional theory on budgeting and planning was described in detail in management accounting books written by Drury (2000) and Kemp and Dunbar (2003). These sources state that traditional short-term budgets are mostly based on annual accounting periods and are connected with forecasting elementary financial indicators. Many authors state that the basis of traditional budgeting is mechanical transformation of a non-financial forecast into financial statements, without taking into account the real needs of an organization (Doyle, 2003). Doyle (2003) also states that most important limitation of traditional budgets is inflexibility and an inability to take on board changes in a business environment that occur throughout a year. Strong criticism of traditional budgeting mechanisms was voiced by Hope and Fraser (2003). Their critique primarily focused on the inability of traditional budgeting to assist in gauging the performance of an organization. Such criticism of traditional budgeting systems resulted in new, modern budgeting methods being introduced, such as Activity-Based Budgeting (Drury, 2000) or Beyond Budgeting (Hope and Fraser, 2003). These methods tend to do away with traditional annual budgets for each department, instead setting up a decentralized system based on selected performance indicators.

The study herein attempts to verify if the behavior of certain financial and non-financial budgetary factors demonstrate limited predictability, which is a prerequisite of modern budgeting approaches. The paper verifies the assumption that dynamic changes in the business environment exert a significant influence on the capability of organizations to accurately predict features of budgets such as revenue streams, costs and profits. This study

was based on a survey of 145 medium- and large-sized industrial companies based in the Czech Republic.

## **2 LITERATURE REVIEW**

Budgeting and planning is considered a fundamental feature of management accounting by many authors (Drury, 2000; Garrisson et al., 2009; Kemp and Dunbar, 2003). While planning is thought of as the design of a desired outcome and developing effective ways to bring it about (Ackoff, 1981), budgets are viewed as detailed plans (Drury, 2000) or as plans turned into currency units (Král, 2010).

Traditional management accounting (Drury, 2000; Garrisson et al., 2009; Kemp and Dunbar, 2003) divides the budgeting process into four consequent steps, as follows: i. preparing the budget, which includes gathering the data and information needed to create budgets; ii. constructing basic budgets and aggregate corporate budgets; iii. verifying the budget and identifying deviations; iv. removing final phase deviations.

Many studies highlight the various issues related to traditional budgeting systems. Drury (2000), for instance, explains the conflicting role of a budget, which is caused by the intended use of the same for several purposes, such as motivation and planning. Bourne (2005) refers to budgeting and planning as an annual ritual for numerous companies that do not consider adding any value to the process. The solution proposed by Bourne (2005) is to understand the strengths and weaknesses of budgeting and use additional mechanisms, thereby eradicating such weaknesses. Managers in research (Oldiges, 2003) generally agree that budgeting is inefficient and ineffective, even though the majority of respondents only estimate the volume of resources defined when budgeting. While 78 percent of the companies surveyed planned to change their system for budgeting, another 12 percent actually planned to cease budgeting entirely (Ricards, 2006). Libby and Lindsay (2010) investigated the use of research budgets in medium- and large-sized companies in the USA and Canada. This research led them to conclude that the majority of the companies intended to continue using budgets for purposes of managing the company, and did not intend to abandon them despite the issues encountered. 20 percent of respondents claimed that budgets were not used in corporate governance.

Growing dissatisfaction with traditional budgeting methods led to the development of alternative budgeting methods, examples being Beyond Budgeting and Zero-Based Budgeting. Beyond Budgeting is a modern budgeting system that emphasizes performance measurement, decentralization and mutual trust between management and organizational units, based on clearly defined performance indicators. This represents an extra-budgetary approach, which is essentially a rapid and flexible response to constantly changing market conditions (Hope and Fraser, 2003). Beyond Budgeting is committed to simplifying budgets and refraining from their use as a tool of motivation, in relation to which it is recommended to apply principles of intercompany and intracompany comparison (Hradecký, Lanča & Šiška, 2008). The principles of Beyond Budgeting offer up a new coherent management model. It assumes that front-line managers are able to regulate their own performance, whereas senior executives play a supportive role. They challenge and guide, but decisions are made locally within a clear governance framework based on principles, values and boundaries. (Hope & Fraser, 2003)

Zero-Based budgeting takes a very different approach from other methods, and starts out by determining which functions are necessary to achieve the required goals (Ojugo & Rymer, 1999). It focuses on thoroughly evaluating or reevaluating the organization's current or planned programs, units or activities, in order to determine if each should be instigated or continued. (Smith, 2010) Between sales volumes and the level of overheads, no linear

relationship is assumed based on past data (Dropkin, Halpin & La Touche, 2007). It is necessary to carry out accurate analysis of the impact made by sales volume on the cost of energy consumption, maintenance, and so on. The same procedure is then determined above all the costs (Ogden, 1978).

### **3 METHODS**

Data was collected via a web-based questionnaire. Firstly, data from the ALBERTINA database was analyzed. Medium- and large-sized companies from the industrial sector were chosen, excluding service and trade organizations. The contact information for individuals or companies was acquired from the afore-mentioned database. Initially, the people selected from the database, in most cases the financial directors, were contacted by telephone. If willing to participate, they received an email containing a link to the on-line survey.

The authors approached 1,139 companies, of which 513 agreed to take part in the survey. In total, 145 questionnaires were filled in, meaning a return rate of 28 percent, the high amount of which is attributed to initial contact being made by telephone. Therefore, in relation to the 1,139 originally contacted, the number of questionnaires filled in equals 12.6 percent.

As stated above, the main aim of the study was to analyze the predictability of different budgetary factors. Hence, the main question in the poll was: “When constructing a budget (or forecast), how easy is it to predict whether the following factors shall change during the period covered by the budget?”

- a. Market actions by key competitors (e.g. pricing, new product/service introductions, marketing programs, etc.)
- b. The business unit’s revenues (i.e. customer demand and prices)
- c. Customer preferences and tastes
- d. Technical developments or advancements in the industry impacting the design of new products
- e. Availability of required input materials purchased from suppliers

The answers given by respondents were expressed on a 6-step scale as follows:

*1 = Easy to predict*

*2 = Mostly predictable*

*3 = Slightly predictable*

*4 = Relatively difficult to predict*

*5 = Difficult to predict*

*6 = Impossible to predict*

The structure of the questions and research methodology were inspired by a similar survey performed in North America in 2009 (Libby and Lindsay, 2010).

### **4 RESULTS**

The first poll focused on the predictability of market actions by key competitors (e.g. pricing, new product/service introductions, marketing programs etc.). The results are displayed below:

Table 1 – Predictability of market actions by key competitors; source: own

	Freq.	%
1 = Easy to predict	8	5.71
2 = Mostly predictable	38	27.14
3 = Slightly predictable	35	25.00
4 = Relatively difficult to predict	31	22.14
5 = Difficult to predict	18	12.86
6 = Impossible to predict	10	7.14
Total	140	100.00
Median		3
Standard deviation		1.34
Average		3.31

As can be seen, no general trend is discernable in the distribution of answers. The tendency is towards answers on the scale relating to the higher predictability of this budgetary factor, rather than towards those stating difficulties in prediction.

The second question was on the predictability of revenues (i.e. customer demand and prices). The results are given below:

Table 2 – Predictability of revenue of a business unit; source: own

	Freq.	%
1 = Easy to predict	4	2.78
2 = Mostly predictable	108	75.00
3 = Slightly predictable	19	13.19
4 = Relatively difficult to predict	7	4.86
5 = Difficult to predict	6	4.17
6 = Impossible to predict	0	0.00
Total	144	100.00
Median		2
Standard deviation		0.79
Average		2.33

The majority of companies responded that revenues tend to be predictable. Over 90% of considered their revenue as predictable in differing amounts.

The third question was on customer preferences and tastes. The results are displayed below:

Table 3 – Predictability of customer preferences and tastes; source: own

	Freq.	%
1 = Easy to predict	6	4.20
2 = Mostly predictable	82	57.34
3 = Slightly predictable	44	30.77
4 = Relatively difficult to predict	7	4.90
5 = Difficult to predict	4	2.80
6 = Impossible to predict	0	0.00
Total	143	100.00
Median		2
Standard deviation		0.78
Average		2.45

Almost 58 per cent of respondents answered that customer preferences are largely predictable. Only eight per cent considered the possibility of anticipating the requirements of their customers as unpredictable. The next question dealt with technical developments or advancements in industry impacting the design of new products.

Table 4 – Predictability of technical developments or advancements in industry impacting the design of new products; source: own

	Freq.	%
1 = Easy to predict	14	9.72
2 = Mostly predictable	64	44.44
3 = Slightly predictable	46	31.94
4 = Relatively difficult to predict	11	7.64
5 = Difficult to predict	7	4.86
6 = Impossible to predict	2	1.39
Total	144	100.00
Median		2
Standard deviation		1.02
Average		2.58

Technical development impacting the design of new products was mostly foreseeable for almost half the respondents.

The final question addressed how predictable the availability of input material was from suppliers.

Table 5 – Predictability of availability of input material from suppliers, Source: own

	Freq.	%
1 = Easy to predict	29	20.14
2 = Mostly predictable	98	68.06
3 = Slightly predictable	13	9.03
4 = Relatively difficult to predict	1	0.69

5 = Difficult to predict	3	2.08
6 = Impossible to predict	0	0.00
Total	144	100.00
Median		2
Standard deviation		0.71
Average		1.97

From respondents, it is clear that the availability of input material from suppliers was largely predictable for most companies.

After performing analysis on the predictability of individual budgetary features, comparison was made with results of a survey performed in 2009 by Libby and Lindsay (2010), with a sample of Canadian and US companies. The following table compares the average median and standard deviation for all five questions:

Table 6 – Results compared with US and Canadian survey; source: own

	Median	St. deviation	N
This survey (2014)	2.2	0.9	144
US survey (2009)	3.0	0.6	78
Canadian survey (2009)	2.8	0.7	110

Comparing the two polls revealed several interesting things. Firstly, the average median of the answers showed that the Czech companies recorded significantly greater predictability of individual budgetary components than those from the USA and Canada. Therefore, these Czech businesses find it much easier to predict the future evolution of the factors influencing the budgets. Secondly, the standard deviation in answers is higher in the Czech sample than the American and Canadian sample, which could be interpreted as a greater diversity in answers in the Czech sample.

## **5 DISCUSSION AND CONCLUSION**

Budgeting and planning practices are facing dramatic changes in the contemporary business environment. Traditional annual budgets, which have been used for control purposes, are frequently criticized for their limitations, and in some cases have been replaced by more flexible systems focusing on increasing performance. The cause of this trend is the lack of flexibility of traditional budgets as they are incapable of representing a relevant system for gauging performance. The limitations of traditional budgets and growing dissatisfaction with budgeting systems have been widely discussed in many studies (Neely et al., 2003; Eckholm & Wallin, 2000). Hope and Fraser (2003) accurately stated that budgets often hold firms back from being flexible and adaptive in an increasingly unpredictable environment.

While the Hope and Fraser (2003) highlighted the increasing unpredictability of the business environment, problems related with rapid changes within it were enhanced by the financial crisis in 2008. Based on these circumstances, the expectations of the study were that the predictability of individual features of budgets would be relatively low and that companies as the whole would have difficulty accurately predicting future events.

Surprisingly, the result of the survey showed relatively high predictability for company revenues and material input prices, as well as the availability of input material from suppliers. Both were easily predictable in more than 75% of cases. Least predictability was indicated in the ability to predict the behavior of competitors. An unexpected result concerned the predictability of customers' demands, which was easily predictable in more than 60% of cases.

Another unexpected finding was the greater predictability of the external environment in the Czech sample, in comparison with the study performed in Canada and the USA in 2009. The answer could lie in the fact that many Czech companies act as suppliers to other EU companies, which sells the product on retail market hence they are much more able to easily negotiate future events. This signifies that Czech companies work in a far more predictable environment.

The study presented herein gives an overview of companies' abilities to predict the various features of a budget, and could contribute towards discussion in the field. Despite several limitations, such as the size of the sample surveyed and the subjectivity of the poll, the results indicate the current approach of firms to the budgeting process.

## **SEARCHING FOR PATTERNS IN COMPETITIVENESS RESEARCH DATA COLLECTION**

*Peter Štetka, Štefan Majtán*

### **Abstract**

The main goal of this paper is similar to its title: to identify (search for) patterns in competitiveness research - Barometer24 – data collection, currently conducted by authors of this paper and cooperating universities from Poland, Slovakia, Czech Republic, Finland and Spain. To achieve this goal we analyzed relations between 48 Barometer 24 questionnaire questions, focused on company competitiveness, on the sample of 660 companies operating in Slovakia, by using statistical toolbox – correlation and regression analyzes. The research outcome is divided into four patterns categories (1) credibility, (2) performance, (3) operational skills, and (4) pricing and brand management patterns; subsequently synthesized in the final General Competitiveness Pattern (GCP).

*Keywords: Competitiveness, Company Competitiveness Barometer, Competitive advantage, competitive potential, competitive positioning*

JEL Classification: L10, L20

### **1 INTRODUCTION**

The previous studies concerning competitiveness have been confirming the importance of the process of competitiveness growth in the economy. However, there are many theories about the level of research on the company's competitiveness, but they have a tiny practical utility. (Flak & Głód, 2014, p. 86) The given approach, which is presented in this article, makes an attempt to break this trend and at the same time to propose a practical and applicable approach to the study of the competitiveness of enterprises at the European level. In other words, the main objective of this paper is to propose a method for estimating determinants of enterprise competitiveness, based on the Competitiveness Integrated Model (Flak & Głód, 2012, pp. 50-72) and the method of measuring company's competitiveness, so called Company Competitiveness Barometer, shortened CCB (Flak & Głód, 2014, pp. 12-14).

This paper also presents: the main basis of the CCB and the importance of the concepts included in this model; the definition of the competitiveness determinants and its elements; the use of the Competitiveness Integrated Model until now and the current status of research under the CCB framework; outline of the research development based on the CCB model; and partial outcomes of CCB measurements, based on 660 Slovak companies - respondents.

Presented paper has a diagnostic and scheme design character. Therefore, all the presented results were used in the diagnostic dimension. Design issues were based on the prognostic method (Bieniok, 2001, pp. 68-75).

## 2 MODELING AND MEASURING THE COMPETITIVENESS

Based on existing knowledge synthesis, described in the literature, we can claim that competitiveness is often associated with product price, quality, productivity, production costs, as well as competitive advantage. (Lombana, 2006, p. 33) However, competitiveness can be also understood as an ability to compete. Companies compete in order to survive market competition. (Gorynia, 2002, p. 48) It may as well mean the ability and way of coping or dealing with competition. One can define competition mechanisms and tools for a long-term and a short-term perspective. (Pierścionek, 2005)

Therefore competitiveness is related to evaluation of competitors' business outcomes, as well as their abilities to gain future profits in a changeable micro-environment. (Bossak & Bieńkowski, 2004, p. 19) We consider this definition as the most significant one among all mentioned, what is adequately reflected in our research design. We deal with the company competitiveness as the set of company's multidimensional features, determining its ability to compete. (Flak & Głód, 2012, p. 44) Competitiveness is an abstract and universal concept. It has some constitutional elements, which are also included in the following Competitiveness Integrated Model (Flak & Głód, 2014, p. 13), shown in Figure 1.

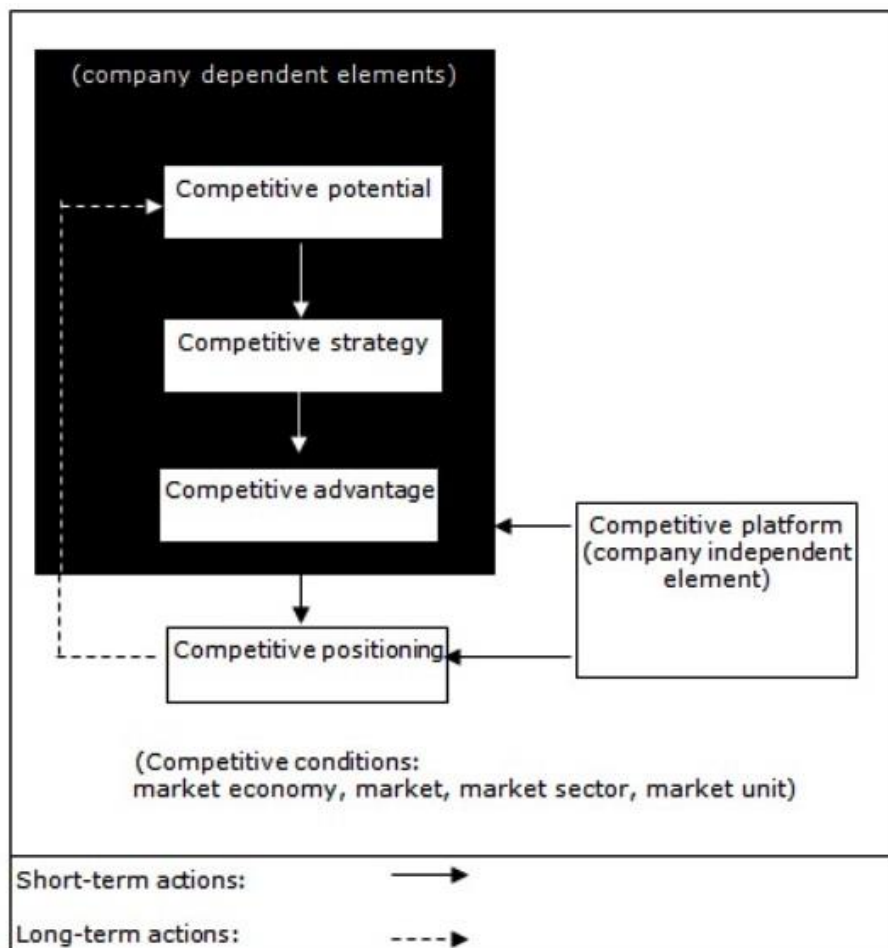

Fig. 1 - The integrated model of company competitiveness. Source: Flak & Głód (2012, p. 57)

Flak (2014, pp. 115 – 116) described this model as follows: The first element is the competitive potential, signifying the resources that enterprise has or should have to be able to use them to build, maintain and strengthen its competitiveness. These are, in a broad sense, possibilities of the company resulting from its tangible and intangible capital. Competitive potential of the company is at the same time the relative multidimensional concept.

Company uses the competitive potential through its strategy of competition, which is an adopted action program aimed at achieving a competitive advantage towards the entities from the competitive environment (microenvironment), serving the basic objectives of the enterprise. The competitive advantage is also the company's ability to deliver the tangible and intangible assets to the customer via the market.

The company's competitive advantage is a relative multidimensional concept. As the result of competitive advantage, the company's competitive positioning is obtained. It can be measured by the means of synthetic market and economic results of the enterprise, resulting from the extent of utilization of the enterprise's capacity to compete. Also the competitive positioning of the company is a relative multidimensional concept.

What influences and determines the activity of the company is its environment. In the Integrated Model of Competitiveness, the environment is called a platform of competition and denotes a set of characteristics of macro and microenvironment in which company operates. Features of the macroenvironment are the same for every company operating in a given sector, while the characteristics of microenvironment may be different for each company. (Flak & Głód, 2012; Flak & Głód, 2014)

Hypotheses concerning the relationship between the competitive potential and the strategy of competition; as well as the strategy of competition and competitive advantage, were verified in the model author's previous publications (Flak and Głód, 2014, pp. 15- 16).

We apply this model through Barometer24 research tool. It's based on the questionnaire method, reflecting directly on the mentioned five integrated competitiveness model areas: competitive potential (12 questions), competitive strategy (10 questions), competitive advantage (8 questions), positioning (6 questions), and the competition platform (9 questions).

We have chosen only such factors influencing on company competitiveness, which knowledge of the components of these given areas of competitiveness of the enterprises is mostly widespread among employees of this concrete company. However, the majority of the research questions do not require any detailed financial information, personal or technical from the respondent. The research tool is available on <http://www.barometer24.org>. Methodology of the Barometer24.org has two independent algorithms to calculate the results. The first is used for statistical calculations using the collected data from the respondents. The second algorithm is used to indicate the respondent, after completing the questionnaire, the degree of competitiveness of the company he or she represents is ready to be checked out automatically. The second algorithm deserves attention because its operation can be checked immediately after completing the questionnaire on Barometer24.org. Additionally, it concerned the method of calculating the measure of the competitiveness of the audited company (from 0 to 300 points, the more points the company is more competitive) and was based on three assumptions:

- there is no theoretical existing model of answers, which would be not only absolutely correct in any sector of economy (the platform of competition), but also actual by the longer period of time- defining the characteristics of the most competitive companies, (Olaf & Głód, 2012, p. 44)

- comparing the competitiveness of companies may take place only in a relative, (Olszewska et al., 2004, p. 507)
- the features of the most competitive companies in the sector are focused basically on some of their own particular features , but there is a low probability that these firms with extreme traits would belong to the most competitive ones. (Bień et al., 1997, pp. 143 – 144)

### **3 SEARCHING FOR COMPETITIVENESS PATTERNS**

To achieve the main goal of this paper, which is to identify patterns in competitiveness research - Barometer24 – data collection, we analyzed relations between 48 Barometer24 questionnaire questions, focused on company competitiveness, on the sample of 660 companies operating in Slovakia. The results are divided into four patterns categories 3.1 Credibility patterns, 3.2 Performance patterns, 3.3 Operational skills patterns, and 3.4 Pricing and brand management patterns. The last part of this chapter (3.5) is focused on synthesis of these four patterns categories into the final General Competitiveness Pattern (GCP).

#### **3.1 Credibility patterns**

The first kind of patterns we found in our competitiveness research data collection (barometer24) analysis is related to company's credibility; based on the survey question no. 2: *"How high is creditworthiness of your company?"*. Possible answers were in scale from very low (1 pt.) to very high (5 pt.).

According to our correlation and regression analysis, where credibility factor is a dependent variable (Y), is company credibility tightly linked to these factors – independent variables (X) ( $p\text{-value} < \alpha$  if  $\alpha = 0,05$ ):

- Operational cash ability:  $r^2 = 0,483$ ; based on the survey question no. 1: *"How do you evaluate the level of your recent cash ability in relation to the demand of your business features?"*. Possible answers were in scale from very low (1 pt.) to very high (5 pt.).
- Operational management quality:  $r^2 = 0,400$ ; based on the survey question no. 8: *"How many details are being recorded about projects, enterprises and processes in your company?"*. Possible answers were in scale from none (1 pt.) to all of them (5 pt.).
- Work experience:  $r^2 = 0,323$ ; based on the survey question no. 9: *"What is the work experience level of employees who significantly influence your company activities?"*. Possible answers were in scale from very low (1 pt.) to very high (5 pt.).
- Pricing strategy:  $r^2 = 0,329$ ; based on the survey question no. 23: *"What is the main goal of your general prices strategy?"*. Possible answers were: (1 pt.) to survive difficulties, (2 pt.) to increase profits in short period, (3 pt.) to increase profit in long period, (4 pt.) to maximize the market share.
- Company's liquidity:  $r^2 = 0,377$ ; based on the survey question no. 31: *"What is the level of cash flow in your company (is your company able to pay short-term obligations)?"*. Possible answers were in scale from very low (1 pt.) to very high (5 pt.).
- Market share:  $r^2 = 0,408$ ; based on the survey question no. 33: *"What is a level of a market share indicator of your products or services?"*. Possible answers were in scale from very low (1 pt.) to very high (5 pt.).

- Profitability:  $r^2 = 0,445$ ; based on the survey question no. 34: “What is a level of profitability in your company (are incomes higher than costs)?”. Possible answers were in scale from very low (1 pt.) to very high (5 pt.).
- Rentability of equity:  $r^2 = 0,367$ ; based on the survey question no. 36: “What is a level of equity profitability (a relation of a profit to investments) in your company?”. Possible answers were in scale from very low (1 pt.) to very high (5 pt.).

### 3.2 Performance patterns

The credibility patterns weren't the only patterns and links we found in our competitiveness research (barometer24) data collection. By analyzing the whole survey data collection, we found also very specific relations between company performance indicators (internal correlation), and between this group of indicators and other factors (external correlation), some of them already mentioned in previous part of this paper. Probably the most specific knowledge we gained from this part of research is that these internally correlated performance indicators are externally correlated with same factors at almost the same rate of correlation.

This group of internally correlated company performance indicators is consisted of: (1) Cash Flow level, based on the survey question no. 31; (2) Market share, based on the survey question no. 33; (3) Profitability, based on the survey question no. 34; and (4) Rentability of equity, based on the survey question no. 36. Internal correlation rate of these indicators is specified in the following correlation matrix.

Tab. 1 – Performance indicators correlation matrix

$(r^2)$	Cash Flow level	Market share	Profitability	Rentability of equity
Cash Flow level	1			
Market share	0,36718	1		
Profitability	0,46892	0,39984	1	
Rentability of equity	0,38323	0,34435	0,48912	1

On behalf of these findings we constructed Integrated Performance Indicator (shortened IPI), based on these four partial indicators by using normalized weights. In the next step we performed a correlation and regression analysis between IPI – as a dependent variable (Y) - and other factors included in barometer24 survey – as independent variables (X). The analysis outcome confirmed links between company performance and ( $p\text{-value} < \alpha$  if  $\alpha = 0,05$ ):

- Operational cash ability:  $r^2 = 0,393$ ; based on the survey question no. 1, mentioned also as an independent variable in 3.1 Credibility patterns.
- Credibility:  $r^2 = 0,445$ ; based on the survey question no. 2, mentioned as dependent variable in credibility patterns analysis.
- Operational management quality:  $r^2 = 0,358$ ; based on the survey question no. 8, mentioned also as an independent variable in 3.1 Credibility patterns.
- Work experience:  $r^2 = 0,312$ ; based on the survey question no. 9, also mentioned as an independent variable in 3.1 Credibility patterns.
- Pricing strategy:  $r^2 = 0,349$ ; based on the survey question no. 23, also mentioned in 3.1 Credibility patterns as an independent variable.

### **3.3 Operational skills patterns**

The third kind of pattern findings we found in our competitiveness research data collection (barometer24) analysis is related to company's operational skills: (1) operational management quality and (2) work experience, both mentioned in previous parts of this chapter. These two operational skills indicators are mutually ( $r^2 = 0,3582$ ) and are also correlated with the same factors, almost at the same rate. To unify these relations we used the same approach as by IPI's construction (already mentioned in 3.2 Performance patterns), but this time we constructed IOSI – short for Integrated Operational Skills Indicator.

Furthermore we performed a correlation and regression analysis between IOSI – as a dependent variable (Y) - and other factors included in barometer24 survey – as independent variables (X). The analysis outcome showed links between company's operational skills and ( $p\text{-value} < \alpha$  if  $\alpha = 0,05$ ):

- Partially mentioned Credibility:  $r^2 = 0,378$  and Performance:  $r^2 = 0,336$  by explaining these relations with both operational skills indicators separately.
- Constructive feedback:  $r^2 = 0,468$ ; based on the survey question no. 6: “How often the constructive conclusions are drawn after finishing successful projects or other activities?”. Possible answers were in scale from never (1 pt.) to always (5 pt.).
- Employees creativity:  $r^2 = 0,398$ ; based on the survey question no. 7: “What is a creativity level of employees who mostly influence on activities in your company?”. Possible answers were in scale from very low (1 pt.) to very high (5 pt.).

### **3.4 Pricing strategy and brand management patterns**

Credibility, profitability and operational skills patterns weren't the only patterns we found in this research. The fourth (still significant) kind of patterns we found is related to company's pricing strategy; based on the survey question no. 23, already explained in 3.1 Credibility patterns. According to our correlation and regression analysis, where pricing strategy is a dependent variable (Y), is pricing credibility tightly linked to these factors – independent variables (X) ( $p\text{-value} < \alpha$  if  $\alpha = 0,05$ ):

- Credibility:  $r^2 = 0,329$ ; based on the survey question no. 2; previously explained in 3.1 Credibility patterns.
- Integrated Performance Indicator (IPI):  $r^2 = 0,332$ ; characterized in 3.2 Performance patterns. Specifically: (1) Cash Flow level  $r^2 = 0,275$ , based on the survey question no. 31; (2) Market share  $r^2 = 0,343$ , based on the survey question no. 33; (3) Profitability  $r^2 = 0,349$ , based on the survey question no. 34; and (4) Rentability of equity:  $r^2 = 0,274$ , based on the survey question no. 36.
- Brand management:  $r^2 = 0,348$ ; based on the survey question no. 16: “Are there any activities focused on creating a strong brand of your company (or your goods)?“ Possible answers were no (1 pt.) and yes (2 pt.).

As we can see, pricing strategy level is linked not only to credibility and performance factors, but also to the brand management implementation. That's why we further analyzed this specific factor. This analyzes outcome led us to conclusion that companies with implemented brand management (Y) have also other common characteristics (X) ( $p\text{-value} < \alpha$  if  $\alpha = 0,05$ ):

- Marketing competences development:  $r^2 = 0,306$ ; based on the survey question no. 13: “Is there a rapid development of marketing competences in your company?”. Possible answers were no (1 pt.) and yes (2 pt.).

- Public Relations (PR) activities:  $r^2 = 0,428$ ; based on the survey question no. 14: “Are there any Public Relations events in order to achieve publicity of your company?”. Possible answers were no (1 pt.) and yes (2 pt.).
- Market research and targeting:  $r^2 = 0,417$ ; based on the survey question no. 19: “Does your company use modern marketing research methods in order to reach your target groups of clients?”. Possible answers were no (1 pt.) and yes (2 pt.).
- Benchmarking and cost-cutting:  $r^2 = 0,337$ ; based on the survey question no. 21: “Does your company use the benchmarking method in order to decrease costs of manufacturing products or services?”. Possible answers were no (1 pt.) and yes (2 pt.).
- Brand impact:  $r^2 = 0,308$ ; based on the survey question no. 21: To what extent have a brand influence on your clients purchasing decisions?”. Possible answers were in scale from very low (1 pt.) to very high (5 pt.).
- Pricing strategy:  $r^2 = 0,315$ ; already mentioned above.

### **3.5 Competitiveness patterns synthesis**

In previous parts of this chapter were presented links between some competitiveness factors, mostly focused on (1) credibility, (2) profitability, (3) operational skills and (4) pricing. These factors can be described by significant correlation not only inside the pattern group (internal correlation), but also between these four groups of competitiveness factors (external correlation). For better understanding of these patterns we created the General Competitiveness Pattern (shortened GCP), shown in Figure 2. This general pattern links all these significant factors in one formula through five branches (relations) ( $p\text{-value} < \alpha$  if  $\alpha = 0,05$ ):

- Credibility x Pricing strategy :  $r^2 = 0,329$
- Credibility x Operational skills :  $r^2 = 0,340$
- Performance x Pricing strategy :  $r^2 = 0,349$
- Performance x Operational skills :  $r^2 = 0,358$
- Performance x Credibility :  $r^2 = 0,445$

Secondary relations recognized in General Competitiveness Pattern (GCP) are linked to Pricing strategy (x Brand management:  $r^2 = 0,348$ ) and Operational skills (HR performance factors - x Employees creativity:  $r^2 = 0,398$  & x Constructive feedback:  $r^2 = 0,468$ ).

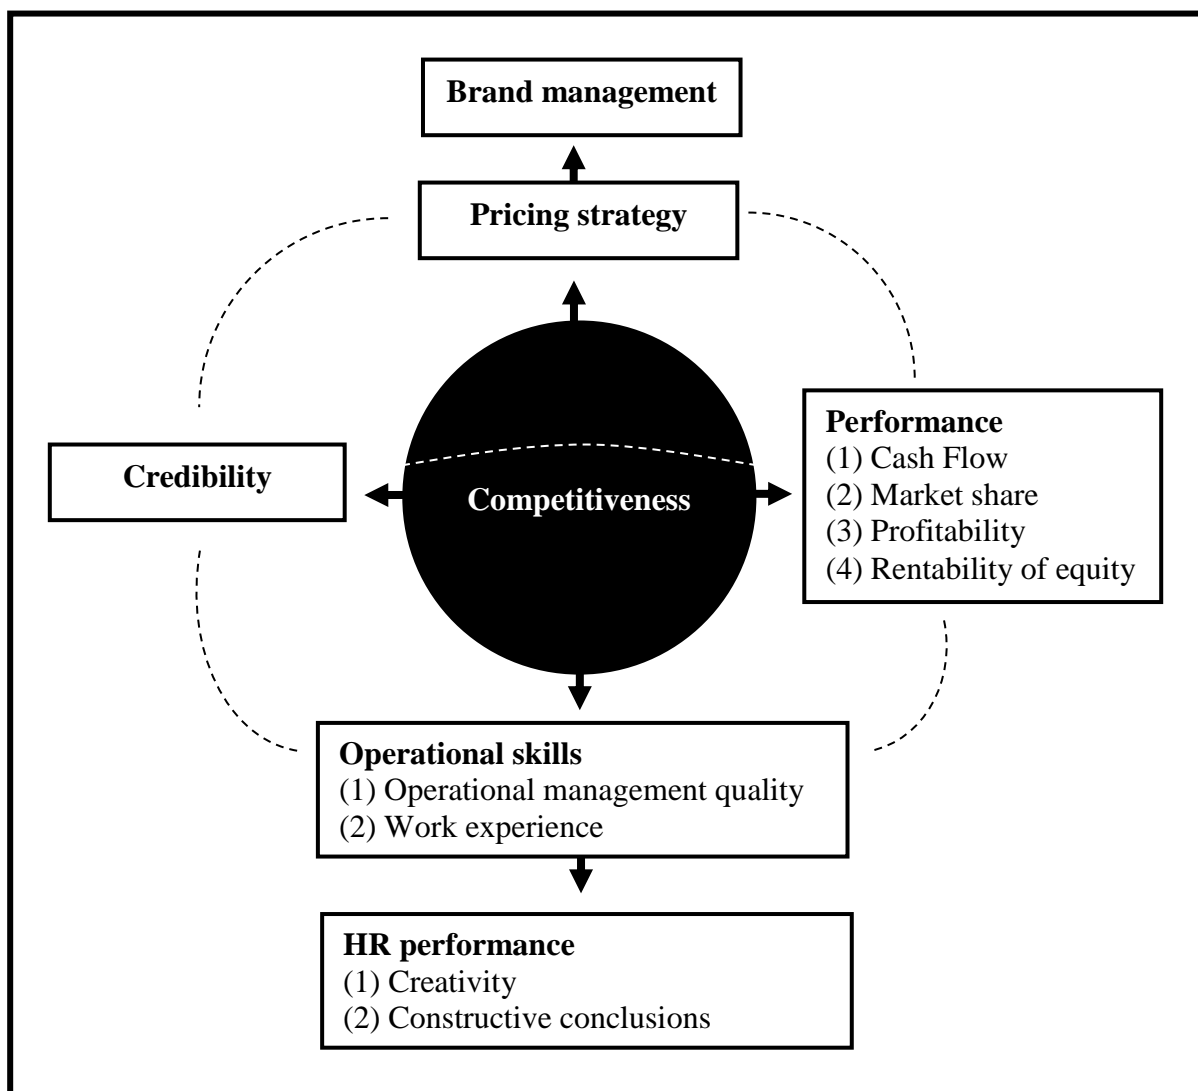

Fig. 2 – General Competitiveness Pattern (GCP)

## 4 DISCUSSION

### 4.1 Credibility and performance

According to our research outcomes, there is strong proportional relationship between the firms credibility and its performance. By its own definition, business credibility is the amount of trustworthiness or expertise that a company has in the eyes of its clients, customers, business partners, and financial resources. Credibility is often a combination of the company's credit profile and its reputation. If it is lacking one or the other, then the company may be viewed as having poor credibility. On the other hand, if the company excels in both areas, it will likely be viewed as a credible company that is worth doing business with. (Krueger & Brazeal, 1994)

The role of credit in business credibility is crucial. It refers mostly to its ability to properly pay its liabilities on time. The identification and quantification of credit rating is based mostly on financial and economic ratio indicators, consisting at least of one of the performance indicators – Cash Flow, profitability and Rentability of Equity. (Kráľovič & Vlachynský, 2006)

While a company's credit rating is one factor in its overall credibility, its reputation is equally important in how potential customers, clients, business partners and financial resources view the company. The link between this dimension of business credibility and the business performance we see is covered by the firms market share.

#### **4.2 Business performance and human resources**

Early efforts to link HR practices to business performance generally focused on a single practice or area of HR. For example, business performance was found to be stronger where the industrial relations climate was more favorable (e.g., lower levels of grievances and conflict, better employee attitudes) and where the use of labor-management cooperation programs was greater (Cutcher-Gershenfeld 1991; Katz, Kochan & Gobeille 1983; Katz, Kochan & Weber 1985). This work was conducted at the plant level of analysis (and typically in unionized settings). Other work, at the firm level of analysis, reported that business performance was stronger in firms emphasizing pay for performance in managerial compensation (Gerhart & Milkovich, 1990) and in firms using more valid employee selection procedures (Terpstra & Rozell, 1993).

Subsequent research expanded the conception and measurement of HR to include an array of practices. To some extent, "AMO theory" (Boxall & Purcell, 2003) has evolved as a model to help guide choice of HR practices to study. AMO refers to ability-motivation opportunity (Appelbaum et al., 2000; Bailey, 1993; Huselid, 1995; Ichniowski et al., 1996). Under the AMO model, HR practices are expected to influence business performance via the workforce's ability (e.g., using selective hiring, training), motivation (e.g., using pay for performance), and opportunity to contribute (e.g., using teams, suggestion systems). At the plant level, key studies showing links between HR practices and performance were conducted by Arthur (1994), MacDuffie (1995), and Ichniowski, Shaw & Prensushi (1997) in manufacturing and in the service sector by Batt (2002).

At the company level, an early and influential study was conducted by Huselid (1995), followed by Delery & Doty (1996). For reviews of these and related studies, see Becker and Gerhart (1996), Boxall and Purcell (2003), and Gerhart (1999). The empirical work generally reports the same finding: the choice of HR practices is related to business performance, often strongly. For example, Gerhart's (1999) review found that a one standard deviation increase in HR system practices (relative to the mean) designed to enhance workforce ability, motivation, and opportunity to contribute was associated with roughly 20 percent better company financial performance. Consider that this finding means that firms one standard deviation above the mean are at 120 % of mean performance, while those one standard deviation below the mean are at 80 percent of mean performance, making for a  $120/80 = 50$  percent advantage of being +1 standard deviation versus -1 standard deviation. This is a large difference.

Based on these facts, we can state that our findings – close relation between HR performance and business performance – correspond to above mentioned previous research outcomes. Therefore human resources can be considered as valid and reliable source of business competitiveness.

#### **4.3 Strategic pricing**

One of our research findings is that the level of pricing is in close relation to both – business performance and credibility. This analysis outcome is not very surprising. The reason why is the essential impact of product price on company sales; its revenues, cash flow and profit (as the difference between revenues and costs). But it's not just the price level influencing the

business competitiveness; it's also the applied pricing approach. It seems that companies using strategic pricing are more competitive than others. They are characterized by higher level of performance indicators (cash flow, profitability and market share), but also by better financial condition – perceived credibility. So what exactly do we understand by “strategic pricing”?

Strategic pricing sets a product's price based on the product's value to the customer, or on competitive strategy, rather than on the cost of production. This approach recognizes that people often make purchasing decisions based more on psychology than on logic, and that what's most valuable to the customer may not be what's most expensive to produce. (Martin, 2012) What customers are willing to pay for a product may be vastly more, or less, than a company would charge if it simply priced based on cost. Discovering what consumers value about the product and how much they value it can let a company increase its price or might suggest that a new product has no chance of turning a profit. For every 1 percent of price increase customers are willing to pay, companies receive 7 to 8 percent higher profits. In this model the product's price is usually set by a marketer or salesperson rather than by the operations and development team. (Meza & Sudhir, 2005)

This approach allows companies to gain more revenues by analyzing the current demand and by identifying the equilibrium between the perceived product value and company costs.

## **5 CONCLUSION**

The main goal of this paper was to identify patterns in competitiveness research - Barometer24 – data collection, currently conducted by authors of this paper and cooperating universities from Poland, Slovakia, Czech Republic, Finland and Spain. But before presenting research outcomes, it was necessary to set some information about the Barometer24 research tool, describe its main characteristics and the approach used in creating this complex competitiveness measuring tool. All these information are included in chapter 2.

To achieve our goal we analyzed relations between 48 Barometer24 questionnaire questions, focused on company competitiveness, on the sample of 660 companies operating in Slovakia, by using statistical toolbox – correlation and regression analyzes. Not all of these questions – meant as competitiveness factors – were interlinked between each other. In fact, we found only 9 factors significantly linked together. These factors could be divided into four patterns categories (1) credibility, (2) performance, (3) operational skills, and (4) pricing. All of them are tightly connected by 5 branches (Credibility x Pricing strategy; Credibility x Operational skills; Performance x Pricing strategy; Performance x Operational skills; and Performance x Credibility). These 5 branches linking 4 kinds of patterns form our synthesized and final General Competitiveness Pattern (GCP).

## **COMPARISON OF PERCEPTION OF EXTERNAL INFLUENCES ON FAMILY BUSINESSES IN THE SLOVAK REPUBLIC AND IN SELECTED EUROPEAN COUNTRY**

*Elena Šúbertová, Zuzana Meszárošová*

### **Abstract**

The paper will focus on the evaluation of business environment in two member states of the European Union (EU) - Slovak Republic (SR) and Republic of Malta (MT). The subject of closer interest is a family business in the SMEs category. The essence of the research is to obtain reliable and up to date knowledge of the family business in these two countries. The article will contribute to raising awareness of external business environment for SMEs, particularly for family business in selected countries. The paper also determines differences between family and non-family SMEs businesses in the Slovak Republic, so we can distinguish a family business as a separate category of business for the purpose of promoting and statistics. There are number of incentives for family businesses in various countries, e.g. through preferential tax rates in case maintaining business to the next generation, incentives for family start-ups, training, mentoring and support for research and development. Based on the results we suggest the recommendations to improve the business environment for SMEs focusing on family business in both countries.

*Keywords: business environment, Malta, Slovak Republic (Slovakia), competitiveness of a company, business support, external and internal factors small and medium-sized enterprises, family business,*

JEL Classification: M21, P51

### **1 THEORETICAL BACKGROUND OF CONDITIONS FOR ENTERPRISES**

The entrepreneurial environment in the Slovak Republic as whole can be characterized especially in the last four year by negative evaluation and therefore also an insufficient support for development activity. Successful entrepreneurship generally and family business especially is a key activity to the development of the economy in many countries, in Slovakia and Malta, too. We would like to identify the reserves of exist business environment for family business in the SMEs category in both countries. The academic community is also involved in the discussions about actual problems of appropriate conditions for development of small and medium sized enterprises. The university teachers were interested in some aspects of external and/or internal conditions for SMEs: Ďuriš, T. analysed the problems with appropriate business conditions for SMEs in the USA (2009).

Veber, J. et al. (2012) analysed the problems with entrepreneurship of small and medium sized enterprises. The internationalization of small and medium sized enterprises in the Czech Republic is analyzed in publication of Šimberová, I. (2014). Human potential in small and medium sized enterprises was characterized in output of Plchova, J. (2012). Social responsibility in SMEs was characterized in article of authors Dyer, W.-Whetten, D. (2006). The evaluation of the disparity of conditions for entrepreneurship in the Slovakia and in other countries of the world is written in publication of Pilkova, A. et al. (2014) and in our publications Šúbertová, E. (2011), Šúbertová, E.- Kinčáková, M. (2014). Special evaluation of family business in Austria was interested Mandl, I. (2008), in the United Kingdom studied the history of family buseiness Coll, A. (2003), in the Czech Republic analyzed family businesses

Koráb, V. (2008), Šíp, V. – Hanzelová, A. - Mihalisko M. (2008), in the Republic of Malta Fenech K.J. (2013) and in the Slovak Republic: Strážovská, Ľ. - Strážovská, H. - Krošláková, M. (2008). Tekelová, Z. was interested in importance of SMEs in Republic of Malta in the European Union (2011). The selected important independent world organizations every year realized evaluation of business environment for entrepreneurs in selected countries about their indicators.

## **2 METHODS AND METHODOLOGY**

The main goal of this paper is to show conditions for economic activities of the SMEs in the Slovak Republic and in Republic of Malta, analyzed their business environment generally in the period from year 2014 to year 2015 and to suggest such solutions for future which should lead to market competitiveness. We compared indicators used by World Economic Forum and The World Bank.

For our analyses, we are using the standard methods of research work, such as analysis and synthesis, comparison, induction, deduction, and generalization. We also applied statistics methods. We used our primary data from the year 2013 for identification of the present financial situation in the SMEs. The database contains the data from 212 questionnaires SMEs in Slovakia and 53 questionnaires from SMEs Malta, which have a status of family businesses. The questionnaire is structured in order to submit it to the fullest a representative sample and to ensure simple transfer of the information to the database. The questionnaire was distributed electronically as well as personally. Of 700 SMEs approached in Slovakia, 212 questionnaires were completed, which means 30.29 % return rate. In Republic of Malta questionnaires were consulted for personal involvement and later electronically distributed to 150 enterprises, out of which 53 replied, what corresponds to 35.33 % of the total number of approached SMEs. The sample is divided almost 50/50 for family and non-family businesses in Malta and the Slovak Republic.

The World Economic Forum evaluates annually countries based upon their *Global Competitiveness Index* (GCI). WEF evaluated 144 countries for year 2014-2015 in 12 major groups (pillars) - the worst evaluation is 1, the best is 7. Following are evaluations and rankings for Slovakia and Malta. The latest evaluation in 2014/15 ranked Slovakia 75<sup>th</sup> with 4.1 points. Comparatively, in 2010/11 Slovakia had rank 60 with 4.25 points, showing fall down by 15 positions. Therefore, a qualitative improvement across almost all entrepreneurial indicators of environment would be required in order to sufficiently support the entrepreneurial activity in the Slovak Republic. The best ever was year 1995, when Slovakia was ranked 35<sup>th</sup>.

The most negative evaluations are in 2014/15 these areas: public institutions, especially in inefficient government bureaucracy, corruption, and political instability. The worst evaluated funding option is the access to funding through initial public offerings, which reflects practically non-existent stock exchange in the Slovak Republic. The big problems have new and growing small and medium sized enterprises. Low evaluations are also in low enforcement of law, low effectiveness of public finance, low trust of public in politicians. On the other hand, positive evaluations are in low import barriers, openness to foreign investments, low risk of terrorism, high density of spread of Internet. However, some of these positives may have negative influence on domestic entrepreneurs, for example low import duties (low excise tax).

Evaluation based upon their Global Competitiveness Index is better for Malta as Slovak Republic. Malta has the biggest problem with small market size, but has very good evaluation in technological readiness, health and primary education and goods market efficiency.

<b>GCI – Global Competitiveness Index</b>	<b>4,1</b>	<b>75</b>	<b>4,4</b>	<b>47</b>

The World Bank compares in its evaluation 10 groups of indicators and evaluates 189 countries. Slovakia was ranked 37<sup>th</sup> in year 2015, which is the better position as in 2014 or 2013 (46<sup>th</sup> position). Very negative evaluation – below 100<sup>th</sup> position – were in “Taxes” (too many and too fast changes in tax legislation), low protection of investments combined with low speed in building of highways (infrastructure), which means problems for moving of goods in international trade. Positives were in business registration, mostly due to functional „cadastre portal“ and „single points of contact“.

Evaluation based upon The World Bank is better for the Slovak Republic as Malta. Malta has the biggest problem with getting credit, but has very good evaluation in paying taxes, trading across borders and protection of minority investor.

### **3 THEORETICAL BACKGROUND OF SMALL AND MEDIUM-SIZED FAMILY BUSINESS**

#### **3.1 Basic historical data of Malta and external environment of SMEs**

British rule in Malta lasted until 1964 when the island became independent. The Maltese adopted the British system of administration, education and legislation. Ten years later, in 1974, Malta became a Republic within the British Commonwealth.

The British military presence on the island officially came to an end on March 31, 1979. Until the 1960s, the Maltese economy depended mostly on the British services and the Naval Dockyard. After independence, industry and tourism advanced at a fast pace, and today Malta and Gozo have established an industrial and services economy and flourishing tourist enterprises. In 1990, Malta applied for membership of the European Union and formally joined the EU in May 2004. In 2008, Malta adopted the Euro as its currency.

The island is located in the Mediterranean Sea, a hundred kilometres from Sicily and close to Tunisia. The population of the country on the basis of the census of 2010, more than 417 000 inhabitants, with respect to the area of the island is very densely populated.

The market of the country is too small to attract foreign investment only because of domestic demand. Despite a given "handicap" means the position of the country strategy and appealing, especially for a good start to the European continent and North African markets.

Malta as a member of the EU adopted 10 principles of the European Charter for Small Enterprises (SBA - Small Business Act) to enhance the competitiveness of small businesses. The report states that the implementation of aid Maltese enterprises is not as successful. The Brussels bureaucracy is too high, and therefore these enterprises have the same problems as enterprises in Slovakia. For small businesses over the past years has been difficult to achieve a return on capital and ensure sustainable business development. Small businesses are too vulnerable to lack of resources, especially financial. Their size certainly does not mean a higher business risk. Bankers are too biased, as well as suppliers behave towards SMEs rather carefully.

Professor Giovanna Debono under the auspices of the Council for Science and Technology in Malta (MCST - Malta Council for Science and Technology) developed a study confirming the trend of innovative SMEs in the country. Studies show that a particular family SMEs are very proud of their products, try to make original and does not duplicate competition.

### **3.2 Family Business in Malta**

Malta is missing structured and researched sources of information relating to the economic, social and other contributions of family business. They are characterized by spreading of family values, by culture of responsible behaviour, long-term investments and generally focusing on long-term returns and interest in the whole business. There is no official definition of a family in Malta. Therefore, we will build on the knowledge of family business.

Most Maltese enterprises belong to a category of small and medium enterprises. Based on the report from the European Commission in 2013, almost 95% of the total number of enterprises is classified as micro-enterprises and the majority of them are considered to be a family business. Maltese SMEs account for 73 % of value added compared with 58 % in the EU. This heightened importance of SMEs is reflected in all size classes, although the differences in the proportions between Maltese SMEs and the EU average are largest for microenterprises followed by mid-sized companies.

Small businesses are active in a wide range of activities from traditional services or craft products, to emerging high-tech activities. Around 85% of Maltese companies are family-owned. The following table illustrates the structure of the business in the non-financial business sector in Malta in 2013.

Tab. 3 - Basic figures of SMEs in Malta in 2013

Source: Eurostat Fact Sheet (2014), found - based on Structural statistics figures, it has been elaborated by EIM – Enterprise Information Management

Category of enterprise	Enterprises			
	Malta		EU 28	Malta – EU 28
	Number	Share (%)	Share (%)	Differences in share (%)
Micro	28 905	94.6	92.4	+ 2,2

Small	1 298	4.2	6.4	- 2,2
Medium-sized	291	1.0	1.0	0,0
<b>SMEs</b>	<b>30 494</b>	<b>99.8</b>	<b>99.8</b>	<b>0,0</b>
Large	54	0.2	0.2	0,0
Total	30 548	100	100	0,0

SMEs in Republic of Malta have main part of SMEs micro enterprises, and big part is family business. SMEs had in 2014 more than 58.1 % share of value added and 66.9 % share on employment. The differences between Malta and countries of EU 28 are only in share of micro and small enterprises.

### 3.3 Family Business in Slovakia

In Slovakia is similar situation as in Malta. Since 2002, small businesses have still been the dominant category in Malta and in Slovakia economy as well. Their business is growing, a significant increase was observed mainly in micro - sized enterprises.

Tab.4: Fundamental differences between family micro-sized enterprises and enterprises  
Source: Subertova, E. – Kincakova ,M. (2014) found

Characteristic feature	Family business, mainly micro - sized enterprises	Enterprise
Founder(s)	Family member	Owner
Major financial decisions – e.g. loan, leasing, etc.	Family members together	Owner (maybe with manager)
Work during weekends and (statutory) holidays	Mostly yes	Mostly no
Categories owner-manager-employee	Mostly identical	Mostly different
Internal guidelines	Verbal agreements	Written documents
Mutual trust among employees	Stronger	Weaker
Transfer of experience	Complete	Limited
Conflicts – interlinking of personal lives and work, transfer of problems between workplace and family	Yes	To a lesser extent
Interest in continuing company's activities after retirement	Mostly yes	Mostly no

There is no official definition of a family in Slovakia. Therefore, we will build on the knowledge of family business.

Tab. 5 - Basic figures of SMEs in Slovakia September 30, 2014  
Source: Slovak Business Agency, Bratislava, own calculation

Category of enterprise	Enterprises			
	Slovakia		EU 28	Slovakia – EU 28
	Number	Share (%)	Share (%)	Differences in share (%)
Micro	547 007	96,9	92.4	+4,5

Small	14 234	2,5	6.4	-3,9
Medium-sized	2 762	0,4	1.0	-0,6
<b>SMEs</b>	<b>564 003</b>	<b>99.8</b>	<b>99.8</b>	<b>0,0</b>
Large	630	0.2	0.2	- 0,2
Total	564 633	100	100	0

Slovak SMEs have main part of SMEs micro enterprises, and big part is family business. SMEs had in 2014 more than 53 % share of value added and 72 % share on employment. The differences between Malta and countries of EU 28 are only in share of micro enterprises.

#### **4 RESEARCH OF PARTICULAR EXTERNAL BUSINESS FACTORS IMPACT ON FAMILY BUSINESS IN SLOVAKIA AND MALTA**

##### **Hypothesis 1**

Factors of macroeconomic policy influence family and non-family businesses in analyzed countries in the same way, i.e. there are no significant differences between family and non-family businesses in terms how they are influenced by macroeconomic policies in the Slovak Republic and in Republic of Malta.

The hypothesis will be tested by further statistical methods - ANOVA (Analysis of Variance). Thanks to the method we can determine whether there is a relationship between the type of business (family / non-family) and the influence of factors external environment. Problematic issues evaluated using P (Sig. /  $\alpha$ ) or F - costing values. If  $P$  (Sig. /  $\alpha$ )  $\leq 0.05$ , the null hypothesis was rejected and vice versa.

##### **Hypothesis 1.1**

There are no significant differences between family and non-family businesses in the Slovak Republic regarding the impact of macroeconomic policy factors on success of a company.

Tab. 6 Results of testing hypotheses H1.1 by sample SMEs in Slovak Republic  
Source: Zuzana Meszárošová - own calculations and processing

<b>Perceptions of the factor impacts</b>	<b>Source</b>	<b>Variance</b>	<b>F</b>	<b>Sig.</b>
Disposable income	Between groups	6.782	4.179	0.017
	Within the group	1.623		
Unemployment in the country	Between groups	0.850	0.599	0.551
	Within the group	1.420		
Inflation	Between groups	0.744	0.636	0.530
	Within the group	1.169		
Economic conditions for SMEs	Between groups	1.837	1.919	0.149
	Within the group	0.957		

There is a difference between family and non-family businesses in the Slovak Republic in terms of variance in the perception of the factor "Disposable income". Significance (Sig.) is 0.017, which is less than 0.05. F (the value of the test criteria) is calculated as the variance

between groups and variance within groups. Other factors have the same impact on the success of the family business as well as in non-family businesses.

### **Hypothesis 1.2**

There are no significant differences between family and non-family businesses in Republic of Malta regarding the impact of macroeconomic policy factors on success of a company.

Tab. 7 Results of testing hypotheses H1.2 by sample SMEs in Malta Republic  
Source: Zuzana Meszárošová - own calculations and processing

<b>Perceptions of the factor impacts</b>	<b>Source</b>	<b>Variance</b>	<b>F</b>	<b>Sig.</b>
Disposable income	Between groups	0.572	0.663	0.423
	Within the group	0.863		
Unemployment in the country	Between groups	1.422	1.887	0.181
	Within the group	1.633		
Inflation	Between groups	0.782	0.578	0.454
	Within the group	1.353		
Economic conditions for SMEs	Between groups	2.775	3.376	0.077
	Within the group	0.822		

Significance (Sig. /  $\alpha$ ) is higher than 0.05 for all factors. Based on the results we evaluate the family and non-family businesses in Malta perceive the impact of macroeconomic policy factors on the success of the company equally.

### **Hypothesis 2**

Legislative and political environment factors influence family and non-family businesses in analyzed countries the same way, i.e. there are no significant differences between family and non-family businesses in the terms how they are influenced by legislative and political environment. The hypothesis will be tested again using statistical methods - ANOVA (Analysis of Variance). Thanks to the method examines the relationship between the type of business (family / non-family) and the influence of factors in a group of legislative and political environment. Results of analyzes using P (Sig. /  $\alpha$ ) or F - costing values. If P (Sig. /  $\alpha$ )  $\leq$  0.05, the null hypothesis is rejected.

### **Hypothesis 2.1**

There are no significant differences between family and non-family businesses in the Slovak Republic in terms of the impact of legislative and policy environment factors on success of the company.

Tab. 8 Results of testing hypotheses H1.2 by sample SMEs in Slovak Republic  
Source: Zuzana Meszárošová - own calculations and processing

<b>Perceptions of the factor impacts</b>	<b>Source</b>	<b>Variance</b>	<b>F</b>	<b>Sig.</b>
Stability of business environment	Between groups	2.387	1.825	0.164
	Within the group	1.308		
Levy system	Between groups	0.690	0.660	0.518
	Within the group	1.044		
Tax system	Between groups	0.073	0.066	0.936
	Within the group	1.108		

Frequent changes in legislation	Between groups	0.568	0.500	0.607
	Within the group	1.136		
Bureaucracy	Between groups	0.932	0.905	0.406
	Within the group	1.030		
Criminality	Between groups	1.972	1.281	0.280
	Within the group	1.539		

There is no difference in the values of variance in the perception of legislative and political environment factors between family and non-family businesses in the Slovak Republic. The significance level (Sig.) is higher than 0.05 in all cases.

### **Hypothesis 2.2**

There are no significant differences between family and non-family businesses in Republic of Malta in perception in the impact of legislative and policy environment factors on success of a company.

Tab. 9 Results of testing hypotheses H1.2 by sample SMEs in Malta Republic  
Source: Zuzana Meszárošová - own calculations and processing

<b>Perceptions of the factor impacts</b>	<b>Source</b>	<b>Variance</b>	<b>F</b>	<b>Sig.</b>
Stability of business environment	Between groups	2.387	1.825	0.164
	Within the group	1.308		
Levy system	Between groups	0.690	0.660	0.518
	Within the group	1.044		
Tax system	Between groups	0.073	0.066	0.936
	Within the group	1.108		
Frequent changes in legislation	Between groups	0.568	0.500	0.607
	Within the group	1.136		
Bureaucracy	Between groups	0.932	0.905	0.406
	Within the group	1.030		
Criminality	Between groups	1.972	1.281	0.280
	Within the group	1.539		

There is no difference in the perception of factors in legislative and political environment between family and non-family businesses in Malta. We consider both at the higher level of significance (Sig.) than 0.05 in all cases.

## **5 DISCUSSION**

Opinions on the importance of external factors of the business environment are different for each country. According to Slovak companies in terms of the measured mean values the most important factors in the external environment are:

- Contribution System - 4.15;
- The tax system - 4.13;
- Bureaucracy - 4.12;
- Frequent changes in legislation - 4.02;
- Competition in the market - 3.91;
- Entry fee - 3.86.

Based on the identified standard deviation of the external business environment factors demonstrate that there is significant difference in the sample surveyed businesses in areas such as the seasonal effect (1.33), disposable income of the population (1.29), the price of raw materials and energy (1.27), crime (1.25), consumer preferences (1.21).

We can say that the views of the foregoing factors, for example, differ depending on the regional localization of business activities. Researched companies, however, have the same views, for example, the issue of globalization processes in Slovakia, the market competition, the levy system and bureaucracy.

The most important factors of the external business environment in Malta from the perspective of enterprises on the basis of measured mean values are:

- Competition in the market - 4.41;
- The price of raw materials and energy - 4.14 (particularly energy);
- Disposable income of the population - 4.07;
- Other economic conditions for SMEs (eg., Globalization) - 3.97.

Enterprises evaluate the factors as those that most affect the success or failure of their business. All companies perceive the indicators like (there is a small standard deviation between them) except prices of raw materials and energy, where the deviation is higher, which may be associated with a business venture.

Standard (authoritative) deviation factors external business environment has shown that there is a difference in the evaluation of surveyed businesses in areas such as infrastructure (1.70), crime (1.43), climatic conditions (1.38), and bureaucracy (1.35). Opinions at the factors are likely to be different because of the different activities, business needs and resources associated with a business focus. Businesses have the same views contrary example. other economic conditions for SMEs (globalization) and competition in the market and the disposable income of the population.

## **CONCLUSION**

Most of external macroeconomic factors are perceived by family and by non-family businesses in Slovakia and in Malta similarly. Only one factor – disposable income of the population – is perceived differently in Slovakia and in Malta. Family and non-family businesses in Malta recognize the impact of macroeconomic policy factors on the success of the company equally.

Among the external factors, family businesses in Slovakia assign the highest importance to taxes and other mandatory payments (social and health insurance, etc.). In Malta, the highest importance is assigned to market competition, to cost of raw materials and energy and to disposable income.

We found that legislative and political environment factors are affecting family and non-family businesses in the same way in both countries. The results of the test may be related to the fact that so far there is no separate legislative scheme for a family business in any of the analyzed countries.

Slovak businesses see the biggest barriers in complex and frequently changing tax system, legislative barriers, but also strong competition, political instability, and unavailability of funds. As to the government intervention in creation of a business environment so important for businesses, the companies would prefer simplification of reporting system, simplification of funding, promoting "Made in Slovakia". Equally important for Slovak businesses are the

technical requirements to improve product quality, consumer protection, environmental protection, promotion and awareness of support programs.

In Malta, interventions in consumer protection are considered very important, as well as environmental protection, promotion and awareness of support programs, establishment of learning/training institutions for young entrepreneurs. Maltese enterprises indicated importance of and protection of competition, regulation of labour relations and promote exports.

## **COMPARISON OF TWO SELECTED METHODS IN EVALUATING OF INVESTMENTS IN TRANSPORT INFRASTRUCTURE**

*Dušan Teichmann, Michal Dorda*

### **Abstract**

The paper is focused on a comparison of two selected approaches to solve investment portfolio optimization problems for projects related to transport infrastructure modernization. For the projects that are aimed at transport infrastructure modernization it holds that the projects are usually very expensive and financed by public financial sources (state budget, European Union funds and so on). However, public financial means are limited. That is the reason why it is necessary to choose such projects that bring the maximum benefit. The benefit cannot be assessed only from the financial point of view, other benefits are also often important. Our motivation to write the contribution was the paper in which goal programming was used to optimize the investment portfolio; in the paper goal programming is recommended for solving such types of the problems and some doubts about using linear programming are formulated. To compare the results got by linear programming with the results achieved by goal programming we employ STEM method that enables the multi-criteria linear optimization of the solved problem. The paper presents the results got by both approaches. The results of the optimization experiment using STEM method verify that both methods can achieve the same results. That means the reservation about linear programming discussed in the original paper is not valid for the all situations.

*Keywords: investment decision-making, goal programming, linear programming*

JEL Classification: C61

### **1 INTRODUCTION – OUR MOTIVATION TO WRITE THE ARTICLE**

Investment projects belong to key projects that are realized in order to achieve bigger future effects to the exclusion of current consumption. According to the publication (Scholleová, 2012) each investment activity has the following characteristic attributes – long-term impact, high capital requirements, relative irretrievability of the decision, time factor and risk.

Investment can be made on macroscopic or microscopic level. Investment projects in transport infrastructure belong to the first group of investment projects that means to the projects having an impact on the national economy.

Apart from vast society-wide impacts there is problematic irretrievability of investments in transport infrastructure. That is the reason why private financial sources are used only seldom and public financial sources are usually used.

Currently, the main attribute regarding to public financial sources that are earmarked for investment is that the sources are limited. Administrators of transport infrastructure must often solve a problem which projects should be supported and which projects should be postponed. Simultaneously with this problem the demand for tools that could be employed to make the decision process as objective as possible comes into existence.

Our immediate motivation to write the paper was the paper (Ahern & Anandarajah, 2007) which is focused on a selection of investment projects related to modernization of transport infrastructure in Ireland. After its publication a Czech translation appeared; the paper was

translated for the administrator of Czech railway infrastructure – The Railway Infrastructure Administration, state organization (SŽDC). One can conclude on the basis of the Czech translation that the selection of suitable investment projects is an actual problem in the Czech Republic.

The paper (Ahern & Anandarajah, 2007) is focused on using goal programming for investment decision process. Known approaches that are based on mathematical decision-making models are analyzed in the introductory chapters. In connection with them the authors of the paper (Ahern & Anandarajah, 2007) cite publications (Lee, 1972) or (Ignizio, 1985) that criticized using typical linear mathematical models to solve such type of the problems; the authors rather suggest applying models of goal programming. By the typical linear models we mean the models with a single optimization criterion. In such typical linear models it is not possible to have positive and also negative deviations from limiting values that are incorporated in constraints of the mathematical model and that must be kept unconditionally. In the case of the goal programming models it is possible to have such negative and positive deviations from the limiting values.

The authors of the paper (Ahern & Anandarajah, 2007) proposed a goal programming model to optimize an investment portfolio. In general, goal programming models try to minimize the deviations from a predefined target state (or target states). In the model described in (Ahern & Anandarajah, 2007) a situation with several target states occurs and the task is to minimize the weighted sum of the negative deviations from these partial values. The reason for minimizing the negative deviations is obvious. To explain it, it is necessary to realize the meaning of the positive and negative deviations. The positive deviation represents achieving a better value of the target state than expected; the negative deviation corresponds to the opposite effect. It is clear that it is desirable to achieve better values than the target state is (the positive deviations from the expected values) and therefore it is not necessary to limit (or minimize) the positive deviations. Therefore the negative deviations are crucial from the point of view of the optimization process. Generally it holds that goal programming models are nonlinear (Jablonský, 2007). However, there is an approach the enables to transform such nonlinear goal programming model into a linear mathematical model – see Section 3.

Because we have been concerned with linear programming over a long period, we decided to find out if the results got by a suitable linear mathematical model differ from the results achieved by a goal programming model.

## **2 STATE OF THE ART**

Generally it holds that we can encounter two groups of problems when talking about investment decision-making.

The first group of the problems is formed by the problems when we need to decide whether a planned investment should be realized or not. In this case we decide about advantageousness of the planned decision – that means we want to know if the investment is advantageous or not.

However, in our paper we pay attention to solving the second group of investment decision-making problems. In this case we must create a portfolio of investment projects that should be realized. In the following text the problem will be called investment portfolio optimization. In practice we encounter such type of the problem in situations when an infrastructure administrator has not enough money (or enough capacity) to realize all the planned investment projects.

As mentioned in the introductory chapter of our paper, decision-makers request to have at least partial tools for decision-making support; the tools should enable to validate the correctness of their decision. We think that due to the fact that investment means are often limited suitable tools to solve our problems are methods that can choose the projects with respect to given limitations and enable to maximize a chosen criterion (or chosen criteria). Mathematical programming, especially linear programming and goal programming represent suitable tools for solving the problem.

The original paper (Ahern & Anandarajah, 2007) describes possibilities of goal programming methods for investment portfolio optimization. The authors of the paper think that goal programming is better than single-criterion linear programming because it can take account of more aspects that we must take into consideration in investment decision-making. The authors deduce it on the basis of the publications (Lee, 1972) or (Ignizio, 1985). Both publications criticize two essential lacks of linear programming – it enables to optimize only a single criterion and is not able to handle flexible constraints. On the other hand, the publication (Romero, 1991) admits a partial equivalence of both approaches.

The approach that is presented in the paper (Ahern & Anandarajah, 2007) is not the sole approach that is based on goal programming. The publication (Wey & Wu, 2007) also employs goal programming for investment portfolio optimization; the results got by goal programming are combined with other approaches.

In connection with investment portfolio optimization we can also mention the paper (Macura et al., 2012), that contains a lot of references regarding other possible approaches that can be used to solve the problem. Apart from mathematical programming we can mention the following approaches:

- Cost Benefit Analysis – for example (Berechman & Paaswell, 2005) or (Van Wee, 2007),
- Multi Attribute Utility Theory (Tsamboulas, 2007),
- Analytic Hierarchy Process (Caliskan, 2006),
- Analytic Network Process (Shang et al., 2004) or (Macura et al., 2011).

### **3 DESCRIPTION OF USED METHODS**

In the chapter we would like to describe both approaches based on mathematical programming; the results got by both methods will be compared in the paper. We begin with the goal programming model that was used in the paper (Ahern & Anandarajah, 2007) and after describing it we will present STEM method that enables multi-criteria linear optimization. We chose STEM method because the method does not request to specify priorities of the individual criteria. Moreover, STEM method does not force us to set criterion weights subjectively. The objectivity of criterion weight settings makes the method efficient.

Let us formulate the problem we want to solve. The problem formulation is partially identical for both methods; therefore we start with it.

Let us consider the following problem. The infrastructure administrator defined a set  $I$  of projects that the administrator wants to realize in future. For each project  $i \in I$  investment costs  $n_i$  of the project realization are given. We must know how much money the administrator can invest in a given time period; let us denote the administrator's budget  $N$ . It is clear that it is meaningful to solve the problem if the condition  $\sum_{i \in I} n_i < N$  holds. Let

us define a set  $J$  of benefit categories and for each project  $i \in I$  we must quantify its partial benefit  $p_{ij}$  of the project  $i \in I$  in the benefit category  $j \in J$ . Our goal is to decide about which projects should be realized so that the total benefit of their realizations is maximized.

Because of the total benefit resulting from realization of the selected projects is expressed via using different quantities in both applied methods, we do not concretize the optimization criterion now. That is the reason why it is not possible to compare the results got by both methods through optimization criterion values; we can compare both methods through the projects that are chosen to be realized.

Our decision about choosing the project for its realization is modelled using variables  $x_i$ . The variables can take values 0 or 1 with the following meaning. If  $x_i = 1$ , then the project  $i \in I$  should be realized; if  $x_i = 0$ , then the project  $i \in I$  should not be realized.

### 3.1 Models of goal programming

Let us formulate a general form of the goal programming model according to (Jablonský, 2007). The general goal programming model has the following form:

$$\min f(x, d) = \sum_{i=1}^k |d_i| \quad (1)$$

subject to:

$$\sum_{j=1}^n a_{ij} x_j \leq b_i \quad \text{for } i = 1, \dots, m, \quad (2)$$

$$\sum_{j=1}^n c_{ij} x_j + d_i = g_i \quad \text{for } i = 1, \dots, k, \quad (3)$$

$$x_j \geq 0 \quad \text{for } j = 1, \dots, n, \quad (4)$$

$$d_i \in R \quad \text{for } i = 1, \dots, k. \quad (5)$$

In the task  $k$  partial benefits appear; the partial benefits are expressed by the group of constraints (3). Our goal is to get to the pre-defined values of the partial benefits as close as possible – the goal is defined through function (1). The group of constraints (2) represents other constraints occurring in the task. The groups of constraints (4) and (5) define domains of definition for all the variables used in the model.

It is clear that model (1) – (5) is not linear because of objective function (1) and the group of constraints (5). To transform the model into the linear model, it is recommended to replace each real variable  $d_i \in R$  by a pair of variables  $d_i^+ \geq 0$  and  $d_i^- \geq 0$  that model the positive and negative deviations from the target values  $g_i$ . Please note that the original variables  $d_i \in R$  model the deviations from the predefined values  $g_i$  in constraints (3). Model (1) – (5) can be transformed into the linear form:

$$\min f(x, d^+, d^-) = \sum_{i=1}^k (d_i^+ + d_i^-) \quad (6)$$

subject to:

$$\sum_{j=1}^n a_{ij}x_j \leq b_i \quad \text{for } i = 1, \dots, m, \quad (7)$$

$$\sum_{j=1}^n c_{ij}x_j - d_i^+ + d_i^- = g_i \quad \text{for } i = 1, \dots, k, \quad (8)$$

$$x_j \geq 0 \quad \text{for } j = 1, \dots, n, \quad (9)$$

$$d_i^+ \geq 0 \quad \text{for } i = 1, \dots, k, \quad (10)$$

$$d_i^- \geq 0 \quad \text{for } i = 1, \dots, k. \quad (11)$$

Models (1) – (5) and (6) – (11) represent the general form of the goal programming models without any connection to the task we solve in the paper. However, the model used for solving our task is based on the general model presented above.

According to the paper (Ahern & Anandarajah, 2007), the goal programming mathematical model requires the definition of the weights of the individual partial benefits. Let us denote the weight of the partial benefit  $j \in J$  by the symbol  $w_j$ . The goal programming mathematical model for investment portfolio optimization has the following form:

$$\min f(x, d^+, d^-) = \sum_{j \in J} w_j d_j^- \quad (12)$$

subject to:

$$\sum_{i \in I} n_i x_i \leq N, \quad (13)$$

$$\frac{\sum_{i \in I} p_{ij} x_i}{\sqrt{\sum_{i \in I} p_{ij}^2}} - d_j^+ + d_j^- = \frac{\sum_{i \in I} p_{ij}}{\sqrt{\sum_{i \in I} p_{ij}^2}} \quad \text{for } j \in J, \quad (14)$$

$$x_i \in \{0; 1\} \quad \text{for } i \in I, \quad (15)$$

$$d_j^+ \geq 0 \quad \text{for } j \in J, \quad (16)$$

$$d_j^- \geq 0 \quad \text{for } j \in J. \quad (17)$$

Function (12) represents the optimization criterion – the total negative deviation of the achieved values from the requested benefit values for all the projects and for all the benefit categories. The requested values of the benefits for the individual benefit categories you can find on the right side of constraints (14). The requested benefit value in the given category arises from the sum of the benefits of all the projects in the given category; the authors probably want to achieve the maximum effect in all the benefit categories. Constraint (13) ensures that the administrator's budget  $N$  is not exceeded. The group of constraints (14) forms a logical link between the constraints and the objective function (using the constraints we can calculate the deviations). The groups of constraints (15), (16) and (17) define domains of definition for the variables used in the mathematical

model. Using the formula  $\frac{\sum_{i \in I} p_{ij}}{\sqrt{\sum_{i \in I} p_{ij}^2}}$  the values of the coefficients and the right sides

of the constraints are normalized for each benefit category.

### 3.2 STEM method

STEM method – see for example (Fiala, 2006) – is a method that enables to solve linear mathematical models with several objective functions. The goal of the method is to find a good compromise solution. The basic principle is that we calculate ideal values of the objective functions at first and then we minimize weighted deviations of the compromise solutions from the ideal values of the objective functions.

STEM method requires cooperation between the investigator and the contract owner. The contract owner must assess whether the achieved solution is acceptable. In the frame of the solving process two steps alternate – a computational step and a decision-making step. Within the computational step the investigator carry out necessary optimization calculations and within the decision-making step the contract owner assess the acceptability of the results. If the contract owner thinks that the results are acceptable then the solving process is terminated. If the contract owner is not satisfied with the results, he must inform the investigator about possibilities of worsening the value of one or more criteria. The admissible worsening of some objective criterion values can lead to improving of other objective criterion values. The solving process is terminated if an acceptable compromise solution has been achieved or if there is no way how to improve the achieved compromise solution.

The solving process of STEM method can be described by the following steps:

1. The investigator calculates the optimal values according to the individual objective criteria (that means he must solve the mathematical model using the individual objective functions; the number of the calculations corresponds to the number of the objective functions in the mathematical model).
2. The investigator computes the weights of the individual criteria according to the formula:

$$w_i = \frac{z_{ii} - \min_{j=1, \dots, k} z_{ij}}{z_{ii}} \frac{\alpha}{\sqrt{\sum_{i=1}^n c_{ij}^2}}, \quad (18)$$

where:

$z_{ij}$ ... an element of the matrix of the optimization criterion values for the optimization according to the individual optimization criteria ( $z_{ij}$  is the optimization criterion value  $j = 1, \dots, k$  in the case of the optimization according to the optimization criterion  $i = 1, \dots, k$ ).

$c_{ij}$ ... an element of the matrix of the optimization criterion coefficients ( $n$  is the number of the variables appearing in the task).

The value  $\alpha$  in formula (18) is computed according to the formula:

$$\sum_{i=1}^k \frac{z_{ii} - \min_{j \in J} z_{ij}}{z_{ii}} \frac{\alpha}{\sqrt{\sum_{j \in J} c_{ij}^2}} = 1. \quad (19)$$

For practical computations we must calculate the value of  $\alpha$  using formula (19) and then we can compute the weights according to formula (18). If the contract owner is satisfied with some values of the optimization criteria, then the weights of such criteria are equal to 0.

If the condition  $w_i > 0$  holds for more than one value  $i = 1, \dots, k$ , the investigator adds a new variable  $d \geq 0$  to the model and solves the model with the new optimization criterion:

$$\min f(x, d) = d. \quad (20)$$

For the variable  $d$  it holds in this case:

$$d = \max_{i=1, \dots, k} \left\{ w_i \left( z_{ii} - \sum_{j \in J} c_{ij} x_j \right) \right\}. \quad (21)$$

The original system of the constraints must be supplemented by constraints of type:

$$w_i \left( z_{ii} - \sum_{j \in J} c_{ij} x_j \right) \leq d \quad \text{for } i = 1, \dots, k. \quad (22)$$

If the condition  $w_i > 0$  holds only for a value  $i = 1, \dots, k$ , the investigator uses the model with the optimization criterion:

$$\min f(x) = \sum_{i=1}^k w_i \left( z_{ii} - \sum_{j=1}^n c_{ij} x_j \right). \quad (23)$$

The sum in the objective function can have only one non-zero term. The original system of the constraints is supplemented by constraints ensuring that the optimization criterion values with the weight equal to 0 will not be worsened. The repetitive application of step 2 may cause that the achieved values of some objective criteria may worsen. In such cases a new constraint must be created to ensure that the worsened value will be satisfied.

After putting the model together (both models are linear) the investigator solves the model.

3. The investigator presents the results got in step 2 to the contract owner; the contract owner must assess the results. If the solution is not acceptable for the contract owner and some values of the objective criteria can be worsened, then the contract owner defines the admissible worsening of the objective criterion values. If the contract owner is satisfied with all the achieved values of the objective criteria or it is not possible to accept the worsening of some objective criterion values in order to improve the values of other objective criteria which are not acceptable, go to step 5; if not, go to step 4.

4. According to the contract owner's requests the investigator adjusts the values of the partial criteria in the constraints and returns to step 2.

5. If the contract owner is satisfied with all the values of the optimization criteria, the investigator can state that the last achieved solution is the compromise solution and can be recommended to the contract owner. If the equality  $d = 0$  is true after solving the model with objective function (20) then we got the optimal values for all the optimization criteria; if not, there is not any compromise solution.

In the next chapter we will apply the theoretical pieces of knowledge described in chapter 3 to the investment portfolio optimization problem. Due to the fact that the authors of this contribution do not have input data from any real investment projects to compare both methods, input data for the optimization experiments was taken from the original paper (Ahern & Anandarajah, 2007).

## 4 NUMERICAL EXPERIMENTS

Let us consider the following problem. Four projects ( $i = 1, \dots, 4$ ) dealing with the modernization of transport infrastructure are planned. The realization of the projects has the benefit in four categories of the partial benefit categories ( $j = 1, \dots, 4$ ). For each project the values of the partial benefits were quantified. The administrator's budget is equal to 200 million of EUR.

The project P1 represents the modernization of Cork suburban transport, the project P2 the modernization of the Limerick – Rosslare railway line, the project P3 the modernization of Navan – Drogheda railway line and the project P4 Limerick – Ballybophy railway line.

Detail information about the planned projects is included in Table 1.

Tab. 1 – Detail information about the planned projects. Source: Ahern & Anandarajah (2007)

Project	Investment costs [mil. EUR]	The benefit category			
		Financial benefit [mil. EUR]	User benefit [-]	Qualitative goal no. 1 [-]	Qualitative goal no. 2 [-]
P1	123,64	6,29	8,34	3	4
P2	33,44	4,06	3,68	3	3
P3	109,87	3,38	4,13	2	1

The weight of the benefit category *		0,249	0,287	0,256	0,208

*\*The values that are required by the goal programming model.*

The benefit categories included in Table 1 were taken from the paper (Ahern & Anandarajah, 2007). In this paper we explain the process of defining the partial benefits in detail.

### 4.1 The solving using the model based on goal programming

The linearized mathematical model of goal programming was taken from the paper (Ahern & Anandarajah, 2007) with some small modifications.

Let us denote:

$x_i$  ... the binary variable representing that the project  $i = 1, \dots, 4$  will ( $x_i = 1$ ) or will not be ( $x_i = 0$ ) realized,

$d_j^+$  ... the nonnegative variable representing the positive deviation from the goal value of the particular criterion  $j = 1, \dots, 4$ ,

$d_j^-$  ... the nonnegative variable representing the negative deviation from the goal value of the particular criterion  $j = 1, \dots, 4$ .

For our solved example the linearized mathematical model of goal programming (12) – (17) has the following form:

$$\min f(x, d^+, d^-) = 0,249d_1^- + 0,287d_2^- + 0,256d_3^- + 0,208d_4^- \quad (24)$$

subject to:

$$123,64x_1 + 33,44x_2 + 109,87x_3 + 28,94x_4 \leq 200, \quad (25)$$

$$\frac{(6,29x_1 + 4,06x_2 + 3,38x_3 + 3,5x_4)}{\sqrt{6,29^2 + 4,06^2 + 3,38^2 + 3,5^2}} - d_1^+ + d_1^- = \frac{6,29 + 4,06 + 3,38 + 3,5}{\sqrt{6,29^2 + 4,06^2 + 3,38^2 + 3,5^2}}, \quad (26)$$

$$\frac{(8,34x_1 + 3,68x_2 + 4,13x_3 + 3,14x_4)}{\sqrt{8,34^2 + 3,68^2 + 4,13^2 + 3,14^2}} - d_2^+ + d_2^- = \frac{9,34 + 3,68 + 4,13 + 3,14}{\sqrt{8,34^2 + 3,68^2 + 4,13^2 + 3,14^2}}, \quad (27)$$

$$\frac{(3x_1 + 3x_2 + 2x_3 + 2x_4)}{\sqrt{3^2 + 3^2 + 2^2 + 2^2}} - d_3^+ + d_3^- = \frac{3 + 3 + 2 + 2}{\sqrt{3^2 + 3^2 + 2^2 + 2^2}}, \quad (28)$$

$$\frac{(4x_1 + 3x_2 + x_3 + 3x_4)}{\sqrt{4^2 + 3^2 + 1^2 + 3^2}} - d_4^+ + d_4^- = \frac{4 + 3 + 1 + 3}{\sqrt{4^2 + 3^2 + 1^2 + 3^2}}, \quad (29)$$

$$x_i \in \{0;1\} \quad \text{for } i = 1, \dots, 4, \quad (30)$$

$$d_j^+ \geq 0 \quad \text{for } j = 1, \dots, 4, \quad (31)$$

$$d_j^- \geq 0 \quad \text{for } j = 1, \dots, 4. \quad (32)$$

The solving of created model (24) – (32) was carried out in optimization software Xpress-IVE. The achieved solution verified the solution given in the paper (Ahern & Anandarajah, 2007). The optimal investment portfolio is formed by the projects P1, P2 a P4.

#### 4.2 Solving using STEM method

We will proceed according to the theoretical background given in Section 3.2. For all the optimization calculations the software Xpress-IVE was used as well.

The variables  $x_i$  have the same meaning as given in Section 4.1. The variable  $d$  represents the deviation, which we will calculate according to formula (21).

Step 1 – the calculation of the optimal values of the particular optimization criteria.

The solved mathematical model has the following criteria:

$$\max f(x) = 6,29x_1 + 4,06x_2 + 3,38x_3 + 3,5x_4, \quad (33)$$

$$\max f(x) = 8,34x_1 + 3,68x_2 + 4,13x_3 + 3,14x_4, \quad (34)$$

$$\max f(x) = 3x_1 + 3x_2 + 2x_3 + 2x_4, \quad (35)$$

$$\max f(x) = 4x_1 + 3x_2 + x_3 + 3x_4. \quad (36)$$

The system of the constraints has the following form:

$$123,64x_1 + 33,44x_2 + 109,87x_3 + 28,94x_4 \leq 200, \quad (37)$$

$$x_i \in \{0;1\} \quad \text{for } i = 1, \dots, 4. \quad (38)$$

Because our example includes four optimization criteria (33) – (36), within the realization of the first step four optimization calculations were carried out. The solutions achieved in the particular optimization calculations are summarized in Table 2.

Step 2 – the calculation of the weights of the partial benefits and forming the mathematical model that minimizes the maximum weighted deviation from the optimal values for the individual optimization criteria.

From the calculated solutions we can create the matrixes  $Z$  and  $C$  :

$$Z = \begin{pmatrix} 13,85 & 15,16 & 8 & 10 \\ 13,85 & 15,16 & 8 & 10 \\ 13,85 & 15,16 & 8 & 10 \\ 13,85 & 15,16 & 8 & 10 \end{pmatrix}, \quad C = \begin{pmatrix} 6,29 & 4,06 & 3,38 & 3,5 \\ 8,34 & 3,68 & 4,13 & 3,14 \\ 3 & 3 & 2 & 2 \\ 4 & 3 & 1 & 3 \end{pmatrix}.$$

Tab. 2 – The achieved values of the individual optimization criteria. Source: The authors according to Xpress-IVE

The benefit category (the individual optimization criterion)	The achieved value (the value of the optimization criteria)	The financed projects
The financial benefit [mil. EUR]	13,85	P1, P2, P4
The user benefit [-]	15,16	P1, P2, P4
The qualitative goal no. 1 [-]	8	P1, P2, P4
The qualitative goal no. 2 [-]	10	P1, P2, P4

To calculate the weights of the individual benefits we must calculate the value  $\alpha$  at first. We will substitute it to equation (19). We can write:

$$\frac{13,85 - 8}{13,85} \frac{\alpha}{\sqrt{6,29^2 + 4,06^2 + 3,38^2 + 3,5^2}} + \frac{15,16 - 8}{15,16} \frac{\alpha}{\sqrt{8,34^2 + 3,68^2 + 4,13^2 + 3,14^2}} + \frac{8 - 8}{8} \frac{\alpha}{\sqrt{3^2 + 3^2 + 2^2 + 2^2}} + \frac{10 - 8}{10} \frac{\alpha}{\sqrt{4^2 + 3^2 + 1^2 + 3^2}} = 1.$$

After the calculation the previous equation, we got the solution  $\alpha = 22,107$ . In the next process we must calculate the weights of the individual benefits according to formula (18). In our case we have:

$$w_1 = \frac{13,85 - 8}{13,85} \frac{22,1073}{\sqrt{6,29^2 + 4,06^2 + 3,38^2 + 3,5^2}} = 0,386,$$

$$w_2 = \frac{15,16 - 8}{15,16} \frac{22,1073}{\sqrt{8,34^2 + 3,68^2 + 4,13^2 + 3,14^2}} = 0,431,$$

$$w_3 = 0,$$

$$w_4 = \frac{10-8}{10} \frac{22,1073}{\sqrt{4^2 + 3^2 + 1^2 + 3^2}} = 0,183.$$

Because it holds  $w_i > 0$  for several values  $i=1,\dots,4$  we must add the new variable  $d \geq 0$  and we create the mathematical model with optimization criterion (20). The group of constraints (22) must be also added to the original system of the constraints. We will get the following mathematical model:

$$\min f(x, d) = d$$

subject to:

$$123,64x_1 + 33,44x_2 + 109,87x_3 + 28,94x_4 \leq 200, \quad (39)$$

$$d \geq 0,386 (6,29x_1 + 4,06x_2 + 3,38x_3 + 3,5x_4), \quad (40)$$

$$d \geq 0,431 (8,34x_1 + 3,68x_2 + 4,13x_3 + 3,14x_4), \quad (41)$$

$$d \geq 0,183 (4x_1 + 3x_2 + x_3 + 3x_4), \quad (42)$$

$$x_i \in \{0;1\} \quad \text{for } i = 1,\dots,4, \quad (43)$$

$$d \geq 0. \quad (44)$$

In model (39) – (44) constraint (22) for the third particular optimization criterion is not included. The constraint is not important in our example because the weight of this particular optimization criterion is equal to 0.

Now we can solve mathematical model (39) – (44). After solving it we got the value  $d = 0$  and  $x_1 = 1$ ,  $x_2 = 1$ ,  $x_3 = 0$  and  $x_4 = 1$ . It follows from the results that the optimization calculation can be terminated (it is not possible to get better results). The optimal investment portfolio includes the projects P1, P2 and P4.

## 5 CONCLUSION

The presented paper is focused on the comparison of the results achieved by two different exact approaches that can be employed to optimize the investment portfolio. Our motivation to write the contribution was the paper published in the journal *Transport Policy*; the paper dealt with using goal programming for solving the problem. The paper also cites some authors who discuss some disadvantages of single-criterion linear programming if it is used for the investment portfolio optimization. After reading the paper one can think that goal programming is the sole tool for solving such problems. However, linear programming methods enable us to form models with several optimization criteria. Therefore we decided to verify whether a selected approach known in linear programming (for testing we chose the multi-criteria approach based on STEM method) can be used to solve the problem and to compare the results got by both methods. Using the concrete example taken from (Ahern, Anandarajah) we demonstrated the results got by the individual approaches do not differ one another (from the point of view of the selected projects). That shows we can verify the reservations about the single-criterion linear programming for investment portfolio optimization published in the original paper. However, such statement is not true in comparison with the results obtained by multi-criteria linear programming.

## **IMPACT OF SOVEREIGN RISK ON CHINA'S FINANCIAL MARKET**

*Thi Ngan Pham, Lin Qi*

### **Abstract**

This paper reviews how and by what means the sovereign risk in Euro-zone affected China's financial market before and after the outbreak of European debit crisis based on the data from the four major financial markets of China between 2008 and 2012 and the long-term credit rating of the 17 Euro-zone countries released by the three major international rating agencies, which is used as the substitution variable of the sovereign risk in Euro-zone. According to the empirical test result, the European debit crisis has significantly intensified the impact of the sovereign risk in Euro-zone on the fluctuation of the co-exceedance in China's financial market. The further study suggests that China's financial market is more sensitive to sovereign outlook reversion than to sovereign rating changes of Euro-zone under the circumstances of European debit crisis. However, the sovereign rating released by Fitch and Moody can also exert significant critical effect of speculative-grade on China's financial market. The study also suggests that the sovereign rating changes of PIIGS have exerted significantly greater critical effect of speculative-grade on China's financial market than on other peripheral Euro-zone countries, but the sovereign outlook reversion of PIIGS has done exactly the opposite. The empirical test result of this paper has enriched the theory of financial crisis conduction and provided information basis for the development of policies to guide the opening and stabilization of China's financial market.

## **1 INTRODUCTION**

Along with the continuous spillover of the European debit crisis around the world and the deepening of China's financial reform, the co-movement among the financial markets from home and abroad are increasing and international financial turbulence is more likely to pose impact on China's financial market and economic development. Therefore, financial security is increasingly becoming a focus of concern for China's academicians (Li Xiangyang, 2009; Luyan, 2011). In order to deal with this issue, this paper studies the impact of the sovereign risk in Euro-zone to verify if it has increased the volatility of China's financial market using European debit crisis as a natural experiment and further looks into its inherent transmitting mechanism based on the sovereign ratings and outlook of different countries in Euro-zone released by the three major international rating agencies.

The international conduction of financial crisis has long been a top subject to be studied by academicians around the world. As a result of financial liberalization and globalization, financial crisis may pose impact on the financial market of the crisis-hit countries (Gande & Parsley, 2005; Sgherri & Zoli, 2009; Fender et al., 2012) and spill over to other crisis-free countries through the financial markets such as foreign exchange market (Eichengreen et al., 1995 and 1996; Cerra & Saxena, 2002; Dungey & Martin, 2004; Hui & Chung, 2011;

Friewald et al., 2012), stock market (Bae et al., 2003; Forbes & Rigobon, 2002; Ito & Hashimoto, 2005; Chiu et al., 2012) and bond market (Favero & Giavazzi, 2002; Dungey et al., 2006; Calice et al., 2011; Bernoth & Erdogan, 2012), thus bringing about imported economic crisis dragging down the economic growth and resulting in financial market disruption (Cerra & Saxena, 2002; Dungey & Martin, 2004; Gerlach et al., 2010). Therefore, financial crisis can serve as a unique natural experiment to study how economic crisis is transmitting among different financial markets in the context of economic globalization, as well as an indicator to measure the openness of a country's financial market.

The sovereign credit ratings released by the three major international rating agencies is the common indicator used by academicians to measure financial crisis (Brooks et al., 2004; Grammatikos & Vermeulen, 2012). However, no consensus is now reached by academicians around the world on the effect of the sovereign credit ratings released by different credit rating agencies and different types of credit ratings (ratings and outlook) released by the same rating agency. The early study of how the change of sovereign credit ratings had affected financial market would merely depend on the sovereign credit ratings released by a single rating agency (e.g. S&P or Moody's) or the simple summation of the ratings released by different rating agencies (Sy, 2004; Hooper et al., 2008), but different credit rating agencies have different influence on financial market (Alsakka & ap Gwilym, 2010 and 2012; Afonso, 2011) as they follow different standards to release sovereign credit ratings (Löffler, 2005). According to previous study, negative sovereign credit ratings have substantial spillover effect (Brooks et al., 2004; Ferreira & Gama, 2007; Hooper et al., 2008; Hill & Faff, 2010). After studying the financial market in Europe between 2007 and 2010; Arezki et al., 2011) pointed out that the sovereign credit rating downgrade could pose significant spillover effect not only on the crisis-hit countries but also the other members of the European Union. In contrast, some other studies have also suggested that outlook and watchlist have greater influence upon financial market (IMF, 2010b; Hill & Faff, 2010; Kim & Wu, 2011). According to the empirical results of Afonso (2011), the sovereign credit ratings, particularly the outlook, released by the three major rating agencies between 1995 and 2010 posed significant spillover effect on the bond market of 24 European countries.

Although many existing literatures have revealed that the change of sovereign credit ratings can really pose significant impact on developed economies (Gande & Parsley, 2005; Ferreira & Gama in 2007; Hooper et al., 2008; Attinasi & Nickel, 2009; Grammatikos & Vermeulen, 2012), nearly none of them have provided insight on how the sovereign risk of Euro-zone countries have posed impact on the financial markets of developing countries, particularly China, in the context of European debit crisis. Therefore, we have conducted empirical study of this issue based on the sample of the four major financial markets in China in order to empirically prove the impact of European debit crisis and its conduction path that has led to the fluctuation of co-exceedance in China's financial market, and provide information basis for the policy-making of China regarding the prevention of global financial crisis in the context of the change of the sovereign credit rating in Euro-zone caused by European debit crisis so as to ensure sustainable development of financial market.

Therefore, we have studied how the sovereign credit rating changes in different Euro-zone countries are affecting the extreme fluctuation of economic return in the 4 major financial markets (monetary market, bond market, stock market and foreign exchange market) of China, sampled for the study, between January 2, 2008 and December 31, 2012 by Multinomial-logit model using the long-term sovereign credit ratings of the 17 Euro-zone countries released by the three major international credit rating agencies as the substitution variable of the sovereign risk in Euro-zone. Furthermore, in view of the different openness and spillover effect of

different financial markets of China and taking into account the chronological order in which the European debit crisis broke out and proceeded and the characteristics of sovereign credit ratings, we have studied the different conduction paths through which the sovereign credit ratings (rating and outlook) of different Euro-zone countries (all the Euro-zone countries, Euro-zone periphery countries and PIIGS) released by the three major rating agencies (S&P, Moody's and Fitch) affected the financial market of China before and after the breakout of European debit crisis.

We have made contributions to the study of the impact of sovereign risk in different ways by this paper. Firstly, we have studied how the sovereign rating changes and sovereign outlook reversion of different Euro-zone countries released by the three major credit rating agencies have affected the fluctuation of the co-exceedance in financial market based on the sample of China's financial market. The study has provided new evidence of the impact of the financial crisis on the fluctuation of economic return in the financial market, as well as information basis for China's policy-making for the maintenance of sustainable development of financial market in the context of financial crisis. Secondly, we empirically studied the conduction paths through which the sovereign risk change in Euro-zone affected the financial market of China before and after the breakout of European debit crisis and provided fresh view for further study of the conduction mechanism of financial crisis which affects financial markets, particularly those of emerging economies, by improving the theory of conduction path of financial crisis. Thirdly, the existing literatures deal with the issue of the impact of sovereign risk with a focus on its transnational conduction in a single market or spillover among developed economies, but we have enriched the literatures regarding the study of the impact of sovereign risk by subdividing the sovereign credit ratings in Euro-zone and taking them into account in the study of cross-market conduction effect.

This paper consists of six sections: Section 1 is an introduction to the paper; Section 2 gives the definitions of the variables and describes the empirical models used in the paper; Section 3 reviews the empirical test of the impact of the sovereign risk change in Euro-zone on the fluctuation of co-exceedance in China's financial markets; Section 4 describes the further study of how and by what means the sovereign rating change and outlook reversion in Euro-zone have affected China's financial market; Section 5 provides conclusions and suggestions for policy-makers to deal with the impact of sovereign risk.

## **2 METHODOLOGY**

### **2.1 Assessment of the sovereign risk in Euro-zone**

A sound and effective substitution variable for the sovereign risk in Euro-zone should be able to distinguish the sovereign credit ratings of different Euro-zone countries released by S&P, Fitch and Moody's and identify the positive and negative impacts brought about by sovereign rating changes and outlook reversion. In contrast to the previous studies ( Favero & Giavazzi in 2002; Arezki et al. in 2011 ), we have used the "modified" method of event-study analysis to assess how the sovereign rating changes and outlook reversion of the 17 Euro-zone countries have affected China's financial market. For example, the upgraded rating of a country in a certain period is valued 1 and the degraded rating of a country in a certain period is valued -1, and similarly, the positive outlook after change is valued 1, the negative outlook after change is valued -1 and the unchanged outlook is valued 0. In addition, a country which is included by a rating agency into the positive watch list is valued 0.5 and a country which is included by a rating agency into the negative watch list is valued -0.5 because the sovereign watch list can provide important information basis for us to predict the sovereign rating

changes of a country in future. We have, therefore, created impulse dummy variables of country  $i$  in period  $t$  in Euro-zone depending on these values. In order to study the spillover effect of the sovereign risk impact of all the Euro-zone countries, Euro-zone periphery countries and PIIGS, we added up all the above impulse dummy variables and obtained the comprehensive assessment index  $SID_t = \sum_{i=1}^I ID_{it}$  of all the Euro-zone countries, Euro-zone periphery countries and PIIGS, i.e. the impact of European debit crisis in a period during which the sovereign rating changes or outlook reversion of several countries are made is expressed by the value obtained by adding up the values of all these countries.

We have defined the speculative-grade critical interval of sovereign rating to span from “BBB (Baa2)” to “B(B2)” in this paper to study if the speculative-grade critical effect of the sovereign rating in Euro-zone in the context of European debit crisis is affecting China’s financial market, because sovereign rating adjusted until it is at or close to speculative-grade will cause extra impact, i.e. “speculative-grade critical effect”, on financial market (Arezki et al. in 2011). We stopped treating a sovereign rating as one that had been changed until it was at or close to speculative-grade when it was degraded (or upgraded) beyond speculative-grade.

## **2.2 Sample selection and data sources**

In order to study how the impact of the sovereign risk in Euro-zone affected China’s financial market before and after the breakout of European debit crisis, we have used the sovereign rating of the 17 Euro-zone countries released by the three major international rating agencies as an index to assess the sovereign risk during European debit crisis. The data of the long-term sovereign credit rating made by the three major international rating agencies are sourced from Bloomberg database and collated by the author of the paper. The data of China’s financial market are sourced from Wind database. All the data of financial market are the close price on business day. The samples used in this paper were taken from January 2, 2008 to December 31, 2012 and all the samples are divided into two groups which were either taken before or after April 1, 2010 (In March 2010, financial problem broke out consecutively in Portugal, Ireland, Spain and Italy. European debit crisis began to spill over to other Euro-zone countries from Greece and evolved from a sovereign debit crisis in a single country into a debit crisis covering all the Euro-zone and finally into a global sovereign debit crisis (financial crisis).) so as to allow us to easily identify if the sovereign risk in Euro-zone has caused “infectious effect ” on China’s financial market and if such effect changed before and after the breakout of European debit crisis.

We have further grouped the sovereign countries in Euro-zone into crisis-hit countries and crisis-free countries to help study if the sovereign rating changes of Euro-zone countries in different groups can affect China’s financial market in a differently way. The crisis-hit countries in Euro-zone includes Portugal, Ireland, Italy, Greece and Spain expressed as PIIGS and other 12 countries around Euro-zone which suffered limited impact from European debit crisis are expressed as *Periphery*. PIIG is made up of the initial letter of the English name of the five countries: Portugal, Ireland, Italy, Greece and Spain. As “PIIGS” looks like “PIG”, it is literally translated into “European Pigs” by some scholars.)

## **2.3 Empirical model and variables**

Following the methodology introduced by Bae et al. (in 2003) , we used Multinomial-logit model in the paper to study if the sovereign rating changes in Euro-zone have posed impact on the fluctuation of co-exceedance among China’s financial markets. The market exceedance

is defined as the value of return where the return in the single market is higher than 95% quintile of its overall distribution or lower than its 5% quintile. The specific Multinomial-logit model is as follows:

$$P(Y_t = i|x_t) = \frac{e^{g_i(x_t)}}{\sum_{j=0}^k e^{g_j(x_t)}} \quad i = 1, \dots, k \quad (1)$$

Where  $g_i(x_t) = \ln \frac{P(Y_t = i|x_t)}{P(Y_t = 1|x_t)} = \alpha + x_t' \beta = \alpha + \beta_1 Y_{t-1} + \sum_{j=1}^L \beta_2^j SID_{t-1}^j$ , in which L is the number of categories of Sovereign credit ratings in Euro-zone;  $SD_t^j$  is the index used to comprehensively measure the change of the sovereign credit ratings measured by the method of “modified” event-study analysis. In view of the time difference between the rating release and the operation of China’s financial market, we used the 1-phase lagged data of the sovereign credit rating in Euro-zone to conduct regression analysis in this paper. In the explanatory variable,  $Y_t = 1, \dots, k$  is the index to measure the fluctuation of the co-exceedance among financial markets, which is defined as such that a value equal to 1 is set when there is fluctuation of co-exceedance in one financial market, a value equal to 2 is set when there is fluctuation of the co-exceedance in two financial markets and a value equal to 3 is set when there is fluctuation of the co-exceedance among no less than three financial markets at the time of  $t$ . The coefficient estimate  $\beta_2^j$  of sovereign credit rating is used in the model to directly verify the correlation between the change of sovereign credit rating and the fluctuation of the co-exceedance among China’s financial markets.

In order to verify how the impact of the sovereign risk in Euro-zone affected China’s financial market before and after the breakout of European debit crisis, we have established the following regression model:

$$Z_t^i = a + \Phi(L)Z_t^i + \sum_{j=1}^L b^{ij} SID_{t-1}^j + \varepsilon_t^i \quad (2)$$

Where  $Z_t^i$  is the return matrix of the N-dimension asset price in the financial market i at time t. We have chosen stock market, monetary market, bond market and foreign exchange market to describe the spillover effect among different financial markets in China. Index Sh, Index Sz and Index Zxb from those financial markets generally reflecting the trend of China’s stock market are chosen in this paper to serve as the index to measure China’s stock market. We have chosen Shibor (Shibor\_1m) for a week as the substitution variable of China’s monetary market because it is the index to effectively measure the liquidity of China’s monetary market (Yi Gang in 2008; Guo Jianwei in 2008). As the bond market consists of treasury bond market and corporate bond market, we have chosen inter-bank fixed rate treasury bond as the proxy variable for treasury bond market while using corporate bond index on Shanghai stock market to assess corporate bond market. We have chosen Euro exchange rate (Eurormb) and USD exchange rate (Usdrmb) as the proxy variable of China’s foreign exchange market because EU and US are China’s first and second trade partners respectively and the sovereign debit crisis broken out in Euro-zone this time. In order to ensure the stability of explanatory variable of vector auto-regression model (VAR), we have stabilized the above variable. SHCOMP, SIASA, SSE SME COMPOSITE, USD exchange rate and Euro exchange rate have been converted into Logarithmic yield, expressed respectively as Rate\_Sh, Rate\_Sz, Rate\_Zxb, Rate\_Euro and Rate\_Usd. The treasury bond market is measured by the difference

of the 1-year and 10-year treasury bond yield with inter-bank fixed interest rate, i.e. the interest spread of treasury bond yield. However, we have adopted first difference in this paper for the interest spread of treasury bond yield which has unit root (see the description about statistics in Section 2.4) to measure the change of the interest spread of treasury bond yield (D\_Bench). Corporate bond market is measured by the difference of the logarithmic yield, i.e. the interest spread of corporate bond yield (Firm\_Spread), of the indexes of both the corporate bond and the treasury bond on Shanghai Stock Market.  $\varepsilon_t^i$  is the white noise process subject to i.i.d.

### **3 EMPIRICAL RESULT AND ANALYSIS**

The regression result (Due to limited space, the Multinomial-logit regression result of how the sovereign ratings of all the Euro-zone countries, Euro-zone peripheral countries and PIIGS affected the fluctuation of the co-exceedance among China's financial markets before the breakout of European debit crisis is omitted here. The complete regression result will be available on request by e-mail. ) of how the change of the sovereign credit ratings of all the Euro-zone countries, Euro-zone periphery countries and PIIGS has affected the fluctuation of co-exceedance among China's financial markets is given respectively in three parts in Table 3. The estimate of how the sovereign credit rating changes and outlook reversion in Euro-zone affected the fluctuation of the co-exceedance among China's financial markets after breakout of European debit crisis is given in the first 4 columns of the table. According to the regression results, the estimate coefficient of the sovereign credit rating changes and outlook reversion during European debit crisis appeared more negative than it did before the breakout of European debit crisis, indicating that the fluctuation of co-exceedance among China's financial markets has become more sensitive to the sovereign risk in Euro-zone since the massive outbreak of European debit crisis, and the sovereign rating at or close to speculative grade after change in the context of European debit crisis can more significantly cause fluctuation of co-exceedance among China's financial markets.

However, the sovereign rating changes of different Euro-zone countries affected the fluctuation of co-exceedance among China's financial markets to different degrees. The sovereign ratings of Euro-zone periphery countries or PIIGS caused fluctuation of co-exceedance among China's financial market when they were at or close to speculative grade after change, but that (at speculative grade) of PIIGS can pose more significant critical effect of speculative grade on the fluctuation of the co-exceedance among China's financial markets, and the sovereign outlook reversion of Euro-zone countries, peripheral Euro-zone countries or PIIGS are more likely to cause fluctuation of the co-exceedance among China's financial markets according to the table. This indicates to some extent that sovereign outlook reversion is more influential than sovereign rating changes (Hill & Faff, 2010; Kim & Wu, 2011).

## 4 FURTHER STUDY: IMPACT OF DIFFERENT CONDUCTION

### PATHS

So far, we have verified that the sovereign risk change of all the Euro-zone countries, Euro-zone periphery countries and PIGGS in the context of European debit crisis has substantially caused fluctuation of co-exceedance among China's financial markets, but we do not know by which means the sovereign risk change in Euro-zone has transmitted its effect to China's financial market, if it transmitted its effect through different paths before and after the breakout of European debit crisis and if the sovereign risk changes in Euro-zone periphery countries and GIIPS posed impact on China's financial market in a substantially different way. Therefore, we further looked into the inside of China's financial market by sub-dividing China's financial market into four segments: stock market, money market, foreign exchange market and bond market and conducted relevant empirical study based on the sovereign credit ratings released before and after the breakout of European debit crisis and the classification of different sovereign credit ratings.

#### 4.1 Sovereign outlook reversion

The sovereign outlook reversion has significantly affected the fluctuation of the co-exceedance among China's financial markets, but by what means did it spread its effect? Especially, did it spread its effect in a significantly different way from different Euro-zone countries before and after the breakout of European debit crisis? This section deals with the

empirical study of these subjects.

The estimate result of the vector auto-regression of how the sovereign outlook reversion in Euro-zone in the context of European credit crisis has affected the four financial markets of China is given in Table 4. The sovereign outlook reversion in Euro-zone in the context of European credit crisis affected China's financial market in a significantly different way than it did before the breakout of European credit crisis, and still more did the sovereign outlook reversion in Euro-zone PIIGS. According to further study, three of China's four financial markets—stock market, foreign exchange market and money market—are most sensitive to the sovereign outlook reversion in Euro-zone. The negative sovereign outlook in Euro-zone raised the level of Shibor\_1m while adversely affecting China's stock market (Rate\_Sz, Rate\_Sh and Rate\_Zxb), resulting in declining of stock indexes and further shrinking of market liquidity. In foreign exchange market, the sovereign outlook in Euro-zone affected USD exchange rate and Euro exchange rate in a totally different way. The negative sovereign outlook in Euro-zone caused appreciation of Euro (positive Euro rate) while depreciating USD (negative USD rate). The ultimate impact posed by Such change on China's export depends on the number of export commodities priced in USD and Euro relative to the total export and the relative appreciation and depreciation of USD and Euro. Unlike that in Euro-zone and Euro-zone periphery countries, the Euro-zone sovereign outlook reversion of PIIGS didn't pose substantial impact on the interest spread of the corporate bond in China's bond market. Besides, neither the sovereign outlook reversion in the Euro-zone countries, Euro-zone peripheral countries or PIIGS could affect the change of the interest spread of China's corporate bond. This indicates to some extent that the sovereign risk of the crisis-hit countries can not affect the sovereign risk (measured by the interest spread of China's corporate bond) of crisis-free countries through their sovereign outlook reversion.

The findings of the study also show that the Euro-zone sovereign outlook released by different rating agencies has affected China's financial market in a significantly different way.

The sovereign outlook reversion of all the Euro-zone countries, Euro-zone periphery countries and PIIGS released by S&P could pose significant impact on China's financial market. Of all the sovereign outlooks of Euro-zone released by Mood's, only those of PIIGS could affect the Euro exchange market of China while only the sovereign outlook released by Fitch could substantially affect the money market of China. Besides, the sovereign outlook of peripheral Euro-zone countries released by either Mood's or Fitch could not affect China's financial market. The above evidence shows that we should pay attention to the sovereign outlook released by S&P and improve risk management in respond to the sovereign outlook reversion released by S&P in order to improve China's financial regulation and management efficiency and maintain the stability of China's financial system.

## 4.2 Sovereign rating changes

The sovereign rating change in Euro-zone can significantly affect the fluctuation of the co-exceedance among China's financial markets, but by what means has it spread its effect? Did it spread its effect in a significantly different way among different Euro-zone countries before and after the breakout of European debit crisis? Especially, will the sovereign rating change in Euro-zone pose significant critical effect of speculative grade on China's financial market? This section deals with the empirical study of these subjects.

The estimate result (Due to limited space, the regression result of VAR model for the sovereign rating changes in the Euro-zone before the breakout of European debit crisis is omitted here. The complete regression result will be available on request by e-mail. The regression analysis of the Euro-zone sovereign rating changes is not made due to lack of the data collected before the breakout of European debit crisis about the Euro-zone sovereign rating for whcih the initial change was made until it was at or close to speculative grade after 2010.) of the vector auto-regression of how the sovereign rating changes in Euro-zone and the sovereign rating at or close to speculative-grade after change in the context of European credit crisis have affected the four financial markets of China is given in Table 5 and Table 6 respectively.

Note: (1) \*means significant below 10% ( $p < 0.1$ ), \*\* means significant below 5% ( $p < 0.05$ ), \*\*\* means significant below 1% ( $p < 0.01$ )

According to Table 5, the sovereign rating change in Euro-zone in the context of European credit crisis had limited effect on China's financial market compared to its behavior before the breakout of European credit crisis. Especially, the sovereign rating change in Euro-zone PIIGS had the least effect on China's financial market. According to further study, three of China's four financial markets—stock market, foreign exchange market and money market—are most sensitive to the sovereign rating change in Euro-zone and the downgrade of sovereign rating in Euro-zone can adversely affect China's stock market, especially the SMEs board market (*Rate\_Zxb*). This indicates that innovative SMEs are more sensitive to the impact of Euro-zone sovereign risk than the well-established enterprises on the main board. Besides, The downgrade of sovereign rating in Euro-zone raised the level of *Shibor\_1m*, resulting in adverse effect on the liquidity of China's money market. In foreign exchange market, like the negative sovereign outlook, the downgrade of sovereign rating in Euro-zone caused appreciation of Euro (positive Euro rate) while only the downgrade of sovereign rating in Euro-zone peripheral countries can substantially cause depreciation of USD (negative USD rate). The sovereign rating change in Euro-zone (rather than PIIGS) posed little impact on the interest spread of the corporate bond and treasury bond in China's bond market. The study result also shows that sovereign rating change made by S&P for the Euro-zone countries, Euro-zone peripheral countries and PIIGS can significantly affect China's financial market (rather than bond market). Only the sovereign rating change of PIIGS released by Moody's can affect the change of interest spread of China's treasury bond while the sovereign rating changes in Euro-zone released by Fitch have little effect on China's financial market.

According to the above study, the significantly smaller impact posed by the sovereign rating change in Euro-zone than that posed by sovereign outlook reversion on China's financial market is probably contributable to the different effect posed by the sovereign rating changes of different grade in Euro-zone on China's financial market, resulting in a generally view that the sovereign rating change in Euro-zone posed smaller impact on China's financial market than that posed by sovereign outlook reversion in Euro-zone. In order to further study such difference, we further looked into the inside of the specific grade of sovereign ratings and particularly studied if the sovereign ratings in Euro-zone can pose extra impact on China's financial market when they are at or close to speculative grade, or speculative-grade critical effect, after change.

According to the regression result in Table 6, the sovereign ratings in Euro-zone can pose significantly critical effect of speculative grade on China's financial market, particularly the bond market, while posing effect on other markets in generally the same way as the sovereign outlook reversion in Euro-zone did on China's financial market. However, taking into account different rating agencies, we found out that S&P had little influence on all the financial markets except the foreign exchange market which was the only market subject to the influence of S&P. The sovereign rating of Euro-zone and PIIGS released by Fitch can exert significant critical effect of speculative-grade on China's stock market when it is at or close to speculative grade after change. The study result also shows that the sovereign rating released by Fitch can exert greater effect of speculative grade on China's financial market as it can significantly affect not only China's stock market through Euro-zone peripheral countries but also China's bond market through Euro-zone and PIIGS. This indicates that the sovereign rating changes of Euro-zone have exerted more complicated impact on China's financial market than sovereign outlook reversion and we should distinguish the sovereign ratings released by different rating agencies when dealing with the adverse impact of European debit crisis on China's financial market, particularly when the sovereign ratings are at or close to speculative grade after change.

## **5 CONCLUSIONS AND SUGGESTIONS**

We comprehensively reviewed the impact of Euro-zone sovereign risk before and after the breakout of European debit crisis on China's financial market in this paper using European debit crisis as a natural experiment based on the quantification of the sovereign credit ratings changes released by the three international rating agencies between January, 2008 and December, 2012. We have also studied if the Euro-zone sovereign risk before and after the breakout of European debit crisis posed significantly different impact on China's financial market in the context of the three international rating agencies' announcement of the sovereign ratings and outlook of different Euro-zone countries and, therefore, provided a panoramic view of the linkage and information path between international financial crisis and China's financial market.

According to the empirical result in this paper, the sovereign risk in Euro-zone can really cause the fluctuation of co-exceedance among China's financial markets, especially in the context of European debit crisis. This indicates that China's financial market is more vulnerable to the impact of the unrest of international financial market under the circumstances of financial globalization and China's financial regulatory authorities should be cautious about financial security which is facing increasingly harsh challenges. We have further identified that the sovereign outlook reversion, especially that released by S&P, in Euro-zone has posed more serious impact on China's financial market than sovereign rating changes by analysis using sovereign ratings in Euro-zone released by rating agencies as a proxy variable of the sovereign risk in Euro-zone. However, the sovereign rating in Euro-zone released by Fitch and Moody's can also pose significant critical effect of speculative-grade on China's financial market when it is at or close to speculative grade after change. We believe that the difference is caused by the fact that the sovereign outlook reversion, which is more

forward-looking than sovereign rating changes, reflected the anticipation made by the three international rating agencies about the sovereign risk change in Euro-zone countries in a period to come. Therefore, sovereign outlook reversion can pose more intensive and widespread impact than sovereign rating changes. We have also discovered that the sovereign rating of PIIGS changed by the three international rating agencies posed more significant critical effect of speculative grade on China's financial market than on the Euro-zone periphery countries, but the sovereign rating changes of the Euro-zone periphery countries have more serious impact than those of PIIGS. Besides, the stock market, monetary market and foreign exchange market among China's four major financial markets are most sensitive to the impact of the sovereign risk in Euro-zone, except bond market which react to the sovereign outlook reversion and the sovereign rating changes in a different way, i.e. the sovereign outlook reversion has impact on corporate bond market while sovereign rating change has impact on treasury bond market.

To better understand the effect of European sovereign risk to Chinese financial markets, we should further study how this risk affect the real economy, especially the investment and financing activities of the microeconomic corpus, through the financial markets in the future research.

## **DIRECTORS' EDUCATION DEGREE AND CORPORATE SOCIAL DISCLOSURE: EVIDENCE FROM VIETNAM**

*Trang Cam Hoang*

### **Abstract**

Using the published annual reports of the firms listed on Ho Chi Minh Stock Exchange (HOSE) and Hanoi Stock Exchange (HNX) in Vietnam, this study examines the relationship between directors' education degree and corporate social disclosure (CSD) of Vietnamese listed firms. CSD is measured based on the Global Reporting Initiative (GRI) Sustainability Reporting Guidelines (G3.1 version). The result shows a significantly positive relationship between the high level of education among directors and CSD. Evidence from this study extends the existing CSD literature on emerging economies and providing valuable insights to Vietnamese policy makers in better understanding Vietnamese listed firms' CSD practices to develop and improve the reporting framework.

*Keywords: board of directors, education degree, corporate social disclosure, Vietnam.*

JEL Classification: G39, I23, M14

### **1 INTRODUCTION**

Although such stakeholders' scrutiny is much stronger in developed nations, recent empirical studies have shown an increasing trend of corporate social responsibility disclosure, of which CSD in this paper is an integral part, in the annual reports of firms in developing countries (Haji, 2013).

The understanding of CSD practices in Vietnamese firms is still poor because it is perceived as philanthropic activities. Bui (2010) also shows that the main reasons why Vietnamese firms pay almost no attention to CSD is because they do not understand how a firm impacts on society, they lack financial resources and a legal framework. These factors have discouraged firms from adopting CSD in their corporate policies. However, when Vietnam joined the World Trade Organization (WTO) in 2007, firms elevated the status of CSD because of its importance with foreign customers and partners. In spite of an increasing trend of CSD in Vietnamese firms recently, there has not been the research examining the effect of directors' education degree in the board of directors on CSD in Vietnamese listed firms. Therefore, this study intends to narrow the research gap to examine this effect.

### **2 LITERATURE AND HYPOTHESIS**

Previous studies mainly examine the impact of gender directors on corporate social responsibility or corporate social performance. Research already suggests that firms with a higher percentage of female board members have a higher level of charitable giving (Wang & Coffey, 1992; Williams, 2003), enhanced work environments (Bernardi et al., 2006; Johnson & Greening, 1999) and better corporate social performance (Hafsi & Turgut, 2013).

Vietnam is the focus of this study, but only one study (K. A. Vu et al., 2011) has examined the impact of corporate governance on voluntary disclosures, including the social disclosure of 45 Vietnamese listed firms in 2008. Controlling for the influence that ownership structure can

have on voluntary disclosures, they find low disclosure levels among Vietnamese listed firms. State ownership is negatively related and managerial ownership is positively related to the disclosure level. Moreover, larger firms are positively associated with voluntary disclosure.

Director education degree is viewed as an indicator of directors' knowledge, cognitive orientation and skill base (Hambrick & Mason, 1984). Previous researches document that the high level of education among directors on the boards results in a greater ability to adopt new ideas and to accept innovations (Carmen et al., 2005; Guthrie et al., 1991; Wally & Baum, 1994), a broader view and larger breadth of understanding (Post et al., 2011). The high level of education among directors on the boards possess more diverse knowledge bases and the perspectives necessary to develop and evaluate solutions to complex problems (Milliken & Martins, 1996; Van der Walt et al., 2006). An educated director can have a broader perspective and superior pattern of thinking and, thus, is more likely understand the wider interests of various stakeholders (Welford, 2007).

From the advisory perspective of governance, the idea that directors' knowledge directly affects corporate social performance and CSD has roots in resource dependence theory (Pfeffer & Salancik, 1978). Resource dependence theorists argued that a firm's socially improved relationships with its constituencies may bring economic benefits and is probably the central tenet in managers' quest for socially responsible activities. Resource dependence theory offers the rationale for the board's function of providing critical resources to the firm including legitimacy, advice, and counsel (Hillman & Dalziel, 2003). Additionally, society nowadays is demanding that the economic development of firms be concomitant with their moral development (Labelle et al., 2010). The moral development of a firm can be classified according to the degree to which its social responsibility is recognized and blended with its economic mission. Directors' knowledge offers the firm support in understanding and responding to its environment (Boyd, 1990) that can help it better manage CSD issues and practices.

Hence, this study anticipates that boards with a higher proportion of directors who have an advanced degree (masters degree or above) exhibit more concern about, and give more attention to, CSD.

Hypothesis: Firms whose boards have a higher proportion of directors with an advanced degree exhibit more CSD.

### **3 METHODOLOGY**

#### **3.1 Measuring CSD**

Content analysis is used to measure CSD because it has been used extensively in the field of corporate social responsibility (Abeysekera & Guthrie, 2005; Haniffa & Cooke, 2005). The relevant information in annual reports are used to examine the CSD practices of Vietnamese listed firms because Corporate Social Responsibility reports or sustainability reports did not exist in the year of the analysis. Annual reports are the central source of corporate communications to investors and other stakeholders, and are widely used by firms for various social disclosures (Abeysekera, 2012; Campbell, 2000). To ensure consistency, only one of the authors coded all the annual reports and a set of basic coding rules was constructed to ensure reliability and validity. This was repeated after two weeks (Haji, 2013) in order to avoid the possibility that the first and the second scoring might influence each other (Weetman & Ghazali, 2006).

This study uses the Global Reporting Initiative (GRI) 3.1 index, the social indicators in particular, to measure CSD practices in Vietnam. Currently, the GRI is the most widely used framework to assess and measure Sustainability Reporting, including CSD (Hopkins, 2012). The social indicators in the GRI 3.1 index identify key performance aspects surrounding labour practices, human rights, society, and product responsibility. They consist of four aspects, including 15 items of labour practices and decent work indicators (LA1 to LA15), 11 items of human rights indicators (HR1 to HR11), 10 society indicators (SO1 to SO10), and 9 product responsibility indicators (PR1 to PR9). Please see Appendix for more details on the social indicators in the GRI 3.1 index.

An un-weighted disclosure quantity index is used to examine the presence of the different items of the checklist using binary scores. This approach is consistent with CSR disclosure studies in emerging capital markets (Haji, 2013; Haniffa & Cooke, 2005; Khan et al., 2013). The disclosure of an item within the check list in the annual reports is scored (1), while the non-disclosure of an item within the check list in the annual reports is scored (0). The scores for each item are then added to compute a total disclosure score for a particular firm. The CSD score (CSD\_INDEX) for each firm is measured by the ratio of actual items disclosed, divided by the maximum possible items that could have been disclosed. Therefore, firms are not penalised for nondisclosure of an item if it is deemed to be irrelevant to their business activities.

### **3.2 Measuring directors' education degree**

Using annual reports, this study compiled the list of directors about directors' education (i.e., degree attained) for the listed firms for the boards in the sample. Firm websites were perused for any information the reference materials could not supply. The directors' education degree (EDU) in this study was measured by the proportion of directors with advanced degrees (i.e., masters degree or above) among the boards in the sample.

### **3.3 Control variables**

This study controls for firm characteristics such as return on assets (ROA), auditors (AUDIT), state ownership (STATE), foreign ownership (FOREIGN) and stock exchange location (STOCK\_EX) which have been shown to influence CSD in previous studies (e.g., Cormier et al., 2011; Purushothaman et al., 2000; K. A. Vu et al., 2011; K. B. A. H. Vu, 2012). Studies document that ROA, measured by net profit over the total assets of firm, is related to CSD (e.g., Haniffa & Cooke, 2005; Lu & Abeysekera, 2014). Additionally, it is on the basis that highly reputable audit firms, such as the 'Big Four' auditing firms, are likely to improve their perceived audit quality by encouraging their clients to participate in disclosing more information (Ahmad et al., 2003; Craswell & Taylor, 1992). AUDIT is a dummy variable that is one if the audit firm is one of the Big Four audit firms and zero otherwise.

The government of Vietnam owns a significant amount of shares in listed firms, especially some strategic industries (K. A. Vu et al., 2011), and the influence of state ownership on CSD has been widely discussed in the literature (Amran & Devi, 2008; Haji, 2013; K. A. Vu et al., 2011), hence STATE, measured by the percentage of shareholding owned by the state, is also a control variable in this study. Prior studies also note that foreign ownership is related to voluntary disclosure, including CSD (Haniffa & Cooke, 2005; K. A. Vu et al., 2011), so FOREIGN is the other control variable, measured by the percentage of shareholding owned by foreign investors. Vu (2012) finds that the stock exchange location of each firm is an explanatory factor for Vietnamese voluntary disclosure practices. In particular, firms listed on the Ho Chi Minh stock exchange are reported to engage in significantly more voluntary disclosure practices than firms listed on the Hanoi stock exchange. Therefore, STOCK\_EX is

used as a control variable in this study, taking one if the firms are listed on Ho Chi Minh stock exchange and zero for firms listed on the Hanoi stock exchange.

### 3.4 The relationship between directors' education degree and CSD

This study tested the hypothesis regarding the effects of directors' education degree on CSD, using an OLS estimator. The regression function is:

$$CD\_INDEX_i = \alpha_0 + \alpha_1ROA_i + \alpha_3AUDIT_i + \alpha_4STATE_i + \alpha_5FOREIGN_i + \alpha_6STOCK\_EX_i + \varepsilon_i \quad (1)$$

Where: CSD\_INDEX<sub>i</sub> = firm i's a CSD index; EDU<sub>i</sub> = firm i's the directors' educational attainment.

As the purpose of this study is to examine the effect of directors' education degree on CSD, the main focus here is the coefficient on EDU. If directors with an advanced degree results in more CSD as contended in our hypothesis, then the coefficient on EDU should be positive and significant in the regression.

### 3.5 The sample

This study examines the annual reports during the year ended 31 December 2013 to capture the extent of CSD of Vietnamese listed firms. The annual reports are retrieved from HOSE and HNX's websites and company websites. Firms in the finance sector operate under tighter regulatory environment and are possibly subject to other disclosure requirements forcing several previous CSR studies to not consider them along with non-finance firms (Haji, 2013; Haniffa & Cooke, 2005). Hence, banks and financial institutions are excluded in this study. A random sample of 100 firms listed on HOSE and HNX was selected. Data required for the directors' educational attainment are hand-collected from the 2013 annual reports and on firm websites.

## 4 RESULTS

Table 1 summarises the score of CSD (CSD\_INDEX) and its four subcategories information (i.e labour practices, human rights, society, and product responsibility). The score of CSD (CSD\_INDEX) ranges from 6.67 per cent to 53.33 per cent with a mean of 22.27 per cent, which reveals that the score of CSD of listed firms in the sample are low. This is because CSD practices are relatively new in Vietnam (K. A. Vu et al., 2011). Our result is consistent with Vu et al. (2011)'s examination of the quantity of voluntary disclosure, including social disclosure in Vietnam. Related to CSD's four subcategories information, the highest disclosure level is for Labour practices and decent work indicators (mean of 36.84 per cent) and the lowest is Human rights indicators (3.21 per cent). The number of firms disclosing items regarding the human rights aspects is the lowest, which is consistent with Lu and Abeysekera's (2014) study on listed firms in China, because these aspects are socially sensitive in Vietnam and there are less social support mechanisms and poorly implemented frameworks to protect workers' human rights (Azizul Islam & Jain, 2013).

Tab. 1 - The score of CSD (CSD\_INDEX) and its four subcategories. Source: own analysis from annual reports of Vietnamese listed firms.

	Max	Min	Mean	SD
CSD_INDEX	0.5333	0.0667	0.2227	0.1021

Labour practices and decent work indicators (15 items)	0.8667	0.0667	0.3684	0.167
Product responsibility indicators (9 items)	0.6667	0.2222	0.3509	0.1183
Human rights indicators (11 items)	0.6364	0	0.0321	0.1015
Society indicators (10 items)	0.5	0	0.0985	0.1161

Table 2 describes the mean, standard deviation, minimum and maximum of the independent variable and the control variables used to analyse the impact of directors' educational attainment on CSD in the sample of 100 Vietnamese listed firms. The proportion of directors with advanced degrees (i.e., masters degree or above) among the boards in our sample ranged from 0 to 80%, with an average of 23.84%. Related to the control variables, only 21 (21 per cent) of the 100 firms in the sample use the Big Four auditing firm. The mean of ROA is 0.08, which is similar to the 0.07 reported by Vu et al. (2011) for a sample of 45 Vietnamese listed firms in 2008. The Ho Chi Minh Stock Exchange includes 84 (84 per cent) of the 100 listed firms in the sample. Because of the 49 per cent maximum foreign ownership ceiling in Vietnamese listed firms, the average percentage of foreign ownership (FOREIGN) in this sample is quite low (14.58 per cent with a range of zero to 49 per cent). The average percentage of state ownership (STATE) is 24.72 per cent (with a range of zero to 79.07 per cent).

Tab. 2 - Descriptive Statistics for independent and control variables. Source: own.

<b>Variables</b>	<b>Max</b>	<b>Min</b>	<b>Mean</b>	<b>SD</b>
<b>Independent variable</b>				
EDU	0.8	0	0.2384	0.2241
<b>Control variables</b>				
AUDIT	1	0	0.21	0.4094
ROA	0.3356	-0.1689	0.0794	0.0727
STOCK_EX	1	0	0.84	0.3685
FOREIGN	0.49	0	0.1458	0.1549
STATE	0.79	0	0.2472	0.2212

This table shows the summary statistics for the independent and control variables used in this paper. The final sample consists of 100 firms listed on the Hochiminh and Hanoi stock exchanges for the 2013 sample. EDU = the directors' educational attainment measured by the proportion of directors with advanced degrees (i.e., masters degree or above) among the boards in the sample; AUDIT = 1 if firm's auditor is a Big 4 and 0 if otherwise; ROA = net profit over the total assets; STOCK\_EX = 1 if the firms listed on HOSE and 0 for firms listed on HNX; FOREIGN = the percentage of shareholding owned by foreign investors; STATE = the percentage of shareholding owned by the state.

Table 3 shows the pairwise correlation coefficients between all combinations variables. As expected, the directors' educational attainment (EDU) is significantly and positively correlated with CSD\_INDEX with coefficients of 0.231.

Tab. 3 - Correlation matrix. Source: own.

		1	2	3	4	5	6	7
1	CSD_INDEX	1.000						
2	EDU	0.231*	1.000					
3	AUDIT	0.249*	0.208*	1.000				
4	ROA	0.205*	0.099	0.064	1.000			
5	STOCK_EX	0.225*	0.075	0.024	0.246*	1.000		
6	FOREIGN	0.098	0.127	0.172	0.531*	0.338*	1.000	
7	STATE	0.025	0.349*	0.264*	0.029	-0.162	-0.145	1.000

\* p value  $\leq 0.05$ . Please see below Table 2 for description of each variable.

This study checks the variance inflation factor (VIF) for the regression analysis and finds that the maximum VIF is 1.59, which is less than 10 for all the regression models, so multicollinearity does not seem to be a problem in the empirical models tested in this study (Gujarati & Porter, 2009).

To confirm whether or not heteroscedasticity exists, this study uses the Breush-Pagan test. If the p-value is not significant, then the null hypothesis not rejected, and that is the variance of the residuals is constant. If the p-value is significant, then the null hypothesis would be rejected, suggesting the presence of heteroscedasticity. The test shows that that p-value is significant ( $p = 0.019$ ) and the null hypothesis is rejected, indicating the presence of heteroscedasticity (untabulated results). To correct the possible influence of heteroscedasticity, this study uses ordinary least squares (OLS) regression with heteroscedasticity robust standard errors (White, 1980) to test the impact of the directors' educational attainment (EDU) on CSD (CSD\_INDEX).

Table 4 provides the result of the test of the hypothesis where CSD\_INDEX is the dependent variable, and EDU is the independent variable. The table shows that the coefficient estimate of EDU are positive and significant (p-value of 0.035), which suggests that firms whose boards have a higher proportion of directors with an advanced degree exhibit more CSD, confirming the hypothesis.

Tab. 3 - The impact of the directors' educational attainment on CSD. Source: own.

	EDU	AUDIT	ROA	STOCK_EX	FOREIGN	STATE	Constant
Coeff.	0.096	0.063	0.308	0.054	-0.111	-0.053	0.162
p-value	0.035	0.014	0.063	0.012	0.214	0.347	0.000
Significance	**	**	*	**			***

$R^2 = 0.175$ , F statistic = 4.64, p-value = 0.000, N = 100.

\*, \*\* and \*\*\* denote significance levels at 10%, 5% and 1%, respectively.

The results for the control variables shown in Table 4 indicate there is a significant positive association (p value = 0.014) between AUDIT and CSD\_INDEX which suggests that CSD is higher for firms audited by the Big Four audit firms, which is consistent with prior studies

(Craswell, 1992; Inchausti, 1997; Uwuigbe & Egbide, 2012). ROA shows the positive and significant coefficient (p value = 0.063), which suggests that firms that perform better financially are associated with more CSD, which is consistent with the literature (Khan et al. 2013; Lu and Abeysekera 2014; Haniffa & Cooke, 2005). Interestingly, STOCK\_EX is positively and significantly (p value = 0.012) associated with CSD\_INDEX, which indicates that firms listed on HOSE are reported to engage in significantly higher CSD than firms listed on HNX. This is consistent with Vu (2012) who examines the determinants of voluntary disclosure for Vietnamese listed firms. FOREIGN and STATE are not significantly related to CSD, as in prior studies (Haniffa & Cooke, 2005; Lu & Abeysekera, 2014).

## 5 CONCLUSIONS

This paper investigates the effect of the directors' educational attainment on CSD of 100 Vietnamese listed firms in 2013. The result provides evidence supporting the hypothesis (i.e. firms whose boards have a higher proportion of directors with an advanced degree exhibit more CSD). Based on resource dependence theory (Pfeffer & Salancik, 1978), members of the board of directors is considered as an important strategic resource for organization and contribute to CSD. Directors' knowledge is likely to establish and enhance a firm's external legitimacy and to improve its relationships with relevant stakeholders. Therefore, directors with an advanced degree have a positive impact on CSD.

The results of this paper, which demonstrate the current CSD practices of Vietnamese listed firms, will benefit regulators in better understanding firms' CSD practices to improve the current guidelines on the CSD of Vietnamese listed firms.

### APPENDIX: Social Indicators in the GRI 3.1 index

<b>Labor Practices and Decent Work Performance Indicators</b>		
<b>Employment</b>	LA1	Total workforce by employment type, employment contract, and region, broken down by gender.
	LA2	Total number and rate of new employee hires and employee turnover by age group, gender, and region.
	LA3	Benefits provided to full-time employees that are not provided to temporary or parttime employees, by significant locations of operation.
	LA15	Return to work and retention rates after parental leave, by gender.
<b>Labor/Management relations</b>	LA4	Percentage of employees covered by collective bargaining agreements.
	LA5	Minimum notice period(s) regarding operational changes, including whether it is specified in collective agreements.
<b>Occupational health and safety</b>	LA6	Percentage of total workforce represented in formal joint management-worker health and safety committees that help monitor and advise on occupational health and safety programs.
	LA7	Rates of injury, occupational diseases, lost days, and

		absenteeism, and total number of work-related fatalities, by region and by gender.
	LA8	Education, training, counseling, prevention, and risk-control programs in place to assist workforce members, their families, or community members regarding serious diseases.
	LA9	Health and safety topics covered in formal agreements with trade unions.
<b>Training and education</b>	LA10	Average hours of training per year per employee by gender, and by employee category.
	LA11	Programs for skills management and lifelong learning that support the continued employability of employees and assist them in managing career endings.
	LA12	Percentage of employees receiving regular performance and career development reviews, by gender.
<b>Diversity and equal opportunity</b>	LA13	Composition of governance bodies and breakdown of employees per employee category according to gender, age group, minority group membership, and other indicators of diversity.
<b>Equal remuneration for women and men</b>	LA14	Ratio of basic salary and remuneration of women to men by employee category, by significant locations of operation.

<b>Human Rights Performance Indicators</b>		
<b>Investment and procurement practices</b>	HR1	Percentage and total number of significant investment agreements and contracts that include clauses incorporating human rights concerns, or that have undergone human rights screening.
	HR2	Percentage of significant suppliers, contractors, and other business partners that have undergone human rights screening, and actions taken.
	HR3	Total hours of employee training on policies and procedures concerning aspects of human rights that are relevant to operations, including the percentage of employees trained.
<b>Non-discrimination</b>	HR4	Total number of incidents of discrimination and corrective actions taken.
<b>Freedom of association and collective bargaining</b>	HR5	Operations and significant suppliers identified in which the right to exercise freedom of association and collective bargaining may be violated or at significant risk, and actions taken to support these rights.
<b>Child labor</b>	HR6	Operations and significant suppliers identified as having significant risk for incidents of child labor, and

		measures taken to contribute to the effective abolition of child labor.
<b>Forced and compulsory labor</b>	HR7	Operations and significant suppliers identified as having significant risk for incidents of forced or compulsory labor, and measures to contribute to the elimination of all forms of forced or compulsory labor.
<b>Security practices</b>	HR8	Percentage of security personnel trained in the organization's policies or procedures concerning aspects of human rights that are relevant to operations.
<b>Indigenous rights</b>	HR9	Total number of incidents of violations involving rights of indigenous people and actions taken.
<b>Assessment</b>	HR10	Percentage and total number of operations that have been subject to human rights reviews and/or impact assessments.
<b>Remediation</b>	HR11	Number of grievances related to human rights filed, addressed and resolved through formal grievance mechanisms.

<b>Society Performance Indicators</b>		
<b>Local communities</b>	SO1	Percentage of operations with implemented local community engagement, impact assessments, and development programs.
	SO9	Operations with significant potential or actual negative impacts on local communities.
	SO10	Prevention and mitigation measures implemented in operations with significant potential or actual negative impacts on local communities.
<b>Corruption</b>	SO2	Percentage and total number of business units analyzed for risks related to corruption.
	SO3	Percentage of employees trained in organization's anti-corruption policies and procedures.
	SO4	Actions taken in response to incidents of corruption.
<b>Public policy</b>	SO5	Public policy positions and participation in public policy development and lobbying.
	SO6	Total value of financial and in-kind contributions to political parties, politicians, and related institutions by country.
<b>Anti-competitive behavior</b>	SO7	Total number of legal actions for anti-competitive behavior, anti-trust, and monopoly practices and their outcomes.
<b>Compliance</b>	SO8	Monetary value of significant fines and total number of non-monetary sanctions for non-compliance with laws

		and regulations.
--	--	------------------

<b>Product Responsibility Performance Indicators</b>		
<b>Customer health and Safety</b>	PR1	Life cycle stages in which health and safety impacts of products and services are assessed for improvement, and percentage of significant products and services categories subject to such procedures.
	PR2	Total number of incidents of non-compliance with regulations and voluntary codes concerning health and safety impacts of products and services during their life cycle, by type of outcomes.
<b>Product and service labeling</b>	PR3	Type of product and service information required by procedures, and percentage of significant products and services subject to such information requirements.
	PR4	Total number of incidents of non-compliance with regulations and voluntary codes concerning product and service information and labeling, by type of outcomes.
	PR5	Practices related to customer satisfaction, including results of surveys measuring customer satisfaction.
<b>Marketing communications</b>	PR6	Programs for adherence to laws, standards, and voluntary codes related to marketing communications, including advertising, promotion, and sponsorship.
	PR7	Total number of incidents of non-compliance with regulations and voluntary codes concerning marketing communications, including advertising, promotion, and sponsorship by type of outcomes.
<b>Customer privacy</b>	PR8	Total number of substantiated complaints regarding breaches of customer privacy and losses of customer data.
<b>Compliance</b>	PR9	Monetary value of significant fines for non-compliance with laws and regulations concerning the provision and use of products and services.

## **BUSINESS PROCESS MANAGEMENT – NEW RESULTS OF QUANTITATIVE RESEARCH IN CZECH REBUBLIC**

*David Tuček, Martin Mikeska*

### **Abstract**

Solution to the issue of process management in this article was created from the original results of the quantitative research evaluating aspects of process management in context of company strategies in Czech enterprises which was carried out in 2006 with regard to the extension of its further utilization. Followed by the interest of the professionals in practice the research continued and was re-implemented in 2012, with the interviews completed in 2013. The main goal was to assess how the usage of process management components has changed, as well as the aspects of process management, i.e., comprehensive views and statements on the issues of the management of business processes, namely goals, factors, components, support and benefits of the process management in the Czech Republic. New trends in process control are shown, especially the importance of basic documents in BPM projects, processing internal control documentation and the emergence of new standards in the BPM especially in production companies. To meet the goals of this article a new methodology is proposed for comprehensive processing and evaluation of similar quantitative surveys applicable to analysing the use of process management in enterprises, based not only on descriptive statistics but also cluster analysis and statistical induction methods.

*Keywords: Business Process Management, quantitative research, the aspects of process management.*

JEL Classification: M21 Managerial Economics

### **1 TRADITIONAL – FUNCTIONAL MANAGEMENT**

Traditional –functional management model is based on a hierarchical decomposition of the organizational structure. Its final result is the division of the enterprise on individual departments and sections up to the individual functional sites. This means that each department has largely separate agenda, power and responsibility. Concept of functional management mainly solves the question of division of labour in the enterprise and also workers' specialization and their competences.

The functional approach often leads to the ambiguous assignment of competences with regard to responsibility for the outcome of the process as a whole, because it does not perceive the process as a whole. The process as a whole often runs across all functional organizational structure (Tuček, Tučková and Hájková, 2013). Where the process runs over the various departments of the company, this situation may cause problems in the transfer of results between individual activities. The purpose of the process approach (Šimonová, 2009) is to uncover the processes that are often covered by "non-functional" functional organizational structure, to clean them from activities that do not add value for the customer and bring them into focus.

## **2 BUSINESS PROCESS MANAGEMENT - DEFINITION**

Business Process Management (BPM) is becoming a hot topic for the scientific community solving a variety of research in the field of BPM as well as for the business sector constantly dealing with problems resulting from dynamic changes in the market. A process approach, which is the basis of BPM, is often referred to as a philosophy that is the cornerstone of the work organization in the company and the foundation of all business operations and activities (Šmída, 2007). The process approach allows organizations to eliminate the biggest disadvantages of a traditional functional approach that cannot be considered as an approach appropriately flexible for changes in the corporate environment, variety of procedures, or excessive substitution of workers.

Process management by Šmída (2007, p. 30) represents: “systems, procedures, methods and tools of permanent ensuring of maximal performance and continuous improvement of business and inter – business processes that are based on a clearly defined strategy of the organization. Its goal is then to meet determined strategic goals.” This author understands the term process approach as the basis for the organization of work, namely as a basis of all business activities in the company. It indicates a process approach as an approach that responds to changes in a corporate environment and simultaneously flexibly responds to customers’ requirements.

### **Afterwards process management as a managerial approach leads to:**

- Integration of fragmented activities into value-chained processes;
- Reduction of unnecessary activities, duplications, approvals, waiting, etc.;
- Unambiguous focus on the customer process;
- Harmonization of processes and strategies of the company;
- Collaboration across individual departments of institution (companies, plants, workshops or individual workplace) due to process teams.

The objective of business process management can be defined (Lewellyn and Armistead, 2000) as the development and optimization running of the organization to ensure effective, efficient and economical reaction to customer requirements. A process-driven company is focused on the outcome of its activities, or the added value for the customer who paid for them. Such company is more flexible and able to respond more quickly to market changes and customer preferences.

BPM principles are applicable in the other areas, e.g., in.:

- the quaternary sector (Tučková, 2012);
- some energy efficiency models for the mini-load AS/RS, for the support of the design process of warehouses (Lerher, Edl and Rosi, 2013; Lehrer et al., 2010);
- logistics processes (Trebuňa, Fil’a and Pekárková, 2013).
- services such as health care systems (Tučková, Fialová and Strouhal, 2012);
- management controlling system of companies (Zámečník, 2014).

Regarding the process measurement performance, some authors, such as Rajnoha and Chromjaková (2009) or Popesko (2010) recommend implementation of Activity-Based-Costing (ABC) method in the enterprise. In the context of cost for the business processes, some of companies notices the causes of the cost remanence but it is not them able to predict. In the context of the emergence of cost behaviour and cost remanence are growing much

faster, these costs are not analysed and are allocated without a difference to individual groups performances. Businesses should strive to limit the causes of the occurrence and extent of exposure, and therefore focus only on the volume of outputs as the sole criteria of variability is restrictive. Variability of costs should be assessed for individual cost items in relation to the analysis of the correlation of variables. Managers should not forget that in a situation where company will be able to assign costs to a specific activity, and in practice it often happens that the analysis of the activity ceases to be necessary, because it is given little attention, and the company loses the opportunity to rigorously control costs (Novák and Popesko, 2014).

Additionally, implementation of calculation based on processes and activities causes also non-quantified effects such as:

- transparency and rationalisation of performed activities and processes,
- more responsible proceeding of enterprise work,
- identification of enterprise's competitive advantages or disadvantages,
- information support for strategic management and goal oriented management,
- assignment of overhead costs to performance on case-by-case basis,
- support of price policy and production-sales program optimization (Rajnoha and Chromjaková, 2009; Popesko and Novák, 2011).

First of all, in this chapter we would like to evaluate the reasons which lead enterprises to exploit elements of process management in their working practices. The aim of Process Management is to develop and to optimise the daily running of an enterprise in a way which defines these work-related procedures (i.e., processes) as a unified flow or cascade of activities throughout the enterprise, where for each and every process its inputs are clearly defined as are the outputs or results, and where the associated responsibilities and personal responsibilities are assigned for each and every process or activity, while establishing a system for the measurement of the performance of these processes and tracking and evaluating each and every process (Vyskočil et al., 2010).

These activities must be realised (i.e., implemented) so that:

- The quality of production will be maintained through given measurement parameters.
- All available resources shall be optimally exploited (Zavadský and Zavadská, 2014).
- All of the performance indices of the enterprise have been improved continuously throughout in line with previously agreed and known and measurable criteria (Vukovič, 2005).

The market forces of today's business processes development have begun to place an important emphasis on business process quality. Evidently, the quality of a business process model highly influences the deployed business process. This motivated several researchers to propose metrics to evaluate the quality of business process model.

In fact, the concept of quality metrics was initially introduced to examine software quality. According to Cardoso et al. (2006), a quality metric is a quantitative scale and a method that can be used to determine the value taken by a characteristic of a software product. Exploiting the maturity of software quality metrics, several researchers adapted several metrics from the field of software engineering for business process models (Gruhn and Laue, 2006; Khelif et al., 2012).

This, however, means that there is a need to describe just what distinguishes or characterises a process, which is a so-called “management process”. This means that such a process has:

- A defined, ranked set of steps to be taken and appropriate responsibilities allocated.
- A set of measurable parameters derived from customer demands or requirements, or internal standards – “owners” of the process/es.
- A permanent process team who meet regularly with the aim of seeking improvements to the process/es.
- An annual plan which contains the requisite outputs/outcomes/results for each and every key process, as well as appropriate budgets and demands on resources.
- A mechanism for the regular and interim controls of the process/es performance.
- Procedures and resources (i.e., the process team) for the resolution of problems associated with the process/es (Šimonová, 2009).

## **2.1 Short History of Business Process Management**

We can begin with the principles. Managers are often confronted, even in renowned magazines, with several similar terms and concepts which may be confusing or at least their correct content and principles may be misinterpreted on the basis of inaccurate information. What do the terms Business Process Management (BPM) and Business Process Reengineering (BPR) mean? What is their application in practice? In this subheading we would like to acquaint the reader briefly but precisely with these terms and their content.

From the point-of-view of management and Business Process Management development, authors such as King, Fingar, Smith, etc., have offered various conceptions in order to comprehend the connections and differences between them. King, for instance, has distinguished between four development waves BPM (Šmída, 2007).

He has mentioned the following in his publications:

- 1) the first wave of BPM – was concentrated on constant improving of the processes and coincides in many ways with the philosophy of TQM (Total Quality Management), a philosophy which leads to an increase in productivity, a simultaneous increase in quality and increased customer satisfaction while decreasing losses caused by poor quality production.
- 2) the second wave of BPM - consisted of a focus on Business Process Reengineering, or in short Reengineering. This is regarded as the second wave involving the trend of management leading towards essential, radical and fundamental changes in the organization of applied work procedures or technologies. The achievement is not merely incremental but has a radical rise in organization productivity as the expected result.
- 3) the third wave of BPM – the authors (Fingar and Smith, 2002) refer to activities leading to the creation of a process focused organization. This involves the application of main component procedures or process management consisting of the following:
  - key process determination including the appointing of process possessors and customers;
  - within the process description, their mapping and process map formation (a company process model) for recording process system management;

- the application of process maps (models) for cost intensity evaluation and increases in their efficiency;
- continual process improvement and measuring of efficiency;
- quality in the enterprise is mainly understood as the demand for quality standards which lead off the process model;
- competence management is comprehended as the system enabling fulfilment of roles in individual processes (both management and key processes) by those who have appropriate knowledge and abilities for them (Cambal et al., 2013).

## 2.2 World Research Results about Business Process Management

F.e Accenture asked, responders (companies Fortune 500) about a common value driver across all six main drivers of BPM. These six are: The three internal drivers of efficiency, compliance and integration (of employees and with internal systems), and the three external drivers of agility, quality and networking (with external stakeholders). Thus, Acenture first asked the participants in this current survey to provide a free-text answer to the question “Why is your organization pursuing Business Process Management?” The answers highlighted that internal drivers for BPM still dominate with aims such as increased corporate efficiency, process-related risk management and improved process-oriented gathering of requirements for software development projects. (Rosemann et al., 2013) Some results you can see in Fig. 1.

Fig. 1 - Drivers for Business Process Management Initiatives Source: Accenture © 2013.

While most software categories reported slow growth during the so-called “Great Recession,” many BPM suite vendors posted healthy revenue gains and increased demand for their offerings say Richeardson. Some argue that BPM — the discipline and the technology — emerged as one of the heroes during the downturn, helping enterprises boost productivity and gain efficiency and greater control over key operational processes. In short, BPM and BPM suites proved their mettle during the storm.<sup>1</sup> Some of the hardest-hit sectors, including

financial services and insurers, had the strongest appetites for BPM suites throughout the recession (see Figure 2).

### 3 BUSINESS PROCESS MANAGEMENT – QUANTITATIVE RESEARCH

#### 3.1 Objectives and hypothesis formulation

The whole research areas cannot be described in this chapter. That is the reason why the focus is only on the utilization level of business process management and its individual components in Czech companies with focus on objectives that managers wish to achieve by BPM implementation and factors that are combined with a process-oriented company. Seven goals of this research were define in accordance with the research in 2006 so that it would be possible to realize the comparison in time in different application areas of process management as following:

*C 0. To propose a methodology for processing and evaluation of quantitative survey that is applicable to analysis of the process management usage in the companies.*

*C 1. On the selected basic set, examine to what extent Czech companies use process management.*

*C 2. Clarify the objectives and procedures that are important for Czech companies when using process management components.*

*C 3. Specify the view on the usage of process management components in Czech companies by comparing the levels of components usage and principles of corporate process management in various sectors along with the size and with the focus mainly on manufacturing companies.*

*C 4. Evaluate which process segmentation is preferred by the company (i.e., for example segmentation according to ISO 900X, BSC, Porter or others) and to highlight the process areas in which the rated companies hide their imperfections.*

*C 5. Determine to what extent respondents use software for supporting of process management.*

*C 6. Evaluate concrete benefits and barriers that are present in the companies while using process management. Compare each sector, i.e., variously sized enterprises (see C 2).*

*C7. Analyse changes in individual process management areas (support of human capital, factors, components, etc.) between the years 2006 and 2013.*

### **3.2 Methodology of data collection and subsequent evaluation**

We conducted extensive research aimed at the utilization level of business process management in Czech manufacturing companies in 2006 and in 2012/2013. The research was focused on several aspects of business process management. In this research, aspects of BPM are understood with the meaning of managers' views and opinions on management of business processes (Business Process Management). The research specialized in the area of goals, factors, components, support, benefits of and barriers to process management. The authors explored the extent to which Czech manufacturing companies use business process management. We focused on the logistics processes too. The utilization level of BPM in Czech companies was determined by self-assessment of managers and according to the actual utilization of BPM components. The research has also clarified the goals and procedures that are important for Czech companies in the use of BPM components and found the extent to which the addressed companies use a software support of process management. Last but not least, the research also focused on identifying the benefits that the company achieved by BPM implementation and also on identifying barriers which the Czech companies faced in the BPM implementation. The results of the research, particularly the first part intent on the objectives and factors of BPM support, are the subject of this article. Part of the paper consists also in comparison of the results of previous research conducted in 2006 (Tuček and Zamečník, 2007) and the current research. The comparison of these findings allows identifying trends of business process management in Czech companies for the past 6 years.

The quantitative research was conducted through a questionnaire survey. The sample included manufacturing companies that have more than 5 employees and their turnover was higher than 0 in 2012/13. A limit on the minimum number of employees (5) was determined based on the experience of previous survey implementation, which showed that small businesses do not use business process management or any of its components. A sample of 300 firms was chosen at random. The return of questionnaires was 144, which is 48%. To minimize the risk of acquiring an insufficient number of completed questionnaires, at first, the authors addressed key employees of selected companies by phone and then the questionnaire was sent.

When processing questionnaire results, all 144 companies were included.

Tab. 1 - Distribution of respondents by number of employees. Source: own analysis.

<b>Characteristics of a company</b>		<b>Number of evaluated companies</b>	
	<b>Number of employees</b>	<b>Absolute frequency</b>	<b>Relative frequency</b>
Micro companies	1 -19	36	25%
Small companies	20 – 49	20	13.89%
Medium-sized companies	50 – 250	43	29.86%
Large companies	250 and more	45	31.25%
<b>TOTAL</b>		<b>144</b>	<b>100%</b>

The aim of this research was to explore attitudes, opinions and judgments of managers of Czech companies to individual aspects of business process management. A scaling method based on the principle of quantifying qualitative data was used in this research. The reason for this usage is that managers' responses involve subjective statements, which must be subsequently converted using a verbally, numerically or graphically expressed scale. Specifically the Likert scale method was used. Likert scales are used to indicate the degree (level) of agreement or disagreement with the specified statements, on which it is subsequently possible to deduce the attitudes and opinions of respondents (Rytíř et al., 2006).

Within this research (in 2013) we chose a more comprehensive evaluation of reliability and validity of the entire survey. The descriptive statistics was an appropriate beginning for our survey interpretation. As a part of the description, relative representation in the responses was detected and the basic characteristics of location and variability were identified. Median was chosen as an ordinal mean value ( $\tilde{x}$ ) and discrete ordinal variance (dorvar) was used as the characteristic of variability.

Calculation of both variables was implemented according to VŠE © 2014.

At ordinal variable, median category (Me) belongs to measures of position. It is the category for which the cumulative frequency (P) is 0,5 or higher, while for the previous category the cumulative frequency was less than 0,5. This means that  $P_{Me-1} < 0,5$  and  $P_{Me} \geq 0,5$ .

Furthermore, the median  $\tilde{x}$  can be calculated, more specifically, according to the formula:

$$\tilde{x} = Me - 0,5 + \frac{0,5 - P_{Me-1}}{P_{Me}} \quad (1)$$

For variability rate of the basic set, we may use so called dorvar ordinal scattering (discrete ordinal variance) (VŠE © 2014), determined by the formula:

$$dorvar = 2 \sum_{i=1}^K P_i (1 - P_i) \quad (2)$$

This rate expresses the exact difference of all pairs. While rewriting the interval from 0 to 1, we will get normalized norm. dorvar ordinal scattering for which the following formula is applied:

$$\mathbf{norm. dorvar} = 2 \times \mathbf{dorvar} / (\mathbf{K} - 1), \mathbf{norm. dorvar} \hat{I} <0;1>$$

Moreover, we calculated another typical characteristics, a mode (modus), as the most frequent value. Such calculated characteristic can be further commented and taken as a "classical" mean value, more specifically, as the median and the variability, i.e., scattering.

Median determines the location of the center of all answers whereas this ordinal version of median does not simply come from an ordered set of values but it calculates center based on the ratio/significance for each category (according to formula specified in the link above). Values "Dorvar" are defined as the differences between all pairs (again across evaluative representation for each category) and it may be taken as a scattering, too. Higher value of dorvar means more diverse representation of answers and lower value represents the same opinion only with minor deviations from the centre.

## **4 RESEARCH RESULTS**

### **4.1 Who supports the use of techniques and tools of Business Process Management?**

One of the objectives of this research was (within the question 3 in the questionnaire) to investigate who supports the usage of techniques and tools of process management from the point of view of human factors – this is interconnected with the question what implementation processes do businesses chose while implementing process management. Subsequently this is related to the fact that either they want to save more and implement changes only after training or they want to spend more with “seemingly more expensive” but often more effective support of consultants.

The following question was aimed at finding out how companies implement various tools and techniques of process management. The purpose was to determine the extent to which businesses use during the BPM implementation and BPM components their own employees, BPM training courses and consulting companies. In the case of using consulting companies, managers were asked about the area for which the consulting company services were used. Managers, who had answered in the first question that process management is an unknown term to them, did not respond to this question, i.e., the question was answered by only 75% of respondents in the year 2006 (Tuček, Tučková and Hájková, 2013). Respondents had an option of multiple choice answers. The results therefore cannot infer the exact number of businesses using the various interest groups.

Summary results of this question in 2006 are displayed in the following figure and table (Fig. 4 and Tab. 5), from which it is clear that companies implementing BPM tools and techniques use mainly the experience of own employees and knowledge gained in BPM training courses (almost 85% of all responses). Only 15% of responses concerned the possibility of using services of consulting companies. Only 8 of the 22 managers who confirmed the use of external companies specified in greater detail the specialization of the consultancy used (Tab. 2). Most often it was a consultancy focused on improving production processes, specifically, e.g.:

- Problem-solving methodology
- QMS
- Poka –Yoke
- Logistics
- Improvement of production processes
- SMED

Fig. 3 - Interest group (year 2006). Source: Tuček and Zámečník, 2007.

Tab. 2 - Legend to the previous graph with quantified confidence intervals (year 2006).  
 Source: Tuček and Zámečník, 2007.

Code	Interest group	Number	Proportion of answers	Lower interval	Upper interval
3A	Own employees only	61	42.36%	0.34592	0.505272
3B	BPM training courses	61	42.36%	0.34592	0.505272
3C	Consulting company	22	15.28%	0.103109	0.220491

Confidence intervals (for reliability estimation of  $1 - \alpha = 0.95$ ), multiple answers

The effect of company size on this question appears to be significant. However, it should be noted that the question was not answered by managers for which the BPM is an unknown term, i.e., managers of mostly micro and small enterprises. Since the use of consulting services can be very expensive, it is not surprising that these services are used almost exclusively by medium-sized and large enterprises (Tab. 3). Even more surprising is the fact that micro enterprises make greater use of external consultants in comparison with BPM training courses (Tuček, Tučková and Hájková, 2013).

Tab. 3 - The effect of company size on the use of interest groups in 2006. Source: Tuček and Zámečník, 2007.

Code	Interest group	Micro	Small	Medium-sized	Large	Total
3A	Own employees only	16.39%	14.75%	37.70%	31.15%	1
3B	BPM training courses	4.92%	11.48%	26.23%	57.38%	1
3C	Consulting company	9.09%	0.00%	45.45%	45.45%	1

In comparison with the results of the previous research, there has not been any significant change.

In 2013, a strong dependence was shown between two factors, namely between who supports the use of techniques and tools of process management and the sizes of enterprises (with

respect to the value of  $p\text{-value} = 0,005$  and value of GK gamma over 0,6 which suggests a relatively strong dependence – both of these are listed in Annex C). KT 3 in Annex D additionally illustrates that the categories of small businesses almost entirely rely on the experiences of own employees. On the other hand, a significant majority of huge companies rely on the services of consultants (consultancy companies operating in the company). In the case of industry itself, no dependence was proven.

In the category of large companies, the services of external consultants in 2013, similarly as in 2006, included the following areas:

- Implementation of the requirements of ISO 9001 or ISO 14001, i.e., consultation in retaining the quality management system (Quality Management System – QMS), EFQM;
- Continuous professional training relevant to the selected process areas (e.g., focusing on process teams or problem-solving methodology);
- However companies often focus their interest primarily on process improvement from key and management groups: e.g., finance, manufacturing and sales, logistics, organizational structure and its optimization in relation to process oriented;
- Similarly as in 2006, respondents mentioned external consultancy focused on quality management system;
- Moreover there appeared also consulting based on economic, accounting, legal, and software basis, selected methods of industrial engineering (SMED, poka-yoke), furthermore consulting of design, development, production and sales, robotics, health and safety conditions, fire safety, etc.

## **5 CONCLUSION: THE MAIN REASONS FOR IMPLEMENTING BPM**

Evaluation of question no. 6 contributes to better clarification of an opinion on how process management is perceived by managers. Simultaneously it illustrates the previous questions on what aims are monitored by managers by using process management. Generally, process management is perceived as a strategic change which affects the processes. As the most significant reasons for this change, in 2006 managers specified the following:

- High inefficiency of the process identified (at the level of 0,64)
- Reorganization of the company requiring a different flow of the process (at the level of 0,60).

After the implementation of changes (processes) through process management, the managers considered these reasons as being medium significant:

- Lack of competitiveness of the company;
- Change in IT support process;
- The need to provide a new product or service.

Fig.3 also shows that acquisition factor or merger in the enterprise (asserted during the growth of the company or during acquisition of new companies, i.e., by merging with other company) proved as a little significant (at the level of 0,40). Other elements were reported by managers only marginally.

How has this understanding changed after approximately 7 years?

As it is evident from Table 1, three same reasons have been revealed in the top four list and these were with the highest importance:

- Identification of high inefficiency of the process;
- Reorganization of the company requiring a different process development;
- Lack of competitiveness.

The first place according to importance went to a change of IT support process. It has the highest value of median factor and the lowest for dispersion:  $\tilde{x} = 3,854$ . As can be observed, dispersion is still relatively high (dovzar = 1,204) and modus  $\hat{x} = 4$  refers to the high importance of IT change for managers.

Tab. 4 - The concept of process management (in 2013) –descriptive statistics. Source: own processing.

Answers option	X6.1 Inefficient business processes	X6.2 Reorganization of the company	X6.3 Insufficient competitiveness	X6.4 Change in IT support process	X6.5 Providing of a new product or service	X6.6 Acquisition or merge
Median value	3,500	3,500	3,521	3,853	2,947	2,500
OR	1,290	1,380	1,411	1,271	1,204	1,396
NOR	0,645	0,690	0,706	0,635	0,602	0,698
modus	4	4	4	4	3	1

Fig. 4 - The concept of process management (in 2013) –graphical representation. Source: own processing.

Due to the median and modus values given in Tab. 4 and due to the density of responses emerging from graphical representation that is a part of the table, it can be stated that the process with high inefficiency is of a slightly lower importance. Acquisition or merger in the

company (asserted during the growth of the company or during acquisition of new companies, i.e., by merging with other company) has emerged as irrelevant, similarly as in year 2006.

In the case of reorganization of the company that required different process behaviour, the following factors have been demonstrated:

The size of the company and its effect can be interpreted by a statistical hypothesis. It is possible to confirm the alternative hypothesis H1, i.e.: “The size of the company according to the number of its employees (and turnover) is significantly associated with the fact that managers understand and evaluate the impacts of business processes due to reorganization of the company.”

This is the evaluation regarding the second largest sector of process management, i.e., essential components. Its usage in the company feasibly meets the real process management principles. Process engineers sometimes name its summarization as the “Ten commandments”. Its application means real and actual usage of the process approach in practice.

Fig. 5 - Process management approach (2006). Source: Tuček and Zámečník, 2007.

Tab. 5 - Reliability intervals (for estimation reliability  $1 - \alpha = 0,95$ ). Source: Tuček and Zámečník, 2007.

Process management is perceived as important by managers due to these reasons::	Average	Standard deviation	Lower int.	Upper int.
1:6D – inefficient business processes	0,638258	0,280258	0,59000	0,68651
2:6A – reorganization of the company	0,602273	0,308831	0,54910	0,65545
3:6C – lack of competitiveness	0,511364	0,322300	0,45587	0,56686
4:6E – change in IT support process	0,507576	0,277907	0,45972	0,55543
5:6B – providing a new product or service	0,475379	0,325242	0,41938	0,53138
6:6F – acquisition or merge	0,401515	0,351873	0,34093	0,46210
6:6G – other reasons	0,054924	0,214713	0,01795	0,09189

The questionnaire also included the so called control questions, which should confirm some claims of the managers. Examples of these may be found in the second block (Area II) of the questionnaire, i.e., the seventh and eighth questions related mainly to the active usage of the components in process management. These components should be used when managers answered the first question that their company fully or partially uses process management. In other words, the real usage of process management components in our companies is presented in the following paragraphs. Managers reported their opinion on the given topic also in other questions and their opinions were often methodically correct. However, for practical usage only answers for two questions are relevant. These components were formulated as the “Ten Commandments” and were included into the most important components that are essential for practical usage of process management in the company. Specifically, these are the components that were defined on the basis of qualitative and quantitative surveys in 2006 (Tuček and Zámečník, 2007).

If we compare the development of the first survey in 2006, it is clear from Fig. 5 that the highest importance is attached to the following principles:

- management of authorities that is seen as a system enabling to assign a role in individual processes (key and managerial) by such employees who have adequate knowledge and skills (at the level of 0,74);
- information technology in the company that leads to support of processes (at the level of 0,72).

In 2006, in the category of small businesses the lower importance was shown in the usage of information technologies for process support (at the level of 0,65), while in investigating large businesses in 2006, it was the principle with the largest weight.

## **PERFORMANCE OF TOURISM IN THE CZECH REPUBLIC**

*Zuzana Tučková, Zuzana Jurigová, Monika Palatková*

### **Abstract**

The growing living standards of people along with the value of leisure time have caused that tourism has become a matter of a wider range of people. It has become one of the most dynamic and fastest growing industries and compared to industries such as automobile or chemical industry, area of tourism can be perceived at the same level. Its development is often associated with the economic growth, development of transport, infrastructure, growing living standards along with the related motivation to travel. Not only for these reasons is tourism taken as a key element of the national economy. It touches a number of sectors and through these sectors it penetrates to a variety of human activities. Vital role of tourism resides in its influence on region since it affects the flow of investment, job creation and it increases the qualification of workforce along with promotion of business activities. For these reasons, managers and stakeholders have to quantify performance and competitiveness of tourism in each destination in order to make it sustainable for future business activities. The purpose of this conference paper is to assess the above mentioned position of tourism by economic factors within the Czech Republic. Though, the paper investigates the performance of tourism in the Czech Republic through selected economic indicators. These economic indicators do not only describe performance of tourism in the Czech Republic but moreover they should give an insight into the relevance of the tourism industry in the Czech Republic and its overall position.

*Keywords: tourism, competitiveness, outbound, inbound, Czech Republic, performance*

JEL Classification: L8

### **1 OBJECTIVE AND METHODOLOGY**

Main objective of this paper is to provide the reader with basic economic indicators of tourism in the Czech Republic since such elaborated summarization of basic Czech tourism indicators is theoretically missing. These indicators serve as measuring performance tool of Czech tourism. Firstly, general importance of tourism is described as a preface to subsequently used economic indicators. With respect to methodology of this paper, researched data are based on own research using relevant expert sources, namely Tourism Satellite Account of the Czech Republic, Czech Statistical Office, Czech National Bank and Economic Data Search Tool by The World Travel and Tourism Council. These data are subsequently analysed and grouped into transparent tables.

### **2 THE IMPORTANCE OF TOURISM**

According to the WTO (World Trade Organization): “tourism comprises the activities of persons travelling to and staying in places outside their usual environment for not more than one consecutive year for leisure, business and other purposes“. (Holloway and Taylor, 2006, p. 6)

Travelling exists as long as humanity itself, but tourism, as we understand it today, began to develop in the 17th and 18th century. It dealt with journeys of noblemen and young apprentices for work experience. Here the first mention about the guiding is also evident.

Tourism in its massive form appeared in the second half of the 19th century. However, its greatest expansion achieved its highest point after the WW II and especially in the last three decades. (Petru, 1999, p. 5) Due to various political changes and consequently a greater freedom, freer movement of people, a desire to travel, to discover new places and to relax, tourism has become one of the fastest growing sectors in the recent years. The formation and development of tourism is associated with satisfaction of two main basic needs - the need for rest/relaxation and the need for knowledge. Over time these needs expanded and today these needs have expanded into more forms. It is also perceived as a kind of fashion and a way of life style. The tourism industry in general includes: boarding services, accommodation services, transport, information, money exchange, services of travel agencies, sports and recreational services, cultural and social tourist services, entertainment services, congress services, spa services, rural tourism services and other activities associated with these services. (Čertík et al., 2001, p. 16).

Tourism is divided into many sectors and it has become increasingly more involved in the formation of GDP and the employment on one side and on the other side it also participates in the preservation of cultural, artistic and historical monuments. (Kiráľová, 2003, p. 9)

In various literature sources, there may appear different definitions of tourism. For instance, in 1942 Hunziker and Krapf defined tourism as “the sum of the phenomena and relationships arising from the travel and stay of non-residents, insofar as they do not lead to permanent residence and are not connected with any earning activity”. (Hunziker and Krapf, 1942). Horner and Swarbrooke (2003) describe tourism as the activity concerning other areas such as accommodation, food and beverage or transportation. In other words, tourism dependence on other economic activities is very strong and this field can not be taken separately. Horner and Swarbrooke (2003) add that the relationship between tourism, leisure services and accommodation or food services is interconnected. However, tourism is taken as an activity, leisure is taken as a time-framed concept and accommodation along with food and beverage belongs to category of ensuring services. Collins (1994) perceives tourism as a company that offers goods and services such as cinema or theater to people during their free time. From this point of view, Collins combines all three, previously mentioned, areas of tourism.

Nowadays the official definition of tourism is given by the World Travel Organization which characterizes tourism as “a social, cultural and economic phenomenon which entails the movement of people to countries or places outside their usual environment for personal or business/professional purposes. These people are called visitors (which may be either tourists or excursionists; residents or non-residents) and tourism has to do with their activities, some of which imply tourism expenditure.” (UNWTO, 2007)

Tourism characteristics must fulfil basic attributes and subsequently the tourism can be formulated into this definition:

- Freedom of movement
- Free resources
- Free time (Palatková a Zichová, 2011, s. 13)

Tourism is a matter of examination from different science fields. It can be examined from economic, geographic, social, psychological or even pedagogical point of view creating disciplines which focus on tourism from different perspectives. These perspectives can be namely tourism economy, tourism psychology, and tourism geography or tourism sociology. People also use different terms to describe tourism, however these are equal to tourism. They might refer to tourism as recreation, relaxation, touring, dispersion or distraction.

## **2.1 Specifications of tourism**

Tourism is not an exception and as well as all other sectors, it has some specific characteristics.

### **The main specifications are:**

- Tourism development is influenced by political and administrative conditions
- Tourism product is not possible to make in advance
- Connection between location and its quality
- Seasonality
- Tourism market is influenced by national resources and by unpredictable sources
- High share of human labour
- Close relation between demand and supply
- Demand relies on disposable income, free time of people and price level of offered services (Jakubíková et. al, 2009, p. 22)

Due to these various specifications of tourism, tourism is categorized into several forms. The categorization can be for example domestic (tourism involves only residents of the country to travel within the country, Slovaks travelling only in Slovakia) or inbound tourism (foreigners coming to the country, e.g. French coming to Slovakia), transit (represented by passing of tourists through a country which is not a destination with a stop) or outbound tourism (involves residents travelling to different countries, e.g. Slovaks travelling to France, Kunešová, 2004, p. 5). Further tourism can be categorized according to the balance of payment (active vs. passive), taking part through the year (year-long, seasonal) or according to sustainability (mass, ecological). Far more classification of tourism describing its purpose exist, however these are the most frequent ones.

## **2.2 The importance of tourism in national economics**

To assess tourism impact on the Czech national economy, two complex tools can be used. Firstly, the balance of payment (BP) recording international tourism of the Czech Republic and secondly, the official and/or unofficial tourism satellite account (TSA) dealing with the set of indicators, esp. tourism impact on the GDP and employment. The official tourism satellite account is created by the Czech statistical office (CSO) while the unofficial tourism satellite account is developed by the World Travel and Tourism Council (WTTC).

Different methods can be used to evaluate the impact of tourism, accepting the fact that tourism can affect the physical, socio-cultural and economic environment in positive as well as in negative way. According to Freyer (2001, p. 316–353), five approaches how to assess tourism impact can be defined:

1. Statistical assessment (statistical monitoring as a basis for further approaches).
2. Economic and financial assessment (economic aspects of tourism).
3. Individual assessment (personality with needs, motivation and consumption/consumer behaviour).
4. Socio-cultural assessment (socio-cultural impact of tourism on the residents and visitors).
5. Global assessment based on the balance of payment (Czech National Bank) and tourism satellite account (Czech Statistical Office and/or WTTC).

Focusing on economic and financial assessment, the magic quadrangle can be used as the basic framework covering the principal macroeconomic indicators, namely GDP / GNI

(economic growth), (un)employment, stable price level (inflation) and external economic balance.

Thus, the analysis of tourism impact on the Czech national economy is primarily the analysis of tourism and the mentioned macroeconomic indicators. Apart from the four mentioned indicators, tourism impact on public budget (receipts and expenditures), capital investment, social development indicators, physical environment, regional development, international trade, exchange rate, foreign direct investment and other fields can be analysed to achieve complex view on tourism impact. Despite of possible complex of connected fields of research and analysis, the set of five indicators has been chosen for purposes of this paper.

The direct, indirect and induced tourism impact has to be distinguished. At present time the Czech official TSA calculates the direct impact either on GDP or on employment only. The unofficial TSA (WTTC) calculates the direct, indirect and induced impact. The direct contribution to GDP/employment is generated by branches that are in direct contact with the visitors (hotels, tour operators, airlines, restaurants and other). The total contribution to GDP/employment means a total of direct, indirect and induced contribution. The indirect contribution to GDP/employment is connected with capital investment, government collective spending and supply-chain effects (purchases of domestic goods and services directly by different branches of the Travel & Tourism sector are taken as inputs to their final tourism output). Induced contribution to GDP/employment covers the additional contribution to GDP/employment generated by spending of employees either directly or indirectly employed by Travel & Tourism (WTTC, 2014).

Tab. 1 - Key economic indicators for the Czech Republic. Source: World Economic Forum. (2013)

Population (millions), 2013	10.9
Surface area (1,000 square kilometers)	78.9
Gross domestic product (US\$ billions), 2013	192.2
Gross domestic product (PPP, US\$) per capita, 2013	18.288
Visitors in 2013 (million)	8.77

### **3 ANALYSIS OF TOURISM IN THE CZECH REPUBLIC**

#### **3.1 Travel & Tourism direct and total contribution to GDP**

GDP represents the financial value of all finished goods and services produced within a country's borders in a specific time period. Though, GDP is usually calculated on an annual basis. It includes all private and public consumption, government outlays, investments and exports less than imports that occur within a defined territory. The direct GDP covers the products/activities produced in the direct branches connected with tourism industry. The indirect GDP is produced in related branches, usually the suppliers to the direct branches. The methodology uses the official services classification of products/activities and related branches (e. g. NACE, SNA – CPC, ISIC).

The data of the CSO and WTTC can be used to analyse the tourism impact on the GDP. The framework methodology is the same and it is based on the IRTS 2008 (International Recommendations for Tourism Statistics) and TSA: RMF 2008 (Tourism Satellite Account: Recommended Methodological Framework). The difference is that the CSO calculates the

TSA with the usage of national accounting whereas WTTC uses the econometric modelling. Surprisingly, the data of the direct tourism impact on GDP are very close to each other as shown in table 1 and table 2.

Tab. 2 - Direct and indirect Travel & Tourism contribution to GDP in the Czech Republic (WTTC) Source: own table based on the Economic Data Search Tool (WTTC)

<b>Czech Republic</b>	<b>1990</b>	<b>1995</b>	<b>2000</b>	<b>2005</b>	<b>2008</b>	<b>2010</b>	<b>2013</b>	<b>2020</b>
<b>Travel &amp; Tourism Direct Contribution to GDP</b>								
US\$ bn	0,483	1,757	2,191	4,351	6,662	5,816	5,636	7,725
Real growth (%)	-10,5	-7,6	18,6	7,9	-3	-0,3	1,4	2,2
% share	2,4	3	3,7	3,3	2,9	2,9	2,8	3
<b>Travel &amp; Tourism Total Contribution to GDP</b>								
US\$ bn	1,368	5,157	6,562	12,801	20,18	17,26	16,65	22,24
Real growth (%)	-8,4	-4	20,8	7,2	0,6	-4,1	1,6	1,9
% share	6,9	8,9	11,1	9,8	8,9	8,7	8,4	8,9

In 2013 the value of goods and services produced by direct branches reached 2,8 % of total GDP produced in the Czech Republic. The total impact of tourism on the GDP was amounted to 8,4 %. Despite the absolute growth of GDP generated in Travel & Tourism, relative share and importance of tourism in the Czech economy is rather diminishing. One reason is the financial and economic crises affecting tourism in the Czech Republic. In a long-term period, the (export) tourism performance lags behind the (export) performance of other branches in the Czech economy. The estimation for 2020 envisages a slight increase of tourism contribution to 3,0 % and 8,9 % respectively.

Similar trend of reducing the economic impact of tourism on GDP is clearly visible in table 3. The maximum reached in 2004 (3,6 %) was diminishing and since 2010 the direct tourism contribution calculated by the CSO has remain at the share of 2,7 %. The conclusion regarding weakening significance of tourism in the Czech economy is underlined by the development of tourism taxes. The total tourism taxes dropped by 30 % in 2004 – 2010 due to slow down of tourism demand and due to “the optimisation” of taxing.

Tab. 3 - Direct Tourism contribution to GDP in the Czech Republic (official TSA)

<b>Czech Republic</b>	<b>2003</b>	<b>2004</b>	<b>2005</b>	<b>2006</b>	<b>2007</b>	<b>2008</b>	<b>2009</b>	<b>2010</b>	<b>2011<sup>1</sup></b>	<b>2012<sup>2</sup></b>
GDP (total) in CZK bn	2 596	2 814	2 987	3 226	3 539	3 693	3 630	3 779	3 845	
Tourism taxes in CZK bn	10,8	18,6	17,4	15,5	16,8	17	15,9	12,9	13,5	14,1

Tourism ratio on GDP (%)	3,5%	3,6%	3,3%	3,1%	2,9%	2,8%	2,9%	2,7%	2,7%	2,7%

<sup>1</sup>)Semi-definitive data, <sup>2</sup>) Preliminary data

Source: own table based on the TSA of the Czech Republic (CSO)

### 3.2 Travel & Tourism direct and total contribution to employment

Jobs creation and tourism is a real issue in modern tourism theory. Commonly, the positive impact of tourism on the number of jobs is emphasized. However, it is emphasized without admitting that the quality of tourism jobs is simply lower compared to other branches (e. g. information technologies, banking or financial operation). Nevertheless, the effect of tourism as a job creator not only at the national, but also at the regional and local level is significant (table 3).

Similarly to the GDP the direct, indirect and induced effects of tourism on employment are monitored. WTTC (table 4) calculates almost 250 thousand direct working places generated in tourism in the Czech Republic. Total number covering direct, indirect and induced working places exceeds 510 thousand. Approximately, 5,5 % of employees in the Czech economy are engaged in Travel & Tourism directly and the total contribution of tourism to employment surpassed 10 % in 2013.

Tab. 4 - Direct and indirect Travel & Tourism contribution to employment in the Czech Republic (WTTC) Source: own table based on the Economic Data Search Tool (WTTC)

<b>Czech Republic</b>	<b>1990</b>	<b>1995</b>	<b>2000</b>	<b>2005</b>	<b>2008</b>	<b>2010</b>	<b>2013</b>	<b>2020</b>
<b>Travel &amp; Tourism Direct Contribution to Employment</b>								
Real growth (%)	-9,7	-8,2	13,1	11,1	0,6	0,4	3,2	-0,1
% share	3,5	4,5	5,5	5,2	5,3	5,3	5	5,6
'000	190	225,1	260,4	248,9	265,2	260,9	248,4	286,4
<b>Travel &amp; Tourism Total Contribution to Employment</b>								
Real growth (%)	-8,1	-7,3	15,9	5,8	1	-4,6	3,4	-0,5
% share	7,8	10,1	12,5	11,4	11,1	10,9	10,3	11,2

The highest absolute and relative tourism impact on employment was recorded approximately in 2000. Since then, the importance of tourism is slightly decreasing. The estimation of WTTC expects moderate increase in 2020 to 5,6 % in direct impact and 11,2 % in total impact.

Tab. 5 - Direct Tourism contribution to employment in the Czech Republic (official TSA) Source: own table based on the TSA of the Czech Republic (CSO)

<b>Czech Republic</b>	<b>2003</b>	<b>2004</b>	<b>2005</b>	<b>2006</b>	<b>2007</b>	<b>2008</b>	<b>2009</b>	<b>2010</b>	<b>2011<sup>1</sup></b>	<b>2012<sup>2</sup></b>
Number of people employed in tourism ('000)	237,8	236,6	236,7	235,9	236	241,2	239,5	235,6	232,5	231,1
Tourism ration on total employment - people employed	4,8%	4,8%	4,7%	4,6%	4,5%	4,6%	4,6%	4,7%	4,6%	4,6%
Number of working places in tourism ('000)*	233,5	232,9	233,7	231,5	233,5	236,4	236,6	232,1	229,2	227,7
Tourism ration on total employment - jobs (%)	4,7%	4,7%	4,7%	4,6%	4,5%	4,5%	4,6%	4,6%	4,6%	4,5%

<sup>1</sup>)Semi-definitive data, <sup>2</sup>) Preliminary data

\*Number of jobs in full-time equivalents

For analysing of the quantity and quality of employment in tourism, the data of the CSO can be applied. The basic data are summarized in table 5. Moreover, the insight into the employment quality in terms of education, age, gender, nationality and other attributes of tourism employment provides highly-valued information. The rate of direct employment in tourism in the Czech Republic oscillates between 4,5 – 4,8 % in last decade, but the trend is rather decreasing. According to the official TSA, 4,5 % of jobs were generated by tourism in 2012.

### **3.3 Visitor Exports (tourism income)**

According to the methodology of WTTC, visitor exports represent the expenditure within the country by international visitors for both business and leisure purposes (e. g. spending on accommodation, transport, but excluding education). Since the 90's, the dynamics of incoming tourism in the Czech Republic was high and the performance of other branches was relatively lower. The amount of visitor exports was growing up until 2000. However, the trend is negative in the last decades. In 2013, the unofficial satellite account states more than 7,6 USD bn of visitor exports with projection for further growth.

Tab. 6 - Visitor exports in the Czech Republic (WTTC) Source: own table based on the Economic Data Search Tool (WTTC)

<b>Czech Republic</b>	<b>1990</b>	<b>1995</b>	<b>2000</b>	<b>2005</b>	<b>2008</b>	<b>2010</b>	<b>2013</b>	<b>2020</b>
<b>Visitor Exports (total inbound tourism expenditure)</b>								
US\$ bn	0,407	2,796	2,887	5,574	8,532	7,682	7,645	10,916
Real growth (%)	-22,2	-2,9	3,8	9,5	-5,5	2,4	0	1,7
% share	5,3	10	8	6,6	5,8	5,8	4,9	4,8

As a supplementary source of information on visitor exports, the Czech balance of payment (Czech National Bank) can be analysed as shown in Figure 1. Concerning the importance of tourism export and import compared to the volume of export of goods and services, the peak was reached in second half of 90's. The proportion of foreign tourism receipts to export of goods got to 19 % and its proportion to export of services exceeded 50 %. Since 1996 – 1998 the weight of tourism in international trade of the Czech Republic was declining. The recent values of the mentioned indicators (2013) are amounted to 5,2 % and 31,5 % respectively. The analogous trend is relevant for tourism import (outgoing tourism).

Fig. 1 - Importance of tourism export and import in international trade in the Czech Republic (1993 - 2013) Source: own figure based on data recorded in balance of payment (Czech National Bank)

### 3.4 Domestic Travel & Tourism spending

The indicator of domestic travel and tourism spending comprises spending within a country by country's residents on domestic trips and the expenditure within the economy of reference of visitors that undertake outbound trips. The outbound spending outside the country is fully aligned with the total outbound tourism and is separately recorded according to the TSA: RMF 2008.

Tab. 7 - Domestic Travel & Tourism spending in the Czech Republic (WTTC)  
Source: own table based on the Economic Data Search Tool (WTTC)

Czech Republic	1990	1995	2000	2005	2008	2010	2013	2020
<b>Domestic Travel &amp; Tourism Spending</b>								
US\$ bn	0,768	1,426	2,106	4,066	6,316	5,264	4,993	6,567
Real growth (%)	-3,3	-20	22,9	4,3	0,9	-1,8	2,7	3,3
% share	3,9	2,4	3,5	3,1	2,8	2,6	2,5	2,6

Since the 90's, dynamic change in the domestic travel and tourism spending is documented in the table 7. Thanks to the positive development of Czech economy and strengthening of the Czech crown (CZK) in 2003 – 2008, the outbound spending realized within the Czech economy increased significantly. After 2009, the domestic spending dropped to approx. 5 bn USD in 2003 due to slowing down of consumption in domestic as well as outbound tourism. The indicators of domestic and outbound tourism illustrating the development in the period 2003 – 2012 are depicted in figure 2. Domestic and outbound tourism consumption was increasing up to 2008 to 107,8 bn CZK and 87,3 bn CZK respectively. Since 2009, the financial indicators of domestic and especially outbound tourism slumped to their minimal value in 2011 and 2012 due to slackening of economic growth, increasing unemployment rate

and weakening exchange rate of CZK to EUR and USD. By contrast, the tourism outbound expenditure recorded in balance of payment was continually growing up to 84 bn CZK in 2012. Number of outbound visitors got at its maximum in 2008 (12,7 mn outbound visitors), but afterwards it declined to 10,9 mn visitors (2011). The dramatic fall can be detected in number of domestic visitors that was diminishing from 105,1 mn (2004) to 76,3 mn in 2012 esp. due to decrease of number of tourists by approx. 20 %.

\* Number of visitors = tourists + excursionists + tourists on business trips

Fig. 2 - Domestic and outbound tourism in the Czech Republic (2003 – 2012) Source: own figure based on data of CSO (incl. TSA) and Czech National Bank (BP), own figure based on data of CSO (TSA).

## 4 INBOUND AND OUTBOUND TOURISM IN FIGURES

The general view in Fig.2 shows the development of the number of tourists, excursionists and total number of inbound, domestic and outbound visitors in the Czech Republic as calculated in the official TSA. The peak in terms of number of trips and overnights in the mentioned categories of visitors was reached in 2008. The previous positive trend was interrupted by the financial and economic crises and the domestic, inbound and outbound demand had declined.

### 4.1 Inbound Tourism

The inbound basic indicators have been focused on number of arrivals and overnights in collective accommodation establishments (CAE) as well as on consumption (visitors, tourists, excursionists). Receipts recorded in balance of payment are summarized in table 8. Range of economic, political, cultural, social, and legislative and other factors influencing inbound tourism in the last decades up to now are worth of mentioning:

- defining and formalizing of the national tourism policy (Ministry for Regional Development),

- marketing activities realised by the Czech national tourism organisation (CzechTourism),
- accession of the Czech Republic in the EU (May 1<sup>st</sup> 2004),
- joining the Schengen area (December 21<sup>th</sup> 2007),
- acquisition of EU funding focusing tourism development in Czech regions,
- liberalisation of European air transport and booming operations of low cost airlines,
- financial and economic crises in 2008/2009 and their negative impact on slumping the demand abroad in following period,
- economic trouble in most of main source markets esp. in Western Europe hit by global economic crises and by internal financial imbalances,
- dynamic increase of arrivals from emerging markets (e. g. South Korea, China, Brazil, Russia, Ukraine, India) due to their growing economic power,
- strengthening of CZK to EUR and USD till 2008,
- decreasing of price competitiveness of the Czech Republic,
- increasing demands and requirements of inbound visitors on quality and structure of the tourist product,
- shift of the prevailing economic motivation influencing the demand to non-economic factors,
- adapting of Czech national legislation to European legislative acts (esp. directives and regulations),
- competition of cheaper and/or high-quality international destinations,
- development of tourist infrastructure in terms of quantity and quality in the Czech Republic (Czech regions),
- natural disasters, more specifically in the form of floods (2002),
- external influence, esp. downswing of internal demand after September 11<sup>th</sup> 2001, the potential conflict between Russia and Ukraine (2014).

Tab. 8 - Inbound tourism in the Czech Republic (2000 – 2013) Source: own table based on data of CSO (incl. TSA) and Czech National Bank (BP)

<b>Inbound tourism indicator</b>	<b>2000</b>	<b>2005</b>	<b>2008</b>	<b>2009</b>	<b>2010</b>	<b>2011</b>	<b>2012</b>	<b>2013</b>
Inbound receipts (BP) in USD bn	2,9	4,6	7,7	7,0	7,1	7,7	7,0	7,1
Inbound consumption (CZK bn) visitors	na	138,0	136,5	125,1	113,5	114,7	119,0	x
Inbound consumption (CZK bn) tourists	na	97,1	90,8	83,8	81,1	80,6	83,8	x
Inb. consumptions (CZK bn) excursionists	na	25,4	27,3	23,8	16,3	17,5	19,4	x
Inbound visitors (mn)	na	24,7	26,6	23,3	21,9	22,8	24,1	x
Inbound tourists (mn)	na	9,4	10,1	8,8	8,6	9,0	9,5	x
Inbound excursionists (mn)	na	15,3	16,5	14,4	13,3	13,8	14,6	x
Inbound arrivals in CAE (mn)	4,9	6,3	6,7	6,0	6,3	6,7	7,2	7,3
Inbound overnights in a CAE (mn)	16,5	19,6	20,0	17,7	18,4	19,4	20,5	20,7

The regional spread of the foreign demand is one of the issues of inbound tourism to the Czech Republic since 90's. Prague is the key destination attracting 65 % arrivals and almost 60 % overnights in the collective accommodation establishments. The region of Karlovy Vary, South Moravia and South Bohemia keep between 5 – 10 % of arrivals and overnights each.

Since 90's, the inbound market portfolio of the Czech Republic has changed. Although the European markets still dominate in terms of arrivals and overnights, the new emerging markets has become the most dynamic part of the portfolio in last decade. The portfolio is much diversified, even fragmented. The biggest share (19 %) holds Germany, Russia is placed at second (10 %) position, Slovakia at third (5 %), Poland (5 %) at fourth and USA (5 %) at fifth rank. The share of Hungary is approximately 1,6 % (115 thousand arrivals).

#### **4.2 Outbound Tourism**

The principal outbound tourism indicators are listed in table 9, showing the development in period 2000 – 2013. In 2003 – 2008 the outbound demand rose dynamically thanks to the advantageous development of CZK exchange rate and prosperous development of Czech economy. The mentioned period was characterised by the quantitative changes, but also qualitative progress of the Czech outbound market mainly in terms of consumer behaviour.

After 2008, the outbound consumption and number of visitors were affected by economic and financial crisis and by worse performance of the Czech economy. The price sensitivity and income sensitivity of outbound demand is obvious, thus the economic factors influencing the outbound demand prevail over the non-economic factors. Nevertheless, during the monitored period, the Czech visitors turned into more demanding and experienced clients requiring a broad range of high-quality tourism services, esp. accommodation and transport services.

Tab. 9 - Outbound tourism in the Czech Republic 2000 – 2013 Source: own table based on data from official TSA (CSO) and Balance of payment statistics (CNB)

<b>Outbound tourism indicator</b>	<b>2000</b>	<b>2005</b>	<b>2008</b>	<b>2009</b>	<b>2010</b>	<b>2011</b>	<b>2012</b>	<b>2013</b>
Outbound expenditures (BP) in CZK bn	49,4	57,8	77,5	77,2	77,6	80,6	84,1	89,9
Outbound consumption (CZK bn) visitors	Na	66,9	87,3	77,3	67,6	61,6	62,8	x
Outbound consumption (CZK bn) tourists	Na	45,4	61,5	53,7	45,0	42,3	44,8	x
Out. consumptions (CZK bn) excursionists	Na	2,9	3,9	3,9	3,7	3,4	4,1	x
Outbound visitors (mn)	Na	10,8	12,7	12,3	11,9	10,9	11,0	x
Outbound tourists (mn)	Na	8,3	9,7	8,9	8,7	7,9	7,9	x
Outbound excursionists (mn)	Na	2,5	3,0	3,4	3,2	3,0	3,1	x
Outbound long trips (thousand)	2,6	4,4	5,0	4,5	4,3	4,3	4,4	4,2
Overnights on outbound long trips (thousand)	Na	38,3	46,0	39,3	38,0	34,7	36,3	35,1
Outbound short trips (thousand)	0,5	1,0	1,5	1,3	1,3	1,0	1,1	1,1

*\* Long trips = Trips at 4 or more overnights, Short trips = trips at 1 - 3 overnights  
(methodological changes in 2003, 2009 and 2011)*

*\*\* Number of visitors = tourists + excursionists + tourists on business trips*

The structure of Czech outbound destinations shows the significant share. 19 % of Czech clients travel to Croatia followed by Italy (12 %) and Slovakia (12 %). Greece, Austria and Turkey take the share of 8 % and 7 % respectively. In 2013, Czechs made 90 thousand trips to Hungary (532 thousand of overnights).

#### **4.3 Domestic Tourism**

In the last decade figures on domestic tourism indicate rather hesitating development of domestic demand. The top level of domestic demand was reached in 2008 ensued by decrease of most of the indicators. Only in 2012 and 2013 first sign of recovery can be found out. Despite of starting the positive trend, high dynamic of domestic demand can not be expected in the future. The domestic tourism has been changed primarily in qualitative way and further qualitative changes can be expected in coming years. It can be generated by increasing requirements of domestic clients as well as by increasing level of quality and widening choice of services.

## **5 CONCLUSION**

The previous analysis of chosen indicators of tourism economic importance in the Czech Republic in period 1990 – 2013 can be summarized in the following way.

The absolute figures of Czech tourism export receipts and import expenditure were continuously increasing except for some years. When looking at the dynamic of import expenditure, it is higher than the dynamic of export receipts. The relative importance of tourism in international business relations has been decreasing since the end of 90's and despite the absolute growth of GDP and employment generated by tourism in the Czech economy its relative share on total GDP and employment is diminishing. In terms of employment, the qualitative aspects have to be analysed within education, age, nationality and other qualitative attributes of employment,

The share of tourism capital investment is stagnating around 4 % in the total capita investment in the Czech Republic in long-term, but its absolute worth does not show unambiguous trend in the monitored period,

The national tourism policy 2014 – 2020 was launched and approved by Czech government, having in mind the strategic vision and strategic goal for the mentioned period. The strategic vision "Destination Czech Republic – the number one in heart of Europe" is followed by the strategic goal focusing increasing of the competitiveness of tourism at the national and regional level and maintenance of its economic performance as the result of equilibrium among economic, socio-cultural, environmental and regional development. Current tourism policy is primarily dealing with a plenty of problems and challenges. One of them are issues related to systemic development of destination marketing management – institutions, power and competencies in tourism, effective and efficient financing. More concretely, European financing and its measurability is taken as up-to-date topic since the role of tourism in regional and social development grows.

Destination marketing activities will be backed up by product development, product distribution and marketing communication. Quality of tourism services will be more based on knowledge and innovation management. Last but not least future change of tourism will be connected with the cooperation and partnership between private and public sectors in order to make the destination more competitive. To sum up all tourism challenges and future policy,

tourism will have to become more sustainable in order to preserve its function and competitiveness for future functioning.

The position of the Czech Republic in the international comparison prepared by World Economic Forum got worse since 2009 (26th rank) to 2013 (31st rank). Compared to V4 countries and to Germany and Austria, the competitiveness index TPCI of the Czech Republic achieved better evaluation than Hungary (39th), Poland (42nd) and Slovakia (54th), but substantially worse result than Germany (2nd) or Austria (3rd). In the V4 group Hungary is the immediate competitor to the Czech Republic or rather Budapest to Vienna in the city tourism market.

In-depth view into particular competitiveness indicators bring following findings on strengths (higher competitiveness rating) and weaknesses (low rating) of the Czech Republic compared to other mentioned destinations.

Competitiveness along with outbound, inbound and domestic tourism represents statistical data that compare the economic situation of tourism to other world destinations, or states. It significantly contributes to employment and GDP which is further mirrored in the overall economic situation of the Czech Republic. All three characteristics were introduced in this article in order to prove the financial importance of tourism in the Czech Republic.

## **FINANCIAL RISK MANAGEMENT IN THE SME SEGMENT IN THE CZECH REPUBLIC**

*Zuzana Virglerová*

### **Abstract**

The aim of this article is to examine the level of financial risk management and the evaluation of Czech managers of their ability to manage these risks properly. In order to do so, entrepreneurs of small and medium-sized enterprises (SME) from a selected region of the Czech Republic were surveyed. The results of this survey were then compared to a similar survey conducted in a selected region of Slovakia. The results show the entrepreneurs in both countries have a similar approach to the financial risk management and share a similar opinion on their ability to manage these risks properly. However, the profitability of their companies has decreased in the current crisis what could be caused exactly by overestimating their own skills in the field of the financial risk management or the poor management of other risks impacting the financial risks afterwards.

*Keywords: Risk Management, SME, Crisis, Risks*

JEL Classification: G32, L26, O16

### **1 INTRODUCTION**

Small and medium-sized enterprises (SME) are without a doubt an essential part of every market economy (Karpak a Topcu, 2010). In line with that Henderson and Weiler (2010) state that SME could be characterised as the most important catalyst for economic growth. 99 % of all companies are from the SME segment in the European Union and the USA (Bhaird, 2010). The key of their success is their business orientation (Brockman, Jones, Becherer, 2012). Soinen, Martikainen, Puumalainen and Kyläheiko (2012) consider innovativeness, risk acceptance and active approach as the base of business orientation. Lumpkin and Dess (1996) add aggressive competitive approach and the entrepreneurs' autonomy.

The SME activity is endangered by many risks. It is vital for entrepreneurs to continually evaluate all the possible risks and to pay the same level of attention to decisions in this field as they pay to decisions in any other field. (Čunderlík and Rybárová, 2002). In fact, every decision poses a risk to a company. For example, Kramoliš (2014) stated that the companies and businesses in the Czech Republic are quite well-oriented in the field of the marketing theory of Product Life Cycle. It means they try to decrease a risk of market failure.

The conclusion of a broad international study of The Economist Intelligence Unit and Dun & Bradstreet (Riadenie odberateľských a dodavatelských rizík, 2013) is that companies that not only manage the business risks but also regularly evaluate such management obtain better results. Omitting a systematic approach forces the companies to solve problems as they appear. Whereas the management of financial risks (e.g. currency or interest rate risks) and customer credit risk is quite wide-spread, companies pay much less attention to other risks, such as supplier risks or the reputation loss risk. Nevertheless, all the above mentioned risks can influence the financial risk itself.

As a result, the aim of this article is to examine the level of financial risk management and the evaluation of Czech managers of their ability to manage these risks properly. The results of the conducted survey are then compared to the results of a similar one from Slovakia.

## 2 THEORETICAL BACKGROUND

European Commission (2011) declares the source of the European economic strength is 23 million European SMEs representing thus 98 % of the business sector. They cover two thirds of the employment contracts in the private sector and have created approximately 80 % of new jobs in the last 5 years. The definition of SME can be found in the Recommendation of the European Commission 2003/361. The main factors determining if a company belongs to the SME segment are:

1. number of employees
2. annual turnover or the annual balance sheet total.

Tab. 1 – Small and Medium-sized Enterprises According to the EC. Source: European Commission (2015)

Enterprise category	Number of employees	Turnover	Or	Balance sheet total
<b>Medium-sized</b>	< 250	≤ 50 million EUR		≤ 43 million EUR
<b>Small</b>	< 50	≤ 10 million EUR		≤ 10 million EUR
<b>Micro</b>	< 10	≤ 2 million EUR		≤ 2 million EUR

EUROSTAT (2015) defines the small and medium-sized enterprises in the following manner:

- micro enterprises: with less than 10 persons employed;
- small enterprises: with 10-49 persons employed;
- medium-sized enterprises: with 50-249 persons employed;
- small and medium sized enterprises (SMEs): with 1-249 persons employed;
- large enterprises: with 250 or more persons employed.

The focus of SME is to gain profit and minimise all the risk appearing within their activities. The risk is according to Smejkal and Raise (2006) characterised in various ways:

- as the probability or possibility of loss or failure
- as the variability of the possible results or the uncertainty of their achievement
- as the variation between expected and real results
- as the probability of any result different from the expected one
- as the situation when the quantitative magnitude of a certain occurrence is subject to a certain probability distribution
- as the danger of the negative variation from the target (so called net risk)
- as the possibility of loss or profit (so called speculative risk)
- as the uncertainty resulting from the asset value volatility (so called investment risk)
- as the average value of the loss function
- as the possibility of a specific threat prospering from a specific system vulnerability

According to Varcholová (2008), risk is a threat of loss at the certain level of knowledge of the environment. It means that from the business decision point of view, risk is compound by two elements: uncertainty and negative influence of this uncertainty on the decision subject.

Thus it is essential for companies to dedicate their resources to risk management. The aim of risk management is to identify, analyse, evaluate, solve and monitor risks possibly endangering the company.

Business risk management can be defined as a structured and disciplined approach putting in harmony the strategy, human resources, technology and knowledge in order to evaluate and manage uncertainty a company is facing in the process of creating value. It is a truly holistic and integrated process covering all the business threats and opportunities. (DeLoach, 2000).

Risk Management Guide for Small and Medium Businesses (2009) created by the organisation CPA Australia enumerates these specific risks of SME: customer risk, supplier risk, personnel risk, operating risk, reputation risk, financial risks (e.g. liquidity, credit, currency, interest rates risk etc.), competitive risk, market risk, economic risk, unexpected owner leave and many others (connected to internal scrutiny, sales, receivables, payables, purchasing etc.).

All the business risks have an impact on the financial performance of a company and could lead to a default. Eurobarometer (European Commission, 2012) focused on doing business in the European Union territory and out of it pointed out that a default risk prevent almost a half of the respondents from founding their own company.

The negative impact of various risks is multiplied in the crisis periods. The last financial crisis has significantly changed the European SME managers view on the risk management. Various studies have revealed certain mistakes that had been done during the crisis, such as poor cash flow management or insufficient financial risks management (i.e. missing early warning of a financial manager). If managers had prevented these mistakes they could have reduced or completely avoided the negative influences of crisis on their companies. (Krištofik, 2010).

In this context Siakas, Vassiliadis, and Siakas (2014) state that family businesses tend to have greater resistance toward the impacts of the financial crises due to the family ties.

### **3 RESEARCH AIM AND METHODOLOGY**

The aim of this article is to analyse risk management (above all the financial risk management and the default risk management) in companies of the Zlin region, the Czech Republic. The results of the conducted survey are then compared to a similar survey carried out in the Trenčín region, Slovakia. The results are a partial conclusion of a wider business environment survey realised at Thomas Bata University in 2013.

As for the sample size, 180 SMEs have been reached in the Zlin region. The companies' data was provided by their owners. In the Zlin region, there were 107,000 SMEs in 2012. (Ministry of Industry and Trade of the Czech Republic, 2013). In the Trenčín region, 105 companies have been reached. The regions were compared as a consequence of their territorial and economical similarities.

According to Czech Statistical Office the region of Zlin has an area of 3,964 km<sup>2</sup>, has approximately 600,000 inhabitants, the GDP per capita is around 11,720 EUR and the current level of unemployment is 8 %.

The structure of the surveyed companies is as follows: 70 % of them exist more than 10 years, 21 % between 10 and 5 years and 9 % between 5 and one year. (5-10 years missing) As for the business sector, 35 % were trade companies, 29 % industrial companies, 12 % constructing companies, 4 % transportation companies and 3 % agricultural companies. The rest is from other sectors.

The research has examined three research questions:

*Q1: The average value of financial risks is at least 30 % in the selected regions of the Czech Republic and Slovakia.*

*Q2: At least 50 % of the surveyed Czech and Slovak entrepreneurs think their company can manage financial risks properly.*

The associations were analysed by Pearson statistics for counting of data.

P-value has been compared to standard 5% confidence level. P-value that is lower than the confidence level leads to the rejection of the null hypothesis. The null claims there is no association between variables. The calculations have been performed in statistical packages XL Statistics and R. Finally, the instruments of descriptive statistics, such as percentages and averages have been used.

For better illustration, the Index of change has been calculated ( $I_{ch}$  = value of the parameter in the Czech Republic/value of the parameter in Slovakia). Value of the Index of change ( $I_{ch}$ ) in the interval (0, 0.200) demonstrates a zone of low intensity of change. The interval (0.201, 0.500) represents a moderate intensity change and the interval (0.501, above) constitutes a high intensity change of the index.

#### **4 RESULTS AND DISCUSSION**

The first research question Q1 was examined by asking the entrepreneurs to quantify the intensity of certain risks. The entrepreneurs were asked to choose from the list of risks (market risk, financial risk, operational risk, personnel risk, legal risk, security risk) the three most important ones. The following Table 2 interprets the average value of financial risks. The Figure 1 then represents the average values of all risks included in the survey.

Tab. 2 – Importance of Financial Risks for Entrepreneurs in the Czech Republic and Slovakia.

Source: own source

	Czech Republic(Zlín) 2013 in pieces/%			Slovakia (Trenčín) 2013 in pieces/%	p- value $I_{ch}$
<b>Financial risk</b>	103	57.22	53	50.48	0.3269
<b>Average value*</b>		34.00		30.10	1.130

\*average of values reported by entrepreneurs in different regions.

Fig. 1. – The Key Business Risks According to Entrepreneurs. Source: own source

The most important business risks which were perceived by entrepreneurs in the Czech Republic and Slovakia were as follows: market, financial and personnel risks. The financial risk was identified as a third most essential risk, which means 57.22 % (average value 34 %) of entrepreneurs in the Czech Republic and 50.48 % (average value 30.10 %) in Slovakia have chosen this risk as a key one. Thus the first research question Q1 has been confirmed.

However, the market risk is perceived as the most important by entrepreneurs of both regions. In the Czech Republic, the second most important is the security risk and the third position is occupied by the financial and legal risk. In Slovakia, the second most important is the legal and the third one is the personnel risk. The importance of the legal risk was also pointed out by Šúbertová (2011): the changes of the legislation for SME are frequent and require much attention from the small and medium companies. These often do not dispose qualified specialists able to monitor all the changes. Entrepreneurs themselves perceive the large number of changes in the legislation very sensibly and 54 % of them find the level of SME legislation changes partially or completely problematic.

Smejkal and Rais (2011) state the most frequent legal risks in organisations:

- Law-breaking practice in the process of legal actions connected to the enterprise existence
- Utilisation of inconvenient internal legal norms, contracts with suppliers, customers or employees
- Ignoring the author's rights protection
- Ignoring the personal data protection
- Breaking the general or specific legal norms regarding a certain subject
- Uninsufficient organisation properties protection, as well as insufficient protection of health, life or properties of individuals
- Incorrect actions of corporate representatives or organisation employees which can lead to a moral or financial damage for the company

Among the many risks an enterprise faces, supply or supply chain risks are especially important to manage, due to the increased importance of supply chain partners (Gottfredson et al.,2005; Narasimhan and Talluri,2009).

The Table 3 shows the opinion of the surveyed entrepreneurs on their ability to manage the financial risks in their companies properly.

Tab. 3 – Ability to Manage Properly Financial Risks in the Company. Source: own source

	<b>Czech Republic (Zlin) 2013 in %</b>	<b>Slovakia (Trenčín) 2013 in %</b>	<b>p-value</b>
<b>yes</b>	41.11	31.43	<b>&lt;0.1323</b>
<b>to the certain extent</b>	55.00	57.14	<b>0.8183</b>
<b>no</b>	0.56	0.00	-
<b>I cannot judge</b>	3.33	11.43	-

As it is obvious from the table, the opinion of the Czech and Slovak entrepreneurs is similar as for their skills to manage financial risks. 96.11 % of the Czech entrepreneurs think they can manage financial risks properly or to a certain extent properly. Their Slovak counterparts are a bit less self-confident, 88.57 % of them share the same opinion. As the p-value in both lines with relevant results is above the critical value (0.05), the null hypothesis cannot be rejected.

As already mentioned above, unprofessional management of financial risks can lead to a company default. In this context, Belás et al. (2014) declares that in the Czech Republic, up to 95 % of entrepreneurs believe their company will survive the next five years. In Slovakia, the rate was 90 % which leads to the conclusion that the level of business optimism is very similar in the Czech Republic and Slovakia. The level of business optimism in the selected regions is not related to the field, the age or the size of a company. (Belás, Bilan, Demjan, Sipko, 2015)

The examination of the third research question is the object of the Table 4.

Tab. 4 – The Current Profitability of SMEs in the Czech Republic and Slovakia Compared to the Pre-Crisis Period. Source: own source

	<b>Czech Republic (Zlin) 2013 in %</b>	<b>Slovakia (Trenčín) 2013 in %</b>	<b>p-value</b>
<b>Significant decrease (more than 20 %)</b>	23.89	30.48	<b>0.2807</b>
<b>Modest decrease (0-20 %)</b>	34.44	37.14	<b>0.7406</b>
<b>Constant profitability</b>	22.22	19.05	<b>0.7078</b>
<b>Modest increase (0-20 %)</b>	12.22	6.67	<b>0.1959</b>
<b>Significant increase (more than 20 %)</b>	3.89	3.81	-
<b>I did not run my business before the crisis</b>	3.33	2.85	-

The average decrease of the profitability in the Czech Republic was 10.44 % (calculated as a weighted average of the upper margins of the single intervals). The average decrease reached the level of 14.09 % in Slovakia. The entrepreneurs in both regions share the opinion that

their profitability rather decreased (58.33 % in the Czech Republic, 67.62 % in Slovakia). The null hypothesis was thus confirmed.

Nevertheless, this research has its limitations. First of all, the respondents could have had problems with understanding the questions or their answers could have been false. However, as pointed out by Graham and Harvey (2001) and Lins et al. (2010), it is not clear why corporate executives would take their time to respond to a lengthy survey if their intent was to be untruthful. Secondly, the survey was conducted only in one region of the Czech Republic and one region of Slovakia which restrains from generalising the results.

## **5 CONCLUSION**

The conducted research of financial risk management in the business environment of the Czech Republic and Slovakia confirmed all three formulated research question.

The first research question Q1 confirmed the Czech and Slovak entrepreneurs perceive the financial risk as one of the most important in the company. The average value of financial risks was found to be at least at the level of 30 % in both selected regions.

The second research question Q2 showed a high self-esteem of the Czech and Slovak entrepreneurs as for their abilities to manage financial risks properly. 96.11 % of the Czech entrepreneurs and 88.57 % of the Slovak entrepreneurs stated they can manage financial risks properly or to some extent properly.

The third research question Q3 compared the levels of current profitability to the pre-crisis period. It was found out the Czech as well as the Slovak entrepreneurs registered decreases in their profitability. This is not in line with the answers to the previous question. If the financial risks had been managed properly, the profitability decrease could have been prevented or at least reduced.

Comparing the situation in both countries, it can be stated that financial risks are better managed in the selected region of the Czech Republic. Not only the entrepreneurs have a higher self-confidence as for the proper management of financial risks, but also the decrease in their profitability is lower than in case of their Slovak counterparts. However, entrepreneurs of both regions share the opinion that the most important risk in their business is the market risk. Thus it seems as if the surveyed entrepreneurs did not realise the final impact of selected risks on the financial risk.

In this context Belás, Bartoš, Habánik, and Novák (2014) state that despite the better macroeconomic trends in Slovakia, the situation for doing business in the SME segment is less favourable in Slovakia than in the Czech Republic. Czech entrepreneurs compared to Slovak entrepreneurs indicate less impact of the crisis on their profitability, slightly better approach of banks to their financing, a better attitude of state to their needs, as well as lower perception of corruption and a higher degree of business optimism.

## **A VALUE-BASED ANALYSIS OF RENTAL CONTRACTS**

*Jan Vlachý*

### **Abstract**

This paper develops a dynamic option-based model for the valuation of rental and similar lease contracts, solved by statistical simulation. Following up on a previously published general firm-theoretical approach by the author in this particular context, it shows that due to path-dependency, Monte Carlo is a suitable tool for analyzing embedded options characteristic for rental and lease relationships. Amongst other insights in a microeconomic context, it demonstrates the sensitivities of particular value drivers, including transaction costs.

*Keywords: Intangibles Valuation, Rental Contracts, Embedded Options*

JEL Classification: D46, D92, G31, L21

### **1 INTRODUCTION**

Value-based methods for assessing tangible investments are a familiar tool for most decision-makers, they form a fundamental part of management education and they are extensively used for key constituents of the strategic management process, such as capital budgeting. The essential principles of the discounted cash-flow model have been public domain for over one hundred years (Rubinstein, 2006).

Besides tangible assets, however, the value of any business may be strongly determined by intangibles. These generally constitute various rights, opportunities and obligations that can substantially boost, and sometimes diminish, the value of a company when compared to the balance of its assets and liabilities, and they may include diverse items, ranging from licences and brands to specific business skills and market share (Kogut and Zander, 1992; Ortiz, 2006). Vlachý (2009a) embraced the topic within the framework of a firm-theoretical model with direct couplings to existing valuation tools based on financial theory, in particular real options. Vlachý (2010), preceded by Vlachý and Vlachý (2008), has developed this valuation concept for the particular case of contractual assets, i.e. any value, positive or negative, constituted by an outstanding contract between a company and any other party, and shown that embedded options may substantially impact the contract's value, as well as the precedent negotiating strategy.

Financial economics describes any right, including the right or opportunity to abandon a commitment, as an option. In contrast to financial options, which are typically conceived as negotiable securities (Hull, 2012), embedded options constitute indivisible components of financial or real contracts (Moore, 2001). These defining attributes notwithstanding, they may materially impact such contracts' value and in some cases, this difference, i.e. option value, can be observed empirically (Myers, 1977; Mitchell, 1991).

This paper utilizes an isogenous method for application in commercial rental agreements, but, by analogy, also suitable for other lease situations. Its goal is to develop and analyze an option-based model of rental lease valuation and contracting, with an emphasis on their value drivers, stemming from termination clauses and transaction costs, which constitute a characteristic feature of contracts in the industry (Goddard and Marcum, 2012). In contrast to

the former papers by Vlachý (2008, 2010), it uses numerical simulation, which is a much more universal approach than searching for closed-form solutions of stochastic differential equations (Breton and Ben-Ameur, 2005).

The paper is organized as follows: First, the various contractual situations will be described and analyzed within the framework of single-step payoff functions. Further, a dynamic multi-step valuation model will be developed. Finally, selected simulation results will be discussed, illustrating how the model can bring useful insights into the nature of particular rental contract value drivers.

## 2 ANALYZING THE CONTRACTUAL TERMS

We assume two contracting parties, the seller of a service (i.e. lessor), designated S, and its buyer (tenant), designated B. The contract will be stipulated at a market-corresponding fixed price  $P$  (rental rate, €/sqm).

From the point of view of the seller, the future value of the contract  $V_S$  will be contingent on the future market rental rate  $p$  as in (1).

$$V_S = P - p. \quad (1)$$

If the buyer has an option to terminate contract (or its compliance is effectively unenforceable), the seller becomes an issuer of a call option as in (2), which is clearly a position with overall negative time value, and the contract would thus seem to be unacceptable to the seller, unless an up-front premium were charged.

$$V_S = \min\{P - p; 0\} \quad (2)$$

In contrast to financial options, it is not customary to charge up-front premiums for embedded options. Other conditions must therefore provide for an equilibrium, that could lead to negotiable terms. The equilibrium may conceivably be influenced by several factors in real-world tenancy agreements.

Apparently, the seller can charge the buyer an above-market rental rate  $R > P$  to compensate for the option value. Assuming no additional constraints, such a solution becomes highly unstable, however, because the buyer has an incentive to terminate as soon as possible (i.e. virtually immediately) and renegotiate at the market price  $P$ . He must therefore be motivated to retain tenancy, which can be achieved by a termination fine  $F$  (an income of the lessor) or any other transaction costs of moving to other premises  $C_B$ . In order for these terms to provide a stable solution, it is essential to ensure that  $F + C_B \geq R - P$ . Either of these constraints also allow for solutions at the market rental rate, i.e.  $R = P$ ; however, these are trivial, because it suffices to set a prohibitively high  $F$ , and effectively make the contract irrevocable.

The value of the contract with an embedded termination right may thus depend solely on the termination fine  $F$ , or its combination with an adjusted rental rate  $R > P$ , both of which are summarily described by (3). This is similar to a short position in an instrument that financial market practitioners usually call cancellable forward or Boston option (Rawls and Smithson, 1989; Kat, 1994).

$$V_S = \min\{R - p; F\}, \text{ assuming } R \geq P \text{ and } F \geq R - P. \quad (3)$$

In either case, the buyer's and seller's positions are symmetric, i.e.  $V_B = -V_S$ . This simple equilibrium characteristic, where both parties are expected to settle at an initial expected value of the contract equal to zero, ceases to hold once transaction costs of termination (e.g. moving, cleanup, refurbishment, commissions, vacancy) are taken into account.

For the sake of generalization, we shall allow for a transaction cost borne by the buyer  $C_B$ , as well as by the seller  $C_S$ . This results in contract value according to (4) from the point of view of the seller, (5) from the point of view of the buyer, both also illustrated under Figure 1. The technical term  $D$  in the sum (4) represents a cash-or-nothing binary (digital) call option (Reiner and Rubinstein, 1991).

$$V_S = \min\{R - p; F + C_B\} - D, \text{ where } D = C_B + C_S \text{ for } p < (R - F - C_B), \text{ else } D = 0, \text{ assuming } R \geq P \text{ and } F + C_B \geq R - P; \quad (4)$$

$$V_B = \max\{p - R; -F - C_B\}. \quad (5)$$

Fig. 1 – Seller's and Buyer's Payoff Functions. Source: Author

Wherever  $V_B \neq -V_S$ , as in (4) versus (5), the two different values do not constitute an equilibrium, but a negotiating margin. The expected contract value may thus possibly be positive for either or both of the parties at inception. Among other factors, the actual negotiation result will be impacted by the respective parties' capability to correctly estimate their counterparty's transaction costs.

### 3 DEVELOPING A MULTI-PERIOD VALUATION MODEL

A usual rental contract is long-term, with potential termination risk arising through its duration, contingent on the temporal development of the market rental rate, as well as its covenants. Any realistic model thus has to take a multiperiodical view, which results in a valuation situation comprising compound options.

Despite the existence of analytical solutions for particular kinds of compound options (Geske, 1979), it is much more efficient and universal to take a numerical approach. Discrete numerical analysis methods for the valuation of options can be divided into two basic categories. One is rooted in the simple and elegant backward-induction lattice model introduced by Cox, Ross and Rubinstein (1979), Rendleman and Barter (1979), and Sharpe (1978), which, in absolute terms, is currently the preferred method for evaluating miscellaneous types of options, including real and embedded options (Reuter and Tong, 2007; Smit and Trigeorgis, 2012).

The alternative, to be used in this study, exploits statistical simulation (Monte Carlo). This technique, long common for miscellaneous applications in areas ranging from Neurology to Technology to Natural Sciences (Fishman, 1996; Chan, 2013), has been initially proposed for

option valuation by Boyle (1977). Whereas it has not gained much acceptance for the valuation of most financial options, with the exception of certain types of path-dependent exotic options (Ekstrand, 2011), primarily because of its relatively high computing power demands, it bears a strong potential for the solution of particular real-option problems, as well as path-dependent embedded options (Mun, 2006; Vlachý, 2009b; Rogers, 2013; Podhraski and Berk, 2014).

The present simulation model is designed as follows: A contract is negotiated for  $n$  periods (years) at the price (rental rate)  $R$ , with the buyer holding an option to terminate at any discrete time step of the simulation  $\Delta t$ . If and when the option is exercised, the buyer pays the seller the amount  $F$ , bears an additional cost  $C_B$ , and the seller bears a cost  $C_S$ ; a new rental agreement is then contracted at the current market price and original premium, stated as a percentage of the rental price (8). Exercise (termination) by the tenant is contingent on the criterion (6), commensurate with (5).

$$p_t < R - F - C_B. \quad (6)$$

The market price  $p_t$  is generated as an opportune stochastic process; the example in Part 4 will be assuming its log-normal Brownian diffusion as described by (7), where  $\mu$  represents the price's expected periodical trend,  $\sigma$  its standard deviation (volatility), and  $\varepsilon$  a random value with normalized normal distribution.

$$p_{t+\Delta t} = p_t \exp[(\mu - \sigma^2/2) \Delta t + \sigma \varepsilon \Delta t^{1/2}]. \quad (7)$$

In order to generalize the results, the rental premium, termination fine and transaction costs are each standardised as percentage values of the rental price, using the parameters as in (8), (9), (10) and (11).

$$\pi = R / P - 1; \quad (8)$$

$$\phi = F / R; \quad (9)$$

$$\chi^B = C_B / R; \quad (10)$$

$$\chi^S = C_S / R. \quad (11)$$

The actual rate  $R$  thus becomes irrelevant (i.e. can be assumed as unit).

#### 4 REPRESENTATIVE MODEL RESULTS

The model can be used for diverse types of analysis. Besides facilitating actual contracting or providing valuation data in M&A transaction, it may also serve to quantify the various sensitivities arising from relevant contractual and market terms. An illustration of this approach will be given here in the form of structured examples, complementing the essential findings in Part 2 and offering a better insight into some of the key value drivers for rental agreements.

In each case, the mean discounted value of the simulation  $*V$  is benchmarked against the *NPV* (Net Present Value) of rental incomes, contracted for a lease with the equivalent time horizon  $n \Delta t$  at the current market price  $p_0$  with no termination rights ( $V_{\text{BENCH}}$ ). Equilibrium of particular contracted terms is then derived by numerically iterating  $*V \rightarrow V_{\text{BENCH}}$ .

All results are based on a contractual maturity  $n = 10$  (years) and the discount rate  $r = 5\%$ , no price trend is anticipated ( $\mu = 0$ ).

#### 4.1 Price premium and termination fine as functions of price volatility

This simulation derives the function  $\phi = \pi = f(\sigma)$ , leaving the other parameters unchanged at  $\chi_B = 0$ ,  $\chi_S = 0$ . In other words, it searches for appropriate levels of the termination fine if set equal to the price premium.

Tab. 1 – Contractual Terms as Function of Rental Rate Volatility. Source: Author.

$\sigma$	2%	5%	10%	20%	30%	40%	50%
$\phi = \pi$	1.7%	4.6%	9.4%	19.5%	30.5%	41.6%	52.5%

The results in Table 1 suggest that as a rule of thumb heuristic, lessors should consider price premiums and termination fines approximately equal to the rental market's expected volatility.

As indicated in Part 2, setting low or null price premiums (barring the unrealistic extreme of  $\sigma = 0$ ) necessitates stipulation of prohibitively high termination fines (for example,  $\sigma = 25\%$  and  $\pi = 0$  leads to  $\phi > 85\%$ ), which is unlikely to be commercially viable in practice, and might even be legally unenforceable (Horák, 2012). On the other hand,  $\pi > \phi$  leads to instability due to the tenant's early incentive to terminate.

#### 4.2 Impact of transaction costs

Formulas (4) and (5) indicate that seller's transaction costs do not impact termination, but they do reduce the seller's payoff on termination. On the other hand, buyer's transaction costs diminish his inclination to terminate, but, in contrast to the termination fine, do not increase the seller's payoff on termination. The four parameters therefore exhibit non-linear relationships.

These will now be examined using a reasonable volatility assumption (see e.g. Kanak and Tien, 2000) of  $\sigma = 25\%$  and, again, setting  $\phi = \pi$ . We thus derive the function  $\phi = \pi = f(\chi_S; \chi_B)$ .

Tab. 2 – Contractual Terms ( $\phi = \pi$ ) as Functions of Transaction Costs. Source: Author

$\chi_S \setminus \chi_B$	0%	10%	20%	30%	40%	50%	60%
0%	25%	24%	21%	17%	13%	9%	5%
20%	31%	28%	23%	19%	14%	10%	6%
50%	37%	32%	27%	21%	16%	11%	7%

The results in Table 2 show that increasing transaction costs  $\chi_B$  borne by the tenant decrease the premium and termination fine levels that the lessor will need to charge for the option to terminate. On the other hand, these will be substantially increased in the special case when moving costs  $\chi_B$  of the tenant are low, but replacement costs of the lessor  $\chi_S$  are high; such a proportion might be typical for some tenants in a market with very high vacancy rates (Sivitanides, 1997). In accordance with intuition, all results converge towards zero with  $\chi_B \rightarrow 100\%$  (it becomes prohibitive for the tenant to terminate).

One of the interesting findings of this simulation, that can be further investigated in game-theoretical settings (Vega-Redondo, 2003), relates to the fact that the lessor may be in a position to discriminate between different tenants based on recognition of their disparate transaction costs. This strategy can be countered by tenants not revealing, or even obfuscating pertinent cost information.

## 5 CONCLUSIONS

In this paper, we have developed and described a dynamic model for the valuation of rental and similar contracts, based on appropriate payoff functions. Besides its straightforward application for quantitative support in contracting or M&A situations, a microeconomic approach has been suggested, facilitating proper comprehension of market dynamics and value-driver sensitivities.

We have thus shown how termination rights become less valuable as a result of tenants' transaction costs on the one hand, and more valuable with increasing market volatility, as well as lessor's transaction costs, on the other hand. Further research opportunities include using outputs of the model for a game-theoretic analysis of rental contract negotiation.

## **THE INFLUENCE OF TRANSFORMATION CHANGES ON THE SPATIAL ACCESSIBILITY OF THE ACUTE BED CARE IN THE CZECH REPUBLIC**

*Iveta Vrabková, Ivana Vaňková and Igor Ivan*

### **Abstract**

The aim of this article is to define the level and the time scale of the spatial accessibility of the acute bed care providers related to the individual car transport and the public transport. The purpose is to compare the state and the structure of the network of the acute bed care providers in years 2003 and 2013 and to deduce the changes which had influence on the spatial accessibility. The method of the network analysis utilising ArcGIS software was applied for the purposes of the analysis of the spatial accessibility by cars and time tables for public transport. The time access to the seat of the acute bed care providers was designated on the basis of the selected time zones – 10, 20, 30 and 60 minutes. The outputs of the network analysis having been implemented are illustrated in the individual maps covering years 2003 and 2013 both with the individual car transport including the road network, and with the public transport. The suitable supplementation of this modelling is the definition of the spatial accessibility of the acute bed care providers for the particular number of population living permanently in the given territory according to the specific time zones. On the basis of the modelling having been implemented it can be concluded that the spatial accessibility deteriorated both with the individual car transport and with the public transport. The reason of the deterioration was especially the influence of the lower number of the acute bed care providers and the change of the structure of the providers of medical branches in year 2013 when it is compared with year 2003. The change of the spatial accessibility concerned nine regions of the Czech Republic – Ústí nad Labem, South Moravia, South Bohemia, Vysočina, Hradec Králové, Pardubice, Olomouc, Moravia-Silesia, and Zlín. When the individual car transport was used, the accessibility deteriorated for 4.75% inhabitants of the Czech Republic and when the public transport was used, the accessibility deteriorated for 15.75% Czech inhabitants.

*Keywords: Spatial accessibility, Geographic information systems, access to health care, transportation mode.*

JEL Classification: I18, R53

## **1 INTRODUCTION**

Modern transformation processes in health care in the Czech Republic began in the 1990s. They were based on the level of the health condition of the population in the context of unsuitable living habits and bad environmental situation. Due to this fact, so-called new system of health care was adopted by the government decree of 12 December 1990, starting the all-society strategy of the health regeneration. There were two central means of the health regeneration strategy – the free actions of informed citizens and community, on the one hand, and the maintenance of available and adequate state-guaranteed health care, on the other hand. The state guarantee included the provision of adequate health care independent of the financial and social situation of the patients, the accessibility of health care in space and time, the right of the patients to free choice of physicians and health care facilities, and the humane approach in health care services. In addition to other features, this part of the health care

transformation also included the creation of new, flexible financial tools, tied up to the ongoing reforms in the public administration.

The health care transformation, logically, involved its important segment – the acute bed care. Another important milestone in the transformation of health care was 1 January 2003, when transfer of property from the Czech Republic to the regions and municipalities was made based on special acts. This applied to property (including health care facilities) managed by the organisational components of state and allowance organisations as of 31 December 2002 and property, the guarantors of which were the district authorities as of 31 December 2012. Therefore, legal form of the acute bed care providers changed significantly in the Czech Republic in favour of the non-governmental sector since 1 January 2003. Nevertheless, this condition further developed in the subsequent years, causing gradual transformation of the regional and municipal allowance organisations, in particular, to business-type organisations (joint-stock companies and limited liability companies).

Current discussions, most commonly on the health care policy level that includes the acute bed care providers, involve the optimisation of the health care accessibility and the assessment of efficiency and necessity of acute beds in the individual types of medicinal branches. The assessment of economic efficiency of acute bed care can focus on the technical as well as allocation aspects, while their combination provides the best explanatory power (Vaňková, Vrabková, 2014). However, all forms of the economic efficiency assessment must consider the specific nature of health care, which is based on the individual needs and individual solutions for the treatment of a hospitalised patient. Several scientific investigations were made into the solutions leading to the improvement of economic efficiency, while enhancing or preserving the accessibility of acute bed care. For instance, both Burian (2002) and Kalábová (2014) state that good-quality health care can be ensured in an economically efficient way through intensification of the hospital activities based on the centralisation and consolidation of complementary, operating, and clinical facilities. The authors add that centralisation leads to concentration of a larger number of critically ill patients and thus to better experience, skills and knowledge, to faster introduction of protocols and methods, and to demonstrably better treatment results – reduction in the duration of hospitalisation, reduction in mortality, and more efficient utilisation of resources.

The efficiency of hospitals is, logically, reflected in the level of accessibility of acute bed care. In addition to other parameters, the accessibility is also an important factor of quality and performance of health care services. In general, the cohesion of requirements for quality and performance on the level of the system, organisational units, processes, and activities is a prerequisite of the modern form of the quality management – the Total Quality Management (Dooren, Bouckaert, Halligan 2010; Vrabková, 2012). Accessibility in health care also contributes significantly to determining the level of equity in health, being accentuated strongly in the hospital bed care conditions.

From the viewpoint of equity in health, the assessment of accessibility of hospital bed care is relevant if approached comprehensively and as seen by the patient as the customer of the health care services. The assessment of the hospital bed care accessibility can be focused either on one dimension of accessibility, or on several formats of accessibility. The most common of them comprise the spatial accessibility (sometimes called the “local” or “transportational”), time accessibility, institutional accessibility, economic accessibility, and information accessibility, see, for instance, Mužík and Szalayová (2013), Lamarch et al. (2011). A government decree became effective on 1 January 2013, which determines the parametric conditions of local (spatial) and time accessibility of health care services paid through public health insurance. The local (spatial) accessibility establishes the longest possible arrival period (in minutes) for selected branches or services as per the outpatient and

inpatient care. These mandatory parameters are guaranteed by the respective health insurance companies to their clients.

**The aim of this article is to define the level and time scale of the spatial accessibility of the acute bed care providers related to the individual car transport and public transport for 2003 and 2013.**

Spatial accessibility shows the distance the patient has to travel in order to attain the required health care. The distance (in kilometres or metres) separates the patient from the nearest or selected provider of hospital bed care. The patient travels the distance over a certain period of time using the existing transportation infrastructure, the quality of which is a general limiting factor of the spatial accessibility. It is also important for the patient what type of means of transport will or can be used to travel said distance, see private and public transport.

The assessment of spatial accessibility of acute bed care in this article was made using the network analysis and the geographic information system (GIS). Google Maps (see Chapter 2.2) also provide significant assistance in evaluating the specified time accessibility. Inspiring examples of possible solutions as well as other information covering this topic in the conditions of health care services can be found in both international and Czech publications, e.g. Comber, Brunson, Radburn (2011), Delamater (2013), Mao, Nekorchuk (2013), Vaňková, Vrabková (2015), Gong, Geng, Chen (2015).

## **2 MATERIAL AND METHODS**

### **2.1 Status and structure of providers of acute bed care in 2003 and 2013**

Fundamental changes in the organisational and legal framework of the hospital care providers were made as part of the second stage of the public administration reform as of 1 January 2003. The changes to the ownership of the hospital property and to the guarantors of the hospitals also paved the way to changing the legal form of the hospitals. At the end of 2003, there were 201 hospitals in the Czech Republic, thereof 176 hospitals with acute bed care and 25 after-care hospitals. The number dropped to 188 in 2013, there of 156 hospitals with acute bed care and 32 after-care hospitals. As regards the legal form of the hospitals, the number of hospitals having the form of allowance organisations of the regions dropped by 72%, from the original 81 allowance organisations of the regions in 2003 to 23 allowance organisations of the regions in 2013. There are no hospitals having this legal form in the following regions: Central Bohemia, South Bohemia, Karlovy Vary, Hradec Králové, Liberec, Plzeň, Zlín, and Olomouc. Hospitals in these regions were transformed to business companies, where the regions have 100% ownership in most cases.

Likewise, fundamental changes were made to the number of acute care bed between 2003 and 2013. The capacity of acute bed care in hospitals dropped by 10,230 beds, i.e. 15.87%, in comparison with 2003. The drop in the number of beds was reported predominantly at internal medicine and surgery wards as well as paediatrics and obstetrics and gynaecology. The efforts to limit the number of beds reflects the issues of restructuring of the bed care, the increase in the after-care bed numbers, the introduction of modern treatment methods (aiming at shortening the duration of hospitalisation of patients in hospitals), the economic intensity of acute bed care, etc.

For the purposes of the investigation into the accessibility of acute bed care in the CR and its comparison in 2003 and 2013, the providers of acute bed care (hereinafter also “the providers”) were determined and classified in 6 groups, see Table 1, accordance with the medical branches. The overall set of providers for both years (2003 and 2013) comprises all

providers, except for the providers of acute bed care for remand prisons and after-care (The Institute of Health Information and Statistics of the Czech Republic registers them as part of the set of acute bed care hospitals).

Table 1 shows six groups of providers:

- I. providers of acute bed care in all basic medical branches (internal medicine, surgery, gynaecology, paediatrics),
- II. providers of acute bed care in major part (3 of 4) of basic medical branches,
- III. providers of acute bed care in selected medical branches only,
- IV. university hospital (UH) – all basic medical branches (internal medicine, surgery, gynaecology, paediatrics),
- V. university hospital (UH) – major part of basic medical branches (3 of 4 basic medical branches),
- VI. university hospital (UH) – selected medical branches.

*PHA - Prague; STC - Central Bohemia; JHC - South Bohemia; PLZ - Plzeň; KAR - Karlovy Vary; UST - Ústí nad Labem; LIB - Liberec; HRA - Hradec Králové; PAR - Pardubice; VYS - Vysočina; JHM - South Moravia; OLO - Olomouc; ZLI - Zlín; MSK - Moravia-Silesia.*

The number of providers dropped by 10% in 2013 in comparison with 2003. The largest decrease, by 23%, was reported in the providers of selected medical branches only (Group III). In practice, the largest decrease in the providers is evident in two regions – Hradec Králové and Ústí nad Labem (see Table 1). Further changes in the number of providers occurred between the individual groups of providers. Two hospitals in Moravia-Silesia Region can serve as an example – Podhorská nemocnice a. s. in Rýmařov and Bohumínská městská nemocnice a. s. These hospital were providing services in all basic medical branches in 2003 (Group I), but since both of them excluded paediatrics from their bed care offer in 2013, they were classified in Group II in 2013.

## **2.2 The Network analysis using the software ArcGIS**

The list of hospitals describing situation in 2003 and in 2013 was taken from the Institute of Health Information and Statistics of the Czech Republic. The first step in delimitation of areas from where a hospital is accessible (hereafter service areas) is process of geocoding. The list of hospitals contains addresses that were used for geocoding on address geographical level using Mapy.cz API. In this paper, accessibility of hospitals is described for both modes of transport – individual car transport and public transport.

Network analysis using the software ArcGIS was used for delimitation of hospital service areas. In general the main issue in this process is defining average speed of particular road segments. The Data200 has been used as data source of road network provided by State Administration of Land Surveying and Cadastre. Average speeds are defined according to combination of road category and number of lines (see the Table 2 below). Additionally, resulting average speeds were modified according to samples of results proposed by Google Maps using randomly selected 100 travel times between a hospital and a municipality. The whole network is valid for the year 2013 and contains more than 66,500 km of roads divided into highways, expressways, first, second and third class roads and main streets in municipalities. The same road network has been used for both analysed years (2003 and 2013). The service areas are divided into five zones consisting of particular municipalities. The travel time from each municipality to the closest hospital is defined as average value from cumulative travel times of road segments within this municipality. This methodology solves problems relating to approximation of polygons representing service areas. The threshold values are defined as 10, 20, 30 and 60 minutes. Average speeds of road segments, see Table 2.

Tab. 2 – Average speeds of road segments. Source: Own elaboration.

Road segment + number of lines	Average speed
Highway and expressway	105 kph
First class roads with 3+ lines	75 kph
First class roads with 2 lines	65 kph
Second class roads with 3+ lines	55 kph
Second class roads with 2 lines	45 kph
Third class roads with 3+ lines	45 kph
Third class roads with 2 lines	35 kph
Street segment with 3+ lines	35 kph
Street segment with 2 lines	30 kph

Service areas were also delimited using public transport utilising database of public transport connections (Horák et al., 2014; Ivan, Horák, 2015). This database contains connections between municipalities within 150 kilometres that are searched in valid time tables and that meet several conditions – travel time is smaller than 90 minutes; number of changes is 5 and smaller; arrival time cannot be earlier than 60 minutes before; and departure time from an origin cannot be earlier than 120 minutes before arrival. In this paper, only connections with arrival between 5 and 8 am in a working day (Tuesday) are considered. Similarly as in case of car transport, service areas are delimited by public transport travel times work on municipality level. All hospitals in the same municipality are aggregated as a single hospital. The same threshold values of travel times are defined.

Differences in service areas between 2003 and 2013 are depicted in maps below and can be also represented by number of people living in municipalities from particular service areas. Population data is valid for the year 2013 and provided by the Czech Statistical Office.

### 3 RESULTS AND DISCUSSION

The output of the accessibility analysis is shown in the maps for 2003 and 2013 in Figures 1–4. The maps show the prescribed arrival times of the acute bed care providers in the CR when using individual means of transport (car) within the road network as well as when using public transport. The individual symbols (assigned to the individual groups of providers) in the map indicate the domiciles of the providers.

The individual map outputs are complemented by Tables 3–6 that define the impact of the selected arrival time zones on the specific number of inhabitants living permanently in the given territory. The inhabitants are also divided into age groups (0–14, 15–64, 65+).

The individual time zones were evaluated using a 5-grade qualitative scale:

- excellent accessibility – arrival time max. 10 minutes;
- good accessibility – arrival time max. 20 minutes;
- aggravated accessibility – arrival time max. 30 minutes;
- poor accessibility – arrival time max. 60 minutes;
- very poor accessibility – arrival time exceeding 60 minutes.

If arrival time exceeding 90 minutes was found in the given territory, acute bed care for the inhabitants of said territory was deemed inaccessible by the authors of this article. However, this phenomenon was reported, albeit insignificantly, in the case of public transport (see Figures 2 and 4; Tables 4 and 6).

The map in Figure 1 shows the distribution of time zones of arrival times to the providers by individual transport in 2003. It is evident that excellent accessibility of the providers is found in urban settlements (mostly towns and cities) and their surroundings. This level of accessibility (see Table 3) applied to 57.14% of Czech population (6,006,435 people), while the capital of Prague participates in this result significantly. Good accessibility held for 26.3% of population in 2003 (i.e. 2,764,934 people). Aggravated accessibility applied to 1,322,990 people, i.e. 12.59% of Czech population. Poor accessibility applied to 414,437 people, i.e. 3.94% of Czech population. Very poor accessibility using individual means of transport (car) held for 3,623 people in 2003, 0.03% of Czech population.

Tab. 3 - Population in accessible areas using cars in 2003. Source: Own calculations and elaboration.

Service area (in minutes)	Population	Population in age group			% of total population	% of population in age group		
		0–14	15–64	65+		0–14	15–64	65+
1–10	6,006,435	882,725	4,053,576	1,070,134	57.14	55.96	57.02	58.62
11–20	2,764,934	433,410	1,875,298	456,226	26.30	27.48	26.38	24.99
21–30	1,322,990	200,694	895,742	226,554	12.59	12.72	12.60	12.41

60 +	3,623	546	2,508	569	0.03	0.03	0.04	0.03
Total	10,512,419	1,577,455	7,109,420	1,825,544	100.00	100.00	100.00	100.00

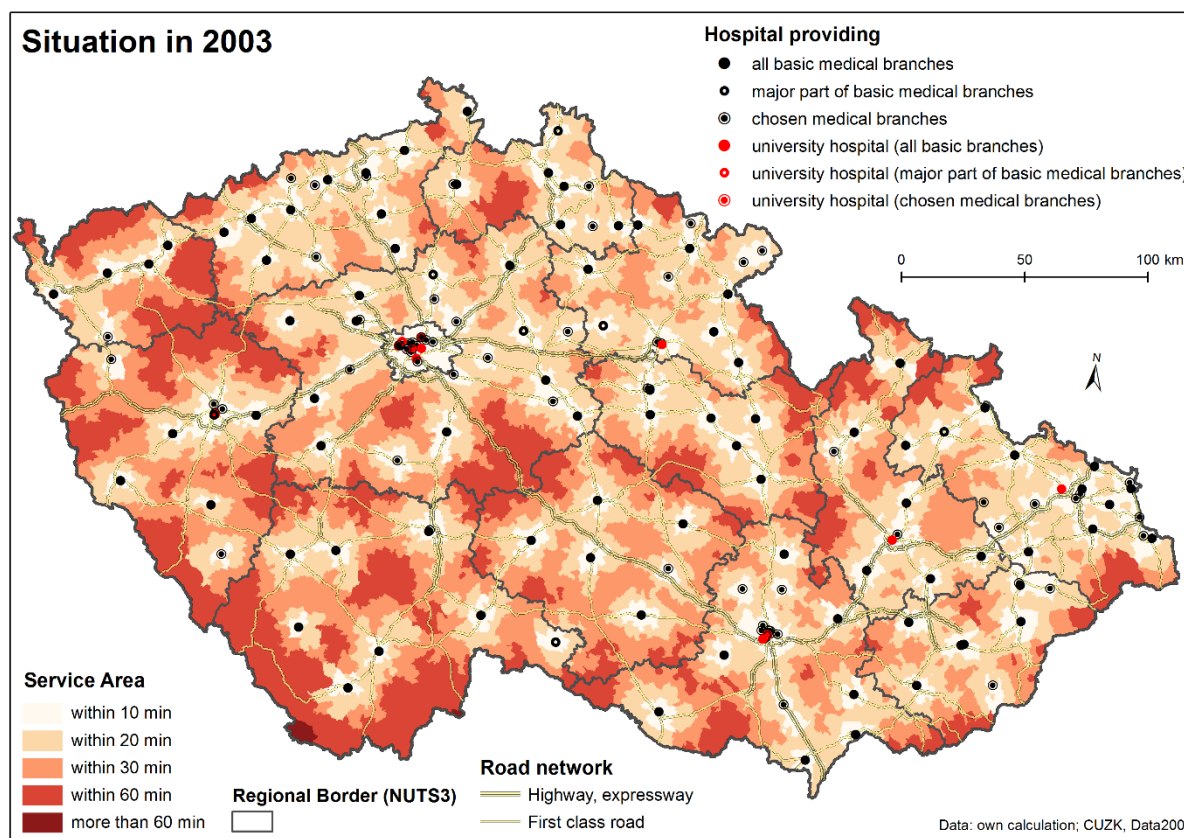

Fig. 1 – Accessibility of acute bed care providers in 2003 – individual car transport. Source: Own elaboration.

In the case of accessibility of the providers by public transport in 2003 (see Figure 2 and Table 4), it can be stated that excellent accessibility was again found in urban settlements, but in a smaller extent compared to individual transport, applying to 34.82% of population (3,660,179 people). Good accessibility held for 33.39% of population (3,509,653 people). Aggravated accessibility (max. 30 minutes) applied to 18.34% of population (1,927,483 people). Poor accessibility was found in 1,305,342 people, i.e. 12.42% of population, and very poor accessibility held for 103,998 people, i.e. 0.99% of population. Acute bed care was inaccessible by public transport for 5,764 people, i.e. 0.05% of population, in 2003.

Tab. 4 - Population in accessible areas using public transport in 2003. Source: Own calculations and elaboration.

Service area (in minutes)	Population	Population in age group			% of total population	% of population in age group		
		0–14	15–64	65+		0–14	15–64	65+

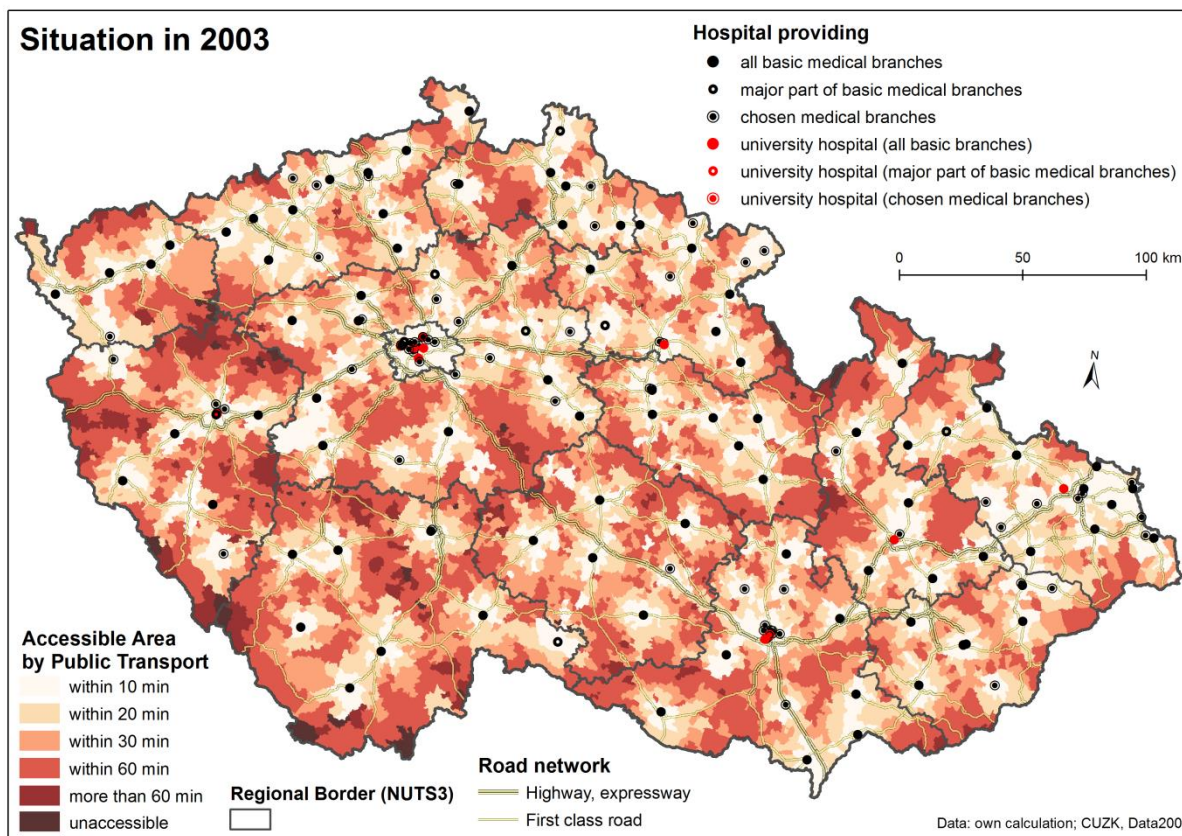

Fig. 2 – Accessibility of acute bed care providers in 2003 – public transport. Source: Own elaboration.

The accessibility of the providers using individual transport in 2013 is shown in Figure 3, while Table 5 shows the impact on the population. It can be stated that accessibility of the providers was excellent for 5,851,158 people, i.e. 55.66% of population. Very good accessibility held for 2,670,090 people, i.e. 25.40% of population. Aggravated accessibility by car was found in 1,459,563 people (i.e. 13.88% of population). Poor accessibility held for 526,746 people (i.e. 5.01% of population), and very poor accessibility was found in 4,862 people (i.e. 0.05% of population).

Tab. 5 - Population in accessible areas using cars in 2013. Source: Own calculations and elaboration.

Service area (in minutes)	Population	Population in age group			% of total population	% of population in age group		
		0–14	15–64	65+		0–14	15–64	65+

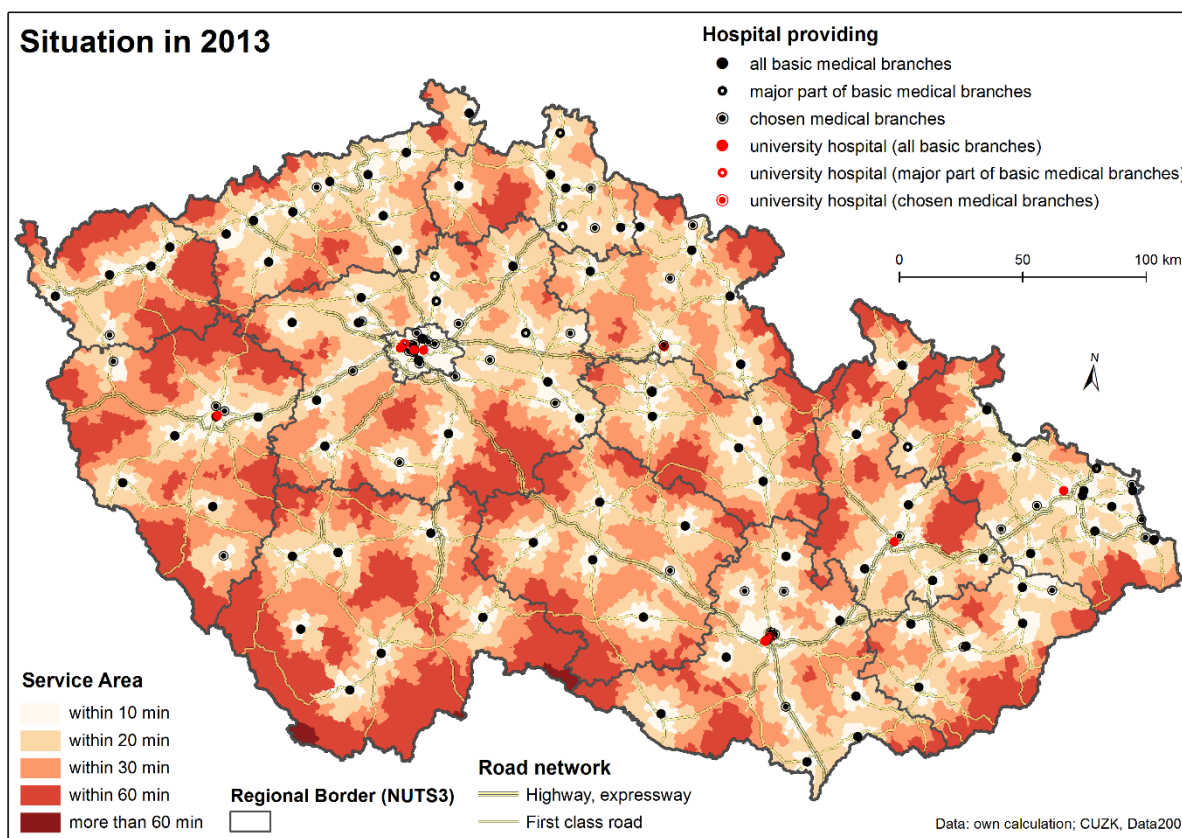

Fig. 3 – Accessibility of acute bed care providers in 2013 – individual car transport. Source: Own elaboration.

The accessibility of the providers using public transport in 2013 is shown in Figure 4, and Table 6 shows the impact on the population. It can be stated that accessibility was excellent for 3,011,391 people, i.e. 28.65% of population. Very good accessibility applied to 31.68% of population (i.e. 3,330,148 people). Aggravated accessibility held for 22.95% of population (2,412,820 people) and poor accessibility for 15.26% of population (1,604,457 people). Very poor accessibility was found in 144,631 people (i.e. 1.38% of population). Inaccessibility of the providers by public transport applied to 8,972 people (i.e. 0,09% of population) in 2013.

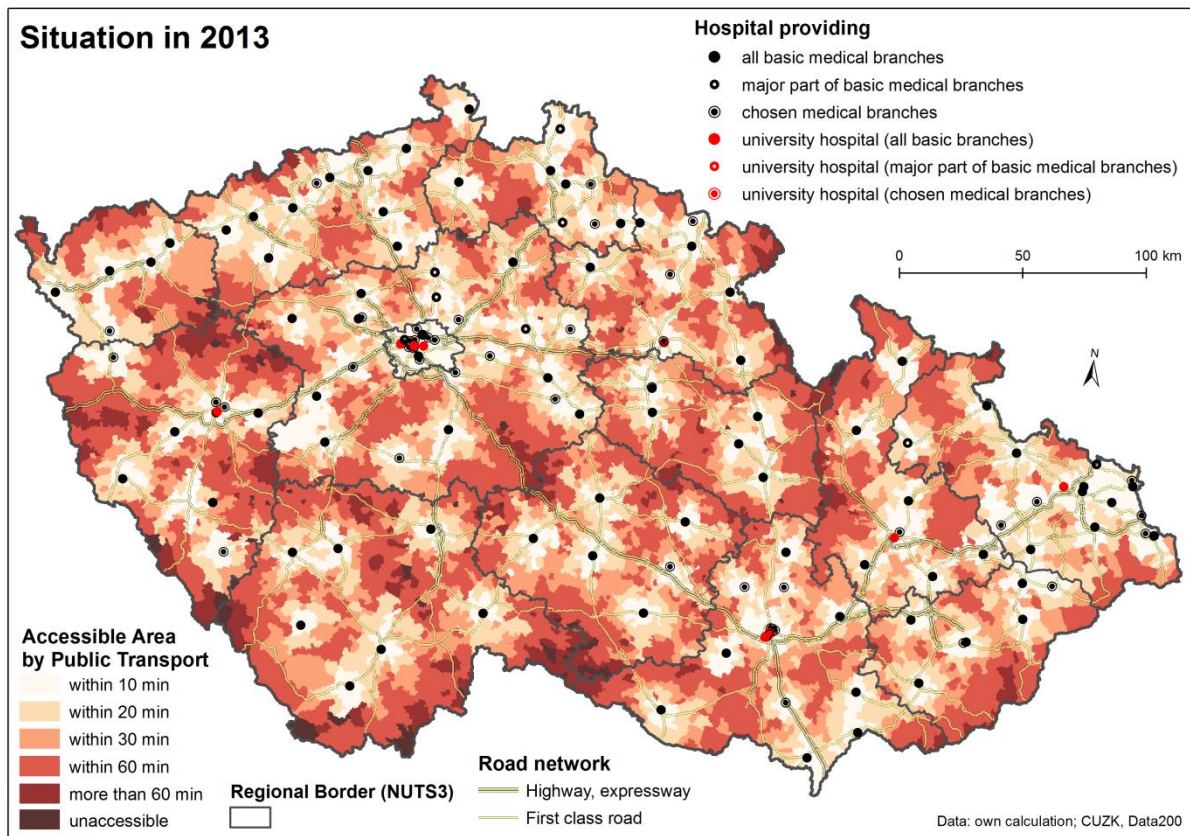

Fig. 4 - Accessibility of acute bed care providers in 2013 – public transport. Source: Own elaboration.

The above implies that, in general, the providers were better accessible using individual transport in comparison with the public transport in both years under review.

The comparison of the accessibility of the providers from the viewpoint of individual transport as well as public transport in 2003 and in 2013 shows that due to the reduction in the number of providers by 20, the accessibility aggravated in 9 regions of the CR in 2013 in comparison with 2003. The level of accessibility aggravated in the following regions: Ústí nad Labem, South Moravia, South Bohemia, Vysočina, Hradec Králové, Pardubice, Olomouc, Moravia-Silesia, and Zlín. On the other hand, the accessibility remained unchanged in the capital of Prague, in Central Bohemia, Plzeň Region, Liberec Region, and Karlovy Vary Region.

The decline in the providers in the individual regions impacted upon the spatial accessibility, depending on the location within the territory. For instance, liquidation of a provider located near another provider (e.g. in Plzeň) did not influence the spatial accessibility. By contrast, liquidation of providers having no other providers located nearby influenced the spatial accessibility heavily. For example, five providers were liquidated in Hradec Králové Region, but the aggravation of accessibility in the region was caused predominantly by the liquidation of 2 of them – Broumovská nemocnice and Nemocnice Nový Bydžov. The accessibility in Ústí nad Labem Region was influenced heavily by the liquidation of Nemocnice Louny, p. o., which provided bed care in internal medicine and surgery in 2003. The accessibility of acute bed care in South Bohemia was influenced fundamentally by the transformation of Nemocnice Dačice. This transformation took effect in three regions – South Bohemia, Vysočina, and South Moravia. Nemocnice Dačice provided acute bed care in 2003 in internal

medicine, surgery and obstetrics and gynaecology, complemented by nursing and after-care services. In 2013, the facility was transformed to after-care hospital that provides nursing services only.

Tab. 7 – The percentage of total population in accessible areas using cars or public transport in 2003 and 2013. Source: Own calculations and elaboration.

Zone	Cars 2003	Cars 2013	Public transport 2003	Public transport 2013
01–10	57.14	55.66	34.82	28.65
11–20	26.30	25.40	33.39	31.68
21–30	12.59	13.88	18.34	22.95
31–60	3.94	5.01	12.42	15.26
61–90	0.03	0.05	0.99	1.38
Inaccessible	0.00	0.00	0.05	0.09
Total	100.00	100.00	100.00	100.00

Table 7 shows that the accessibility of the providers as perceived by the persons involved (i.e. patients and visitors) aggravated in 2013 as compared to 2003, predominantly because of the reduction in the number of providers. This applies to individual transport as well as public transport in all time zones. The aggravation was more striking in the case of public transport. This phenomenon is documented in Figure 5.

Fig. 5 – Time zones of accessibility of the providers in 2003 and in 2013 from the viewpoint of people involved. Source: Own calculations and elaboration.

It can be stated that the accessibility of the providers slightly aggravated due to organisational transformation in 2013 in comparison with 2003 in all time zones under review. The number of people dropped in shortest arrival zones, i.e. 1–10 minutes and 11–20 minutes, in comparison with 2003. By contrast, the number of people in the remaining time zones

increased. It is possible to conclude that accessibility by individual transport changed negatively for 500,242 people, while accessibility by public transport aggravated for 1,656,586 people.

The above-mentioned information implies serious discussion, which considers economic consequences of the deteriorated accessibility of the acute bed care in year 2013 in comparison with year 2003, for the parties involved (the population, the acute bed care providers, the health insurance companies, the state, the regions and the municipalities). At first sight, it is yet evident that the negative economic impact was caused by the change of the accessibility of the acute bed care provides given to citizens. This fact as a consequence increases both direct expenses spent on the transport (the fare). And indirect expenses connected with the loss of time for 1,656,586 citizens. In this connection the discussion can also be lead on pouring the expenses of the government and health insurance companies to the population.

Nevertheless, the discussion in the sense of the influence of the transformation process taking place under conditions of the acute bed care on the efficiency of the acute bed care providers ought to be lead on the basis of the results, e.g. the results of multi criteria analysis, which enable to model the technical and also allocation efficiency.

#### **4 CONCLUSION**

Acute bed care is a crucial segment of institutional health care and its general accessibility is characteristic of modern and advanced society. The acute bed care accessibility also includes its spatial variant that shows the distance the eventual patients and other involved persons have to cover to obtain this care. The distance can be covered individually or collectively, i.e. by car or by public transport.

The aim of this article was to use network analysis and time tables to determine the level and time scale of the spatial accessibility of the acute bed care providers in the Czech Republic by individual car transport and public transport in 2003 and 2013.

The comparison of the spatial accessibility in 2003 and 2013 follows the consequences of gradual transformation processes implemented in the acute bed care conditions after 2003.

The total of 5 time zones were selected and monitored from the viewpoint of individual and public transport in both years. It can be stated that acute bed care is spatially accessible by both individual and public transport in the Czech Republic. Nevertheless, accessibility is better by individual transport. Excellent accessibility of the providers holds true for 55.66% of population if using individual transport, but only for 28.65 % of population if using public transport. Good accessibility applies to 25.4% of population if using individual transport and to 31.68% of population if using public transport. Aggravated accessibility was found in 13.88% of population in case of individual transport against 22.95% of population in case of public transport. Poor accessibility by individual transport as compared to public transport was in the ratio of 5.01% to 15.26%. Very poor accessibility affects 0.05% of population if using individual transport and 1.38% of population if using public transport. Acute bed care was inaccessible for 0.09% of population if entirely dependent on public transport only.

The accessibility of the acute bed care providers changed in nine regions of the CR in 2013 in comparison with 2003. The accessibility by individual transport aggravated for 4.75% of the Czech population, while worsening for 15.75% of the Czech population when using public transport.

The design of the network of acute bed care providers in connection with the quality of the transportation infrastructure forms the level of spatial accessibility. In this context, it can be stated that both networks (providers and infrastructure) are formed by social and political priorities, regional requirements and economic potential of the actors involved, including the population.

The perspectives of the level of spatial accessibility of the acute bed care providers must be discussed and assessed together with quality and economic efficiency of this care. However, the rationalisation and transformation processes, mainly triggered by economic factors, that interfere with the number and structure of the acute bed care providers in a given territory must be implemented with respect to the transportation potential of the territory. This implies that sufficient and quality transportation infrastructure creates prerequisites allowing implementation of acute bed care intentions that lead to improving their expertise, professionalism and equipment. This means replacing the quantity by quality and providing legitimate acute bed care services for the population in a flexible and competent manner.

## **RELATIONSHIP BETWEEN THE GROWTH-RATE OF TURNOVER OF SME'S IN RELATION TO THE AGE OF THE DIRECTORS OF THESE COMPANIES**

*Jaroslav Vrchota, Monika Maříková*

### **Abstract**

The aim of this paper is to analyze the relationship between the growth rate of turnover of small and medium-sized companies in relation to the age of the directors of these companies. The research was conducted in 2013 to 168 companies, under a grant gaju 079/2013 / S. The results using Chi-square test and Cramer's coefficient proved to be correct weak correlation between the two variables. It was also found that the company's sales growth rate reaching over 20% of managers governed mostly under 40 years old.

*Keywords: rate of turnover, manager's age, SME's*

JEL Classification: J5

### **1 INTRODUCTION**

Flexibility, the ability to react to changes quickly, are one of the most declined words of these days Smejkal & Rais, 2013). Matter of management of top managers is one of the issues addressed by each firm. The ability to lead people, motivate, organize work properly, plan and anticipate the future are just some of the skills that should be familiar to managers (O'Neill, 2011). The question remains whether young manager, ignorant of Long-term practice can be more successful than the one that directs the undertaking number of years, usually decides the same way and does not like change.

The success of the enterprise is difficult to define, it is the subjective opinion of everyone according to what each individual is considered a success. Generally, we consider it a success if it achieves the desired objectives (Plamínek, 2014). For the purposes of this paper was regarded as a successful business the one that showed growth in recent years, specifically the pace of business growth was reviewed.

### **2 THEORETICAL BASIS**

Personality is a unique combination of psychological traits that characterize an individual. Identifies ways how he experiences the world around, dealing in various situations and objectives to be reached. It is significantly reflected in the results of the work and human relationships (Šuleř, 2008). The manager is the person who achieves his/her targets with people and through them (Lojda, 2011). Definition of Yukli (1989) manager is the person who occupies a position in which performance management is expected, but without any assumptions this process actually occurs (Folwarczná, 2010).

Age together with competencies of managers is one of the key factors that may play a role (Daft, 2012). The research of the firm Kienbaum shows that lack of self-criticism and reappraisal of themselves is an important factor which young managers trip through the path to success. They lack soft skills, ability of suitable manners (Hospodářské noviny, 2012). The results highlight the power of the CEO, the tendency to consolidate the top positions under the CEO, and the greater accountability of the person in the combined position for firm

performance (Harrison, 1988). As Bateman (2013) and Panczaková (2010) stated, employers today are looking for quality above all a man age matters to them, contrary frequent criterion while choosing a future manager is that he/she must not be younger than a set limit. DMC management company based on his research published that on the age of managers when choosing a candidate does not matter as well as quotes Robbins (2013). At age matters only at specific positions, where an important medical condition is important. At the present time when many businesses are struggling to survive, employers are turning to more experienced ones, who have long practice, because there is no time to experiment in the form of young inexperienced managers who want change. The advantage of older managers is the fact that they "do not seek themselves, know what a job entails. Young managers are hardworking, tough and able to adapt (Termann, 2002).

Tab. 1 – Older versus younger managers, Source: Dohnal, 2011; Navrátil, 2014; Panczaková, 2010

Older managers (40+)	Younger managers (less than 40)
More experienced and knowledged	They bring new ideas, unusual solutions and creativity
Handle crisis situation easier	Know work with information systems better
Can utilize the potential of their subordinates better	Are ambitious
Are more loyal to the employer	Have a lot of enthusiasm and energy
Sometimes recognition of new processes may také longer	Some are „seeking themselves“
More modest, less conflict, lower life demands, higher dose of humility	Dynamics
Greater gratitude and honesty	
Better treat stress	

The crucial phase of the whole business life cycle is a period of growth. This period determines the success or failure of the organization. A key factor for success is thus considered to achieve and sustain a growth rate of business (Vochozka & Mulač, 2012). The growth rate can be expressed as an increase in the value relative to the previous period (Holman, 2005). The growth rate of turnover is one of the indicators that are used as a criterion for the success of enterprise (Kašparovská, 2006).

### 3 METHODOLOGY

The aim of this paper is to compare rate of turnover with age of the company directors and try to prove or disprove the relationship. Following definition of turnover was used for the purposes of this paper: Turnover means the total output value of economic activities carried out during a certain period of time, usually measured by total annual revenues after deduction of returned goods (Synek, 2010). Paper gauged the rate of enterprises growth. Definition of the positive or negative value of growth is essential for time comparison. The ratio of increment and the value of the baseline period give a relative growth or growth rate variable (Kubálková, 2009). The growth rate =  $O = (O_1 - O_0) / O_0$ . Directors of companies stated the business turnover growth rate (as defined above) in the survey, which was verified in the financial statements. Data were obtained within the GAJU 079/2013 /s research, which was

aimed at SMEs and process management within these companies, which followed the SMEs field research (Brezinova, 2013). Data were collected during 2014 from 198 companies (those companies were chosen to match the statistical distribution by areas of business in the Czech Republic), while the question of age, and also on the rate of growth of the company in recent years was responded and can be verified at 168 respondents. This data was divided according to the frequency into groups according to age of directors (40, 41-50, 51 and over) and according to the company's growth rate: negative or zero growth, 0.1-5%, 6-10%, 11 to 20% and more than 20%. The intervals of growth rate were taken from Williams (2012).

For further comparison, tested variables were adjusted using contingency tables. Contingency tables show how one characteristic depends on the other. Tables were set of two nominal variables  $X, Y$  (Hendl 2012). Let  $X$  acquire variants  $x_{[1]}, \dots, x_{[r]}$  and  $Y$  acquires variant  $y_{[1]}, \dots, y_{[s]}$ . Let the  $(\pi_{jk}) = P ( X=x_{[j]} \wedge Y=y_{[k]} )$  be the probability of simultaneous pair variants of the  $(x_{[j]} y_{[k]})$ ,  $\pi_j = P ( X=x_{[j]} )$  marginal probability variants  $(x_{[j]} y_{[k]})$ ,  $\pi_k = P ( Y=y_{[k]} )$  marginal probability variants  $y_{[k]}$ . (Freund, 2010)

Later a two-dimensional random range distribution  $n z$  was conducted, applicable to a two-dimensional discrete random vector  $(X, Y)$ . Identified absolute simultaneous frequency  $n_{jk}$  pair variant  $(x_{[j]} y_{[k]})$  are arranged in a contingent Table 1.

Tab. 1: Absolute frequency of the  $n_{jk}$  pair, Source: *Friedrich 2010, Lander 2014*

	<b>y</b>				
		$y_{[1]}$	. . .	$y_{[s]}$	$n_{j.}$
<b>x</b>	$n_{jk}$				
$x_{[1]}$	$n_{11}$		. . .	$n_{1s}$	$n_{1.}$
.	.			.	.
.	.		. . .	.	.
.	.			.	.
$x_{[r]}$	$n_{r1}$		. . .	$n_{rs}$	$n_{r.}$
$n_{.k}$	$n_{.1}$		. . .	$n_{.s}$	$n$

The frequency is determined from the relationship where,  $n_{j.} = n_{j1} + \dots + n_{js}$  is marginal absolute frequency of the variant  $x_{[j]}$ ,  $n_{.k} = n_{1k} + \dots + n_{rk}$  is marginal absolute frequency of variant  $y_{[k]}$ . Furthermore, simultaneous probability will be estimated using simultaneous

relative frequency  $p_{jk} = \frac{n_{jk}}{n}$ , marginal probabilities  $\pi_j$  and  $\pi_k$  are estimated using marginal

relative frequencies  $p_{j.} = \frac{n_{j.}}{n}$  a  $p_{.k} = \frac{n_{.k}}{n}$ . (Freund 2010 Budíková 2010, Walker 2013)

We test the null hypothesis  $H_0$ :  $X, Y$  are stochastically independent random variables against the alternative  $H_1$ :  $X, Y$  are stochastically dependent random variables. The test is based on

comparing the detected frequency  $n_{jk}$  and so called theoretical frequencies  $\frac{n_{j.} \times n_{.k}}{n}$  of the pair variant  $(x_{[j]}, y_{[k]})$ , which if the null hypothesis should be very similar. (Hendl, 2012)

$$K = \sum_{j=1}^r \sum_{k=1}^s \frac{\left( n_{jk} - \frac{n_{j.} \times n_{.k}}{n} \right)^2}{\frac{n_{j.} \times n_{.k}}{n}} \quad (\text{Budíková 2010})$$

The test statistic has the form:

For the test are met conditions of good approximation (80% takes the value  $\geq 5$  and the remaining 20% are below 2), then the statistic  $K$  is asymptotically conducted by the

distribution of the  $\chi^2((r-1)(s-1))$ . The critical value domain  $W = \langle \chi^2_{1-\alpha}((r-1)(s-1)), \infty \rangle$ . The hypothesis of independent variables X, Y, is rejected at the asymptotic significance level  $\alpha$  if the test statistic K is realized in the critical field W. (Walker, 2013)

The level of the measured values dependence of the nominal type is determined by use of Cramer's coefficient:

$$V = \sqrt{\frac{K}{n(m-1)}}$$

(Freund, 2010)

Where n represents the range and  $m = \min \{r, s\}$ . The coefficient takes values between 0 and 1. The closer to 1, the stronger is the measured dependence between X and Y, the closer to 0, the dependence is looser.

Tab. 2: Importance of Cramer's coefficient values, Source: Budíková 2010

0,0 - 0,1	negligible dependence
0,1 - 0,3	weak dependence
0,3 - 0,7	medium dependence
0,7 - 1,0	strong dependence

Dependence between age of the director and growth rate is determined using a form of hypotheses about the independence of the individual indicators on asymptotic significance level of 0.05.

## 4 RESULTS

Within results is investigated independence between company director's age and rate of growth of the company. Testing was done using the  $\chi^2$  test of independence with one degree of freedom. If the tested hypothesis will have been refuted, further dependence will be measured using Cramer's coefficient.

Tab. 3: Cross-tabulation of directors age and growth rate, Source: own research

	The grow rate	Age < 40	Age < 50	Age >51	Totals
Frequency	Zero or negative	6	7	15	28
Column		10,34%	12,96%	26,79%	
Row		21,43%	25,00%	53,57%	
Frequency	0,1 - 5%	8	11	12	31
Column		13,79%	20,37%	21,43%	
Row		25,81%	35,48%	38,71%	
Frequency	6 - 10 %	4	7	11	22
Column		6,90%	12,96%	19,64%	
Row		18,18%	31,82%	50,00%	
Frequency	11% - 20%	18	15	10	43
Column		31,03%	27,78%	17,86%	
Row		41,86%	34,88%	23,26%	

Frequency	víc jak 21%	22	14	8	44
Column		37,93%	25,93%	14,29%	
Row		50,00%	31,82%	18,18%	
Frequency		58	54	56	168

As we can see in Table 3 the age distribution of managers in 168 companies could be evenly divided to 54 cases. In contrast, in terms of growth rate, companies reaching growth rates of over 11% dominate compared to other groups.

In terms of zero or negative growth rate of outweigh managers older than 51 years of 53.6% compared to younger directors who are equally represented approximately 25% and 21.4%. Distribution is similar for companies achieving 5% growth rate, but there is again most managers with over 51 years of age (38.7%), followed by managers between 41 and 50 years (35.5%) and 25.8% of the directors under 40 years. The difference occurs in companies with a rate between 6 and 10%, were group represented by managers older than 51 years (50%) is again strongly followed by managers between 41 and 50 years, with 31.8%. At growth rates between 11% -20% and more than 21% is the order opposite to the previous ones in both categories dominate directors under 40 years of age, with 41.9% and 50.0% against the managers over 51 years where the distribution of 23 3% and 18.2%. Directors between 41 and 50 years maintained mid-values across the whole sample. From these data it can be concluded that a higher growth rate is achieved under the leadership of the company directors aged 40 years and younger and at the same time companies with a growth below 10% are managed by directors older than 51 years. It's assumable, based on the data in the table, that there is a certain relationship between the two variables, which is then tested using X2 test of independence with one degree of freedom on the chosen significance level  $\alpha = 0.05$ . Following hypothesis are tested.

$H_0$  = age and growth rate of the directors shall be independent

$$H_A = \text{non } H_0$$

Firstly, the conditions of good approximations were validated - at least  $80\% \geq 5$  and the remaining  $20\% \geq 2$ , see Table 3 based on theoretical frequency =  $\frac{n_j \times n_k}{n}$

It's possible to determine the expected frequency for age and growth rate, from the table below. For control purpose row and column totals are given. Table 4 was created using the Statistica software.

Tab. 4: Expected frequency for age and growth rate, Source: own research

Growth rate	Age < 40	Age 40 - 50	51 and more	Sums
Negative or zero	9,66667	9,00000	9,33333	28,0000
Up to 5%	10,70238	9,96429	10,33333	31,0000
Up to 10 %	7,59524	7,07143	7,33333	22,0000
11%-20%	14,84524	13,82143	14,33333	43,0000
More than 21%	15,19048	14,14286	14,66667	44,0000
All groups	58,00000	54,00000	56,00000	168,0000

It is evident that the conditions of a good approximation are met and in 100% cases the values  $\geq 5$ . Therefore, Pearson Chi-kv test can be used.

$$\chi^2 = \sum_{j=1}^r \sum_{k=1}^s \frac{\left(n_{jk} - \frac{n_j \times n_k}{n}\right)^2}{\frac{n_j \times n_k}{n}} \quad \chi^2=18,036 \quad df=8 \quad p=0,021$$

Since the p-value is lower than the chosen  $\alpha$ , the hypothesis of independence age and growth rates Decline  $H_0$  at significance level of 0.05. Now we try to express dependence by Cramer's

coefficient: 
$$V = \sqrt{\frac{K}{n(m-1)}} = 0,232$$

The Cramer's coefficient suggests that there is a weak dependence between monitored variables, as illustrated.

## 5 DISCUSSION

Also competencies are closely related to the age of managers. During life of managers, competencies are developing but can also disappear. Even some competencies at a certain age can not convey at all or in limited quantities, which may also have an impact on the success of management and consequently the success of the enterprise. From this follows that younger managers in this area would have an advantage (Benes, 2004), as follows also from our research. Younger directors lead companies with higher growth rates.

In 2010 in Germany, the research which was attended by 300 top managers. The results show that young managers (aged 30-39 years) often change their profession and the field in which they are employed, do not have such deficiencies in education, think more entrepreneurial and comprehensively evaluate the tasks to be performed. Research has shown that younger managers are at a given position, on average, one year shorter than older colleagues (young managers are at a given position on average 2.9 years) but perform their tasks faster and more efficiently than older colleagues, which confirms the findings of this contribution. Younger managers lead companies that exhibit faster growth rate (are more successful) (Kariérainfo 2010). This effect may be due to their greater flexibility and freedom through which they can easily be replaced by more companies and choose the most perspective.

European governments are trying due to lack of manpower to create a trend of an extension of the age limit for retirement. Effect of that factor on the effort of companies to keep senior managers was dealt by Karpinska (2013) and her team. She examined this phenomenon in the Netherlands on 238 employees. The research came to the conclusion that, contrary to all expectations, businesses prefer early retirement pension of managers, which supports our findings that older managers do not bring desired profit to the companies. In deciding whether to keep or to let senior managers go mainly personal relationships and financial requirements decide, Furunes (2011).

Study of Kunze (2013) focuses on the importance of age variability of managers in terms of business performance that managed to prove statistically in 147 companies. In contrast, and in accordance with our results, Guerin (2003) showed that managers over the age of 50 years no longer achieve such performance as younger colleagues. Similar results are confirmed by the research (Cologna, 1998) of top bank managers. It was shown that younger managers compared to the older ones achieve better results.

“For the theory of firm growth, this implies that the firm experiences constant (growth) returns to managerial resources. The rate of grow firm does not affect its managerial intensity, but the size of firms does inversely affect it. For the economy-wide theory of growth, this implies that managerial resources need not be a drag on the growth of output.” says Gander (1991). Other research in international companies looking to hire older managers as evidenced by an article from the German magazine *Manager Magazin* (E15 2013). For example the globally recognized institutions such as Procter & Gamble, Air Berlin, the European Central Bank, the Swiss bank UBS and others. A number of older managers retires and then returns back to work. The trend today is that older managers do not retire at all from the top positions shift to less lucrative positions, they become consultants or team coaches, which is for business an ideal combination of ferocity of youth and experience of older. "A new broom sweeps clean. But the old knows where the dirt is," says Alfred Odendahl, head of Bosch Management Support, himself at retirement age (Buchhorn & Klaus, 2013; E15, 2013).

## **MEASURING CUSTOMER SATISFACTION: A LITERATURE REVIEW**

*Vu Minh Ngo*

### **Abstract**

Customer satisfaction (CS) has attracted serious research attention in the recent past. This paper reviews the research on how to measure the level of CS, and classify research articles according to their approaches and methodologies. This paper also tries to supply some insights about the state of measuring CS in Vietnam. The main objective is to provide a conceptual basic to understand existing methodologies used for measuring CS. A total of 103 articles from more than 50 journals and international conferences are reviewed. A number of important methodologies used for measuring CS are defined and classified into two different approaches based on their nature. Another important contribution of this study is to suggest some criteria which should be considered to make CS measurement as a leading indicator of the financial performance. This paper can be helpful for managers to gain basic conceptual ideas of the methodologies used for measuring CS and also the criteria which make CS measurements more likely as a driver of financial performance when they are satisfied.

*Keywords: Customer satisfaction, Measure customer satisfaction, Customer satisfaction index/ measurements, SERVQUAL, National Customer satisfaction index*

JEL Classification: C10, M30

### **1 INTRODUCTION**

In today market-oriented business environment, it can be said arguably that the question how to satisfy customers becomes the ultimate concern of most of the companies in any kind of business. Therefore, understanding customer satisfaction (CS) dimensions, measuring it and taking advantage from these measurements become the urgent need for managers and establish the mainstream in academic literature about CS in the recent past. CS is important to measure because of its significant impacts on firms' long-term performance and also customer purchasing behaviors. In the academics, consistently providing high CS is well acknowledged to be associated with higher customer loyalty and enhanced reputation (Fornell, 1992; Anderson & Sullivan, 1993; Wangenheim & Bayon, 2004). Customer loyalty is considered as the outcome of a process beginning with customer satisfaction (Oliver, 1999). There exist definitely other factors other than customer satisfaction that form the customer loyalty and retention such as personal determinism and social factors. But satisfaction is a necessary step in loyalty formation (Oliver, 1999). CS can also supply a higher barrier against switching to other competitors. Loss cost and move-in cost were positively significant related to the CS (Kim, Park & Jeong 2004). Exploring the relationship between CS and the economic return is also one of the most interesting topics. Anderson, Fornell and Lehmann (1994) attempted to explore the relationship between CS and financial returns using a national customer satisfaction index (NCSI) and ROI (return on investment). They found the significantly positive association between ROI and CS but not immediately realized. Ittner and Larcker (1998) found that CS is a leading indicator of customer purchasing behavior, growth in the number of customers, and accounting performance. Banker, Potter and Srinivasan (2000) used operating profits per available room to measure financial performance and verified its lead-lag relation with CS for 18 hotels managed by a hotel corporation. However, there were also quite

a few of studies found no positive relationship between CS and economic returns. Yu (2007) found that “higher CS leads to higher customer revenue and higher customer costs at the same time, and thus customer profits remain unaffected”. There is obviously a tradeoff and lead to the question of probability. Thus, in order to achieve more practical implications, CS measurements do not only need to respond to the evaluation of current situation but also being a leading indicator for financial performance. The main objective of this study is to review and provide the conceptual basics to understand the methodologies used for measuring CS. Also, the article suggests ideas for making CS measurements to be leading indicators of financial performance by undertaking a review of the literature in CS research. In addition, it makes an attempt to get some insights about the state of measuring CS in the practice of Vietnam market in particular.

The remainder of this paper is organized as follows. Section 2 discusses the methodology used for reviewing in this paper. Section 3 is about the statistical and citation analysis of selected articles. Section 4 provides the conceptual basic ideas about methodologies used for measuring CS. Section 5 is about discussion, suggestion of criteria to make CS measurements being leading indicators of financial performance and some insights about measuring CS in Vietnam. Section 6 is conclusion.

## **2 METHODOLOGY**

### **2.1 Research agenda**

The research agenda is about the methodology used for measuring customer satisfaction. The search key for finding articles, books, and documents related to the research agenda are: “measure/develop customer satisfaction”, “customer satisfaction measurements”, “technique for measuring customer satisfaction”, “customer satisfaction”, and “customer satisfaction proxy/index/scale”. The main aim of the research is to define the most popular methodologies which are used to measure CS which are proposed and applied in the practice. These key works help to identify the articles which are most likely to studies about measuring CS.

### **2.2 Literature search criteria**

In search of relevant articles, the search will consist of journal articles with peer reviewed, books, government publication, conference proceedings and other relevant work. The search of literature will be conducted by using major multi-purpose databases such as Web of Science (Thomson Reuters), ProQuest, Emerald, Science Direct and EBSCO. A search for more articles using the same search key words will be conducted on the Internet using Google Scholar in order to increase the coverage of the literature search. The search criterion for the publication period is up to December 2014.

### **2.3 Literature search procedure**

The initial searches revealed that a total 265 articles were found from various sources included academic and professional journals, books and other publications. Then these articles' content would be analyzed for the relevance of method or proxy used for measuring CS. When the articles were found to be relevant to the study agenda, they would be assessed in more detail of its purposes, methodologies and findings. The citation criteria were applied to get the articles which are most valuable to the research topic. Except the very recent articles and books, the articles published more than 2 years and received less than 2 citations were eliminated. After the analysis, 103 relevant articles and books were chosen.

### 3 STATISTICAL ANALYSIS OF SELECTED ARTICLES

The literature searches from various sources produced 103 articles and books whose contents substantially related to the topic of how to measure CS. The coverage of the selected articles can be classified based on the methodology used for measuring CS. There are also some articles cover related topics to CS included such as Halo effects, statistical techniques, etc. Table 1 shows the numbers of articles writing about each methodology.

Tab.1 – Number of articles for each methodology. Source: Own research

<b>Methodologies</b>	<b>Number of articles</b>
National Customer satisfaction index (NCSI)	20
Service quality (SERVQUAL)	21
MUSA method	9
Probit/Logit model	4
DEA method	4
Important Performance Analysis (IPA)	8
Cluster Analysis	5
Conceptual papers	10
Other methods	14
Other issues related to CS	8

These selected articles are from a wide spread of journals with more than 50 journals. The journals with the high volume of selected articles as to measuring CS are Total Quality Management, The Journal of Services Marketing, The Journal of Marketing, Expert Systems with Applications, European Journal of Operational Research, International Journal of Bank Marketing, and Managing Service Quality.

Except for newly published articles and books, all other articles were adequately cited, the lowest being 2 citations as like the citation criteria. Table 2 shows the number of articles for each interval of citation from the articles.

Tab. 2 – Number of articles for each interval of citation. Source: Own research

<b>Citation</b>	<b>Number of articles</b>
> 100	9
50 -100	15
30-49	17
29 - 10	31
<10	31

### 4 METHODOLOGIES FOR MEASURING CS

After undertaking a literature review, the most popular methodologies in measuring CS are defined. The objective of this section is to provide the basic conceptual ideas about the most popular methodologies.

#### **4.1 National Customer Satisfaction Index (NCSI)**

Sweden has become the first country to establish a national economic indicator reflecting customer satisfaction. Claes Fornell (1992) in the articles "A national Customer Satisfaction Barometer: The Swedish Experience" proposed a method for measuring CS in more than 30 industries and for more than 100 corporations. After the first national customer satisfaction was developed in Sweden, a number of both national and international customer satisfaction barometers and indices have been introduced such as the American Customer Satisfaction Index (ACSI) (Fornell, Johnson, Anderson, Cha & Bryant, 1996), European Customer Satisfaction Index (ECSI), Norwegian Customer Satisfaction Barometers (NCSB) (Andreassen & Lindestad, 1998), etc. The implementation of national customer satisfaction indices seems to be suitable for a sustainable evaluation of the performance of companies in an international context. (Grund & Bruhn, 2000)

In this methodology, Customer Satisfaction Index (CSI) represents its served market's - its customers'- overall evaluation of total purchase and consumption experience, both actual and anticipated (Fornell, 1992; Johnson & Fornell, 1991). Each version of NCSI can include some modifications. But all of them are based on two fundamental properties. First, the methodology must recognize that CSI is a customer evaluation that cannot be measured directly. Second, as an overall measure of CS, CSI must be measured in a way that not only accounts for consumption experience, but is also forward-looking (Anderson & Fornell, 2000). Therefore, it includes not just antecedents but also the consequences of overall CS. The antecedents of CS is based on the expectation and disconfirmation paradigm which suggest that the dispersal between expectation of performance and perceived performance can determine customer satisfaction (Yi, 1990). These antecedents are usually performance expectation of a product or service, the perceived performance and perceived value. The consequences of overall customer satisfaction are the customer behaviors such as loyalty and complaint (Fornell, 1992; Fornell, Johnson, Anderson, Cha & Bryant, 1996; Grund & Bruhn, 2000; Johnson, Gustafsson, Andreassen, Lervik & Cha, 2001; Anderson & Fornell, 2000). These antecedents and consequences are latent variables which can be measured through other manifest variable which related to them. Structural Equation Modelling (SEM) is usually the technique for finding the CS level and validating the causal relationship between CS and antecedents, consequences in this methodology. One of the most important advantages of SEM is its capacity to study the relationships among latent constructs that are indicated by multiple measures (Lei & Wu, 2007). In addition, SEM can provide separated estimates of relations among latent constructs and their manifest variables (the measurement model) and of the relations among constructs (the structural model) (Tomarke & Niels, 2005). The goal of SEM is to determine whether a hypothesized theoretical model is consistent with the data collected to reflect this theory.

#### **4.2 Service quality (SERVQUAL)**

The SERVQUAL method was suggested to evaluate CS by Parasuraman, Zeithaml, and Berry (1988). Consequently, there have been several follow-up articles and studies about the SERVQUAL method and its application. Research in service quality has also been conducted within the framework of the expectation and disconfirmation paradigm. The central idea in this model is that service quality is primarily a function of the difference scores or gaps between expectations and perceptions (Jamali, 2007). The service quality research has been dominated by the SERVQUAL instrument which is usually cluster in five group quality determinants: Reliability, Responsiveness, Assurance, Empathy and Tangible (Parasuraman, Zeithaml & Berry, 1985; Ghobadian, Speller & Jones, 1994; Curry & Herbert, 1998; Wisniewski, 2001).

However, there has been controversy in the service quality literature about the sequential order of the two constructs: CS and service quality. While authors such as Dabholkar, Shepherd and Thorpe (2000); Cronin, Brady and Hult (2000) regard perceived quality as an antecedent to satisfaction, other authors (e.g. Parasuraman et al., 1988; Bitner, 1990), however, consider CS as an antecedent to service quality. The majority of recent publications (e.g. Yavas, Benkenstein, & Stuhldreier, 2004; Carrillat, Jaramillo, & Mulki, 2007; Jamali, 2007) consider service quality as an antecedent to CS. Thus, SERVQUAL can be used as a methodology used for measuring CS. The objective of SERVQUAL methodology is usually to develop the best instrument for measuring CS. The best instrument can be defined as the best service quality constructs for predicting CS for a specific firm. Structural Modelling Equation, Factor Analysis or Multiple Regression analysis are usually used for choosing and validating the best service quality constructs among the proposed ones.

Various scholars however pointed out that SERVQUAL is not a generic measure that could be applied to any service and that it needs to be customized to the specific service under consideration (Carman, 1990; Babakus & Boller, 1992). Li, Riley, Lin and Qi (2006) proposed five quality dimensions for comparing overall CS between two largest US parcel delivery companies, the UPS and FedEx. They are availability, responsiveness, reliability, completeness, and professionalism of service. Jamali (2007) proposed a conceptual model which included not just basic service quality dimension but also others antecedents of CS such as: Equity, Attributions, Cost/benefit analysis, Emotion, etc. Chadee and Mattsson (1996) investigated the best attributes influence on the overall satisfaction of a quality dimension during tourist encounters. The quality dimensions in the article were eating out, hotel accommodation, renting a car and going on a sightseeing tour. Andaleeb and Conway (2006) used factor analysis and regression model to find the impact of service quality determinants on CS in the restaurant industry.

### **4.3 Multicriteria Satisfaction Analysis (MUSA)**

The MUSA method was first introduced by Grigoroudis and Siskos (2002). The main objectives of MUSA method are: (1) supply the evaluation of customers' satisfaction level, both globally and partially for each of the characteristics of the provided service; (2) The supply of a complete set of results that analyze in depth customers' preferences and expectations, and explain their satisfaction level; (3) The development of a decision tool with emphasis on the understanding and the applicability of the provided results (Grigoroudis & Siskos, 2002). The proposed MUSA method defines CS as the aggregation of individual judgments into a collective value function assuming that client's global satisfaction depends on a set of  $n$  criteria or variables representing service characteristic dimensions. The required data for the MUSA method is collected through a questionnaire through which the customers are asked about their perception about the overall satisfaction ( $Y$ ) and their satisfaction about the set of pre-defined criteria ( $X_i$ ). The MUSA method follows the principles of ordinal regression analysis under constraints (Grigoroudis & Siskos, 2002):

$$Y^* = \sum_{i=1}^n b_i X_i^* ; \quad \sum_{i=1}^n b_i = 1;$$

where,  $Y^*$  and  $X_i^*$ , respectively, given customers' judgments  $Y$  and  $X_i$ ;  $b_i$  is the weight of the  $i$ -th criterion and the value functions  $Y^*$  and  $X_i^*$ .

The main objective of the method is to achieve the maximum consistency between the value function  $Y^*$  and the customers' judgments  $Y$ . The result of MUSA method provide us the weighting  $b_i$  for each criteria, the value  $y^{*m}$  for each  $m$ -th overall satisfaction level and the value  $x_i^{*k}$  for  $k$ -th satisfaction level of criteria  $i$ . The main advantage of the MUSA method is that it fully considers the qualitative form of customers' judgments and preferences, as they

are expressed in a CS survey. The MUSA method avoids the arbitrary quantification of the collected information, because the coding of the qualitative scale is a result, not an input to the proposed methodology. This does not occur in a simple linear regression analysis (Grigoroudis & Siskos, 2002). Moreover, the MUSA method result also offer complete information set more than just only focused on the descriptive analysis of CS.

Arabatzis and Grigoroudis (2010) has been using MUSA method and related software for identifying the factors affecting visitors' satisfaction level, as well as the critical points that the management authority of the National Park must concentrate its improvement actions. Ipsilandis, Samaras and Mplanas (2008) in their paper used MUSA method for analyzing the satisfaction of project managers with respect to satisfaction criteria associated with four dimensions: the project's results, the operations of the programme organization, the support of the project organization and the performance of the project team. Manolitzas, Grigoroudis and Matsatsinis (2014) used multicriteria decision analysis to evaluate patient satisfaction in a hospital emergency department through the application of MUSA method. They find that the average level of complete satisfaction is low (73.4) indicating that the citizens are somehow satisfied regarding the emergency department.

#### **4.4 Ordered Probit and Ordered Logit model**

Probit and Logit model are widely used in marketing and other fields such as artificial neural networks, biology, medicine, economics, mathematical psychology (Grigoroudis & Siskos, 2010). The most advantage of Probit and Logit model is that they take the qualitative ordinal characteristics of collected data into considers. In Probit and Logit model, the customers' satisfaction levels are assumed to be dependent on set of independent variables which can be illustrated as:

$$y_j^* = x_i' \beta + \varepsilon_i$$

Where  $\varepsilon_i$  are assumed independent and identically distributed random variables as usual,  $x_i'$  is the matrix of explanatory variables,  $\beta$  is the vector of coefficients to be estimated and  $y_j^*$  is unobserved (Barboza & Roth, 2009). According to Greene (2003), what one observed is q

$$\begin{aligned} y &= 0 \text{ if } y^* \leq 0 \\ &= 1 \text{ if } 0 < y^* \leq \mu_1 \\ &\quad \vdots \\ &= j \text{ if } \mu_{j-1} \leq y^* \end{aligned}$$

Where  $y$  is customers' satisfaction level; 0, 1, 2, ...,  $j$  is the level of satisfaction;  $\mu_i$  are unknown parameters to be estimated with  $\beta$ . It should be emphasized that the value 0, 1, 2, ...,  $j$  are simply coding and do not take quantify the  $y$  variable. According to this explanation, the probability that one customer has expressed for the  $m$ -th satisfaction level, given his/her satisfaction judgments  $x_i'$  is

$$\Pr(y_j = m) = \Pr(\mu_{m-1} < y^* \leq \mu_m) = F(\mu_m - x_i' \beta) - F(\mu_{m-1} - x_i' \beta)$$

Where  $F(\mu_m - x_i' \beta)$  and  $F(\mu_{m-1} - x_i' \beta)$  is the standard normal distribution function for the Ordered Probit model and the standard logistic distribution for the Orederd Logit model.

The estimated vector of coefficients  $\beta$  can provide information about the effect of independent variables on the probability that an overall satisfaction level can happen (Barboza & Roth, 2009). The orederd probit and ordered logit models provide the probability that each level of overall satisfaction can happen with a specific sample of data. For example, Gan, Clemes, Limsombunchai and Weng (2006) used logistic regression to identify that the factors which

influenced the customer's choice between electronic banking and non-electronic banking in New Zealand are the service quality, perceived risk factors, user input factors, employment, and education. In the same stream of research, Eboli and Mazzulla (2009) also used ordinal logistic regression analysis to estimate the weight of the service aspects on the overall satisfaction. The paper showed the valid of logistics regression analysis which can be applied to the CS assessment process. The probit and logit model also can be used as the extension for the SERVQUAL method. After using SERVQUAL method for identify and validate the factors which affect to customer behavior. The logit and probit model can be used to rank the factors with regard to their impact on customer behavior (Clemes, Gan & Zhang, 2010).

#### **4.5 Other methods**

*Important-Performance Analysis (IPA).* The importance–performance analysis (IPA) is a widely used analytical technique that yields prescriptions for the management of CS. IPA is a two-dimensional grid based on customer-perceived importance of quality attributes and attribute performance (Matzler, Bailom, Hinterhuber, Renzl, & Pichler, 2004). It provides an attractive snapshot of the importance of a set of selected attributes in customers' behaviour processes and how well the products/services met consumer expectations. Thus, it can provide a clear direction for a company's future resource allocation decisions (Liu & Jang, 2009). This approach assumes that attribute performance and attribute importance are two independent variables (Matzler et al., 2004). Therefore, this approach can offer augmented assessment for other methods in term of measuring CS after valid attributes are defined.

Liu and Jang (2009) used IPA method as a first step for identifying the effects of food, service, atmospherics and other attributes on CS and behavioral intentions. Along with factor analysis and multiple regressions, this study indicates that food quality, service reliability and environmental cleanliness are three pivotal attributes to create satisfied customers and positive post-dining behavioral intentions. Matzler, Sauerwein, and Heischmidt (2003) used a revised model of IPA to investigate the asymmetric characteristics of impact of impact of the different attributes on overall satisfaction. They found that four types of factors which are basic factors, high performance factors, low performance factors, and excitement factors have different importance characteristics if concerning two different context business of high and low performance.

*Cluster Analysis.* The objective of Cluster analysis in dealing with CS is to identify Benefit Segments of Customers. In other words, the method can identify different clusters of customers who allocate importance to performance attributes in similar way within each cluster and in different way comparing with others (Vavra, 1997). For example, in the customer base, there might be a group of customers who might place a high importance on after-sale service. Another group might accord higher importance to a wide array of features. In Cluster analysis, you need to identify from previous literature the performance attribute and collect customer judgments about the importance of these attributes. Andriotis, Agiomirgianakis and Mihiotis (2008) used the framework included both factor analysis and cluster analysis to identify the right factor which influence the satisfaction of tourists to the island of Crete. The cluster analysis also produced three clusters: the "higher-satisfied", "the In-Between", and the "Lower-Satisfied". Bjertnaes, Skudal and Iversen (2013) used cluster analysis to identify response clusters of patients, based on their responses to single items about overall patient satisfaction, benefit of treatment and perception of malpractice. The study identified five response clusters with distinct patient-reported outcome scores, in addition to a heterogeneous outlier group with very poor scores across all outcomes.

*Data Envelopment Analysis (DEA).* The traditional DEA technique has long been utilized as an invaluable tool in the field of operations research and management science to solve

problems in wide range of industries as well as in not-for profit (Bayraktar, Tatoglu, Turkyilmaz, Delen & Zaim, 2012). The DEA model measures the efficiency of any Decision Making Unit (DMU) which is obtained as the maximum of a ratio of weighted outputs to weighted inputs subject to the condition that the similar ratios for every DMU be less than or equal to unity (Charnes, Cooper, & Rhodes, 1978). In DEA model for CS, a DMU is a customer which expresses judgments. The inputs are usually the attributes of overall CS which are pre-defined from the literature. The outputs are usually customer behaviors such as: overall CS, customer loyalty, customer re-purchase intention, etc. DEA method respects and takes into account the cause-effect relationship between inputs and outputs makes it suitable for measuring the result of the company's efforts to satisfy customers. DEA model provides the efficiency score which express how efficient the attributes from products/services make the customer satisfy comparing with other products or services. DEA can be used most effectively for benchmarking to compare the satisfaction level between a group of companies. Löthgren and Tambour (1999) used DEA network model to obtain measures of efficiency and productivity that account for CS of Swedish pharmacies. Estimation results from the network model and a direct productivity model (without CS) are compared and indicate that the technical efficiency is lower under the network model. Bayraktar et al. (2012) used DEA for analyzing and comparing CS and loyalty efficiency for mobile phone brands in an emerging telecommunication market, Turkey. Drawing on the perceptual responses of 251 mobile phone users, the DEA models reveal that from the top six mobile phone brands in Turkey, Nokia features as the most efficient brand followed by LG and Sonny Ericsson in terms of CS and loyalty.

There are still a lot of methods and models which can be useful for measuring CS. They are not mentioned in detail in this study concerning the less popular of these methods for both academic research and practical application in term of measuring CS. These methods can be named such as: Descriptive Statistics, Discriminant analysis, Kano model, multiple regressions, conjoint analysis, etc.

## **5 DISCUSSION AND SUGGESTED CRITERIA**

### **5.1 Different approaches**

There are two approaches for measuring CS in the selected articles with respect to the objective of the methodologies. The first approach is based on theoretical backgrounds to propose the attributes which influence CS. Then it assumes that these pre-defined attributes are the best for predicting CS. This approach pays much attention to the validation and reliability of the model with the collected data. The most important result of this approach is usually the current level of CS. In addition, the methodologies following this approach usually supply more information which is useful for practical context. This approach is standardized and has more comparative power across firms, industries or sectors. NCSI, MUSA, DEA can be classified into this approach.

The second approach focuses on finding and testing the relationship between proposed attributes and CS. This approach also based on the theoretical background to posit the attributes which affect to CS. Then it will attempt to evaluate whether these attributes have statistical significant relationship with CS. The most important result of this approach is the set of attributes which are defined as the best ones for measuring CS. This approach usually cannot estimate the current level of CS; however it can be used for developing an appropriate instrument for assessing customer about their satisfaction. This approach can be very flexible. Each firm, industry or sector has different attributes which are the most influencer to CS. Therefore, this approach can be useful to investigate the CS for a specific business context

when the comparison is not essential. SERVQUAL, Ordered Logit/Ordered Probit model, IPA, Cluster analysis can be classified into this approach.

In sum, two different approaches for measuring CS can be seen from the selected articles. The first approach is more completed and can be used as a standard for comparison. This approach focuses on getting the overall level of CS. On the other hand, the second approach is more flexible and should be used in specific business context when the attention of the manager is more about finding what makes CS.

## **5.2 Suggested Criteria**

### *The need of research on measuring CS as a leading indicator*

Among the articles about measuring CS, there were just a few ones mentioned to the purpose of measuring CS as a leading indicator for financial performance (Grigoroudis, Nikolopoulou & Zopounidis, 2008; Fornell, 1992; Fornell et al., 1996). The main objective of the most articles is to validate the relationship between service/product attributes and CS or customer behaviors (Chen, Hsiao & Hwang, 2012; Grigoroudis & Siskos, 2002; etc.). The main themes of the implications from these studies focus more on the management and marketing areas. What can be derived from these articles is that they assume the methodologies can effectively measure the CS index which can be served as a leading indicator of financial performance though it was not directly stated in most of the articles. The articles about the relationship between CS and financial performance also did not mention to the specific criteria for measuring CS as leading indicator for financial performance (Fornell, Mithas, Morgerson & Krishnan, 2006; Yu, 2007; Gómez, McLaughlin & Wittink, 2004). Ittner and Lacker (1998) measured the relationship between CS with financial measures using different types of CS measures. Although their study found that there was no significantly different result when using different CS measures, it did not mention to the criteria for the matter of leading indicator. This study also suggested doing further research on why there was unexpected negative relationship between CS measures and financial measures in some industry which can be caused by the problem of using unsuitable CS measures. For the practical implication, CS measures require capacity to drive the financial performance. As a leading indicator for financial performance, CS measurements should have a stable positive relationship with financial performance. Therefore, there should be distinguished the measurement of current CS level for management and marketing purpose and its role as a leading indicator for financial performance. Thus, taking consideration of CS measurement as a leading indicator of financial performance becomes a gap in CS research. This discussion pays more attention to the suggestion of the idea of criteria for measuring CS measurement as a driver for financial performance.

### *Suggested criteria*

*The financial measures for study.* As mentioned in the introduction, the researches on the consequence of CS are one of the most selected and concerned topics. One question raised from the topic is about which financial measurements should be used for investigating the leading effect of CS measures. The Service-Profit Chain (SPC) framework can be used to shed some light on this issue. SPC is a framework for linking service operations, employee assessments, and customer assessments to a firm's profitability (Kamakura, Mittal, de Rosa & Mazzon, 2002). There are two different approaches to the financial measures to which the SPC should aim. The first one is the original SPC framework which was proposed by Heskett, Jones, Loveman, Sasser and Schelesinger (1994). This approach focuses on customer retention and revenue. The first approach did not include the cost and investment to achieve the better customer perception. On the other hand, the second approach- Return on Quality

framework which was proposed by Rust, Anthony and Timothy (1995) takes into account the cost and investment so that the focus is probability. It is assumed that the ultimate goal of any firm towards to profitability. Hence, in order to make CS measurement as a leading indicator for profitability, the employed methodology should consider the cost spent to achieve the satisfaction of customer. Otherwise, the revenue-related financial measurements should be used to study the economic return of CS measures. The further step can be taken to investigate the profitability of CS index. Because all the aforementioned methodologies do not take the cost for improving CS into account when measuring CS, it is more realistic to study the relationship between revenue-related measures and CS measures from these methodologies.

*The overall CS.* The overall CS should be used in any methodology if its role is a leading indicator of financial performance. Overall CS reflects the cumulative evaluation of customers' experience with a firm. Compare to the transaction-specific satisfaction, overall satisfaction is more consistent through time and includes the effect of more other factors for example the past experience, the comparison with other competitors, etc. It also reduces the influence of specific unusual event on the customers' evaluation. So, this type of satisfaction has more capacity to explain the customer post-purchased behaviors. Then in turn it has much more directly influence on financial performance in comparison with transaction-specific satisfaction.

*Forward looking.* Forward looking means that CS measures should not only just measure the customer's past experience but need to have predictive capability as well. The predictive power of CS measurements can be achieved by satisfying two conditions. The first condition is that CS measures have stable positive relationship with financial measures. The second one requests that it should lead or drive financial performance. The predictive capacity can be gained through including the proxy of economic return such as customer retention and price tolerance when measuring CS (Anderson & Fornell, 2000). In addition, the methodology for measuring CS also needs to have causal relationship between antecedents and consequences of CS. The reason for this criterion rises from the need that manager need to know both what make customer satisfied and how CS level drives the customer behavior and then financial performance.

*Weighting criterion.* According to this criterion, the factors which have more influence upon the economic return should be realized and have more weight when calculating the final CS level. It should be noticed that the methodology should focus on the factors which have impacts on the economic return rather than just on the CS. If this weighting criterion cannot be done, it is more likely that CS index only measures effectively the satisfied customers but they are not willing to pay more. For example, Stauss and Neuhaus (1997) found that customers who give equal satisfaction scores have different emotions towards the service provider, different expectations concerning the service provider's future capabilities to perform, and different behavioral intentions to maintain the relationship.

*The Comparison Norm.* Most of the aforementioned methodologies use the expectation-disconfirmation paradigm for the background theory to investigate the CS. There is another paradigm which can be used as substitution for it which is called Norm of Comparison standard. The Norm standards refer to what "should be" the performance of the product, whereas the predictive expectations in the basic confirmation paradigm mean what "will be" the likely product performance (Yi, 1990). In order to link CS to customer retention which then leads to economic return, the Competitor Norm Standard should be used. The expectation do not count on the competitive feature which can cause customers who are satisfied still move to competitors whose products or services are over current customers'

expectation. The Competitor Norm Standard should be applied to measure CS level together with the perceived value to get the real CS level which is more likely to lead to the customer retention and economic return.

### **5.3 Measuring CS in Vietnam**

This paper tries to make a small survey about the use of CS measures and how CS is applied in Vietnam. The questionnaire used in the survey has two sections. The first section is about how companies in Vietnam perceive the importance of CS measures in predicting financial performance. The second focuses on how the CS measures are obtained from customers' opinions. Online surveys were sent to 650 companies which are listed on the Ho Chi Minh Stock Exchange and Hanoi Stock Exchange. 76 surveys were completed and collected for further analysis. The response rate is 12% which is relative low but can be expected for the online survey with no incentive included. The companies which participated in the survey come from wide range of different industries. This reduces the bias which can be caused by the individual characteristics of companies.

After analyzing the survey, the result shows that, most of the companies (65/76) agree that non-financial measures and especially CS are important and very important to future financial performance. But only about two-thirds in total 76 companies (51 companies) conduct the survey about CS. However, the structures used in the survey for measuring CS by these companies are mostly the simple versions which include only one or two questions about the CS level from customers. As a result, all the companies which report having CS survey do not use any sophisticated statistical methodology which are suggested in this paper. This can be explained by the fact that measuring CS is the new concept in such an emerging market as Vietnam. Vietnam started to open the economy with the aim of forming a liberalized economy with fully competitive markets for just more than 20 years after a long time under State Controlled economy. Therefore, just recently, the increasing highly competitive environment in the economy has pushed firms toward customers-focused strategy and lead to the concept of measuring CS. Another reason for not using sophisticated statistical methodologies for measuring CS can also come from the fact that the companies do not know and understand how they could be beneficial and how to use these methodologies. Being asked about the willingness to use any sophisticated methodology, most of the companies (56/76) answer that they might consider to use if they have chance to understand them basically. So that this paper can be helpful to show corporate executives the conceptual basic of the statistical methodologies for measuring CS in Vietnam.

In addition, the companies which conducts CS survey are usually belong to the business to customers (B2C) sectors such as Consumer goods, Financial and Banking service and transportation. The explanation for this can be that companies operated in business to business (B2B) sectors do not have large customer base so that they can manage CS by individually contacting with a particular customer. It is not true in B2C sectors in which companies have to deal with thousands of customers per day. This difference in measuring CS in B2B and B2C can be seen as an interesting topic for future studies.

## **6 CONCLUSION**

In order to manage CS effectively, managers need to measure it. This study attempts to review most of the popular methodologies for measuring CS such as NCSI, SERVQUAL, MUSA, DEA, Ordered Probit and Ordered Logit model, etc. For practical application, CS measurements should be used as a driver for financial performance. For this objective, this paper attempts to suggest criteria which should be satisfied to make the CS measurements as

leading indicator of financial performance. It also gives some insights about how companies in Vietnam measure CS and raises the need for studies about the difference between measuring CS in B2B and B2C companies. The limitation of this paper lies on the lack of suggestion of methods to apply these criteria in methodologies for measuring CS which can be a concern for further research on measuring CS.

### **Appendix:**

#### **A survey about measuring customer satisfaction in Vietnam**

This survey serves for the educational purpose only - No detailed company profile is needed and revealed

#### **Which sectors is your company operating?**

1. Business to Business

2. Business to Customers
3. Service
4. Manufacturing
5. Finance and Banking
6. Healthcare
7. Real Estate
8. Mining
9. Other:

**Section 1:**

Perception of companies about customer satisfaction

**Question 1: How is the non-financial measures important to your company in term of pursuing long-term profitable objective?**

1. Very important
2. Important
3. Somehow important
4. Not so important
5. Not important at all

**Question 2: Which are the following non-financial measures which your company choose to include in your performance system?**

1. Employee satisfaction/survey
2. Productivity of employees
3. Customer satisfaction/survey
4. Staff turnover
5. New idea implementation
6. Hours of training
7. Delivery time
8. Number of complaints
9. Other:

**Question 3: How are customer satisfaction measures important to your company in term of pursuing long-term profitable objective?**

1. Very important
2. Important
3. Somehow important
4. Not so important
5. Not important at all

**Section 2**

The implementation of measuring customer satisfaction

**Question 1: Has your company already measured customer satisfaction?**

If “Yes” go to Question 2 and Question 3. If “No” go to Question 4. Question 5 is for all participants

Yes

No

**Question 2: Which kind of survey has your company used to measured customer satisfaction?**

1. Survey with one question about customer satisfaction
2. Survey with set of questions not only about customer satisfaction but also the drivers of customer satisfaction.
3. Other: ....

**Question 3: Has your company used any of following methodology to measure customer satisfaction?**

1. National Customer Satisfaction Index
2. Service quality (SERVQUAL)
3. MULTICriteria Satisfaction Analysis (MUSA)
4. Ordered Probit and Ordered Logit model
5. Important-Performance Analysis (IPA)
6. Cluster Analysis
7. Data Envelopment Analysis (DEA)
8. We do not use any one of them
9. Other: .....

**Question 4: Does your company have project of measuring customer satisfaction in the near future?**

YES

NO

**Question 5: If your company has not used any sophisticated statistical methodology, would your company consider to use them for measuring customer satisfaction?**

1. Yes, we are going to use them
2. Yes, if we can understand them basically
3. Yes, if others companies also use them
4. Yes, but we have to outsource it for other parties
5. No, we find our current methodology adequate
6. No, we do not need measure customer satisfaction
7. Other: ...

## **STOCK-MARKET LINKAGES: EVIDENCE FROM THE MAJOR FOREIGN EXCHANGE MARKETS**

*Jana Vychytilová, Miloš Král*

### **Abstract**

The main aim of this paper is to investigate the stock-market linkages between the five most regularly quoted stock market indices and to explain how the cross-market linkages have changed over time including crisis and non-crisis periods. By studying the time-series properties of the American S&P 500, the Japanese Nikkei 225, the British FTSE 100, the German DAX 30 and the European EURO STOXX 50 we find that these leading Blue-chip indexes are significantly correlated based on the parametric and non parametric correlation analysis and normality tests almost for the full sample. Empirical results report statistically significant positive correlations between the pairs of indices over the last fifteen-year period at the 95.0% confidence level. However, the strength of the relations between the pairs of indices varied in the researched years. These conclusions were reached from the correlation analysis of monthly indices relative returns from February 01 1999 to January 01 2015. The empirical evidence from the cross asset markets confirm the basic findings and are beneficial for policy-makers, shareholders and traders. In particular, the results are useful in the areas of global tactical asset allocation, evaluation of business cycles and trend analysis.

### **1 INTRODUCTION**

The recent global financial crisis and turmoil in international financial markets, has invigorated the new debate on contagion and global financial integration. Policymakers and shareholders in emerging markets are increasingly concerned about the consequences for the domestic equity markets when companies list stock abroad while effects of cross-listing depend on the quality of intermarket information linkages. Much of this current debate on nature of today's interdependent financial markets has been aimed at significant increase in cross-market linkages after crisis periods (Domowitz, Gien and Madhavan, 1998; Dornbush, Park and Claessens, 2000).

Historically, the approaches that have been used by traders to analyze financial markets in an effort to identify and forecast the direction of price trends have been divided into two *single-market* distinct methods: fundamental analysis and technical/chartist analysis. The importance of the chartism and fundamental analysis in the foreign exchange markets may have increased over the last decade. However, forecasting styles and the overall importance attached to fundamental versus chartist analysis vary across different trading locations. Moreover, in the past few decades, when the financial markets were less volatile and tended to trade independently of one another, those popular single-market methods were rightfully so. Park and Irwin (2007) state the empirical literature on the profitability of technical trading strategies is categorized into two groups, "early" and "modern" studies. They conclude according to the characteristics of testing procedures, "early" studies indicate that technical trading strategies are profitable in foreign exchange markets and futures markets, but not in

stock markets, and that the "modern" studies indicate that technical trading strategies consistently generate economic profits in a variety of speculative markets at least until the early 1990s. Nowadays, traders need to expand their perspective to take into consideration also external factors that affect other markets, because it is not worthwhile enough to look only at each individual market by itself anymore. This can be accomplished by using *intermarket* methods that not ignore the interdependencies of the financial markets and their effects on one another and that can *retrospectively* and *prospectively* look at various markets in their own interaction. By analyzing the effects of related markets, important early warnings of impending changes in market direction can be gleaned from intermarket data well before these changes begin to show up on the charts of traders who limit the scope of their analysis to each individual market. Another main advantage of intermarket approach is that it builds on the strengths of single-market analyses, adding another dimension to the analytic framework so that the behavior of each market can be analyzed within a broader intermarket context (Mendelsohn, 2000, 2012; Oberlechner, 2001).

This contribution is oriented on intermarket investigations within the equity markets. The theoretical background of the paper is focused on cross-market linkages measurement and on contagion, cointegration and related financial markets. We also show how our investigation relates to previous research and explain the parametric/non parametric correlation methodology that we adopt to investigate stock-market linkages and comovements in major foreign stock markets. The main aim of this paper is to investigate the stock-market linkages between the five most regularly quoted stock market indices and to explain how the cross-market linkages have changed over time including crisis and non-crisis periods.

## **2 THEORETICAL BACKGROUND**

### **2.1 Cross-market linkages measurement**

Previous and current studies on contagion and intermarket investigation offer many approaches and methods to examine cross-market linkages and to measure the propagation of international shocks across countries. The more widely used processes include the cross-market correlation coefficient procedures and correlation analysis.

King and Wadhvani (1990) used processes including the cross-market correlation coefficient procedures. Arshanapalli and Doukas (1993) used recent developments in the theory of cointegration and provide new methods of testing the linkage and dynamic interactions among stock market movements. Al Awad and Goodwin (1998) examined weekly real interest rates for G-10 countries using a variety of time-series tests and their results imply leadership roles for the US in international asset markets.

Mendelsohn (2000) points out the best way to implement intermarket analysis is through the use of neural networks to excel at finding reoccurring patterns and relationships between related markets. He states, that globally related markets can be analysed with regard to their confirmation or divergence from one another over time, in response to various global and domestic economic considerations. Wang (2006) presents a new interactive model for constructing a tactical global assets allocation through integrating fuzzy scenarios clustering-based approaches it mean-variance, that serves as an alternative forecasting rebalance quantitative model to the popular global assets allocation. Hon, Strauss and Yong (2004) used the bias-correction procedure and GARCH framework to examine whether contagion occurred three and six months after September 11, 2001 shock, across 25 economies via measuring the response of international stock markets to the U.S. shock.

Katsanos (2008) states when assessing intermarket relations it is important to keep in mind that these are neither fixed nor static in time, but they fluctuate continuously in strength and time. He adds it is usually very difficult to determine which market is leading or lagging. A lead can shift over time and become a lag, with the markets switching positions as follower and leader. In addition, a weak positive correlation can sometimes become negative and vice versa. For this reason it is always prudent to look at the prevailing rate of change of the correlation between two related markets before reaching any important conclusions or trading decisions. Correlation is a relatively simple concept but absolutely mandatory in the use of investments. It basically refers to whether or not different investments or asset classes will move at the same time for the same reason and in the same direction (Katsanos, 2008).

Katsanos (2008) points out when two variables appear to be normally distributed it is better to use Pearson's correlation coefficient than Spearman's because in calculating Spearman's coefficient some information is lost because the prices are converted to ranks. The main advantage of using the Spearman coefficient is that it is not sensitive to outliers because it looks at ranks as opposed to actual values.

Aloui, Aïssa and Nguyen (2011) offer several copula functions providing the necessary flexibility to capture the dynamic patterns of fat tail as well as linear and nonlinear interdependences that can be used to model the degree of cross-market linkages.

Kim and Park (2011) used Spearman and Kendall rank correlations to examine monthly, quarterly and semi-annual returns.

Results from previous empirical studies vary depending on the methodology used.

## **2.2 Contagion, interdependence and related financial markets**

Previous empirical studies by Dungey and Martin (2007) and Fleming, Kirby and Ostdiek (1998) showed strong evidence that cross-market links are important.

Arshanapalli and Doukas (1993) discovered strong interdependence among national stock markets prior to October 1987 and furthermore, that the degree of international co-movements among stock price indices has increased substantially for the post-October 1987 period, with the Nikkei index the only exception. They found the US stock market has a considerable impact on the French, German and UK markets in the post-crash period. Moreover, they found that the response of the French, German and US markets to US stock market innovations were consistent with the view of cross-border informationally efficient stock markets. However, Arsanapalli and Doukas (1993) state the Japanese equity market performance has no links with US stock market and the stock markets in France, Germany and United Kingdom during the pre- and post-October crash period. Dungey and Martin (2007) and Fleming, Kirby and Ostdiek (1998) state that cross-market linkages have become stronger since the 1987 stock market crash while the spillovers have a relatively larger effect on volatility than contagion.

Ayuso and Bianco (2001) investigated whether there has been an increase in the degree of financial market integration during the nineties focusing on stock markets. They suggested that during the nineties there has been an increase in the degree of market integration between stock markets. Westerhoff (2003) explores multiasset market dynamics and observes high degree of comovements in stock prices too. Results from earlier empirical study of Hon, Strauss and Yong (2004) indicate the international stock markets, particularly in Europe, responded more closely to U.S. stock market shocks in the three to six months after the terrorist attack in the United States on September 11, 2001.

Caporale, Cipollini and Spagnolo (2005) test for contagion within the East Asian region and suggest a significant increase in the degree of comovement between stock returns in different countries. Andersen, Bollerslev, Diebold and Vega (2007) investigated the response of US, German and British stock, bond and foreign exchange markets to real-time US macroeconomic news. They conclude that equity markets react differently to news depending on the business cycle.

Katsanos (2008) finds out yearly correlations between the S&P 500, four major international indices DJ-30, DAX, FTSE and NIKKEI before 1996 were inconsistent and unpredictable but started to converge during the last ten- year (1996-2007) period. He points out the most incongruous relationship is that between the S&P 500 and Japan's Nikkei as it fluctuated from negative to positive values over that period of time.

Aloui et. al., (2011) state the extent of the current global crisis and contagion effects induce conducting an empirical investigation of the extreme financial interdependences of some selected emerging markets with the US markets. Additionally, they investigated strong evidence of time-varying dependence between each of the BRIC markets and the US markets during both bullish and bearish markets.

Chevallier and Lelopo (2013) assess the cross-market linkages between commodities, stock and bonds in a cointegration framework and discuss how traditional assets actually interact from a dynamic perspective. Beirne and Gieck (2014) assess interdependence and contagion across three asset classes (bond, stocks and currencies) over the period 1998-2011 using a global VAR. They find in times of financial crisis US equity shocks lead to risk aversion by investors in equities and currencies globally and in some emerging market bonds.

### **3 MATERIALS AND METHODS**

We set the basic hypothesis *PI* in our research, based on a priori intermarket idea saying all financial markets are interconnected – domestically and globally; and based on Al Awad and Goodwin (1998) results of time-series tests implying the leadership role for the U.S. in international asset markets:

*PI*. The Japanese (*N225*), British (*FTSE*), German (*DAX*) and European (*SX50*) stock market indices were positively correlated with the American stock market index (*SPX*) during the analysed period- (*PIa*): The American stock (*SPX*) and the Japanese stock (*N225*) markets were positively correlated during the analysed period; (*PIb*): The American stock (*SPX*) and the British stock (*FTSE*) markets were positively correlated during the analysed period; (*PIc*): The American stock (*SPX*) and the German stock (*DAX*) markets were positively correlated during the analysed period; (*PId*): The American stock (*SPX*) and the European stock (*SX50*) markets were positively correlated during the analysed period.

Empirical estimation of correlations between each pair of indices is challenging indeed. We expect by visual inspection of the multiple comparison chart (Fig. 2) that we find positive statistical significant correlations. The use of the correlation coefficient is essential for our analysis of multiple markets.

#### ***Data and Methodology***

We have collected monthly adjusted closing prices (dividend yields and splits are not considered in calculation) in equity markets from February 01, 1999 to January 01, 2015. Overall stock market trends we represent by using world leading Blue-chip indexes: 1) the American *S&P 500* ("*SPX*"), 2) the Japanese *Nikkei 225* ("*N225*"), 3) the British *FTSE 100* ("*FTSE*"), 4) the German *DAX 30* ("*DAX*") and 5) the European *EURO STOXX 50*

("SX50"). The data has been obtained from YahooFinance, Bloomberg and Investing.com online databases.

The data are measured in different units, therefore we use horizontal analysis to estimate monthly relative performances in the first step by

$$r_{t-1}^i = \frac{P_i(t) - P_i(t-1)}{P_i(t-1)} \quad (1)$$

where  $P$  is the market index monthly closing price adjusted for dividends and splits.

Testing for distributional assumptions and for normality in particular is another part of our statistical research. Then we use the appropriate correlation coefficient to measure the strength of association between two variables and to find out whether the variables are significantly correlated based on the correlation analysis and normality tests for the full sample.

### ***Test for normality***

Shapiro, Wilk and Chen (1968) discuss the mainly used statistics for studying alternative distributions that are  $W$  (Shapiro and Wilk Statistic  $W$ ),  $V/b1$  (standard third moment),  $b2$  (standard fourth moment),  $KS$  (Kolmogorov-Smirnov),  $CM$  (Cramer-Von Mises),  $WCM$  (weighted  $CM$ ),  $D$  (modified  $KS$ ),  $CS$  (chi-squared) and  $u$  (Studentized range). They conclude (i)  $W$  statistic provides a generally superior omnibus measure of non-normality; (ii) the distance tests ( $KS$ ,  $CM$ ,  $WCM$ ,  $D$ ) are typically very insensitive; (iii) the  $u$  statistic is excellent against symmetric, especially short-tailed, distributions but has virtually no sensitivity to asymmetry; (iv) a combination of both  $-Ab$ , and  $b2$  usually provides a sensitive judgment but even their combined performance is usually dominated by  $W$ ; (v) with sensitive procedures, good indication of extreme non-normality (e.g., the exponential distribution) can be achieved with samples of size less than 20.

Shapiro and Wilk (1965) introduced the statistical procedure for testing a complete sample for normality. The  $W$  test statistic for normality can be obtained by dividing the square of an appropriate linear combination of the sample order statistics by the usual symmetric estimate of variance. They stated this ratio is both scale and origin invariant and hence the statistic is appropriate for a test of the composite hypothesis of normality. The Shapiro-Wilks test is based upon comparing the quantiles of the fitted normal distribution to the quantiles of the data. The  $W$  test statistic for normality is defined by

$$W = \frac{R^4 \hat{\sigma}^2}{C^2 S^2} = \frac{b^2}{S^2} = \frac{(\hat{a}y)^2}{S^2} = \frac{(\sum_{i=1}^n a_i y_i)^2}{\sum_{i=1}^n (y_i - \bar{y})^2}, \quad (2)$$

where

$$R^2 = m'V^{-1}m,$$

$$C^2 = m'V^{-1}V^{-1}m,$$

$$a' = (a_1, \dots, a_n) = \frac{m'V^{-1}}{(m'V^{-1}V^{-1}m)^{\frac{1}{2}}}$$

and  $b = R^2 \hat{\sigma} / C$ .

Shapiro and Wilk (1965) suggest that the mean values of  $W$  for non-null distributions tends to shift to the left of that for the null case and further, it appears that the variance of the null distribution of  $W$  tends to be smaller than that of the non-null distribution. They point out this

fact is due to the positive correlation between the numerator and denominator for a normal population being greater than that for non-normal populations. The  $W$  statistic therefore provides a generally superior omnibus indicator of non-normality judged over the various symmetric, asymmetric, short- and long-tailed alternatives. Therefore,  $W$  statistic will be used for basic testing distributional assumptions and for normality in our stock-market research indeed (Shapiro, Wilk and Chen, 1968). A glance at the empirical cumulative distribution of  $W$  (Fig. 1) confirms that  $W$  is becoming less skew as  $n$  goes from 5 to 50.

Fig. 1 – Normal probability plot of the empirical cumulative distribution unction of  $W$ , with sample sizes 7,8,10,20,50,70,100,200,1000. Source: Royston (1982)

In our research we also test whether the data come from a normal distribution and we use Royston's extension of Shapiro and Wilk- $W$  test for normality to large samples, available when  $2 \leq n \leq 2000$  (see Royston, 1982) to compute the Shapiro-Wilks statistic and P-Value. The small P-value for the Shaipro-Wilks test then indicates that the data do not come from a normal distribution. When the smallest P-value amongst the tests performed is less than 0.05, we can reject the idea that resistivity comes from a normal distribution with 95% confidence.

### ***Parametric and Nonparametric Methods***

Depending on the results of the normality test we use the appropriate correlation coefficient to calculate yearly correlations amongst pairs of variables to find out whether the variables are significantly correlated. Moreover, we calculate correlations among them also for the whole last fifteen year period (from February 01, 1999 to January 01, 2015). Correlation coefficients, referred to as  $r$ , measure the strength of the correlation between two variables on a scale of -1 to +1. Perfect positive correlation yields a +1. Perfect negative correlation yields a -1. If there is no relationship,  $r$  will be close to 0. If the P-Value is less than 0,05, then there is a statistically significant correlation between the pair of variables at the 5% significance level. We use *nonparametric* statistical techniques (multiple variable analysis) to provide alternatives to classical analyses for data that do not come from a normal distribution. Therefore, we estimate Pearson product-moment correlations or Spearman rank correlations

coefficients depending on the assumption of linearity. We use nonparametric Spearman's rank correlation coefficient to measure correlations between variables that are not normally distributed and Pearson's correlation coefficient to calculate correlations between variables that are normally distributed. Pearson's correlation coefficient is given by

$$r = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{[\sum_{i=1}^n (x_i - \bar{x})^2][\sum_{i=1}^n (y_i - \bar{y})^2]}} \quad (3)$$

where  $x_i$  and  $y_i$  are the value of  $x$  and  $y$  for the  $i^{th}$  individual.

Spearman's rank correlation coefficient is defined by

$$r_s = 1 - \frac{6 \sum_{i=1}^n d_i^2}{n(n^2 - 1)} \quad (4)$$

where  $d_i$  is the difference in ranks for  $x$  and  $y$ .

The interpretation of correlation coefficients is different for medical research, social, economic or financial time series data. In the case of financial time series the interpretation can again be different depending on whether we compare raw price data or percent changes (yields), as the direct calculation of the correlation based on absolute prices tends to over estimate the correlation coefficient as relations between financial price series are seldom linear. Correlations based on price percent changes, on the other hand, produce more realistic values for the correlation coefficient as they deviate less from linearity (Katsanos, 2008).

## 4 RESULTS

### 4.1 Visual inspection of multiple comparison performance plot

We plot five stock international indices in one multiple comparison performance plot from January 04, 1999 till May 24, 2007 and from the crisis period till nowadays- from June 05, 2006 till February 02, 2015 (Fig. 2). From the visual inspection of these relative comparison plots (Fig.2) we expect to estimate non-zero correlations. We point out the indices have responded more closely in crisis periods.

Fig. 2 –Multiple comparison plot of leading international indices- the S&P 500, the Nikkei, the FTSE, the DAX and the Euro Stoxx 50 performances over the period 04 January 1999-24 May 2007 and over the period 26 May 2006 – 10 February 2015. Source: Own processing

To find out whether or not the leading international stock indices probably move at the same time for the same reason and in the same direction we estimate appropriate correlation coefficients depending on whether the time series data come from a normal distribution. We use Roysten's extension of Shapiro and Wilk-W (see Royston, 1982).

#### 4.2 Test for normality

At first, we use horizontal analysis (1) to estimate monthly relative performances from collected monthly adjusted closing prices (dividends and splits are not considered in calculation) of the indices. Then we use our calculated time series data and test them for normality by creating histograms, Q-Q plots and by applying Shapiro-Wilk test based upon comparing the quantiles of the fitted normal distribution to the quantiles of the data (Tab. 1, Fig. 2).

Tab. 1 – The Shapiro-Wilk test. Source: Own processing

Fitted Distribution	Mean	Standard deviation	Shapiro-Wilk W Statistic	P-Value
<i>Normal</i>				
SPX	0.333073	4.37568	0.976206	0.14481
N225	0.242396	5.67063	0.980187	0.34625
FTSE	0.13875	4.06576	0.965398	0.00404
SX50	0.0975	5.44986	0.973126	0.06185
DAX	0.557448	6.31818	0.972029	0.04412

Tab. 1 shows the results of fitting a normal distribution to the data on leading international stock indices estimated parameters of the fitted normal distribution. To test whether the normal distribution fits the data adequately we apply Shapiro-Wilk test. In addition, we assess visually how well the normal distribution fits by frequency histograms (Fig. 3). Since the smallest P-value amongst the tests performed is greater than or equal to 0,05, we cannot reject the idea that S&P 500 (SPX), Nikkei 225 (N225), and EURO STOXX 50 (SX50) come from a normal distribution with 95 % confidence (Tab. 1, Fig.3). Therefore, we use nonparametric Spearman's rank correlation coefficient to measure correlations between these variables that are not normally distributed.

Since the smallest P-value amongst the test performed is less than 0.05, we can reject the idea that FTSE 100 (FTSE") and DAX 30 (DAX) come from a normal distribution with 95% confidence interval and can use Pearson's correlation coefficient to calculate correlations between these variables that are normally distributed.

*N225*

*FTSE*

*SX50*

*DAX*

Fig. 3 –Frequency histograms and Quantile-Quantile plots of leading international indices the S&P 500, the Nikkei, the FTSE, the DAX and the Euro Stoxx 50 performances over the period 1999-2014. Source: Own processing

Tab. 2 shows the final results summary, when we use parametric or non-parametric methods to calculate correlations between the international indices.

Tab. 2 – The Shapiro-Wilk test. Source: Own processing

	<i>P-Vaule from Tab. 1</i>	<i>Can we reject the variable comes from a normal distribution?</i>
SPX	P-Value $\geq 0.05$	NO; parametric methods (2)
N225	P-Value $\geq 0.05$	NO; parametric methods (2)
FTSE	P-Value $< 0.05$	YES; non-parametric methods (3)
SX50	P-Value $\geq 0.05$	NO; parametric methods (2)
DAX	P-Value $< 0.05$	YES; non-parametric methods (3)

Tab. 1, Tab. 2 and Fig 3 indicate we should use non-parametric correlation coefficients to calculate correlations between the pair of the indices that includes variable *N225* or *SX50*. In other cases when we cannot reject the idea that the variable comes from a normal distribution with 95% confidence level we can use parametric Pearson's correlation coefficient to calculate correlations.

### 4.3 Correlation analysis

We measure the strength of the relationship between the variables and test the statistical significance of the estimated relations. Tab. 3 and Tab. 4 show estimated Pearson product moment correlations between the indices *S&P 500* and *Nikkei 225*. We highlight P-Vaues that indicate statistically significant correlations. In contrast to the more common Pearson correlations, we calculate the Spearman coefficients in Tab. 4 and Tab. 5 from the ranks of the data values. Consequently, they are less sensitive to outliers than the Pearson coefficients.

Tab. 7 shows Pearson product moment correlations and Spearman rank correlations between each pair of indices for the 15 year period from 1999 to 2014. The second number in parantheses in each location of the table is a P-value which test the statistical significance of the estimated correlations. P-values below 0.05 indicate statistically significant non-zero correlations at the 95.0% confidence level. All indices have P-values below 0.05 in the analysed 15 year period and we have investigated positive correlations in all cases (Tab.7).

## 5 DISCUSSION

The research about stock market linkages has been conducted on the basis of foreign studies results dedicated to cross market linkages investigation (Ayuso and Bianco, 2001; Arshanapalli and Doukas, 1993; King and Wadhvani, 1990; Katsanos, 2008; Kim and Park, 2011; Hon, Strauss and Yong, 2004; Aloui et. al., 2011).

We report evidence on the cross-market linkages and statistical significance among five major global stock markets. However, the strength of the linkages varied in researched years (Fig. 4). The linkages among leading stock market indices are shown in Tabs. 3-7. In this research, the statistically significant positive dependence between the American stock (SPX) and the Japanese stock (N225) markets (see Tab. 3) has been found during the entire past fifteen period ( $r = 0.6108$ ,  $p\text{-value} = 0,0000$ ). However, the strength of investigated positive linkage

varied in the researched years. The positive SPX-N225 correlations were statistically significant in 1999 (p-value = 0.04); 2001 (p-value = 0.01); 2006 (p-value = 0.01); 2007 (p-value = 0.04); 2008 (p-value = 0.00); 2009 (p-value = 0.04); 2010 (p-value = 0.00); 2011 (p-value = 0.04) and 2012 (p-value = 0.01). The hypothesis P1a is therefore accepted in these periods. We identified statistically significant relations between American stock (SPX) and the British stock (FTSE) markets indices (see Tab. 4). The statistically significant positive SPX-FTSE correlations in accordance with the hypothesis P1b were proven in years 2000 (p-value = 0.01); 2001 (p-value = 0.00); 2002 (p-value = 0.00); (p-value = 0.03); 2005 (p-value = 0.04); 2007 (p-value = 0.01); 2008 (p-value = 0.00); 2009 (p-value = 0.02), 2010 (p-value = 0.00), 2011 (p-value = 0.00), 2013 (p-value = 0.01); 2014 (p-value = 0.01) and in the whole period 1999-2014 ( $r = 0.8206$ , p-value = 0.0000).

Our research shows statistically significant positive SPX-DAX correlations. The hypothesis P1c about positively correlated American stock (SPX) and the German stock (DAX) markets during the entire past fifteen period ( $r = 0.7941$ , p-value = 0.0000) has been proved (Tab. 7). Yearly correlations were statistically significant positive in accordance with hypothesis P1c in 1999 (p-value = 0.01); 2001 (p-value = 0.00); 2002 (p-value = 0.00); 2003 (p-value = 0.01); 2004 (p-value = 0.03); 2005 (p-value = 0.01); 2006 (p-value = 0.01); 2007 (p-value = 0.01); 2008 (p-value = 0.01); 2009 (p-value = 0.01); 2010 (p-value = 0.01); 2011 (p-value = 0.01); 2012 (p-value = 0.04) and 2013 (p-value = 0.04). The strength of the estimated correlations is shown in Tab 5.

Tab. 6 and Tab. 7 indicates that hypothesis P1d about statistically significant positive linkage between the S&P 500 the European *EURO STOXX 50 (SX50)* can be accepted in summarized past fifteen period ( $r = 0.8317$ , p-value = 0.0000). Using parametric correlation analysis, we found statistically significant positive correlations between these indices in 1999 (p-value = 0.00), 2001 (p-value = 0.00), 2002 (p-value = 0.00), 2003 (p-value = 0.00), 2004 (p-value = 0.00), 2005 (p-value = 0.01), 2006 (p-value = 0.00), 2007 (p-value = 0.00), 2008 (p-value = 0.00), 2009 (0.00), 2010 (p-value = 0.00), 2011 (p-value = 0.00), 2012 (p-value = 0.01) and 2013 (p-value = 0.01). Other correlations were non-zero but statistically insignificant.

According to results Ayuso and Bianco (2001) during the nineties there has been an increase o the degree of market integration between stock markets. Our correlation analysis indicates the the S&P 500 has been correlated with international indices during the past fifteen year period and that the estimated correlations between the leading international stock indices strengthen during the crisis periods (Fig. 4). Moreover, we have found the Nikkei had the most volatile correlation with the S&P 500. These conclusions are compatible with the conclusions of Katsanos (2008). According to results of Hon, Strauss and Yong research (2004) the international stock markets, particularly in Europe, responded more closely to U.S. stock market. We investigated strong positive correlations between the American and European stock markets during the past fifteen period too. Our conclusions are also compatible with the conclusion about high degree of comovements in stock prices of Westerhoff (2003).

Further research could be directed towards testing the causality between indices.

## **6 CONCLUSION**

The aim of this contribution was to examine the development of the relationship between leading international stock indices the S&P 500, Nikkei 225, FTSE 100, DAX 30 and EURO STOXX 50 and to identify statistically significant correlations during the different periods, including the crisis period. Our research has been conducted on previous knowledge from foreign empirical studies related to cross-market linkages. In this research, the monthly

closing prices with the sample period from February 01, 1999 to January 01, 2015 have been used to estimate monthly relative stock market returns. Internal data have not been included into the examination. The strength and the direction of the relation between pair of indices have been examined within Pearson's product momentum correlation coefficient/ Spearman's rank correlation coefficient, depending on results of normality tests. The statistical significance of the calculated correlations has been tested with P-value statistics. The substantially positive correlations between the the S&P 500 and leading international indices existed over the last fifteen-year period have been proved. However, the strength of the relations between the pairs of indices varied in researched years. The empirical results point out financial markets are globally interconnected and imply the leadership role for the U.S. in international asset markets. Moreover, we have found the Nikkei had the most volatile correlation with the S&P 500.

## **A STUDY OF THE INVESTMENT BEHAVIOR BASED ON BEHAVIORAL FINANCE**

*Yu Zhangand, Xiaosong Zheng*

### **Abstract**

Behavior finance introduces psychology, sociology and other research methods into the study of investment behavior to explain how investors handle the information and take actions. This paper presents the literatures as theoretical solutions to the market anomalies of the traditional market theories. The behavioral psychology is examined through the study on the questionnaire of Chinese security investors. The results show that the investors are not always adopt rational behaviors as traditional finance theory assumed, but make a lot of irrational decisions based on individual cognitive and prejudices, even institutional investors often show the characteristic of irrational. In the guidance of the behavioral finance theory, the research will be closer to the reality and give more significant insight to the selection of investment strategy and psychology characteristic used to explain market anomalies.

*Keywords: behavioral finance, market efficiency, irrational behavior, investor psychology, market anomalies*

JEL Classification: G11, G14

### **1 INTRODUCTION**

The behavior of security investors is assumed to be rational based on traditional finance theory. And as per this concept, a series of theories are formed such as Efficient Market Hypothesis (EMH), Capital Asset Pricing Model (CAPM), Portfolio theory, Two-fund separation theorem (MM) etc. However, consistent support comes with various arguments in recent years. For example, the benefits of diversify investing are emphasized by traditional theories, while still a few stocks are hold in portfolios by individual investors. Traditional finance theory considers rational investors can seize the opportunities created by irrational ones to survive and occupy the whole security market, while some empirical researches and abnormal phenomenon such as momentum effect, winner-loser effect, Friedman-Savage Puzzle and riddle of bonus bring challenge to it. As psychologists and sociologists have found their way into finance in the last decade, economic agents are also no longer to be assumed as rational actors. Instead, they are normal human beings with faults and cognitive foibles including emotional responses, reference points, overconfidence, positive illusion, loss aversion, framing, confirmatory bias, outcome bias, hindsight bias and so on, causing the emergence of behavioral finance (Jones, 2012).

Being described as contradictory to much of traditional market theory, Shiller illustrated finance from a broader human and social perspective, including sociology and psychology. Since 1990s, the focus on traditional asset pricing model has shifted towards new models incorporating psychology (Patrick & Charles, 2011). The editor of Journal of Behavioral Finance, previously naming Journal of Psychology and Financial Markets, pointed out that the importance of social behaviors and human cognition is prompted by behavioral finance theory.

Sent (2004) pointed out that the success and prevalence of behavioral finance attribute to its efficient availability of data and testable predictions compared with traditional efficiency

market theory, thus revealing that learning, arbitrage and evolution do not eliminate complications and human limitation. More meaningful thing is to use behavioral finance theory as a mirror to find blemishes of ourselves rather than just a magnifying glass to research the biases of others (Jones, 2012).

Under the condition of Chinese security market's short development and China's special system, the investors' irrational performance is more noticeable, irrational psychology and behavior will have a long-term, substantial effect on the entire market. Therefore, behavioral finance theory is not applicable in terms of analyzing the behaviors of Chinese security investors.

## **2 THEORETICAL SOLUTIONS**

Several influential theories have been prompted by behavioral finance theory through the study on investor psychology, which can be used to explain market anomalies to some extent.

### **2.1 Heuristics bias**

Several influential theories had been prompted by behavioral finance theory through the study on the psychology of investors, which can be used to explain market anomalies to some extent.

Three common heuristics (representativeness, availability, and adjustment and anchoring) were identified by Kahneman and Tversky (1974) as systematic biases in investment-decision judgment. Patrick and Charles (2011) argued that people often rely on rules of thumb or heuristics rather than rational analysis to evaluate risks in face of uncertainty. Trivers (1985, 1991) also pointed out that the true internal states cannot perfectly controlled by irrational investors.

(I) Representativeness refers to that A represent B through assessed possibilities which A resembles B (Patrick & Charles, 2011). Tversky and Kahneman (1974) pointed out that representative heuristics would prompt two main biases; one of them is the ignorance of the prior probabilities the sample is drawn because of over-emphasis on one characteristic. The ignorance of the significance of the size of the sample is the other bias, resulting in obtaining conclusion on the basis of little data, which is called Gambler's Fallacy effect by Rabin (1999).

Andreassen and Kraus (1990) found that subjects tend to buy on dips while sell on rises when the price fluctuates, which is in consistence with gambler's fallacy. Andreassen and Kraus (1990) also provided evidence to show that this kind of trick is less used by the subjects who would prefer chasing trends when an obvious trend appears. De Bondt and Thaler (1985) argued that investors are prone to believe the continuousness of past situation, over-pessimistic on loser and over-optimistic on winner, causing the deviation from true value of stocks.

(II) Availability bias means that people tend to assess the probability of an event based on the recalled past event rather than actual data collection (Patrick & Charles, 2011). Tversky and Kahneman (1974) pointed out that investors would predicate higher probability of upward tendency of a stock on account of the media publicity. According to Fischhoff, Slovic, and Lichtenstein (1978), people often undervalue the possibility of an indirect or invisible event. Overreaction and overconfidence can be suggested when unforeseen events occur (Hirshleifer, 2001). Shiller (1984) also argued that the focus of attention of investors can be unsteady and easily changed by other people, especially alleged experts.

(III) Anchoring and Adjustment bias describes the investors who usually reduce ambiguous with some reference points and reach a conclusion through appropriate adjustment (Liu, 2006). Patrick and Charles (2011) stated that investors with this bias would like to assume the rough correct of stocks' current price, resulting in certain predictability biases. Lovric (2008) pointed out that the adjustment of this heuristic bias is always insufficient which will cause overreliance on the anchor price. Shefrin (2000) argued that security analysts often being conservative and slowly adjust to the new information. Tversky and Kahneman (1974) also found that people tend to be constrained by meaningless "initial anchor".

## **2.2 Cognitive bias**

Typical cognitive bias include over-confidence, over-reaction and herd effect.

(I) Over-confidence refers to people over-evaluate the probability of success and accurate of private information (Liu, 2006). Numerous literatures indicate that people often believe their knowledge is broader than it really is. For example, Alpert and Raiffa (1982) argued that the confidence interval of 98% contain the really quantity of only 60%. Griffin and Tversky (1992) stated that experts tend to be more overconfidence than ordinary investors when evidence is ambiguous and predictability is low. Kahneman and Reiepr (1998) confirmed that investors would like to narrow margin of error on future stock index under the influence of overconfidence. De Bondt and Thaler (1995) also pointed out that over-confidence may be one of the steadiest human psychologies, which causes biased assessment on uncertainty events.

(II) Over-reaction is a common phenomenon that investors over-weight information as a result of irrational bias (Wu, 2004). Russell (2000) found that at least 10% of investor over-reaction when making decision. De Bondt and Thaler (1985) conducted an in-depth study on over-reaction in the article "Does the stock market overreact?" and argued that investors are not as rational as assumed, instead, they often overestimate new information and ignore long-term information. In contrast, institutional investors are tend to be under-reaction, which means they are usually confident at their judgment and don't change their minds easily.

(III) Herd behavior is a special irrational behavior which illustrates the psychology of investors imitating others' investment decision and over-relying on public opinion without consideration of their own information. Lakonishok, Shleifer and Vishny (1992) defined herd effect as investors buy or sell stocks at the same time with other investors. Scharfstein and Stein (1990) pointed out that herd effect will impact the efficiency of security market, causing the fluctuation of stocks' price.

## **3 OBJECTIVES AND METHODOLOGY**

### **3.1 Objectives**

Behavioral finance theory has explained some anomalies of traditional finance theory through several psychology biases of investors. In order to further examine the existence and significance of these behavioral psychology biases, the paper selects four typical ones to analyze. This paper can also help ordinary and institutional investors recognize their psychology biases and improve investment accordingly.

### **3.2 Methodology**

The paper analyses quantitative data to conduct descriptive study. Sekaran (2003) pointed out that the descriptive study can explain the features of the variables. Moreover, a survey questionnaire with predetermined questions implemented by Dong is applied to study the

behavior of Chinese investors) with the survey sample clients being selected from 20 sales departments of Southwest Securities, Northwest Securities, Huatai Securities, Hantang Securities, United Securities and so on (Dong, 2003).

Stratified random sampling method is used (institutional and ordinary investors are divided according to the transaction amount), 1000 survey questionnaires are given out randomly and collected back on time. 95% of all questionnaires are issued to ordinary investors, and 5% to institutional investors with 623 and 37 pieces of effective questionnaires respectively. The method of data collection is self-administered questionnaires containing predetermined questions to enable researchers to get results easier and quicker. Sekaran (2003) argued that personally administer the questionnaires is a good choice when conducting the survey in a local area. Lower cost and faster speed are two main reasons to choose questionnaire as research method.

## **4 RESULTS AND DISCUSSION**

### **4.1 Conservative bias**

Obvious conservative bias among Chinese security investors is reflected through two aspects.

(I) When the stocks with ordinary performance suddenly receive excessive returns, 61.99% of Chinese investors choose to sell at opportune moment while only 39.57% prefer buy in additionally. In terms of institutional investors, 70.82% choose to sell and 29.16 to buy in. (II) In face of new information, 42% of ordinary investors would require further confirmation rather than make use of it immediately (21.33%). Institutional investors show more preference on further confirmation (58.33% compared with only 8.33%) (see Tab. 1).

Different proportion on these two questions indicates various expected return in the future and extent of conservation. Obviously, institutional investors have more conservative bias than ordinary investors in China. The phenomenon of conservatism is identified by Edwards in 1968 that individuals are not prone to change their beliefs as a rational Bayesian under new information. Edwards (1968) also argued that the more useful the new information, the larger the difference between rational updating and actual updating. Grether (1992) pointed out that different judgments can be made in different situations according to experimental evidence, showing various kind of conservatism.

The people who choose to sell the good-performance stock are more than twice the time as ones who keep holding it. This reveals the psychology that investors tend to hold certain profit rather than chase more dubious return. More investors in China are small-to-medium retail investors who are prone to engage in short-term investment, which means once the stock have excess return, they will sell it to get certain return.

Hirshleifer (2001) argued that one of the explanations for conservatism is that conducting new evidence and updating opinion is costly and people may be under-react to new evidence. The phenomenon of under-reaction is more evident among experts as half of them would not like to incorporate new information into their investment strategy and think it needs further consideration. Conservative bias can be one of the most typical opposed evidences for market efficiency theory as prices will not effectively reflect market information.

### **4.2 Over confidence**

According to the research figure, half of ordinary investors consider own judgment as correct and 20.86% obtain higher return from their own judgment. Ones who are not sure about their judgment account for 22.18% while only 6.95% admit the mistakes they have made.

Institutional investors are even more confident than ordinary investors, respectively 52%, 40% and 8% of them regard their judgment as correct, not sure and wrong. Furthermore, investors who think themselves as talented represent 79.07%, compared with 20.93% who consider the opposite. The figures among institutional investors are 96% and only 4% hold the opinion of untalented (see Tab. 1).

Obvious characteristic of over confidence of Chinese security investors can be seen from the above two questions and institutional investors are more confident than ordinary investors. According to numerous research and literatures, investors tend to overrate their judgment, which can cause biased evaluation. It is interesting to note that almost all of institutional investors consider themselves as talented people, resulting in half of them believe the accurate of their strategy. Scheinkman and Xiong (2003) argued that institutional investors would like to buy overvalued stocks when they have positive information as they are confident to sell them to people of more extreme beliefs. However, in face of uncertainty, over-confidence may cause the abnormal change of stock price, especially as institutional investors hold a large amount of fund, which can influence the trend of stocks in finance market.

In terms of another angle of view, Bernardo and Welch (2001) argued that overconfidence of investors can contribute to the emergence of new ideas, which is beneficial to economy and finance market.

### **4.3 Self-attribution bias**

When contradiction exists between the fact and own judgment, 58.27% ordinary investors believe that the situation is ambiguous and more time is necessary to examine the results, 22.18% of them even insist the original judgment and only 19.53% admit the mistake of original judgment. However, if the fact is consistent with judgment, 36.45% attribute it to their own judgment ability. This bias is more obvious among institutional investors with success self-attribution accounts for 72% and 64% unwilling to attribute inconsistent to fault judgment (see Tab. 1).

The characteristic of self-attribution can be seen from the statistic figure. People, especially institutional investors, are more prone to attribute good results to own abilities and bad results to external reasons (Hirshleifer, 2001). Self-attribution and overconfidence can attribute to similar psychology of investors as they over-believe in the correctness of their investment strategy. Hirshleifer (2001) also argued that self-attribution and overconfidence are dynamic and static counterparts; self-attribution lead to overconfidence instead of converging to the actual self-evaluation.

### **4.4 Loss aversion**

Regarding a gamble from which you can win \$200 and loss \$100 at equal possibilities. 42.86% ordinary investors and 37.83% institutional investors are unwilling to take part in. However, as the repeat number of gamble increase to 100 times, 88.92% and 91.89% investors would like to conduct the gamble (see Tab. 1).

Another interesting comparison is, when the bet of the gamble is to win and loss \$100 at equal possibilities, 35.63% ordinary and 32.43% institutional investors would like to accept it while if the bet increases to \$10000, only 18.94% and 18.91% investors would like to accept it.

The psychology of loss aversion can be seen from the above comparisons. Hirshleifer (2001) defined that loss aversion is the phenomenon that people are prone to avoid risks that relative to a reference point in the utility function. Samuelson (1963) pointed out that for the choice of a single gambling that near the reference point, quite a few people tend to reject the gamble

with the fear of the loss of \$100 although the gamble have obvious benefits. However, the selection is far from the reference point when the gamble can be repeated 100 times, so most people chose to accept the gamble (Samuelson, 1963). Barberis and Huang (2001) examined that loss aversion can result in excess fluctuation in stock prices. Barberis (2001) pointed out that loss aversion bias can help explain equity premium puzzle as investors require a high premium to long-term hold stocks. Moreover, Grinblatt and Han (2005) stated that momentum effect can also be explained by loss aversion psychology.

Fig. 1 – S-shaped curve of the value function.

The value function (see Fig. 1) indicates the different relative value for investors in face of different outcome. As seen from Fig. 1, the corresponding absolute amount of value in the result of loss is larger than that of the result of win. The sensitivity of win and loss are also not equal, investors are more sensitive to loss when the amount of loss is low and the value of win is lower when the profit is not very large, which shows the aversion to loss in investment. Moreover, the larger the amount of loss, the lower the sensitivity. The feeling of loss often much more intensity than win in investment (Li, 2012).

Tab. 1 – The results of questionnaire.

Behavioral psychology	Questions	Options	Proportion	
			Ordinary investors	Institutional investors
Conservative bias	When the stocks with ordinary performance suddenly receive excessive returns, which option would you prefer?	A. I will sell the stocks at opportune time.	61.99%	70.82%
		B. I will buy the stocks additionally.	39.57%	29.16%
	In face of new information, which option would you prefer?	A. Further confirmation is needed to make final decision.	42%	58.33%

		B. I will make use of the new information immediately.	21.33%	8.33%
over confidence	How do you consider about the correctness of your own judgment?	A. Generally correct and I can get higher return from my own judgment.	20.86%	52%
		B. Generally correct while I cannot grasp it appropriately.	50%	40%
		C. Not sure.	22.18%	8%
		D. Usually Wrong.	6.95%	0%
	Do you consider yourself as talented people in investment?	A. Yes, I think so.	26.91%	52%
		B. Yes, while I am just general talented one.	52.15%	44%
		C. No, I don't think so.	20.93%	4%
Self-attribution bias	When contradiction exists between the fact and your own judgment, which option would you prefer?	A. I think more time is needed to further examine it.	58.27%	64%
		B. I will insist the original judgment.	22.18%	25%
		C. I will admit the mistake of original judgment.	19.53%	11%
	If your judgment is consistent with the fact, which option would you prefer?	A. It can be attributed to accidental factors or there is no clear attribution.	63.53%	28%
		B. It should be attributed to my ability of judgment.	36.45%	72%
Loss aversion	Would you want to take part in the gamble that you can win \$200 and loss \$100 at equal possibilities?	A. Yes, I want to.	42.86%	37.83%
		B. No, I don't want to.	57.14%	62.17%
	If the repeat number of the gamble increase to 100 times	A. Yes, I want to.	88.92%	91.89%
		B. No, I don't want to.	11.08%	8.11%

	If the bet of the gamble is to win and loss \$100.	A. Accept the gamble	35.63%	32.43%
		B. Not accept the game	64.37%	67.57%
	If the bet increase to \$10000	A. Accept the gamble	18.94%	18.91%
		B. Not accept the game	81.06%	81.09%

## 5 CONCLUSION

The paper has reviewed the literatures associated with behavioral psychology such as heuristics biases, including representativeness, availability and anchoring, and cognitive bias, which consists of over-confidence, over-reaction and herd effect. These psychology characteristics can provide explanations and solutions to the market anomalies to some extent.

The paper also studies the investment psychology of Chinese investors based on questionnaire. As seen from the above analysis, investors, especially institutional investors, in China show the irrational characteristic in making investment decision. Conservative bias, over-confidence, self-attribution bias and loss aversion are four main psychology biases according to the research. These biases are more obvious among institutional investors, which means that the psychology biases cannot be improved or eliminated by studying and accumulating experiences.

Behavioral Finance is an exciting and interesting new field in terms of stock market research. The evidence of behavioral finance theory helps us understand behavioral psychology deeply and give more insight into stock market anomalies and investment strategy selection.

## **HUMAN RESOURCES CONTROLLING AS A TOOL FOR MEASURING HUMAN RESOURCES KEY PERFORMANCE INDICATORS**

*Roman Zámečník*

### **Abstract**

The paper focuses on one of the functional fields of the Enterprise Controlling field – i.e. Human Resources Controlling (hereinafter “HR Controlling”). It presents HR Controlling as an integral part of the management controlling system and an important tool for measuring Human Resources Key Performance Indicators (hereinafter “HR KPIs”) in an enterprise. The focal point of this paper is the analysis of the possibilities for the use of the qualitative instruments of HR Controlling in a selected industrial enterprise. In contrast to the quantitative instruments, the measurement of these qualitative values (indicators) is more difficult and their enumeration is one of the main problems of HR Controlling. For example - motivation, employee satisfaction, the quality of the competencies of individual employees, or performance assessments of employees can be ranked among such instruments. There is no universal guide for estimating these values in specialized literature. In spite of this fact, we tested a methodology for the measurement of these qualitative values by means of some selected statistical methods in some carefully-chosen Czech and Slovak industrial enterprises. The paper also deals with an outline of motivation factor analysis methods in a selected industrial enterprise.

*Keywords: human resources controlling, human resources key performance indicators, analysis of motivation factors, cluster analysis*

JEL Classification: M12, M40, M54, 015

### **1 INTRODUCTION**

What to measure? How to measure it? Where to measure? When to measure? These questions make measurement of human resources indicators difficult. The following statement: “*What cannot be measured cannot be managed*” may be therefore considered to be the starting proposition for HR Controlling a Human Resources Key Performance Indicators.

In order to manage the various and varied human resources processes, HR Controlling requires a variety of measurement indices and quantities. One of the most fundamental questions HR Controlling seeks to answer is the establishment of relevant measurement quanta and indices. Among the key problems faced by HR Controlling, are those of the question of measuring the so-called “soft” factors and that of the measurement of the results of the human resources management process. These problems and issues are covered in the following chapters.

The primal aim of this paper is the analysis of the possibilities of using qualitative instruments for HR Controlling purposes in a selected industrial enterprise. We have divided our paper into three parts.

In the first part, we characterise the basic HR Controlling principles. In the following part, we introduce the HR Controlling instrumentaria in their quantitative and qualitative forms. The

third section deals with an outline of motivation factor analysis methods in a selected industrial enterprise.

The analysis of motivation factors, and their order, takes into account the level of importance they have for the employees - which is assessed using the Questionnaire Method. The Cluster Analysis method is used due to the possibility of creating various types of motivational programs.

The result is a proposal for the creation of methodologically-unified motivation programs using multi-factor statistical analysis (i.e. Cluster Analysis).

## **2 LITERATURE REVIEW**

In the dictionary of personnel managers increasingly grows the concept of „HR Controlling“, which follows the effort of companies to manage the performance of human capital, to measure its value, and to compare the results with another organizations (Soósová, 2011).

In the paper, ”Human Resources Key Performance Indicators”, Gabčanová (2012, p.127) suggests that organizations try to measure performance according to the financial drivers but in the recent period top leaders attempted to find new performance indicators (indices) which would take the “wind from sail” to their rivals in the market.

According to Gabčanová one of these competitive advantages is human capital. As the Tootell et al. (2009) stated “since 1980s there has been an increasing emphasis on the importance of HR measurement.” Yeung and Berman (1997) declared that “HR measures should be impact rather than activity orientated, forward looking than backward looking, and should focus on the entire HR system not just on individual practices.”

Toulson and Dawe (2004) identified three obstacles in measuring HR: lack of HR experience and precision and difficulties in measurement. There were defined tools by various authors for measuring the HR capital. Srimannarayana (2010) cited in Gabčanová (2012), brought brief overview of invented methods to evaluate HR capital:

- Multiple constituency approach suggested by Tsui,
- Human resources accounting system proposed by Flamholtz,
- McConnel identified 16 categories to be measured in HR,
- Return of investment methodology investigated by Fitz-Enz,
- Ulrich has showed how HR practices relate to BSC through productivity, people and process indicators,
- Methodology of behavioral costing to measure the financial impact to HR activities proposed by Cascio and Boundrenau,
- BSC in which strategic goals, i.e. operational objectives are transfer into 4 perspectives.

Based upon the model of BSC introduced by Kaplan and Norton (2007) and consequently its application in the area of the human resources, a new tool HR Scorecard for the management and measurement of the human capital was established. Becker, Huselid and Ulrich (2001) who have outlined HR Scorecard, added that it does two important things:

- Manage HR as a strategic asset,
- Demonstrate HR´s contribution to firm´s financial success.

Also Ulrich and Brockbank (2005) appended that strategic contribution accounts for almost half of HR's total influence on business performance.

Huselid, Becker and Beatty (2005) also confirmed that the HR Scorecard is designed to guide management of the HR function and declared that the elements in the HR Scorecard are key leading indicators for workforce success. Key performance indicators are assigned to each perspective in strategy map and lately KPIs on HR level became significant benchmark in the entrepreneurial sector.

Bean and Gerathy (2003) presented that according to their experience; KPIs are valid and effective when applied in a consistent and comprehensive manner. Further, they declare that financial performance must be respected as the critical measure of the Access for every business but financial KPIs are closely related set of operational metrics i.e. on HR level, too.

Bauer (2005) stated that once KPIs have been indentified, defined and formalized, business leaders may feel that KPI battle is won. Where possible, KPI targets must be based on concrete data and non-manipulative formulas. Griffin (2004) pointed out that there should be a direct link from KPIs to goals, from goals to objectives and from objectives to strategies. Skibniewski and Ghosh (2009) defined that all KPIs should impact a business decision in some time scale, depending on the window of time available. That makes the decision process difficult from the decisions made under no time constraint. Organizations should identify areas of business processes that are the most critical to the financial success of the organization. Further, KPIs can be divided into lagging and leading. Kaplan and Norton (2007) explained the difference between them. Leading indicator is a metric that mainly refers to future developments and drivers/causes. Lagging indicator is a metric that mainly refers to past developments and effects/results, e.g. reflects history and outcomes of certain actions and processes.

Eckerson (2007) described what characterizes "good" KPIs. According to his study effective KPIs are:

- Sparse: The fewer KPIs the better.
- Drillable: Users can drill into detail.
- Simple: Users understand the KPI.
- Actionable: Users know how to affect outcomes.
- Owned: KPIs have an owner.
- Referenced: Users can view origins and context.
- Correlated: KPIs drive desired outcomes.
- Balanced: KPIs consist of both financial and non-financial metrics.
- Aligned: KPIs don't undermine each other.
- Validated: Workers can't circumvent the KPIs.

On the other hand, Hursman (2010) defined next five criteria for effective KPIs:

- Specific
- Measurable
- Attainable
- Relevant

- Time bound

“S-M-A-R-T” is a fine way to spell KPIs, as this is a solid framework for making decisions about KPI selection (Gabčanová, 2012).

Ever-more frequently, new instrumentaria for Human Resources Management (hereinafter “HRM”) are used more and more in the strategies – of not only industrial manufacturing enterprises, since these allow an enterprise to better optimise and manage their costs and any surpluses that arise and to invest these into new investment or development activities, which will contribute in turn to increasing the competitive ability of the given enterprise, or simply to use them as motivational tools for their employees – which is, today, considered to be the form of investment with the greatest return-on-investment.

Similarly to other fields of management today, not even HRM can do without the setting of aims and objectives and the tracking and evaluation of deviations from plans in reality – that is to say, without those activities today known as Controlling. The significance of HRM for the effective performance of an enterprise and its long-term character make HR Controlling one of the strategic company management tools.

In many enterprises, costs relating to human labour absorb the largest part of the total costs. As seen against such a background, the depiction of “value-added” through human labour is an important – but equally, extremely demanding task of the Controlling function. These problems associated with the valuation of “value-added” through human labour provided the basis for developments in HR Controlling as a variant of the controlling function. Further causes which could lead to developments in the Controlling for Human Resources field are:

- Growth in employee qualification requirements as a consequence of technological changes.
- A concentration on employee qualifications, e.g. their readiness to further educate themselves, teamwork, flexibility, etc. (Horváth & Partners, 2004).

HR Controlling – or simply stated, the tracking and analysis of selected human resources indicators, may thus be of use in the identification of an enterprise’s strengths and weaknesses regarding their HRM and to discover reserves for increases in effective performance and competitive abilities.

The aim of HRM is to assure that an enterprise has the right staff, with the right qualifications, at the right cost structure levels, and that they are in the right place at the right time. The task of HR Controlling is this process: to manage and track (i.e. measure). At the same time, HR Controlling functions as an early-warning system drawing attention to deviations between the set aims and reality. HR Controlling at the same time, may contribute towards the evaluation of the intangible activities of an enterprise (through the intermediary of human capital values), and which create an ever-larger part of an enterprise’s value.

Lubelec (2003), defines HR Controlling as a method and mechanism for us to exploit in order to document and prove that financial resources invested into individual types of personnel issues and activities, and overall into the human resources field, bring a return for both the enterprise and its staff through the effects we require, (i.e. achieving performance-related goals, behaviour, the quality of the functioning of processes, etc.), or respectively – which we have set for them, and thus – that they have been used effectively.

According to Urban (2004), we can understand HR Controlling as a tool which proves that Personnel Management is not only a cost item.

Horváth (2004), states that HR Controlling is a function, which stretches across the full breadth of an enterprise. It contributes to the planning, control, management and provision of information functions for all personnel measures.

Konetzny (2000), relates HR Controlling to all the fields and levels of Personnel Management.

Problems and issues relating to the question of the centralisation or decentralisation of an enterprise's Controlling function – which also have a direct bearing on HR Controlling, are dealt with in their work by, for instance, Rajnoha and Dobrovič (2011) or Tuček and Dlabáč (2013).

Urban (2004), states that developments in HR Controlling are transforming from the operative to the strategic. Traditional fields of HR Controlling, with regard to an enterprise's management's point-of-view of, include the tracking of employment levels and the reduction of personnel costs. Modern HR Controlling differentiates between strategic investments and operative costs. The correct evaluation of the costs relating to a certain measure can only be achieved in combination with their potential for increasing the value of an enterprise.

HR Controlling - in a narrower sense, has a quantitative and operative character, and evaluates the efficacy and outputs of the human resources process. HR Controlling – in a wider sense, tracks the quality of the management of human resources, its approaches and procedures, and the tools and instrumentaria. For both conceptions of HR Controlling, they have three characteristics with methodological features in common:

- The verification of the benefit/contribution of HRM for achieving the enterprise's aims and goals.
- The necessity to include qualitative – or “soft” – characteristics in the tracking activities as well. In the management of human resources, these often play a decisive role.
- The use of indicators, based upon special ways of acquiring data (i.e. market and field research studies, i.e., interview, employee questionnaires, enquiries, etc.) (Urban, 2004).

Despite the fact that a whole range of managers consider this to be a very “soft” and difficult to measure discipline, the quality of the human potential creates value for an enterprise as well as determines its standing on the market. Formánková (2006) states that HR Controlling endeavours to resolve two fundamental issues: On the one hand, to identify just which HR KPIs are key ones, and then to suggest the appropriate tools or instruments, i.e. how to track/measure them; or, on the other hand, to provide “benchmarking” standards for the possible identification of weak points. Measurement should be by means of those indicators which could best discover the influence of the correct management of human resources on the successful implementation of an organisation's strategies and thereby increasing its performance.

The fact that the quality of the analysis of selected HR KPIs contributes to higher profitability for an enterprise was shown in the PricewaterhouseCoopers study “*HR controlling 2013 – Measuring Performance of Human Capital*”. This also summarises the most useful HR KPIs and their numerical values in the most successful enterprises – according to profitability. It was shown that the most successful enterprises were those which, in comparison to the others, use HR Controlling a great deal more, and have much better and more elaborate strategies for the management of human resources and also – conduct more frequent investigations into their employees' satisfaction.

As has already been mentioned hereinabove, HR Controlling tools and instruments can be primarily subdivided into the quantitative and the qualitative. We rank economic indicators (e.g. wage/salary costs, cost for the individual personnel processes, etc.), and socio-economic indicators (i.e. absenteeism, fluctuations, etc.), among the quantitative tools. Among the tracked qualitative indices are things like employee motivation and satisfaction, the quality of the various competencies of the individual employees, or evaluations of their performance. Quantitative Personnel Controlling indices can be relatively easily compared and measured. However, the measuring of qualitative indices (the so-called “soft” tools) ranks as one of the core problems facing Personnel Controlling and not even in the available literature is it devoted sufficient attention. This is confirmed by Zámečník (2009), who states that - in the course of the evaluation of the results of human endeavours, it is necessary to take into consideration the unique character of working with human resources. And, since in comparison with controlling oriented on other enterprise activities, there continues to be a lack of adequate models, and it is necessary to learn to exploit existing quantitative quanta and to suggest appropriate ways and means of measuring qualitative quanta. In the following section of this paper for this reason, we orient ourselves on the possibilities of tracking and measuring selected qualitative quanta (employee motivation) under the concrete conditions pertaining to industrial manufacturing enterprises.

As Devadass (2011) states scholars and practitioners care about cultivating, increasing, and maintaining work (employee) motivation. Motivation research has a long history of considering employee motives and needs (Alderfer, 1969; Maslow, 1954; McClelland, 1961). Interest in these areas peaked in the 1970s and early 1980s, and the last fifteen years has seen little empirical or theoretical research. According to Moorhead and Griffin (1998) is employee performance frequently described as a joint function of ability and motivation, and one of the primary tasks facing a manager is motivating employees to perform to the best of their ability. Pinder (1998) cited in Devadass (2011), describes work motivation as the set of internal and external forces that initiate work related behaviour, and determine its form, direction, intensity, and duration. Work motivation is a middle range concept that deals only with events and phenomena related to people in a work context. The definition recognizes the influence of both environmental forces (e.g., organizational reward systems, the nature of the work being performed) and forces inherent in the person (e.g., individual needs and motives) on work-related behaviour. An essential feature of the definition is that it views work motivation as an invisible, internal, hypothetical construct (Devadass, 2011).

Motivation, delegation of powers gets its importance at the present time as well. Authors Foot and Hook (2005), Armstrong (2002) cited in Gabčanová (2011), unanimously agree upon the fact that the management of the performance is the process by which the performance of the organization, team and individual improve and is used by the leaders for managing. Hall (2008) clearly declares that the very best way for managers to improve employee performance is to set clear expectations and hold regular business reviews to those expectations. The scientists try to discover the dependence between working performance and motivation. However, the answer is not unequivocal in all cases (Gabčanová, 2011).

### **3 RESEARCH OBJECTIVES AND METHODOLOGY**

The need of an employee motivation program was solved for a number of Czech and Slovakian industrial manufacturing enterprises. The paper shows the results of their application on a selection of furniture-making enterprises in the category of shop-floor workers. This company uses the following motivation factors: payments and allowances, education of employees and other advantages. According to motivation criteria used in the

company it is necessary to detect the following research questions for the current system of workers motivation improvement:

- to analyze the current condition in motivation of workers,
- to find other motivation factors that highly influences worker performance and also verifying if there are exceptions to the primary motivation factors (measured or estimated) also so called latent motivation factors (hidden, immeasurable) acting in the background of primary motivation factors,
- to check the possibility of creating an unification motivation program for workers with the intention of its effective application in the practice.

Analysis of motivation structure accepts general knowledge from the theory of motivation. Together with analysis of employees' motivation profile it allows us to obtain information about strong and weak aspects of managerial systems within organizations and its motivation impacts. Without those basic knowledge suggestions are only stochastic processes which will miss the goal when they do not correspond to employees' priorities. The most important criteria for employee performance are those which cause that employees feel that they do a work which has a sense, which is important for an employer, interesting for employees and which give to employees ability of their personal development. But there are also other factors which impact employees' performance-career growth, adequate financial reward, suitable working environment and interpersonal relationships and last but not least respect of personal honour.

Before analysis of motivation structure it would be understood and evaluated all events which have a big impact on company function, on workers willingness to work and on workers performance. Therefore it is necessary to get information about:

- technical and organizational conditions of work,
- socially-demographic and qualification features of employees,
- information about features of job environment, about job conditions and about social equipment of job places,
- applied systems of evaluation and rewarding,
- application of personal management system and own personal work in a company,
- application of social welfare system and employees advantages in a company,
- collecting and analysis of so called soft data (information about satisfaction or dissatisfaction of a worker, about their value orientation, aspirations, relation to work, relation to superiors, to fellows and to whole company).

After analysis of presented social-economic information it can be created outstanding motivation program for employees. These issues are the subject of the works by authors, for instance, Hitka and Rajnoha (2003) and Zámečník (2007 and 2014).

These authors have elaborated and applied a methodology for the analysis of employee satisfaction and for motivational factors for the employees of industrial manufacturing enterprises through the assistance of multi-criteria statistical analysis methods – i.e. cluster analyses. A partial task of this methodology is the creation of a universal, easily modifiable questionnaire that is usable for all employee categories and which determines the valuation spread used to evaluate responses to the questionnaire. On the basis of practical verification with the assistance of cluster analysis, groups are formed of similarly motivationally oriented employees. Analysis of these groups is further determined by the priority allocated a

motivational factor for an individual group. The motivational factor can subsequently be used in the creation of a motivational programme for a group of similarly motivated employees.

Cluster analyses are one of the possibilities available to exploit the information contained in multi-dimensional comparisons using the differentiation of sets into several relatively unified sets of clusters. The application of the cluster analysis method leads to favourable results – especially there where the set under investigation in reality falls into classes, and where objects have a tendency to gather together into natural clusters. Through use of appropriate algorithms, the structure of the set under investigation can be peeled away to reveal its consistent components and thus to classify the individual objects. This can be achieved through the radical reduction of the dimensions of roles – and this in such a way that a number of variables will be represented by one variable expressing its association or belonging to such a defined class or type. The aim being to achieve in essence such a state where, the objects to be found within a cluster will as similar to one another as possible and the objects in various clusters will bear as little similarity to one another as is possible. In view of the fact that employee motivational systems are based on differing criteria according to variable characteristics, it is appropriate to use cluster analysis – further only CLUA, for the final evaluation of motivational factors, where through the use of a suitable algorithm, we can work our way to an evaluation of the realistic order of motivational criteria. Application of the CLUA system is performed in three stages: differentiation – the selection of groups, their interpretation – naming of these groups and their “profiling” – and the description of the characteristics of each of these groups. Cluster analyses can therefore be used for research investigations into the possibility of creating certain types of motivational programmes, that is to say, the possibility of establishing a unified motivational programme for a group of workers with similar motivational profiles. The aim of analysis, is to discover on the basis of the measurement of the similarity of respondents` answers to questionnaires, whether or not it is possible to identify a group of employees with a similar make up of motivators among the employees – for whom it would be possible to elaborate (tailor-made) unified motivational programmes with the intention of simplifying and rendering more effective the validation in practice of motivational programmes in everyday practice. Apart from the aforementioned, cluster analysis can also be used for more detailed verification of the structures and ranking of the importance of motivational criteria. From among the wide range of cluster analysis methods available, we chose the Hierarchical Clustering Method – i.e. the so-called Ward Method with its measurement of the scale or degree of similarity in the responses of individual respondents in the simplest possible way, i.e. through the use of the so-called Euclidian Distances Method.

The actual phases in the preparation, creation, and realisation/implementation of the motivational programme can be broken down into the following basic steps. (Fig. 1):

Fig. 1 – Schema of the creation of motivational programmes using the cluster analysis Source: own study

## 4 RESULTS

As already mentioned above, this methodology was applied in a number of Czech and Slovakian industrial manufacturing enterprises. In order to foster a better understanding, the contribution shows the results of their application on a selection of furniture-making enterprises in the category of shop-floor workers. Information regarding motivation in these enterprises was acquired by means of questionnaires containing 27 motivational factors. Out of the 100 respondents, 66 shop-floor workers filled-in the questionnaires. From the statistical significance point-of-view, this is a sufficient number for the determination of motivator cluster structures and cluster analysis of the motivational criteria of the shop-floor workers of this enterprise. The respondents had the task of indicating the motivational factors and assigning them an evaluation ranging from 5 to 1 (5 – Most significant; 4 – Very significant; 3 – Significant; 2 – Quite insignificant; 1 – Insignificant).

Table 1 shows the rankings of the individual motivational factors.

Tab. 1 – Motivator Ranking in Selected Enterprise Source: own study

<b>Ranking:</b>	<b>Motivator:</b>	<b>Sum of responses</b>
1	Self-sufficiency (Independence) when working	264
2	Free time	251
3	Interpersonal relationships within the workplace	241
4	High degree of personal responsibility	239
5	The atmosphere in the workplace	234
6	Job security	230
7	Interesting work	229
8	Wages/salary levels	226
9	Way work instructions are delivered	224
10	The quality of the inputs needed to work well	222
11	Working hours, overtime	221
12	The company's "name"	219
13	Independence	205
14	The enterprise's ecology	204
15	Sufficient space to work in, in the workplace	201
16	The relationship between the management and employees	200
17	The organisation of work	198
18	The working environment	197
19	Financial bonuses and benefits	196
20	Noise, dust, heating and lighting conditions at work	193
21	Recognition, rewards, praise by superiors	192
22	Validation through use of one's qualifications	185
23	Ways decisions are made	185
24	Social services	180
25	Career growth possibilities/opportunities	166
26	Information flows	163
27	Education and personal growth	157

From the results of the analysis, it is clear that – surprisingly, among the most important motivators in the enterprises investigated were - self-sufficiency (i.e. independence) when working, free time, interpersonal relationships within the workplace, degree of personal responsibility and atmosphere in the workplace. It is only in eighth place of importance that wage/salary levels are to be found, and which – in parallel research into comparable

enterprises (as well as in earlier research studies conducted within these same enterprises) this was to be found in the priority position at the peak of the motivator rankings. This is proof of the need of employees for improvements in the interpersonal and working relationships in employment, and which suppress the primary desire for a higher income.

Fig. 2 shows the motivational structure criteria for labourers in selected enterprises hierarchical cluster – the tree-diagram depicts the cluster analyses of 27 mutually dependent motivational factors. These clusters of mutually-interdependent motivators was created through use of the principles of the hierarchical agglomeration procedure, which is founded on the progressive clustering of groups of elements – starting with the most similar, and, in the following steps – mutually less similar clusters.

Fig. 2 – Hierarchical cluster analysis of the structure of motivational criteria for labourers in selected enterprise. Source: own study

The first motivator cluster is how interesting the work is, self-sufficiency/independence when working, a high degree of personal responsibility, and free time. This group of criteria can be complexly called the work result recognition group.

The second motivator cluster is made up of motivators like validation through the use of one's qualifications, the sufficiency of room to work freely in the workplace, the working hours, independence, and the possibility of education and personal growth. It is possible to see the effort by co-workers to find self-realisation and to develop their own personalities

The third cluster is composed of the working environment and noise, dust, and heating and lighting conditions. Behind the above-mentioned motivators, can be seen the interest by the workers in suitable ergonomic conditions in the workplace. To a wider extent, the third cluster is linked to cluster No. 2.

The fourth cluster is made up of the motivators – job security, wage/salary levels and financial benefits and bonuses. This cluster can be called the materialistic cluster. In its background can be felt the material needs of the workers and their efforts to secure the same.

The fifth cluster is composed of the motivators – the possibility of career growth, social services, information flows, decision-making methods, and the relationship between the enterprise’s management and its employees. This cluster can be called the organisational–career cluster.

The sixth cluster is that of motivators like the “name” of the enterprise, the quality of inputs needed for good work, and the ways in which decisions are made. This goes together with the seventh cluster - made up of motivators like the ecology of the enterprise, the organisation of work, recognition, rewards and remuneration and praise by superiors, atmosphere in the workplace and interpersonal relationships. This cluster can be called the collaboration and cooperation cluster.

Similarly, it is also possible to depict the structure of the similarities between the individual profiles of the workers in the selected furniture-making enterprises, and subsequently – to identify groups of workers with similar motivational structures. Interpretation of the identified groups by means of more detailed breakdowns of the individual motivational factors is a further task in the course of analysing the make-up and creation of motivational programmes for workers of industrial manufacturing enterprises.

Fig. 3 shows below the structure of similarities between individual worker profiles in the selected industrial manufacturing enterprises. From an overall point-of-view, it is possible here to identify 5 groups of workers with similar motivational structures. These are the group of workers designated C\_1 – C\_66, C\_4 – C\_55, C\_8 – C\_36, C\_2 – C\_64 and C\_5 – C\_27.

The problems and issues associated with employee motivation in the analysed furniture-making enterprises were also conducted to meet the needs of the middle management.

Fig. 3 – Hierarchical cluster analysis of the structure of motivational profiles of individual workers in selected enterprise. Source: own study

## **5 DISCUSSION**

Marking the motivators in the questionnaire provides information as to the character of ordinal qualitative features. From the methodological perspective, this has to do with a classical multi-dimensional matrix of the *Objects × Tracked Features* type useable in the course of upholding certain basic principles for the validation and application of multi-dimensional statistical methods. Of these methods, in this analysis, we used the Cluster Analysis Method due to the need to investigate the possibilities of creating certain types of motivational programmes – that is to say, the possibility of establishing a unified motivational programme for a group of employees with similar motivational profiles (not only for blue-collar workers, but also for middle management too).

The aim of the analysis was to discover whether or not – and on the basis of the measurement of similarities between the responses by workers to the main questionnaire, there existed the possibility of identifying groups with similar compositions of motivators for whom it would be possible to elaborate a unified motivational programme with an orientation on its simplification and on making it effective to validate such a motivational programme through implementation in everyday working practice. Apart from this, the Cluster Analysis Method was also used for a more detailed verification of the structures and rankings by importance of motivational criteria. Out of the great quantity of potential cluster analysis techniques, we selected the “Hierarchical (Tree) Clustering Method” – the so-called “Ward Method” and for more detailed analysis purposes, we chose the method with an orientation on the measurement of degrees of similarity in the responses of individual respondents in the simplest way possible, through the so-called “Euclidian Distances” Method. The whole overall approach was chosen in such a way as to be suitable for qualitative, non-metric quanta (i.e. motivational factors) set out in a unified scale (Degree of importance: 1 – 9; eventually: 1 – 5).

## **6 CONCLUSION**

The results demonstrate that HR Controlling is a term, which is more and more often to be found in the vocabularies of HR managers. It is associated with the growing effort by Czech and Slovak enterprises to measure the value of human capital, to direct and manage performance in line with the overall commercial strategy, and to compare its data regarding personnel practices with that of other enterprises. With the assistance of HR Controlling, it is possible to analyse not only the economic (financial), but also the social consequences of measures which in the first instance influence performance and employee motivation within an enterprise.

The design and implementation of an effective and economically-effective motivational programme should be one of the key roles of each and every enterprise. An incorrectly and poorly-applicable motivational programme has a negative influence on the employees and simply does not motivate them to strive for maximum performance. At the current time, the motivation of the majority of employees in the majority of industrial manufacturing enterprises fails to meet all of the needs and requirements of those employees.

On the basis of analysis and of the acquired results, it can be stated that - in the enterprises we analysed, there exists the possibility of creating motivational programmes for groups of similarly motivationally-oriented employees unified according to their motivational and

value-orientations. At the same time, it is necessary to point out that the suggested possibility for the unification of motivational programmes for groups of employees of necessity must undergo even more detailed practical elaboration and subsequent verification. At the same time, there is a need to emphasise the interim and ongoing need for the updating of motivational programmes in the context of developments in employees' values orientations, which may change through time. Further, there exists the possibility for the eventual individualisation of generalised motivational programmes through the use of motivators associated with self-realisation and individual employees' personal ambitions.

## **REGIONAL TAX REVENUES AS THE INDICATORS OF ECONOMIC ACTIVITY OF REGIONS IN THE CZECH REPUBLIC**

*Jarmila Zimmermannová, Jolana Skaličková, Jan Široký*

### **Abstract**

The paper is focused on an analysis of relationships between selected indicators of economic activity of regions in the Czech Republic (GDP, unemployment) and regional tax revenues obtained from taxes imposed on economic activity (VAT, income taxation). Firstly, the introduction and literature overview is provided; then the economic activity taxation in the Czech Republic is described. The methodology is based on correlation analysis (both the Pearson's and the Spearman's correlation coefficients), using data from official statistics of the Czech Republic. The main idea of the paper is that VAT and income taxes revenues in particular regions should give us the picture of economic activity of residents and entrepreneurs in these regions. Based on the results, we can say that there is statistically significant positive relationship between regional VAT revenues and regional GDP, and statistically significant negative relationship between regional income taxes revenues and regional unemployment. In spite of the weaknesses of this analysis, the results show us that these regional tax revenues can serve as an additional source of information about economic activity of particular regions.

## **1 INTRODUCTION**

### **1.1 Literature overview**

Focusing on economic activity of particular countries or regions, we can use different macroeconomic indicators as GDP, unemployment, inflation and balance of trade, or their components (consumption, investments etc.). These macroeconomic indicators show us the economic health of particular regions and we can use them to compare the development of particular regions in selected period.

On the other hand, there is problem of data delay – especially in case of regional macroeconomic indicators. For the purposes of regional policy planning and regional management, the policy makers need actual economic data. Since there are tax offices on the regional level (represented by regional and organizational units), we can assume, that regional policy makers can obtain some economic data from these tax offices, for example regional tax revenues. However, there is a question of suitability of tax based information for regional management and decision making, since it cannot give the whole picture of the regional economy.

Generally, economic theory assumes that the relationship between indirect taxation and economic growth is negative, for example Mendoza et al. (1997); moreover specific excise taxes generate less distorting effects on economic growth than the general consumption tax, as stated in Widmalm (2001), focusing on Czech literature Kubátová (2010) and Vitek (2008).

Existing scientific studies, focusing simultaneously on issues of regional economic health and regional tax data, deal mainly with income taxation and tax burden and try to analyse the impact of regional taxation on GDP development in particular regions.

For example Arhipova and Rudusa (2005) focused on development of territories within countries in transition period, mainly in Latvia. They analysed GDP, unemployment level, the number of economically active enterprises and businesses, nonfinancial investments and the amount of income tax. The results of their research should contribute to strategic cooperation for the improvement of entrepreneurial processes.

Cebula and Clark (2014) provided preliminary analysis for OECD countries and non-G8 OECD nations; they focused their research on study of the impact of economic freedom, regulatory quality and relative burden of taxation on the level of GDP in period 2003 – 2007. They analysed the relationships between the degree of economic freedom and GDP, the level of regulatory quality and GDP and the overall tax burden and GDP.

Reshina and Vocish (2011) deal with budgetary policy and inter-budgetary relations at the regional level in Latvia, particularly the taxation capacity (financial potential) across the regions.

Szarowska (2011) analysed the effect of tax burden on economic growth in the countries within the European Union. The analysis is performed on a panel data of 24 EU countries in a period 1995 – 2008, methodology is based on panel regression with fixed effects. Author presents statistically significant negative effect of both tax burden and direct tax on GDP growth, moreover negative correlation between corporate income taxes and GDP growth.

Folster (2002) focused on relationship between taxation and self-employment, using a panel data from OECD countries and Sweden. He presents a strong negative correlation between the tax burden and the share of self-employed within total employment.

Currently, there is a lack of studies focused on the relationships between revenues obtained from the regional economic activity taxation and the regional economic development. Moreover, the authors did not find any study focused on analysis of regional tax data as economic indicators for policy decision making.

The main goal of this paper is to analyse relationships between selected indicators of economic activity of regions in the Czech Republic (GDP, unemployment) and regional tax revenues obtained from taxes imposed on economic activity (VAT, income taxation). For the purposes of this main goal, the authors define the following 4 hypotheses:

*H1: There is a statistically significant relationship between regional VAT revenue and the value of regional GDP.*

*H2: There is a statistically significant relationship between regional income tax (PIT and CIT) revenue and the value of regional GDP.*

*H3: There is a statistically significant relationship between regional VAT revenue and the regional unemployment.*

*H4: There is a statistically significant relationship between regional income tax revenue and the regional unemployment.*

## **1.2 Taxation of economic activities in the Czech Republic**

The tax system of the Czech Republic had the same features as standard European tax systems in the analysed period (2005 – 2012). Economic activity taxation is based on the

following legislation: Act No. 586/1992 Coll., on income taxes (Czech Republic, 1992) and Act No. 235/2004 Coll., on value added tax (Czech Republic, 2004).

The trends in particular tax rates development and fiscal indicators development are shown in Table 1. Regarding VAT, tax rates were changed 3-times in the analysed period (Široký et al., 2014). Focusing on income taxation, the most significant change is visible in case of personal income tax (PIT), whereas since 1<sup>st</sup> January 2008 there has been introduced flat tax rate for all individuals within the Czech Republic (calculated from the so-called super gross wage). Regarding legal entities, the tax rate of corporation income tax (CIT) decreased from 26% in 2005 to 19% tax rate in 2012 (Schelleckens, ed., 2014). Primarily due to a reduction in the statutory CIT, the effective tax rate of corporate tax calculated according to the methodology Deveroux (in more detail Denis et al., eds., 2014) decreased in the analysed period by 6 percentage points (from 22.7% to 16, 7%).

		2005	2006	2007	2008	2009	2010	2011	2012
1	VAT rates	5; 19	5; 19	5; 19	9; 19	9; 19	10; 20	10; 20	14; 20
2	PIT rates	15; 20; 25; 32	12; 19; 25; 32	12; 19; 25; 32	15	15	15	15	15
3	CIT rates	26	24	24	21	20	19	19	19
4	ETR CIT	22.7	21.0	21.0	18.4	17.5	16.7	16.7	16.7
5	Tax quota in total	35.7	35.3	35.9	34.4	33.4	33.6	34.6	35.0
5a	Tax quota - State Budget	24.8	24.5	25.0	23.8	22.8	23.0	23.8	24.1
5b	Tax quota - budgets of municipalities	5.2	5.0	5.1	4.9	4.7	4.7	4.8	4.8
6a	PTQ - VAT	6.9	6.4	6.3	6.8	6.9	6.9	7.1	7.2
6b	PTQ - PIT	4.4	4.2	4.3	3.7	3.6	3.5	3.7	3.8
6c	PTQ - CIT	4.3	4.6	4.7	4.2	3.5	3.4	3.4	3.3
6d	PTQ - SSC	15.4	15.6	15.7	15.5	14.8	15.2	15.5	15.6

*Notes: VAT - Value added tax, PIT - Personal income tax, CIT - Corporate income tax, ETR - Effective tax rates, PTQ - partial tax quota. Row 2 in the table: in the period 2005 - 2007 - progressive tax rate, in year 2005 in the range 0 - 109 200 the tax is 15 %, 109 201 - 218 400 the tax is 20 %, 218 401 - 301 200 the tax is 25 %, more than 301 200 the tax is 32 %. In the period 2006 - 2007 in the range 0 - 121 200 the tax is 12 %, 121 201 - 218 400 the tax is 19 %, 218 401 - 331 200 the tax is 25 %, more than 331 200 the tax is 32 %. Since 2008 - flat tax rate 15 %. Rows 5a and 5b in the table: the distribution of the total tax quota to the state budget and budgets of municipalities. Supplement consists of funds of social insurance, health insurance funds and payments to the EU budget.*

The tax quota of the Czech Republic (as the most widely used indicator of the tax burden) was fluctuating around the average of EU28 in the analysed period. Focusing on the partial tax quota (PTQ), the Czech Republic is above the average of the EU-28, regarding PTQ value added tax; it was the 18<sup>th</sup> highest within the EU-28 in year 2012. In the same year, PTQ was low in case of personal income tax (on the 25<sup>th</sup>) and high in case of corporate income tax (4<sup>th</sup>) and social security contributes (3<sup>rd</sup>). It should be mentioned, that the ratio of distribution of total tax revenues between the state and municipal budgets was in the ratio of 6: 1 in the analysed period.

## 2 DATA AND METHODOLOGY

### 2.1 Data

The main data sources used to analyse relationships between selected indicators of economic activity of regions in the Czech Republic (GDP, unemployment) and regional tax revenues obtained from taxes imposed on economic activity (VAT, income taxation) are the following: Czech Statistical Office (CZSO, 2015), Ministry of Labour and Social Affairs (MLSA, 2015), and Financial Administration of the Czech Republic (FACZ, 2015).

For the purposes of the correlation analysis, the following data are used: GDP in the regional breakdown, share of employed in the regional breakdown - indicator compares the number of job applicants (aged 15-64 years) to all residents (in this age group), value added tax (VAT) revenues and income tax revenues (PIT and CIT) in the regional breakdown, fulfilled in tax forms. All of the data represent period 2005 - 2012.

Regarding regional tax revenues, we can present the differences between particular regions in the graphical expression. For example Figure 1 shows the differences between regional tax revenues in year 2012.

Fig. 1 Tax revenues in regional breakdowns in Y2012. Source: FACZ, 2015; authors.

You can see that VAT revenues represented the most important part of tax revenues in almost all of the regions in year 2012. However, Prague achieved the highest VAT revenue, mainly due to the allocation of seats of many large corporations. Regarding both CIT and PIT revenues, they had similar importance within particular regional tax revenues. The importance of the analysed tax revenues was almost the same in the whole analysed period.

The following Figure 2 and Figure 3 illustrate the development of unemployment and GDP in all regions in analysed period 2005 - 2012.

Fig. 2 The development of unemployment between 2005 and 2012. Source: MLSA, 2015; authors.

Fig. 3 The development of GDP between 2005 and 2012. Source: CZSO, 2015; authors.

You can see that all of the regions show similar trends in the analysed period. Moreover, there is also visible the impact of the economic crises in year 2008, since the unemployment

increased significantly in the following year 2009 in all regions of the Czech Republic and GDP decreased in the same year in almost all of the regions within the Czech Republic.

## **2.2 Methodology**

Generally, the following classical methods are used: input data and indicators examination, comparison of particular characteristics at regional level, deduction and synthesis for the purposes of conclusions formulation. The research presented in this article is also based on the study of current legislation of the Czech Republic.

For the purposes of achieving the main objective of the paper, the authors use the correlation analysis.

Thanks to the calculation of the correlation coefficients, the correlations between selected economic indicators and the tax revenues are studied. Correlation coefficients can take the value in the interval  $<-1; 1>$ , whereas the positive or negative values signal the dependence direction. The absolute value expresses the strength of the dependence. The dependence can be studied as linear (the Pearson's correlation coefficient) or nonparametric (the Spearman's correlation coefficient).

The Pearson's correlation coefficient is defined as

$$r = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^n (x_i - \bar{x})^2 \sum_{i=1}^n (y_i - \bar{y})^2}}$$

and the Spearman's correlation coefficient as

$$\rho = \frac{6 \sum_{i=1}^n (p_i - q_i)^2}{n(n^2 - 1)}.$$

These correlation coefficients were successfully applied by the authors in their previous research connected with the impacts of particular economic instruments of public economy in the Czech Republic (Zimmermannova, 2012; Zimmermannova and Mensik, 2013) or in research focused on the dependence among various variables - income structure, health and social insurance and personal income tax; GDP per capita, net disposable household income per capita, and the mean gross monthly wage in the Czech regions (Kvicalova et al., 2014). In the case of net disposable income, for instance, strong dependence on the quantities of mean gross monthly wage, employment incomes, health and social insurance, personal income tax and the GDP per capita can be seen. Social incomes, on the other hand, show low levels of correlation coefficient towards all of the other quantities (Kvicalova et al., 2014).

For the purposes of this paper, the correlation analysis is performed for the period 2005 – 2012 as a whole.

## **3 RESULTS**

Firstly, we should focus on the relationships between selected indicators of economic activity of regions within the Czech Republic (GDP, unemployment) and regional tax revenues obtained from taxes imposed on economic activity (VAT, income taxation), based on linear

dependence. The following Table 2 shows us the results of correlation analysis based on the Pearson's correlation coefficient. The amount of observations was 8 for each indicator and region.

Tab. 2 – The Pearson's correlation coefficients. Source: authors.

Regions	VAT and GDP	VAT and share of unemployed	CIT and GDP	PIT and GDP	CIT and share of unemployed	PIT and share of unemployed
Prague	0.650	0.716*	-0.333	-0.624	-0.889**	-0.627

Zlin	0.843*	0.275	-0.347	-0.575	-0.839**	-0.726*
Moravian Silesian	0.817*	-0.681	-0.401	-0.474	-0.508	-0.173

*\*Correlation is significant at the 0.05 level. \*\*Correlation is significant at the 0.01 level.*

Regarding the relationship between value added tax (VAT) revenues and GDP, we can see positive statistically significant relationship in the most of the regions. The values of Pearson's correlation coefficient are higher than 0.8 in five of fourteen cases and higher than 0.7 in eight of fourteen cases. However, there is also negative statistical significant relationship in the Usti region – the development of GDP was similar as in the other regions (see Fig. 3), but values of VAT revenues were decreasing from year 2006. Also income taxes revenues showed decreasing trend. It could be caused by movement of the seats of regional companies to other regions for the purposes of lower frequency of financial controls.

Analysing the relationship between VAT revenues and unemployment, we can say that the Pearson's correlation coefficient is significant only in case of the Prague region, other values of correlation coefficient are weak; moreover it is not clear, whether their mutual relationship is positive or negative. It follows that the development of the examined variables are mutually independent and different in particular regions.

Focusing on income tax revenues and GDP, there is low level of correlation coefficients, both in cases of PIT and CIT. However, we can see the direction of their mutual relationship, which is negative.

Regarding the relationship between income taxation revenues and unemployment, we can see strong negative statistically significant relationship between corporate income tax (CIT) revenues and share of unemployed in almost all of the regions. The values of the Pearson's correlation coefficient are higher than 0.8 in ten of fourteen cases (for regions Prague, Central Bohemian, South Bohemian, Pilsen, Liberec, Pardubice, Vysocina, South Moravian, Olomouc and Zlin). The values for Karlovy Vary and Hradec Kralove are higher than 0.7.

Lower negative statistically significant relationship can be visible also among personal income tax (PIT) revenues and share of unemployed. The values of the Pearson's correlation coefficient are higher than 0.7 in six of fourteen cases.

Analysing the nonparametric relationship of particular variables, the following Table 3 shows us the results of correlation analysis based on the Spearman's correlation coefficient. The amount of observations was 8 for each indicator and region.

Tab. 3 – The Spearman's correlation coefficients. Source: authors.

\*Correlation is significant at the 0.05 level. \*\*Correlation is significant at the 0.01 level.

Focusing on the Spearman's correlation coefficient and the relationship between VAT revenues and GDP, the values of correlation coefficient are lower than in case of the Pearson's correlation coefficient, moreover there are statistically significant only in five cases. Also as in case of Pearson's correlation coefficient, we can see here negative correlation in three regions; however, the value of correlation coefficient is statistically significant only in one of them - the Pardubice region. There has been significant slump of VAT revenues during the analysed period. As is mentioned above, it can be caused by movement of the seats of regional companies to other regions for the purposes of lower frequency of financial controls.

Analysing the relationship between VAT revenues and unemployment, we can say that the results are almost similar as in case of the Pearson's correlation coefficient - the Spearman's correlation coefficient is significant only in case of Prague region, other values of the

correlation coefficient are weak; similarly it is not clear, whether their mutual relationship is positive or negative.

Dealing with income tax revenues (both PIT and CIT) and GDP, we can see that the correlation is significant only in two cases – Pilsen and Hradec Kralove regions.

Regarding corporate income tax (CIT) revenues and share of unemployed, it is obvious, that there is strong negative statistically significant relationship between them in almost all of the regions; it is similar as in case of the Pearson's correlation coefficient. The values of the Spearman's correlation coefficient are higher than 0.8 in eight of fourteen cases and higher than 0.7 in twelve of fourteen cases.

We can also see strong negative statistically significant relationship between personal income tax (PIT) revenue and share of unemployed values, in more cases than in previously used the Pearson's correlation coefficient. The values of the Spearman's correlation coefficient are higher than 0.7 in eight of fourteen cases.

## **4 DISCUSSION**

The main goal of the paper is to analyse possible relationships between regional tax revenues and their economic activity. Generally, the relationships between regional tax revenues and economic growth are the subject of research provided mainly by the neoclassical economists dealing with the growth models (in more details for example in Barro and Sala-i-Martin (2004) or Widmalm (2001)). This research is focused on an application of economic growth issue to the regional level and also includes the other aspects, for example unemployment. The originality of this paper is also determined by analysis of not only the tax rates, but tax revenues at the regional level.

The authors are aware of the barriers of the presented research, particularly the “regional” tax revenues and the indicators of the “regional” performance using the GDP. It can be for example the situation, where the corporations have their seats in another region than in which they operate, respectively run their activities. The typical example can be Prague region, since many of companies have their seats in Prague due to many economic subjects in this region and consequent low frequency of financial controls.

**H1: There is a statistically significant relationship between regional VAT revenue and the value of regional GDP.**

We can partially confirm this hypothesis H1. Focusing on the results in the previous chapter, we can see statistically significant positive correlation in eight regions (Central Bohemian, South Bohemian, Pilsen, Hradec Kralove, South Moravian, Olomouc, Zlin and Moravian Silesian). However, not all regions show similar results, for example the Usti and the Pardubice regions show unusually negative statistically significant correlation coefficients. This can be caused for example due to fluctuations and irregular development of tax revenues during the analysed period (especially significant reduction in tax revenues).

We can say that VAT revenues represent the added value within the regional economic activities in most of the regions of the Czech Republic.

**H2: There is a statistically significant relationship between regional income tax (PIT and CIT) revenue and the value of regional GDP.**

We can reject this hypothesis H2. We anticipated that the relationships between income tax revenues and the value of regional GDP would be similar as in case of VAT and GDP; that means that regional tax revenues represent the regional economic activity. Nevertheless,

regional income tax (PIT and CIT) revenues are not correlated significantly with the value of regional GDP. Within our analysis, there were noted low and insignificant values of correlation coefficients. It can be caused by regular tax optimization carried out by companies and self-employed.

We can say that income tax revenues do not represent the value of regional economic activities in the regions of the Czech Republic.

**H3: There is a statistically significant relationship between regional VAT revenue and the regional unemployment.**

We can reject this hypothesis H3. There is no clear relationship between regional VAT revenues and regional unemployment. The results of the correlation analysis are ambiguous and the correlations are weak.

We can say that regional VAT revenues have no relationship with the value of regional unemployment.

**H4: There is a statistically significant relationship between regional income tax (PIT and CIT) revenue and the regional unemployment.**

We can partially confirm this hypothesis H4. Regarding relationships between regional CIT revenues and the regional unemployment, there can be observed statistically significant negative correlation in twelve regions, both in cases of linear and nonparametric relationship (except of only two regions - Usti and Moravian Silesian). We can say that the value of regional unemployment is in opposite relation to the production and profits of companies within particular regions. Regarding correlations between regional PIT and regional unemployment, there is visible only negative nonparametric relationship. Statistically significant negative correlations can be observed in 8 regions.

We can say that it is obvious, that higher regional income tax revenues are connected with lower regional unemployment, in other words we can anticipate that their values go to the diverse direction. Therefore the low share of unemployed persons in regions together with higher number of companies would create additional PIT and CIT revenues.

As is mentioned above, there are weaknesses of the presented research, based mainly on the differences between official seats of particular companies and the place, where the company really operate. However, the results show that in spite of this situation, there can be significant relationship between some of the analysed indicators. Comparing the results with for example Mendoza et al. (1997), we can say that our results are “the other side of the same coin” – the relationship between indirect taxation and economic growth is negative; however higher regional VAT revenues represent higher economic activity of particular regions, expressed officially by regional GDP indicator.

Further research in this area can be focused on an analysis of regional aspects of public finance by applying of complex methods, for example regression analysis, cluster analysis or I-O analysis.

## **5 CONCLUSION**

The paper presents the first analysis of the relationships between selected indicators of economic activity of regions in the Czech Republic (GDP, unemployment) and regional tax revenues obtained from taxes imposed on economic activity (VAT, income taxation).

Based on the results, we can say that there is statistically significant positive relationship between regional VAT revenues and regional GDP, and statistically significant negative

relationship between regional income taxes (PIT and CIT) revenues and regional unemployment. Therefore we can use regional VAT revenues and its development as the additional indicator of economic activity of particular regions.

In spite of the weaknesses of this analysis, the results show us that the analysed regional tax revenues can serve as an additional source of information about regional economic activity for the purposes of decision making of policy makers on governmental or regional level.

## **MANAGEMENT CONTROL OF INNOVATIVE ACTIVITIES: RESEARCH RESULTS FROM CZECH MANUFACTURING INDUSTRY**

*Ondřej Žižlavský*

### **Abstract**

The paper investigates how owners and/or managers are currently performing innovation activities and simultaneously managing performance and measures they are currently using to facilitate these dimensions. To achieve the goal the author evaluates and interprets the results of survey conducted in 2014 within research project 13-20123P sponsored by Czech Science Foundation. To gain data the quantitative methodology was applied in the form of on-line questionnaire survey. This data and the information collected through their further process were completed with primary qualitative data from personal interviews and secondary data from previous studies. The main conclusion of the paper rests in empirical findings that the continece still prevails in Czech business practice. Managers use modern management control tools, but usually in combination with tradition methods. Results of this study are limited to analysis of a single case study, representing starting point for further research in other industries and countries. Moreover, the results of this study are exploratory and are not to be interpreted as the only possible answer to the research questions.

*Keywords: Innovation, management control, performance measurement, metrics, Czech manufacturing industry*

## **1 INTRODUCTION**

The old adage says: “You cannot manage what you do not measure.” This is especially true for innovations where it is necessary to bring focus, intelligibility and discipline, particularly to the initial, inventive phase of the innovative process. Innovation is a continuous process. Companies are continually creating changes in their products and processes and gathering new knowledge. Measuring such a dynamic process is much more complex than in a static activity.

According to the abundance of books and publications that have been written over the past few years on the topic of measuring enterprise performance (see Neely, 2005 for an overview of the state of the art of performance measurement and further research perspectives), it might seem that we know everything we need. Despite this, many companies do not have this issue supported and it is often taken for granted and considered resolved within the scope of the existing information systems.

Management control systems are essential and crucial to the success of innovations. It is not enough just to pick a few areas, use random indicators and expect to obtain the information needed for managing innovations. It ends up mostly in a situation where the competent managers are overwhelmed with analysis results that they do not use in their work or that they use in a completely inefficient manner. This approach is time-consuming and draining on productivity. It can also lead to inconsistent analyses and incorrect measures (Davila et al., 2013; Skarzynski & Gibson, 2008).

How do Czech companies actually manage and control innovation performance? This was the aim of the own research. The objective of this paper is to present the contemporary situation of innovation management control as it is implemented in current Czech business environment. The research framework is based on primary research carried out in Czech innovative manufacturing companies under the auspices of the Faculty of Business and Management Brno University of Technology with financial support from Czech Science Foundation research project No. 13-20123P.

After a short introduction, the crucial terms, such as innovation, innovative capability and innovative performance, are defined. Then the methods, hypothesis and process of research survey are presented along with the results in the field of management control of implemented innovations, followed by a discussion on the contemporary situation.

## **2 LITERATURE REVIEW**

The most commonly used substantive typology of innovation terms is the classification under the Oslo Manual prepared by experts in the field of measurement and evaluation of innovation activities from OECD member states. The Oslo Manual defines innovation as the implementation of a new or significantly improved product (goods or services), or a process, a new marketing method, or a new organizational method in business practices, workplace organization or external relations (OECD, 2005). Although, there exist more publication about innovation classification, the Oslo Manual is the foremost international source of guidelines for the collection and use of data on innovation activities in industry (Gault, 2013). Therefore, definition of innovation proceeds from the Oslo Manual in this paper.

Besides, the Oslo Manual defines four types of innovation that encompass a wide range of changes in companies' activities:

- Product innovations involve significant changes in the capabilities of goods or services. Both entirely new goods and services and significant improvements to existing products are included.
- Process innovations represent significant changes in production and delivery methods.
- Organizational innovations refer to the implementation of new organizational methods. These can be changes in business practices, in workplace organization or in the firm's external relations.
- Marketing innovations involve the implementation of new marketing methods. These can include changes in product design and packaging, in product promotion and placement, and in methods for pricing goods and services (OECD, 2005).

Nowadays, successful companies reach or maintain their success by continuous changes in the industry where they compete with the help of systemic innovation. Their competitive success comes from "running differently", by reinventing themselves through innovation capability (Fiorentino, 2010). Innovative capability is currently considered the key condition of companies' competitiveness (Andergassen et al., 2009) and performance. This relates particularly to small and medium-sized enterprises (SMEs), which, thanks to their less structured organizational and administrative systems, are able to react more quickly to customers' requirements and trends in development (Audretsch, 2003; Zeng et al., 2010). An increasing number of studies underlines the existing correlation between the innovative capability and innovation market success (Baden Fuller & Pitt, 1995; Barker & Duhaime, 1997; Christensen & Raynor, 2003; Drucker, 1999; Epstein et al., 2004; Markides, 1997; Tushman & Anderson, 2004).

Hence, innovation performance can be understood as the ability to transform innovation inputs into outputs, and thus the ability to transform innovation capability and effort into market implementation. The result of innovative performance is innovation market success.

The innovative performance overarches the measurement of all stages from R&D to patenting and new product introduction. In other words, this definition of innovative performance in the broad sense focuses on both the technical aspects of innovation and the introduction of new products onto the market, but it excludes the possible economic success of innovations (Ernst, 2001; Stuart, 2000).

If we want to assess the success of innovations, we need to choose a type of criteria to be used for the assessment. Hauschildt recommends the following three types of criteria to measure innovation success, i.e. technical, economic and others (Hauschildt, 2004). This paper is intended to assess the economic performance of the innovation process (for better understanding of innovation process see Zizlavsky, 2013a). Options for expressing innovation process effectiveness by economic indicators have also been investigated by the prominent Czech expert Valenta. In his last publication, he concludes that better economic performance of a company is not only the result of innovative measures in the manufacturing area, but also of non-manufacturing innovations expressed in managing and servicing activities, and is also intensively influenced by the external environment (Valenta, 2001).

In innovations, we want to find out what economic benefits have been generated by new products, or what savings have been made by the implemented process innovations, and what is the ratio between those benefits and their costs. In each stage of the innovation process, questions should be raised about whether it makes sense to continue working on the project, whether the parameters set will be achieved, and even whether the innovation stands a chance of asserting itself on the market (Tidd et al., 2009). There are several ways to approach innovation process performance assessment, from identifying barriers that might threaten the process, pre-setting criteria for individual stages of the innovation process to economic evaluation. Determining innovation performance has a lot in common with determining the success of investments (Erner & Volker, 2010). Just as in investments, it involves significant expenditure that may bring concrete results only after a certain period of time (Patterson, 2009). At the same time, the assessment of innovation process performance has a number of very specific features. There are other authors (e.g. Gailly, 2011; Huang et al., 2004), who also propose assessing investment performance using indicators analogous to those applied to the assessment of the effectiveness of investment (NPV, EVA, profitability, payback period, etc.). We can also use a project management approach: we estimate future cash flows, create a cash-flow, calculate the rate of return on capital invested, compute financial indicators, and compare the values calculated with pre-determined criteria. The use of the above indicators, however, is hampered by problems with determining the costs incurred, and especially with the quantification of future earnings on investment (Kislingerova, 2008).

### **3 METHODOLOGY**

With regard to the identified objective of research project – learn and study the current state of issues of the management of innovative activities and their performance measurement as these areas are currently being solved in Czech, as well as foreign expert literature and practice in Czech innovative manufacturing companies – the following research hypotheses were defined:

**Hypothesis 1:** Large companies tend to evaluate their innovative activities more than SMEs.

**Hypothesis 2:** Large companies implement “innovative” techniques of innovation management control.

When deciding which method to adopt for a study, there are many factors that should be considered. First, all methods have their strengths and weaknesses, so it is important to evaluate each method’s appropriateness regarding the research project. Second, because a research project is usually made up of different types of data, namely primary and secondary data, a number of methods might be used in order to be able to address the research problem. As a consequence of the difference between these types of data, a collection of various methods has to be adopted. Based on the purpose of our study we decided to start with a survey.

This section provides an overview of the data used for this paper and the main characteristics of the research sample. After extensively examining previous relevant, related literature and research in innovation, management control, performance measurement, and related topics (Žižlavský, 2013a; Žižlavský, 2013b; Žižlavský & Sággy Estélyi, 2013; Žižlavský & Senichev, 2013; Žižlavský, 2014a; Žižlavský, 2014b; Žižlavský & Karas, 2014), the field research was started in 2014. Three types of data were collected for this study: questionnaire and interviews, company data and public information. We consider data from a survey conducted every two years by the Czech Statistical Office.

As concerns the methodological approach, following recent examples (Baird et al., 2004; Careno & Turolla, 2010; CZSO, 2012; CZSO, 2014; OECD, 2009; Sulaiman & Mitchell, 2005; ZEW, 2013; Žižlavský, 2013b), a questionnaire-based survey was implemented to gather information and determine the real state of solved issues of management control of innovation activities. The survey method is often used to collect systematic data since it is time and cost-efficient and allows carrying out a statistical analysis (Groves et al., 2009). In addition, the replication of questions is possible and thus consents a comparison of results and pattern analysis.

The first step was to define the research sample. Before the research commenced, the circle of respondents was duly considered. Research could have been limited based on a company's size, the field, and distribution of companies in the Czech Republic. After careful consideration, it was decided to carry out the research via a random selection of various-sized innovative companies from manufacturing industry in the Czech Republic.

As far as the first feature is concerned, this choice is related to the fact that managerial tools primary originated, and were subsequently developed, in manufacturing companies. The second feature was the fact that manufacturing industry is considered as the most significant industry for development of the Czech economics. According to Czech Statistical Office and its survey in 2014, 51% from 5,449 innovative companies belong to manufacturing industry. Moreover, these companies participated in total revenues by 45,4% in 2012 in mentioned part of Czech economics (CZSO, 2014, p.15).

The key was to approach as many respondents as possible and so to acquire a sufficiently large data scale factor for evaluation of primary research. The inquiry itself provided quantitative, as well as semi-qualitative data on the current state of the issue in question. Simplicity and the relative brevity of the questionnaire, affecting a respondent's willingness to fill it out, was an important factor when creating the questionnaire. There were the following types of questions:

- With selectable answers and the option to select just one.
- With selectable answers and the option to select several answers.

- With pre-defined answers with an evaluation scale.
- Some questions had the option to fill in answers freely.

The questionnaire is structured in two parts. The first part consists general information about company, whereas the second part focuses on innovation measurement and management and used management control tools and methods.

The questionnaire, part of the research project titled “Innovation Process Performance Assessment: a Management Control System Approach in the Czech Small and Medium-sized Enterprises” and sponsored by the Czech Science Foundation (GACR), was web-based.

Once drawn up, the questionnaire should be tested on a sample population. Therefore, the questionnaire was pre-tested by a number of academics and then send to several practitioners for further review. Minor adjustments in wording and layout were made in order to further understanding of the questionnaire. None of these respondents considered the questionnaire difficult to complete.

#### **4 RESEARCH RESULTS**

The survey was composed of 15 questions and was conducted by sending a fully standardized questionnaire by e-mail to the company (a link to the electronic questionnaire was included in the e-mail). The e-mail implied a brief introduction clarifying the purpose and objectives of the research project and invitation to contact us if they wish to participate in an in-depth interview to be conducted later. It was send exclusively to CEOs, top managers, executive officers, or in small companies, directly to owners. The survey was anonymous, took approximately 10 to 15 minutes to complete, and was conducted from April to November 2014.

Addressed companies were those that, by their principal activities, belong to manufacturing industry (according to CZ-NACE rev. 2, division C, section 10-33). Data on the total number of companies in the target population of the survey are taken from the Czech Statistical Office. We estimate that the target population consists over 11,000 manufacturing companies (CZSO, 2014). Selective sample of these companies was obtain from the database Technological Profile of the Czech Republic ([www.techprofil.cz](http://www.techprofil.cz)). A random sample of 2,467 innovative companies was drawn from basic sample.

Tab. 1 – Overall statistics and distribution of companies engaged in research survey. Source: Own research

Basic sample		Manufacturing enterprises in the Czech Republic				
Selective sample		Innovative manufacturing enterprises in the Czech Republic				
Category (Number of employees)		Micro (1-9)	Small (10-49)	Medium (50-249)	Large (>250)	Total
Response	Number	26	101	158	69	354
	%	8.93%	14.41%	20.18%	9.97%	
Non-response	Number	265	600	625	623	2,113
	%	91.07%	85.59%	79.82%	90.03%	
Total	Number	291	701	783	692	2,467

	%	100.00%	100.00%	100.00%	100.00%	
<b>Response rate</b>	%	<b>8.93%</b>	<b>14.41%</b>	<b>20.18%</b>	<b>9.97%</b>	<b>14.35%</b>

After the first posting at the beginning of April 2014, non-responding companies received a reminder at the end of May or beginning of June, a follow-up was a few months later. At the end of November 2014, 354 completely filled questionnaires were collected. The real response rate more than 14% can be considered as good because response rates of mail-back questionnaires are usually less than 10%. The detailed statistics of the questionnaire inquiries are shown in Table 1.

Moreover, using Pearson chi-square test, we found no statistically significant difference between the two groups: the size of respondents and non-respondents. Null fragmental hypothesis FH0 is going to be tested that random values are not depended in comparison with alternative fragmental hypothesis FH1.

*FH0: Size of the company and response are not related to each other.*

*FH1: Size of the company and response are related to each other.*

Calculated test criterion for micro companies:

$$\text{Chi-Sq} = 3.662; \text{DF} = 1; \text{P-Value} = 0.056$$

(63 complete questionnaires and 562 potential respondents)

Calculated test criterion for small companies:

$$\text{Chi-Sq} = 0.004; \text{DF} = 1; \text{P-Value} = 0.949$$

(94 complete questionnaires and 674 potential respondents)

Calculated test criterion for medium companies:

$$\text{Chi-Sq} = 0.122; \text{DF} = 1; \text{P-Value} = 0.727$$

(123 complete questionnaires and 853 potential respondents)

Calculated test criterion for large companies:

$$\text{Chi-Sq} = 2.927; \text{DF} = 1; \text{P-Value} = 0.087$$

(74 complete questionnaires and 434 potential respondents)

For selected significance level  $\alpha = 0.05$  is determined a quantile chi-sq (1) = 3.841. Because the value of test criterion was not realized in critical field ( $3.662 < 3.841$  and  $\text{P-Value} = 0,056$  for micro companies;  $0.004 < 3.841$  and  $\text{P-Value} = 0.949$  for small companies;  $0.122 < 3.841$  and  $\text{P-Value} = 0.727$  for medium companies;  $2.927 < 3.841$  and  $\text{P-Value} = 0.087$ ), fragmental null hypothesis FH1 is refused on five percentage level signification and alternative fragmental hypothesis FH0 is accepted.

#### **4.1 General characteristics**

Questions from the first part of the questionnaire were related to the basic characteristic data of the company, such as the company's size, origin, market, etc. Company size is traditional contingency factor in economic research. Specifically, this paper studies the impact of one factor linked to company size: number of employees (although, the revenue data were collected with help of questionnaire as well. However, due to limit of the paper, only number of employees in concerned). In fact, this factor is usually the basis of company classification. Distribution of companies by size is based on EU law and the Recommendation of the

European Commission 2003/361/EC of 6 May 2003 (EC, 2003, p.36). This standard divides four groups: micro, small, medium and large company. Figure 1 show the percentages obtained from using the number of employees indicator.

Fig. 1 – Distribution of companies engaged in research survey (n=354, number of employees).  
Source: Own research

The first empirical evidence of the survey emerged by way of descriptive statistics. We noted through the analysis of questionnaires that innovations are mostly performed by SMEs (80.51% in total), resp. by medium enterprises (44.63% of respondents) followed by small enterprises (28.53% of respondents) with large (19.49% of respondents) and micro companies (7.34% of respondents) at the tail.

The factor that may be behind this result is the economic crisis of that period. It can be assumed that companies were aware of the threat of losing their competitiveness that could potentially lead to their end. While large enterprises focused on operational efficiency and cost saving, SMEs could react to changes in the environment through innovation. The bigger the company the more organizationally demanding are any innovative changes, which is why mainly smaller businesses with flexible organizational structure innovate in these times. Large companies naturally strive to support innovation as well but due to more complicated organization these activities may manifest themselves later. The importance of small and medium enterprises for the development of Czech economics is therefore increasing. This is highlighted also by the Concept for Support of Small and Medium Entrepreneurs for the period of 2014–2020 carried out by the Ministry of Industry and Trade of the Czech Republic (for more information see MIT, 2012).

However, these results contrast with study of the Czech Statistical Office (CZSO, 2014) that consider large companies as innovation leaders in the Czech Republic. Previous studies conducted within 2009-2011 under the sponsorship of the Internal Grant Agency of the Faculty of Business and Management Brno University of Technology (Žižlavský, 2013b) has reached the similar contradictory conclusions.

Majority of respondents (76.55%) is carrying out innovation irregularly and randomly, i.e. as a consequence of intuitive and immediate decisions, or reverse the negative development. Only 23.45% of respondents execute innovation regularly, i.e. as a standard part of their businesses and systematically managed (see Table 2).

Tab. 2 – Period of innovation (n=354). Source: Own research

Category (Number of employees)		Micro (1-9)	Small (10-49)	Medium (50-249)	Large (>250)	Total
Regularly	Number	2	17	29	35	83
	%	7.69%	16.83%	18.35%	50.72%	<b>23.45%</b>
Irregularly	Number	24	84	129	34	271
	%	92.31%	83.17%	81.65%	49.28%	<b>76.55%</b>
Total	Number	26	101	158	69	354
	%	100.00%	100.00%	100.00%	100.00%	100.00%

Respondents answered the question about what innovations had been implemented by the company during the last three years and what importance they carry for the company represented another part of the research. They could select from four predefined answers (see innovation classification according to Oslo Manual). The questionnaire includes a list of examples for each type of innovation. Some of the key research findings are summarized in Table 3.

Tab. 3 – Implemented innovations (n=354). Source: Own research

Category (Number of employees)		Micro (1-9)	Small (10-49)	Medium (50-249)	Large (>250)	Total
Product innovation	Number	11	48	54	23	136
	%	42.31%	47.52%	34.18%	33.33%	<b>38.42%</b>
Process innovation	Number	8	26	50	20	104
	%	30.77%	25.74%	31.65%	28.99%	<b>29.38%</b>
Organization innovation	Number	1	8	21	10	40
	%	3.85%	7.92%	13.29%	14.49%	<b>11.30%</b>
Marketing innovation	Number	6	19	33	16	74
	%	23.08%	18.81%	20.89%	23.19%	<b>20.90%</b>
Total	Number	26	101	158	69	354
	%	100.00%	100.00%	100.00%	100.00%	100.00%

The most performed innovation type is product innovation (38.42% of respondents), followed by process (29.38% of respondents) and marketing innovation (20.90% of respondent). The organization innovation is at the tail with 11.30% of respondents. These balanced results highlight the fact that product innovations often require process innovations, e.g. in the form of acquiring new production technology, and in order for these product innovations to be successful on the market and bring the company higher value, it is often necessary to seek new distribution channels via marketing innovations.

The importance of innovation was evaluated by the scale: 1 – very important, 2 – important, 3 – neutral, 4 – not important, 5 – completely unimportant. In the summary of the percentage

ratio of positive answers, i.e. values 1 (very important) and 2 (important), the order of individual possibilities was determined. Therefore, results show that respondents see the importance of innovations for their company in the following order: innovation of products, processes, organization, and marketing.

Tab. 4 – Importance of particular innovation types for companies (n=354). Source: Own research

	Mean	Standard deviation	Median	Evaluation 1–5 (%)					Σ 1+2 (%)
				1	2	3	4	5	
Product innovation	2.5426	1.4769	2	120	193	94	80	53	313
Process innovation	2.4442	0.9926	2	128	187	106	67	41	315
Organizational innovation	2.6220	0.9256	3	100	188	174	53	59	288
Marketing innovation	2.5077	0.9024	2	107	181	127	66	37	288

Since respondents were able to select more answers for this question, a recalculation had to be carried out where relative frequency was determined as a percentage of the number of selected answers out of the total number of respondents in the group. Evaluation of the importance of individual types of innovation for companies is shown in Table 4.

Innovation expenditures includes all expenses for both in-house and externally purchased activities that aim at the development and introduction of innovations, regardless whether these innovations have been introduced yet. They comprises current (e.g. labor costs, externally purchased goods or services etc.) and capital expenditures (e.g. on machinery, instruments, intangible assets etc.).

Innovation expenditures are an important metric to determine the amount of resources that company provided for carrying out innovation activities. To overcome unwillingness of the respondents to transmit confidential information four categories were predefined; innovation expenditures based on actual needs, up to 5% of an annual budget, 5-10% of an annual budget and more than 10% of annual budget.

We noted that the most frequent innovation expenditures are up to five percent of an annual budget, especially in small and medium companies. SMEs invest into innovative activities according the actual needs. The largest contribution to this fact is made by micro companies (65.38% of respondents) identically followed by small (38.61% of respondents) and medium companies (36.08% of respondents). To contrast, inverse pattern is observed for the expenditures from five to ten percent, from 11.54% for micro companies to 34.78% for large companies. Large companies (23.19% of respondents) devote more than ten percent of their annual budget for innovations, while micro companies invest into innovation according actual needs (65.38% of respondents). In other words, the greater company the higher expenditures, regularly planed and annually spend on innovations.

Tab. 5 – Innovation expenditures (n=354). Source: Own research

#### 4.2 Management control of innovation

Well-managed innovations successfully commercialized in the market are a tool that companies can use to win competitive advantages that will allow them to prosper even under the conditions of the current recession. It is a modern trend to innovate, but innovations must be implemented prudently and in a targeted manner. Moreover, innovative activities are very costly and they tie a substantial part of a company's available resources for a significant period of time. Effort and resources expended must be recouped if the company is to stand a chance of surviving in the strongly competitive environment. The need of management control system is crucial in innovations.

Tab. 6 – Evaluation of innovation projects (n=354). Source: Own research

Category (Number of employees)		Micro (1-9)	Small (10-49)	Medium (50-249)	Large (>250)	Total
Yes	Number	5	23	49	24	101
	%	19.23%	22.77%	31.01%	34.78%	<b>28.53%</b>
Rather yes	Number	11	62	72	35	180
	%	42.31%	61.39%	45.57%	50.72%	<b>50.85%</b>
Rather no	Number	8	9	21	8	46
	%	30.77%	8.91%	13.29%	11.59%	<b>12.99%</b>
No	Number	2	7	16	2	27
	%	7.69%	6.93%	10.13%	2.90%	<b>7.63%</b>
Total	Number	26	101	158	69	354
	%	100.00%	100.00%	100.00%	100.00%	100.00%

Therefore, a key area of the survey was the question of evaluation and responsibility for innovative activities – where the key decisions are made and where it is decided whether the innovation is viable. When asked whether the enterprises had evaluated the implemented innovative projects, the vast majority (79.38% of respondents) answered affirmatively. On the other hand, what is disquieting is the fact that this area is neglected by 20.62% of the respondents even though innovations are implemented by them (see Table 6).

Based on these data, hypothesis 1 “Large companies tend to evaluate their innovative activities more than SMEs” is tested. Independence statistical testing of two qualitative characters is carried out for statistic dependency verification. For this purpose following question “Does your company evaluate innovation? is used. Null fragmental hypothesis FH0 is going to be tested that random values are not depended in comparison with alternative fragmental hypothesis FH1.

*FH0: Size of the company and evaluation of innovation are not related to each other.*

*FH1: Size of the company and evaluation of innovation are related to each other.*

Tab. 7 – Relation research of evaluation of realized innovation and size of the company (n=354). Source: Own research

Size of company/ Innovation evaluation	SMEs	Large	n <sub>i</sub>
No/rather no	63	10	73
Yes/rather yes	222	59	281
n <sub>j</sub>	285	69	354

Calculated test criterion for large companies:

$$\text{Chi-Sq} = 1.967; \text{DF} = 1; \text{P-Value} = 0.161$$

For selected significance level  $\alpha = 0.05$  is determined a quantile  $\text{chi-sq}(1) = 3.841$ . Because the value of test criterion was not realized in critical field ( $1.967 < 3.841$  and  $\text{P-Value} = 0.161$ ) fragmental null hypothesis FH1 is refused on five percentage level signification and alternative fragmental hypothesis FH0 is accepted. In other words, SMEs are aware of importance of innovation evaluation and they perform it as well as large companies. On the other hand, SMEs use different techniques of management control than large companies (see Table 8).

For enterprises who responded affirmatively to the above question, the method of evaluating the innovative activities has been examined. Here again respondents were able to select more answers for this question, a recalculation had to be carried out where relative frequency was determined as a percentage of the number of selected answers out of the total number of respondents in the group. The management control tools were divided into two groups; financial and non-financial.

Tab. 8 – Management control methods (n=354). Source: Own research

Category (Number of employees)	Micro (1-9)	Small (10-49)	Medium (50-249)	Large (>250)
Balanced Scorecard	0.00%	2.38%	10.95%	33.91%
Budget	67.45%	72.46%	84.27%	100.00%
Cost accounting (with cost drivers)	11.33%	19.31%	35.13%	42.67%
Cost accounting (without cost drivers)	20.38%	24.59%	22.54%	14.17%

Productivity and quality indicators (lead time, etc.)	3.43%	6.81%	15.70%	32.76%

## 5 DISCUSSION

Focusing on companies adopting measurement and management control systems, the following analysis investigates the diffusion of management control techniques. Table 7 shows that budget, revenues from innovation and EBITDA are the most frequently applied managerial tools in Czech innovative manufacturing companies. Based on these results we can claim that the prevailing approach is the monitoring of financial indicator. On the other hand, EVA, Balanced Scorecard and innovativeness are implemented the least. In other words, the companies analyzed and adopt traditional management control tools, whereas, “innovative” techniques are implemented in small number of companies (It is very difficult to confirm or invalidate Hypothesis 2 based on these insufficient results). Here, the gap between global and Czech companies has been discovered (cf. Chiesa & Frattini, 2009).

A first reason that could explain the gap between Czech and foreign companies could stem from lack of knowledge. Especially small Czech companies are not usually familiar with these managerial instruments. A second reason is the fact that in management of the vast majority of these companies is the owner, who prefers his own experience instead of the management control tools. A third reason could lie in the characteristics of the management control tools. They are primarily design to solve homeland company issues (such as Balanced

Scorecard from USA, which represents robust management control system). Therefore, it is difficult to adopt them to different context without making adjustments. Besides, the high level of uncertainty avoidance does not allow Czech companies to try out new management control instruments.

In addition, Table 7 demonstrates that financial indicators are more frequently adopted than non-financial indicators. Financial assessment is an integral part of every project. Simply speaking, only those projects that pay off should be implemented. But how to assess objectively the rate of return of the invested efforts and time? Assessing the results of an innovation project only in terms of its economic benefits may not be the most advantageous way, since it may also result in rejection of projects in which the qualitative benefits significantly exceed the potential costs associated with project implementation.

Many large global companies, as well as most of the surveyed Czech companies, measure the results using financial indicators, although the majority of managers in these companies feel that also non-financial indicators should be used to monitor the undertaken innovative efforts and projects. The managers should rely more on non-financial indicators than on the financial ones, because these indicators provide a better assessment of progress in real time and of the probability of success.

Integration of non-financial metrics into systems for measuring performance allows managers to better understand relations between various strategic innovation targets, communicate the linking of these targets with workers' activity and, upon the defined targets to formulate priorities and allocate resources (Kaplan & Norton, 2000). The main contribution of non-financial indicators is the identification of key factors influencing the development of financial indicators. These indicators are also more sensitive to changes, which can be considered a crucial characteristic in the current turbulent environment. There is also space for the measurement of other important factors that support the innovation, such as creative climate, commitment to innovative activity, the number and quality of ideas, communication inside the company, etc. (Humphreys et al., 2005). Scientific research in measurement methods and indicator creation describing innovations and their effects on the social environment has only just started (Hipp & Grupp, 2005).

In fact, profitability metrics, cash flow etc., typically short-term indicators are the most significant measures adopted by companies to evaluate their innovation performance. These financial metrics are connected with short-term aims and based on historical accounting data. They are also known as delayed indicators, because they are used to measure past results. But innovations are more oriented into the future and are connected with long-term aims. The innovation has to be understood as the long-term creation of values and for companies the future financial performance has to be stronger moving power than short-term cycle. Hence, focusing only on financial metrics is not correct way. A well-designed management control system of innovation should therefore include an appropriate mix of financial and non-financial indicators, which should be subsequently, compared using benchmarking with competitors or with models of excellence.

However, empirical evidence highlights an increasing group of companies adopting non-financial measures. In particular, number of new customers and their satisfactory index are the most implemented when compared to the innovativeness and cannibalization of existing products by innovative ones, which was assessed by the respondents as an insignificant indicator. Thus, the most significant effect of innovations was shown on the satisfaction of customer needs, which should be subsequently reflected in the growth of sales or, more precisely, operating profit.

Finally, the empirical evidence demonstrates that low adoption rate of the Balanced Scorecard. Most Czech companies, especially medium and large, monitor performance of innovation activities by using specific financial and non-financial measures, but without any logical link between them. In other words, only a small number of companies, especially large ones and those having different perspectives, actually understand the importance of cause-effect relationship between metrics. In addition, after overcoming the barriers and reluctance of the managers to communicate more detailed information about their systems of innovation evaluation, these systems proved not to be very appropriate, while being biased in favor of financial indicators.

As concerns number of employees indicator, empirical data demonstrates that medium and large companies adopt instruments to a greater extent than smaller companies. In addition, Table 7 suggests a positive correlation between company size and the adoption of innovation management control tools. For instance, focusing on budget, we noted that the percentage of diffusion increases from 67.45% in micro companies to 100.00% in large companies. In other words, the greater company, the higher the adoption of a budget system. Similarly, we noted the same positive trend, even if with different percentages, for revenues and cost accounting with cost centers, number of new customers and their satisfactory index.

Simple cost accounting (a single-basis cost allocation without cost centers) and profitability indicators show a negative trend. This suggest the bigger and more complex company the greater need for more reliable and quicker information. Therefore, it requires analytical and advanced management control tools. In this context, simple cost accounting become less productive for managers, whereas cost accounting with cost centers meet the new need.

Focusing on advanced management control approach, Balanced Scorecard, we found a gap between micro and small companies and medium and large enterprises. In the first two groups (micro and small companies), Balanced Scorecard is implemented only in minority group. Less than 3% of respondents adopted this method. However, this percentage increases in medium and large companies. We noted the same positive link between company size and management control tools, both traditional and “innovative”. For instance, the percentage of adoption budget, revenues, number of new customers, Economic value added EVA, payback period, market share, patents etc. grow with the increasing number of employees.

## **6 CONCLUSION**

Well managed and successfully introduced innovations into the market represent a tool for the companies, by means of which they can achieve competitive advantages and enabling their prosperity. Therefore, the effectiveness must be assessed by management control tools and indicators in all stages of the innovation, from the birth of the idea to the final commercialization stage. From this point of view, management control systems represent a key element in all enterprises.

The aim of research was to study the current state of issues of the management of innovative activities and their performance measurement mainly in Czech innovative manufacturing companies.

Based on gained data we can state that Czech manufacturing companies consider innovation as an essential success factor for their business. Most companies performing innovation pay attention to evaluation of realized innovation (irrespective of size of the company), since they tie a substantial part of a company's available resources for a significant period of time.

This paper reveals the fact that management control methods, especially “innovative” methods such as Balanced Scorecard, are mainly implemented in medium and large

companies. In addition, the study shows a positive correlation between company size and management control systems. The larger the company is, the higher the adoption of managerial techniques.

## **7 ACKNOWLEDGEMENT**

The author would like to thank all participants in the research survey and Czech Science Foundation for its funding support within post-doc project No. 13-20123P “Innovation Process Performance Assessment: a Management Control System Approach in the Czech Small and Medium-sized Enterprises”.
